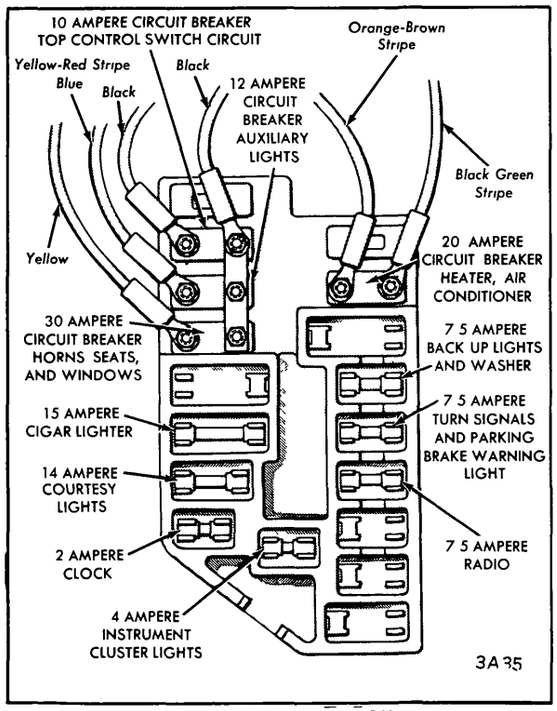
CIRCUIT BREAKERS



1 - Headlight circuit On headlight switch
2 - Windshield wipers At lower left end of instrument panel near steering column
3 - Electric Windows (including Tailgate), Seats, Convertible Top On starter relay

FUSES

1 - Fuse block on headlight switch
2 - In-line fuses in feed wire for each of the following units Clock (Fairlane & Meteor only), Air Conditioner, Spotlight, Windshield Washer Pump, Instrument Panel Lamp Rheostat
3 - Fuse on Overdrive Relay

THUNDERBIRD

See Fuse Box Illustration Fuse box located on right cowl panel under right end of instrument panel

THUNDERBIRD FUSE BOX

ELECTRICAL (C ntinu d)

SWITCHES, GAUGES, & SPEEDOMETER

► *1963 GALAXIE TURN SIGNAL SWITCH NOT CANCELLING CORRECTION* May be caused by turn signal lever binding on steering column tube and pin flange assembly To correct, remove signal lever and grind off the 1/16" lip in slot in housing using a fine mill file

► *INDICATOR GAUGES INACCURATE READING & MALFUNCTION NOTE* 1) On Temperature and Oil Pressure gauges, unit is grounded at sending unit threads To insure good ground connection, use Sealer C3AZ-19554-B on threads of sending units This sealer has aluminum particles in it to insure grounding

2) On FM-radio equipped cars radio suppression choke is installed on ignition (input) side of gauge voltage regulator Make sure choke is installed on correct terminal before checking for malfunction or inaccurate readings

► *1963 MONTEREY INOPERATIVE STOP LIGHTS (BLOWN FUSE) CORRECTION* May be caused by overload condition on circuit (includes parking, tail, dome, and instrument lights) if all lights are on at the same time To correct, connect stop lights into back-up light and turn signal circuit as follows Cut green-red wire (next to green-yellow wire) at female connector and splice into black-red wire at fuse block using a butt connector *See Wiring Diagram*

NEUTRAL SAFETY SWITCH STEERING COLUMN SHIFT AUTO TRANS.

All Models - Switch located on steering column under instrument panel To adjust loosen steering column-to-switch attaching screws and position switch so starter circuit is closed when selector lever is in "N" or "P" positions, then tighten attaching screws Starter circuit must be open in all positions except "N" or "P"

NEUTRAL SAFETY SWITCH FLOOR MOUNTED SHIFT AUTO. TRANS.

All Models - 1) Remove shift lever detent button, spring, and knob assembly from lever. Remove console top chrome trim panel. Put selector lever in "N" and remove quadrant indicator assembly. Remove bulb socket, being careful not to scratch quadrant cover. 2) Loosen switch attaching screw, apply both service and parking brakes, turn ignition key to start position, and move switch until starter operates Tighten switch screws and check for starting in "P" position. Check operation of back-up lights. Tape detent rod to shift lever to hold rod in position, and reassemble console and shift lever assembly.

HEADLIGHT SWITCH REMOVAL

Press down on button on top of switch and remove switch knob and shaft Remove retaining bezel nut (Tool No 17470-N-51) and remove switch Separate fuse block from switch and disconnect wiring

STOP LIGHT SWITCH

On brake master cylinder Not adjustable

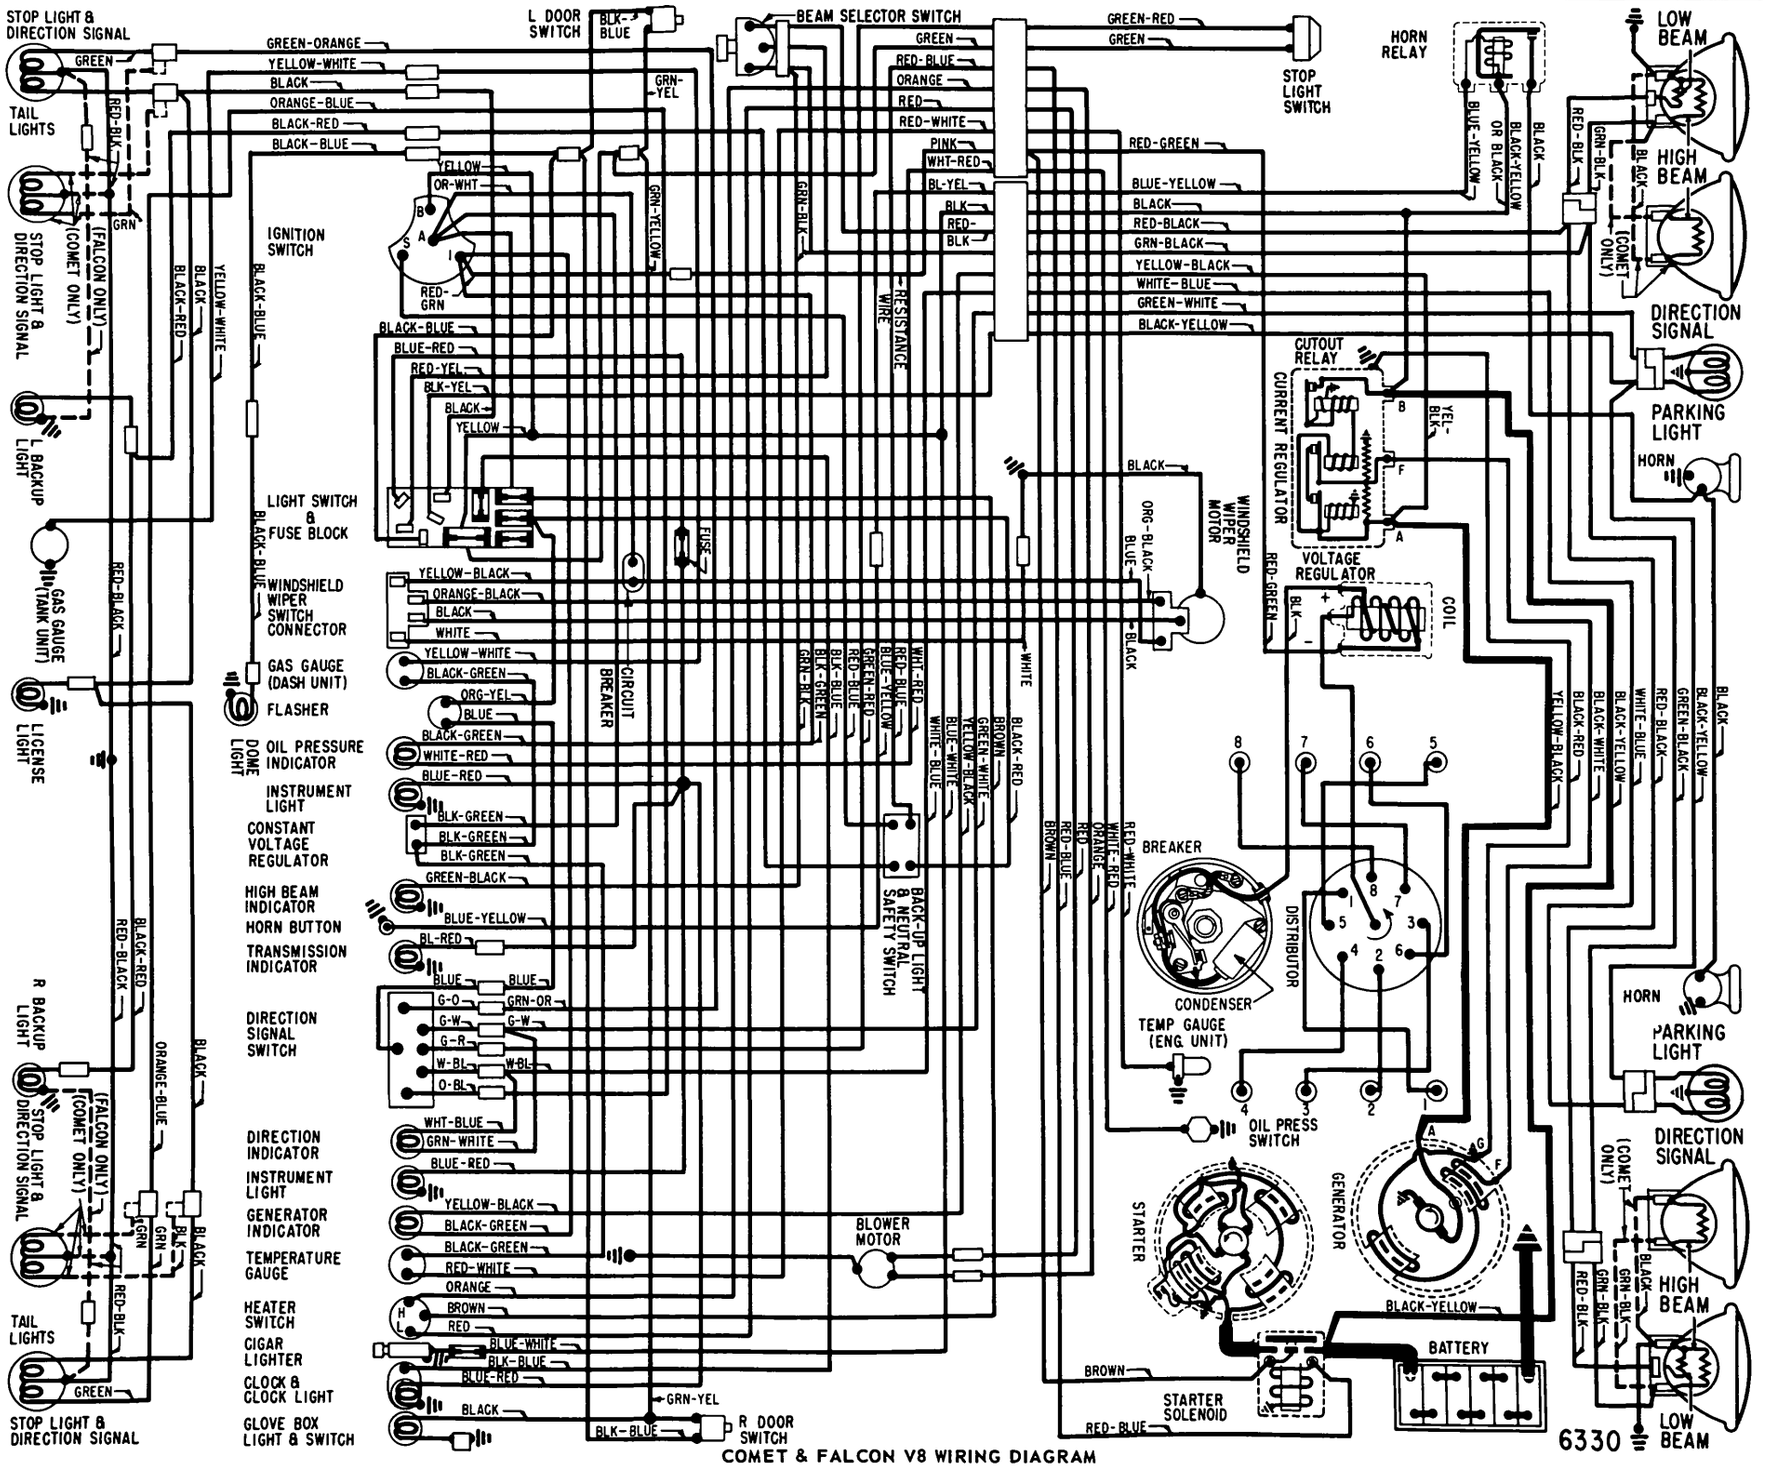
TURN SIGNAL FLASHER

Clipped on back of instrument cluster above and to left of speedometer (except Fairlane & Thunderbird), at extreme left of instrument cluster (Fairlane & Thunderbird)

SPEEDOMETER REMOVAL

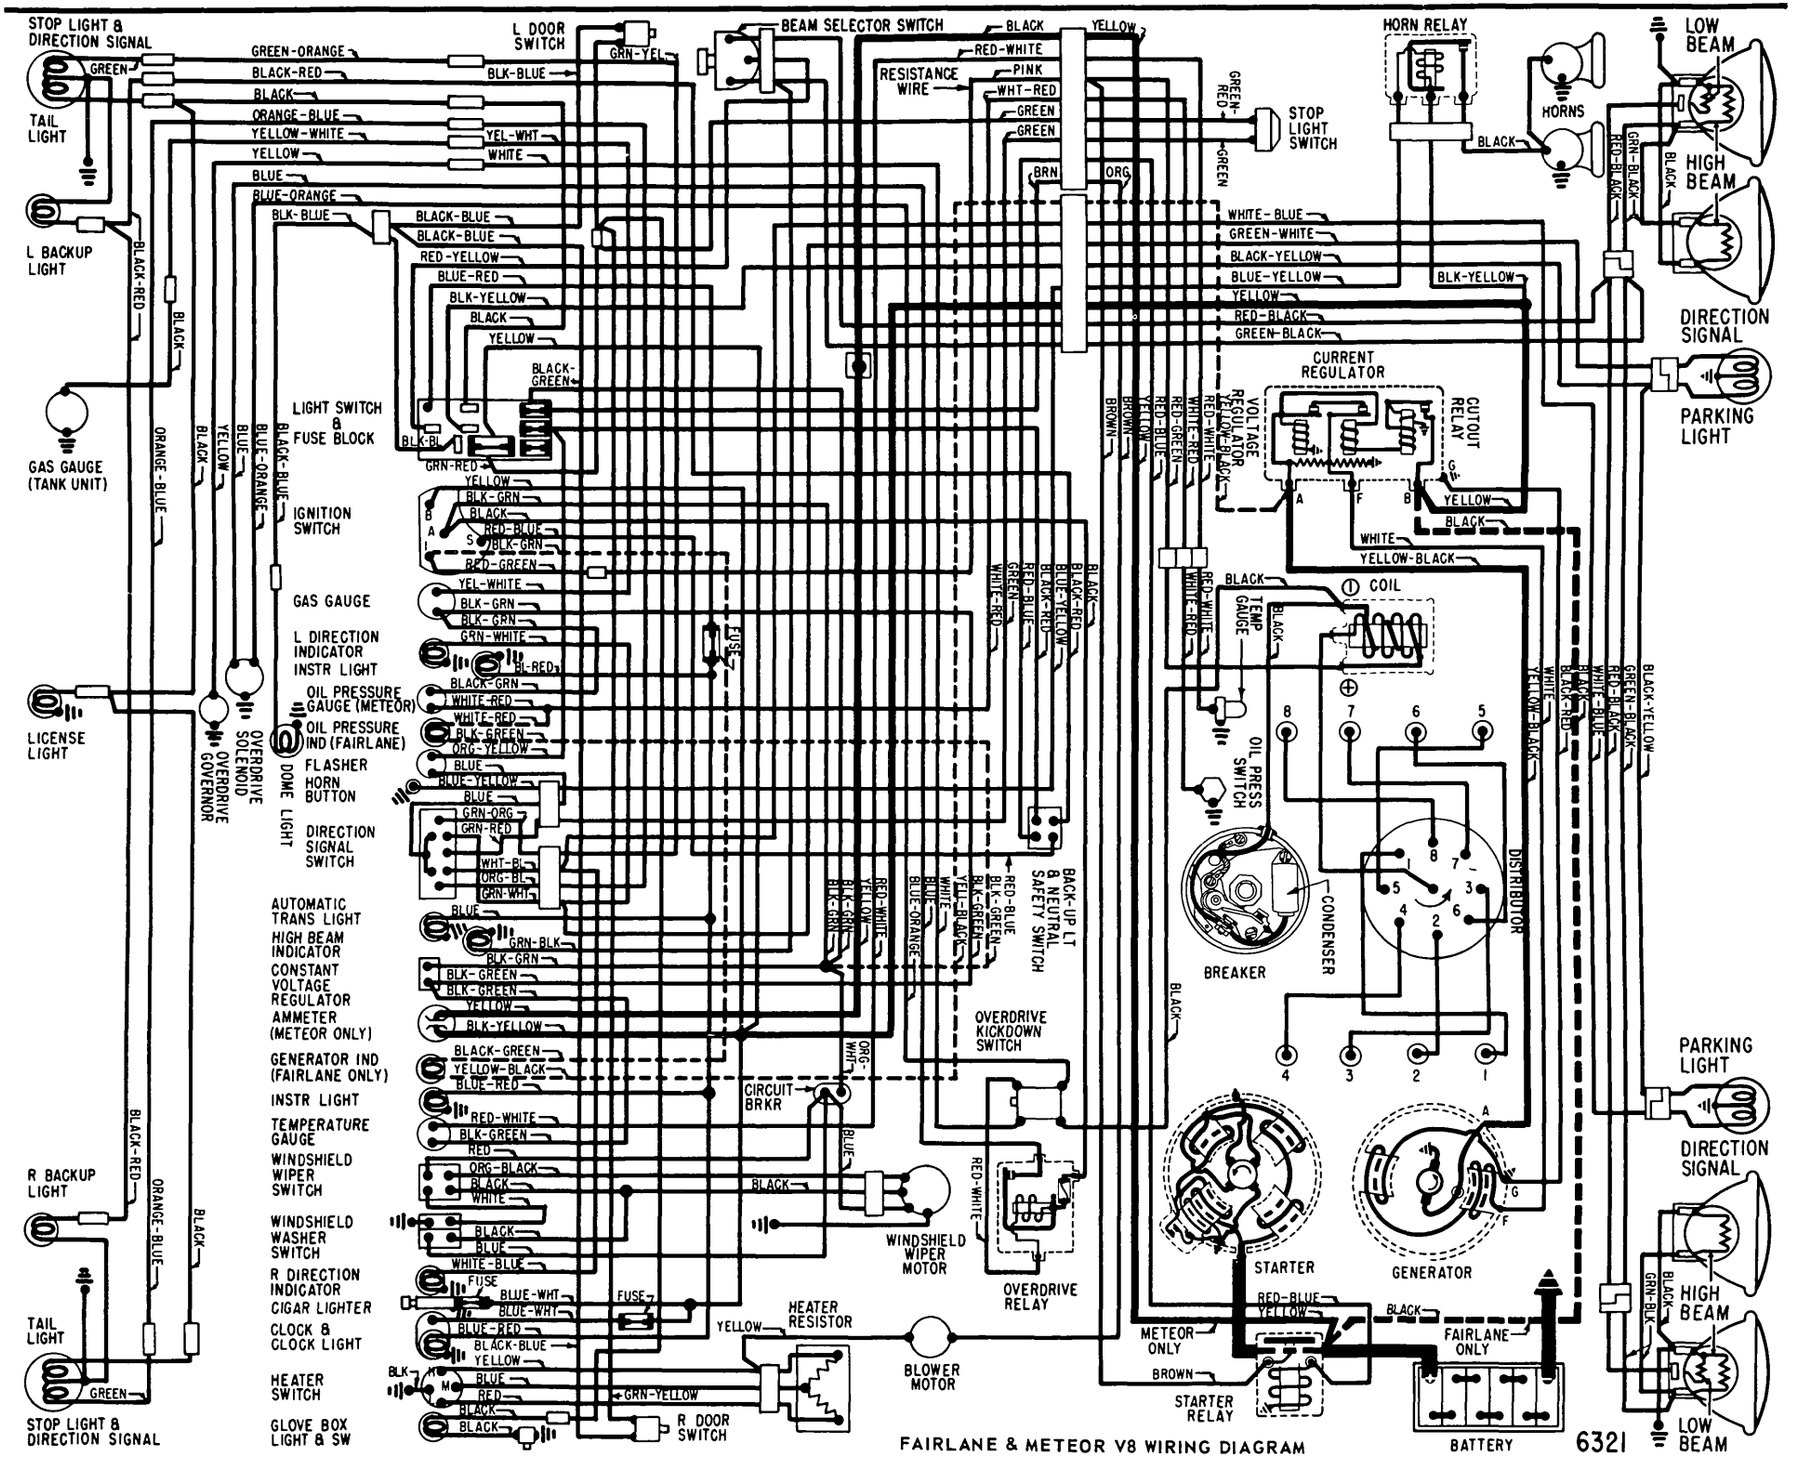
Falcon & Comet - Disconnect speedometer cable, then remove instrument cluster bezel, lens, and cluster mask plate from cluster housing Remove speedometer attaching screws and remove speedometer

Fairlane, Meteor, Galaxie, M nt rey - Speedometer and other instruments may be removed from cluster after cluster removed from instrument panel (see below)



Thunderbird - Remove chrome ring retaining screws, then remove chrome ring Remove speedometer attaching screws and pull speedometer out to disconnect cable and remove lights Remove speedometer

INSTRUMENT CLUSTER REMOVAL



Falcon & Comet - Remove instrument cluster bezel, lens, and cluster mask plate from cluster housing Remove fuel or temperature gauge as required
Fairlane & Meteor - Disconnect speedometer cable and remove wiring harness from retaining clamps *NOTE - On Meteor, disconnect ammeter wire from terminal block on steering column right support and remove wire from ammeter loops* Disconnect cluster from instrument panel and lay on steering column Disconnect all wires and lamps from cluster, then remove cluster
Galaxie - Remove steering column cover plate, and, on automatic transmission cars, turn shift indicator needle downward on shifting shaft Disconnect speedometer cable Remove wiring harness from retaining clips, then disconnect cluster from instrument panel and lay cluster on steering column Disconnect all wiring, and remove lights from cluster Remove cluster
Monterey - Disconnect speedometer cable, then remove all cluster wiring from retaining clips on back of cluster Remove transmission selector cover Remove upper cluster-to instrument panel retaining screws (4 long screws at top of cluster, 4 short screws at bottom of cluster, and 2 screws just above steering column) Lay cluster on steering column, disconnect wiring remove socket and lamp assemblies, then remove cluster
Thunderbird - *Unnecessary to remove cluster to remove an individual instrument* To remove an instrument, remove chrome ring retaining screw, chrome ring, and instrument attaching screws Pull instrument from panel and disconnect wires or cables Remove instrument *NOTE - Constant voltag r gulator is on a bracket near the clock Remove clock for acc ss*

427" Two 4-Bbl	425 at 6000	11 5-1	4 23"	3 78"	427 cu ins

ℂ - Later Engines Early Engines were 10 5-1 *See "Compression Ratio & Cylinder Head Production Change"*

ENGINE REMOVAL

Engine (without transmission) may be removed from above in the usual manner Observe the following Remove hood, radiator, fan, pulley, and starter Disconnect power steering pump from engine and tie out of way (unnecessary to disconnect hoses or drain system) Isolate air conditioning compressor, then disconnect from engine and tie out of way *See "Ford Motor Co Air Conditioning" in Miscellaneous Section for compressor isolating procedure* Be sure to support transmission and converter, and tie or secure converter in housing

ENGINE FRONT MOUNTS (COMET & FALCON)

Right insulator bracket is painted with a yellow stripe to avoid improper installation Be sure to install this bracket on the right side

ENGINE REAR MOUNT (CANTILEVER SPRING TYPE)

To prevent high frequency high speed vibration caused by transmission extension contact with rear mount, 20" minimum clearance must be maintained between rear mount upper insulator and transmission extension Tighten spring-to-support attaching shoulder bolt until bolt bottoms Do not add washers between lower insulator and spring as noise and vibration would result

ENGINE NOTES

► *1962-63 221" & 260" ENGINES CYLINDER HEAD NON-INTERCHANGEABILITY & IDENTIFICATION NOTE* Cylinder head combustion chamber volume is different for these engines and heads must not be interchanged To identify, cast part number on head has suffix letter "E" for 221", "F" for 260" Cast number located below No 3 & 4 and No 5 & 6 exhaust ports, or on bottom side of head directly under end intake manifold hold-down boss (about 1" from top edge), or cast on one end of head and visible when head removed

► *1962-63 FAIRLANE & METEOR ENGINE REAR MOUNT BOLT REPLACEMENT NOTE.* New type bolt, locking nut, cotter pin, and flat washer used to attach rear support bracket on later cars Use new type for **all** service replacement Torque for new bolt is 58-75 ft lbs

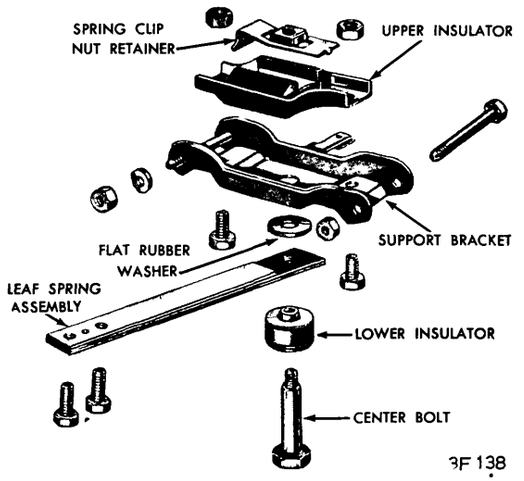
► *1963 THUNDERBIRD & MONTEREY ENGINE COMPARTMENT "WHINE" NOISE CORRECTION:* Noise most noticeable at 5-18 MPH and 800-1000 RPM, and may be thought to be caused by transmission front pump, power steering, etc To check, disconnect wiring from alternator regulator If noise stops, replace regulator *NOTE - Regulators with yellow paint on regulator base have been modified to correct this noise*

► *406" & 427" ENGINES REBORE CAUTION:* Manufacturer recommends no reboring of these cylinder blocks

► *1963 390" 4-BBL ENGINES COMPRESSION RATIO & CYLINDER HEAD PRODUCTION CHANGE:* Later engines have 10 8-1 compression ratio (was 10 5-1) and new cylinder heads with C2SE-6090 casting number between No 3 & 4 or No. 6 & 7 spark plugs are used. These heads may be used on earlier engines if the correct distributor is used

► *352", 390", 406", 427" ENGINES INTAKE MANIFOLD SEAL INSTALLATION NOTE* Special procedures required for seal and manifold installation *See "Intake Manifold Installation" below*

► *1963 390" (EXCEPT POLICE) ENGINE CRANKSHAFT & CONNECTING ROD PRODUCTION CHANGE & NON-INTERCHANGEABILITY NOTE* Later type connecting rods have increased "I" beam cross section and crankshaft has increased counterweight and bob-weight sections These rods and shaft must be used together as a set, and may also be used on 1961-62 engines



► *1962-63 390" POLICE & 406" ENGINES CONNECTING ROD PRODUCTION CHANGE & ROD CAP NUT INSTALLATION NOTE* New type connecting rod, No C3AZ-6200-A, used on later cars Rod bearing cap nut must be installed with machined shoulder contacting rod bearing cap Torque for this nut is 53-58 ft lbs

► *1962-63 406" ENGINE CYLINDER HEAD & VALVE SPRING SEAT PRODUCTION CHANGE, NON-INTERCHANGEABILITY CAUTION & CYLINDER HEAD INSTALLATION NOTE-* Later type heads have the internal valve spring pilot machined off to eliminate chamfering of pilot by spring and subsequent engine damage New separate valve spring seat, No C3AZ-6A536-A, with slots to measure valve spring height is used with new head *Do not intermix old and new design heads and spring seats* Also, Flatwashers, No 351453-S8, must be installed under each cylinder head bolt head to minimize bolts becoming embedded in head and losing torque

► *FALCON & COMET ENGINE LIFTING CAUTION* To avoid damage to accelerator linkage when raising or jacking engine (mount replacement, etc), disconnect accelerator shaft arm from accelerator pedal shaft

► *1963 390", 427" ENGINES OIL BEING DISCHARGED THROUGH FILLER CAP CORRECTION.* Caused by oil filler cap being loose on filler pipe and excessive crankcase pressure To correct, install new type oil filler pipe, C3AZ-6763-A (With internal bump to engage filler cap spring) and new type oil filler cap, C3AZ-6766-A (Chrome) C3AZ-6766-B (Black) which has six holes for improved crankcase ventilation *NOTE - Thes parts installed on later production engines*

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

FALCON & COMET CANTILEVER SPRING ENGINE REAR MOUNT ASSEMBLY (EXPLODED)

OIL PAN REMOVAL

Falcon & Comet - Drain crankcase, then disconnect exhaust pipes from exhaust manifolds Disconnect stabilizer bar from underbody and pull bar down below oil pan Remove oil pan attaching bolts, crank engine as necessary for clearance, then remove oil pan *INSTALLATION NOTE - Tabs of oil pan front and rear seals must be installed over the oil pan side gaskets*

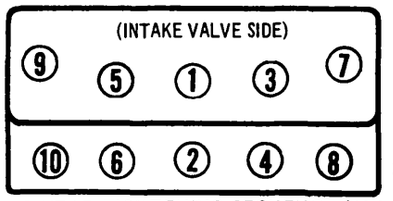
Fairlane & Meteor - Drain crankcase and remove dipstick. Remove front crossmember. Remove oil pan retaining bolts, crank engine for necessary clearance, and remove oil pan. *NOTE - When installing pan, tabs of oil pan front and rear seals must be over oil pan gasket.*

Galaxie (260" Engine) - Drain crankcase, remove dipstick, and remove starter and dust seal. Remove oil pan retaining bolts, crank engine for necessary clearance, and remove oil pan.

Galaxie & Monterey (352", 390", 406", 427" Engines) - Drain crankcase and remove dipstick.Remove flywheel housing lower cover. On Monterey, remove stabilizer bar from mounting studs and pull ends of bar down for clearance. On all cars, remove oil pan retaining screws and let pan rest on frame crossmember. Crank engine for necessary clearance between crankshaft counterweight and rear of oil pan. Swing oil pump pick-up tube and screen out of way or let drop into oil pan. Remove oil pan by moving forward and tilting down.

Thunderbird - Drain crankcase and cooling system. Disconnect radiator upper hose at supply tank. Remove oil pan retaining screws and let pan rest on underbody crossmember. Rotate crankshaft so counterweight will clear oil pan and move pan forward. Raise engine so there is tension on front engine mounts, disconnect mounts and raise engine so oil pump retaining bolts can be removed. Remove oil pan and pump.

ENGINE (Continued)



CYLINDER HEAD

Removal - On 221", 260", 289" engines, loosen rocker arm stud nuts and pivot rocker arms to one side so pushrods can be removed On 352", 390" Hydraulic lifter engines, observe rocker arm shaft removal procedure below

Installation - Coat new gasket on both sides with gasket sealer Gaskets must be installed with word "Front" to front of engine, and word "Top" facing upwards *NOTE - If gasket not marked "Top", make sure water passage holes line up as right and left gaskets are interchangeable* On 221", 260", 289" engines, coat head bolts with water resistant sealer On 406" engines (later type heads), Flatwashers, No 351453-S8, must be installed under each cylinder head bolt head to minimize bolts becoming embedded in head and losing torque On all engines, tighten bolts in sequence shown in diagram **3 times around** to torque limits shown in table below *Do not disturb bolts after final step completed.*

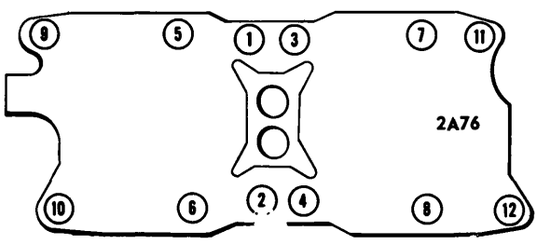
INTAKE MANIFOLD

Removal - On 352", 390" hydraulic lifter engines, observe rocker arm shaft removal procedure below.



Installation (221", 260", 289") - Coat cylinder block seal surfaces with oil resistant sealer. Install new seals and gaskets. *Gaskets must be interlocked with seal tabs.* Install manifold and use aligning dowels in bolt holes No. 10 & 12 (left side). Tighten manifold attaching bolts in sequence shown in diagram **3 times around** to following torques: **Step 1** - 3-5 ft. lbs. (aligning tools in place); **Step 2** - 3-5 ft. lbs. for bolts 10 & 12 (aligning tools removed); **Step 3** - 11-14 ft. lbs. (all bolts); **Step 4** - 14-16 ft. lbs. (all bolts).

Installation (352", 390", 406", 427") - 1) Be sure all mating surfaces are free of old seal and oil. Apply a thin coat of quick-drying adhesive to seal mating surfaces of block, then apply non-hardening sealer (Permatex No. 2) to mating line of cylinder head and block.

2) Place locating tabs at each end of seal in slots of manifold gaskets and press seal into position on block. *Be sure seal is properly positioned as it will stick to adhesive immediately.* Press tabs of seal into slots in gaskets and cover the four connections with Permatex No. 2. Install manifold carefully so as not to dislodge seals and gasket. Apply Permatex No. 2 under head of each attaching bolt, then install and tighten bolts to correct torque, starting from the center bolts.

VALVE ROCKER COVER INSTALLATION

Apply oil-resistant sealer to one side of new cover gasket, position gasket in cover (cemented side toward cover), install cover, tighten bolts to specifications. Wait 2 minutes, then retorque bolts to same specifications

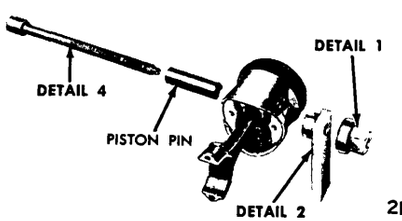
FITTING PISTONS

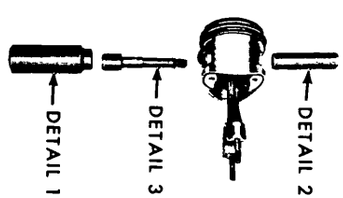
Place a length of ½" wide feeler stock (see table below for feeler thickness) between inverted piston and cylinder wall 90° from piston pin holes. Hold piston in bore so bottom of piston skirt is about 1½" below top of block and piston pin bore is parallel to crankshaft. *Feeler must extend entire length of piston.* Pull feeler from cylinder with a spring scale and note reading on scale. Specifications should agree with table below.



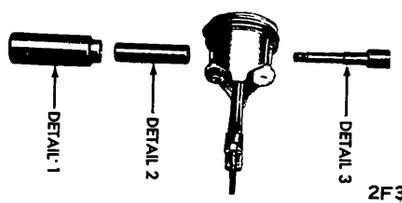
PISTON PIN REPLACEMENT (221", 260", 289")

TOOL T60K-6135-A MODIFICATION - If tool not previously modified to prevent damage to piston, make following modification so piston will not be damaged when Detail 2 of tool seats against piston pin boss: Grind a 1/16" - 45° chamfer around outer edge of Detail 2.

Removal - Press pin out of piston and connecting rod using Tool T60K-6135-A and vise and wrench, or Tool 6135-J and arbor press as shown in illustrations.



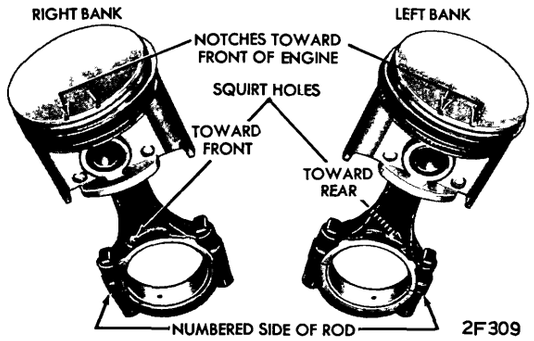
REMOVAL



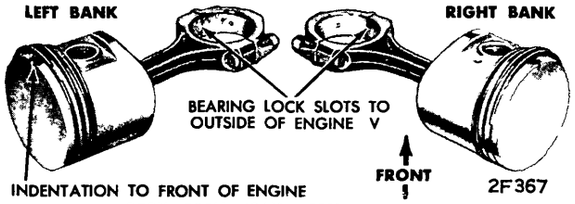
INSTALLATION

221", 260", 289" ENGINES PISTON PIN REPLACEMENT (VISE & WRENCH METHOD)

REMOVAL



INSTALLATION



221", 260", 289" ENGINES PISTON PIN REPLACEMENT (ARBOR PRESS METHOD)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

Installation - Lightly coat all parts with engine oil, assemble piston and connecting rod correctly and press pin into piston and rod as follows 1) With Tool T60K-6135-A and vise and wrench draw pin into assembly until pin seats in Detail 2 2) With Tool 6135-J and arbor press, press pin into assembly until Detail 2 is firmly seated in Detail 1 *See Illustrations*

221", 260", 289" ENGINES
PISTON & ROD INSTALLATION

352", 390", 406", 427" ENGINES
PISTON & ROD INSTALLATION

MAIN BEARING CAP INSTALLATION

1) All Caps - Caps are numbered from front of engine and should be installed in correct position with arrow on cap pointing to front of engine

2) Rear Cap - Coat only rear mating surface of cap with oil resistant sealer Do not use sealer forward of oil slinger groove (221", 260", 289"), forward of side seal grooves (352", 390", 406", 427") Install cap immediately after sealer applied so sealer will not set and cause an oil leak

3) 427" Engine Intermediate Cap Cross-Bolts - Intermediate bearing caps have side bolts in crankcase Install caps as follows Torque all bearing cap bolts to 95-105 ft lbs Assemble cross-bolt spacers and washers properly (see illustration for markings) Torque cross-bolts in sequence shown in illustration in **2 steps:** 1) 20 ft lbs 2) 40 ft lbs

REPLACEMENT BEARINGS

Standard size replacement main and connecting rod bearings available in 2 sizes marked Red and Blue for selective fit Any combination of red and blue inserts may be used to obtain desired clearances

REAR MAIN BEARING OIL SEAL

NOTE - Upper seal can be replaced only with crankshaft removed from engine

CRANKSHAFT, MAIN BEARINGS, CONNECTING ROD

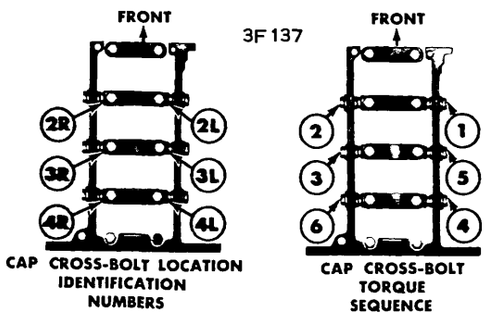
④ - No. 3 Bearing. Wear limit .012". ⑤ - Wear limit. 019",
⑥ - **No. 1** - .001-.002", **No. 2,3,4,5** - .0010-.0031". ⑦ - Wear limit .027".



THRUST BEARING ALIGNMENT

Install all bearing caps except thrust bearing cap and torque to specifications Install thrust bearing cap with bolts finger tight Pry crankshaft to rear of engine, then to front of engine While holding crankshaft forward, tighten thrust bearing cap bolts to specifications Check crankshaft endplay

Upper & Lower Seal - *CAUTION - Use Installing & Forming Tool as indicated in table below, and follow procedure listed exactly to prevent seal shift and oil leaks* Preform seal by hand and install into block or cap with thumbs, seating seal at center and then working from the ends toward the center Now place installing tool properly in block or cap as follows Large flanged face of tool must be toward rear of engine for upper seal, and toward rear face of cap for lower seal Tool flanges must bottom on seal groove rear flange and bearing saddle (insert removed) Hold tool firmly and strike top of tool sharply Cut seal ends flush with block or cap Trim frayed ends

Side Seals (352", 390", 406", 427") - Dip side seals in penetrating oil and install **immediately** into grooves *CAUTION - DO NOT use sealer Seals expand with oil* Tap seals firmly into position DO NOT trim ends

Testing Seal Installation - Squirt a few drops of oil into parting lines between cap and cylinder block from the outside Blow compressed air against seals from the inside of block If air bubbles appear in oil, seal leaks

427" ENGINE BEARING CAP CROSS-BOLTS

Crankshaft Rear Seal Installing Tool

Engine	Tool No.
221", 260", 289"	T62F-6701-A or 6701-E
352", 390", 406", 427"	T58P-6701-A or 6701-C

ENGINE FRONT COVER

Removal (221", 260", 289") - Front cover with water pump attached is removed in the usual manner Unnecessary to remove radiator, or to disconnect fuel pump flexible line (lay fuel pump to one side)

Removal (352", 390", 406", 427") - Front cover is removed in the usual manner after observing the following: Remove radiator When removing power steering pump, it is unnecessary to disconnect lines or drain system (just tie pump out of way) If crankshaft sleeve is stepped down type, remove with three-jawed puller If crankshaft sleeve is not stepped down, remove with Puller T56P-6362-A Unnecessary to disconnect fuel pump flexible line (lay fuel pump to one side) Air Conditioner compressor brackets are attached by front cover screws

Installation (All Engines) - Use Pilot (alignment tool) as indicated in table below to center cover on crankshaft Push in on tool and tighten cover bolts to specifications Reverse removal procedure to complete the installation

Engine Front Cover Aligning Tool

Engine	Tool No.
221", 260", 289"	T61P-6019-A or 6059-F
352", 390", 406", 427"	T61P-6019-B or 6059-F

ENGINE FRONT COVER OIL SEAL

Remove old seal with punch and clean recess in cover Drive new seal in cover with tool listed in table below until seal is fully seated and make sure spring is positioned properly in seal

Front Cover Seal Installing Tool

Engine	Tool No.
221", 260", 289"	T58P-6700-B or 4676-H
352", 390", 406", 427"	T58P-6700-B or 6700-B

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

VALVE GUIDE SERVICING

To ream guides for installation of valves with oversize stems, always use reamers in sequence and reface valve seat after valve guide is reamed Reamers are furnished 003" oversize with standard diameter pilot; .015" oversize reamer with 003" oversize pilot; and .030" oversize reamer with 015" oversize pilot

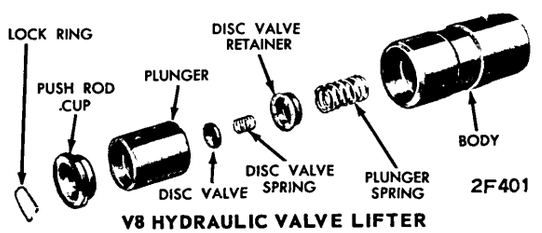
VALVE STEM SEALS

Cup or umbrella type seals used on all valves. Install seals with cup side down over valve guide

VALVE SPRING INSTALLED HEIGHT

Installed height of valve spring must not exceed specifications listed in table below. Measure height from surface of cylinder head spring pad to underside of spring retainer. *NOTE - On 406", 427" Engines with separate type valve spring seat, measure spring height from one of the slots in valve spring seat to top of spring.* If height greater than specified, install .030" spacer on head under spring to bring height within limits *CAUTION - Install spacers only if necessary and do not use more than 2 spacers (will overstress springs and overload camshaft lobes).*

Valve Spring Height Specifications



Engine	Installed Height
221", 260"	1 3/4 - 1 25/32"
289" 2-Bbl	1 3/4 - 1 25/32"
352"	1 13/16 - 1 27/32"
390" (Except Police)	1 13/16 - 1 27/32"
390" Police	1 51/64 - 1 53/64"
406", 427"	1 51/64 - 1 53/64"

VALVE SPRING INSTALLATION

Spring ends must be square within 1/16". Install springs with damper (closed) coil end down toward cylinder head If damper spring used, end of damper spring coil must be 135° counterclockwise from coil end of valve spring

HYDRAULIC LIFTERS

See illustration for arrangement of parts. Leakdown rate should be 10-100 seconds Use a lifter tester according to directions of manufacturer

V8 HYDRAULIC VALVE LIFTER

HYDRAULIC LIFTER OPERATING RANGE ADJUSTMENT(221", 260", 289")

1) With No. 1 and then No. 6 pistons at TDC of compression stroke, adjust valves indicated in Steps 2 & 3 below as follows: Loosen rocker arm stud nut until there is clearance at pushrod, then tighten nut until all pushrod-to-rocker arm clearance is just removed Then tighten stud nut an additional **2 turns** to place hydraulic lifter plunger in center of its travel *NOTE - Clearance between valve stem tip and rocker arm with lifter fully collapsed should be .082-.152".*

2) With No. 1 piston at TDC of compression stroke, adjust the following valves:

No 1 Intake	No 4 Exhaust
No 1 Exhaust	No 5 Exhaust
No 2 Exhaust	No. 7 Intake
No 3 Intake	No 8 Intake

3) With No. 6 piston at TDC of compression stroke, adjust the following valves:

No. 2 Intake	No 6 Intake
No. 3 Exhaust	No. 6 Exhaust
No 4 Intake	No 7 Exhaust
No 5 Intake	No. 8 Exhaust

HYDRAULIC LIFTER OPERATING RANGE ADJUSTMENT (352", 390")

1) With No 1 and then No 6 pistons at TDC of compression stroke, adjust valves indicated in Steps 2 & 3 below as follows: *NOTE - Tool T58P-6565-A or 6513-K is available for this operation.* Bleed lifter down and hold collapsed Insert 083" feeler or tool between valve stem tip and rocker arm If gauge or tool enters, use standard length pushrod If gauge or tool does not enter, use .060" **shorter** pushrod. If .183" feeler or tool can be inserted between valve stem tip and rocker arm, operating range is excessive (incorrect pushrod, or wear on other parts) If all other parts of valve train are within limits, install .060" **longer** pushrod

2) With No 1 piston at TDC of compression stroke, check the following valves:

No 1 Intake	No. 5 Exhaust
No. 1 Exhaust	No 7 Intake
No. 3 Intake	No. 8 Intake
No. 4 Exhaust	No. 8 Exhaust

VALVES

① - Also furnished .003", .015", .030" Oversize.

② - Wear limit .0045"

③ - Wear limit .0055". ④ - Wear limit .005".

⑤ - For all valves: .2303" (2-Bbl.); 2316" (4-Bbl Std); .264" (4-Bbl.Police); 2576" (Three 2-Bbl.)

⑥ - For 2-Bbl Eng : .2303" Int., .2375" Exh
For 4-Bbl Eng.: 298" Intake & Exhaust

⑦ - For 427" Engine: Later Intake Valves have 2.09" Head Diameter.

3) With No. 6 piston at TDC of compression stroke, check the following valves:

No 2 Intake	No. 5 Intake
No 2 Exhaust	No. 6 Intake
No 3 Exhaust	No 6 Exhaust
No. 4 Intake	No 7 Exhaust

MECHANICAL LIFTER INITIAL ADJUSTMENT AFTER OVERHAUL (289", 390",406", 427")

Tappet Clearance (Cold) listed in table below. For hot clearance (after engine operated for 30 minutes at 1200 RPM), see Tune-Up Data.

1) Place No 1 piston at TDC of compression stroke Adjust following valve clearances: No. 1, 7, 8 Intake; No. 1, 4, 5 Exhaust

2) Turn crankshaft ½-turn or 180° (No 4 piston at TDC). Adjust following valve clearances: No 4 & 5 Intake; No 2 & 6 Exhaust

3) Turn crankshaft ¾-turn or 270° from second position above (No 3 piston at TDC) and adjust following valve clearances: No 2, 3, 6 Intake; No 3, 7, 8 Exhaust

Valve Tappet Clearanc (Cold)

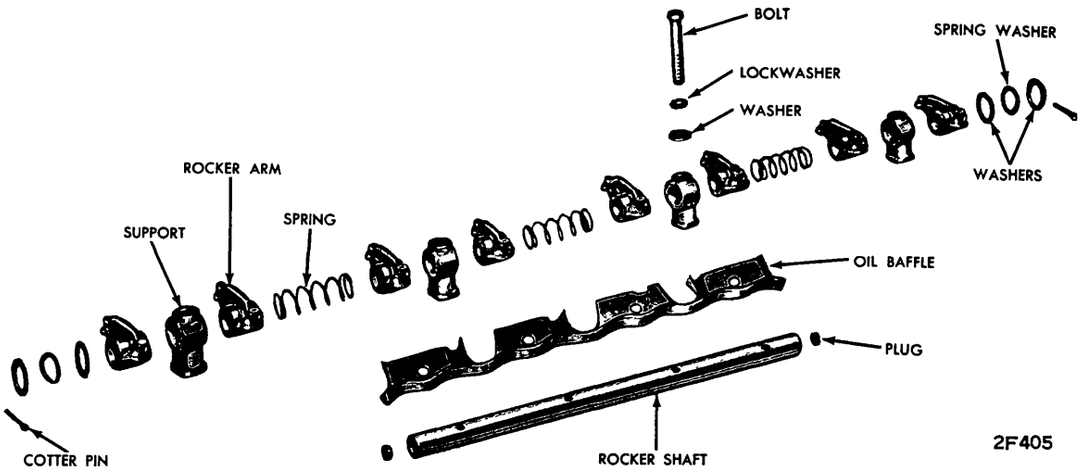
Engine	Clearance
289" 4-Bbl.	.024" Int. & Exh
390" 4-Bbl Police	.028" Int. & Exh.
406", 427"	.028" Int & Exh.

ROCKER ARM ADJUSTING SCREW NOTE - If torque required to turn self-locking adjusting screw is less than 3 ft lbs., install new standard or .0023" oversize screw. If minimum 7 ft lbs. torque cannot be obtained with oversize adjusting screw, replace rocker arm and adjusting screw assembly

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ROCKER ARM STUD REPLACEMENT (221", 260", 289")

NOTE - On 289" 4-Bbl Engines, rocker arm studs are threaded into cylinder head instead of being pressed in When installing n w stud, torque to 60-70 ft lbs Tool Kit T62F-6A527-A is available for this operation After removing old stud always use reamers in sequence and finish ream before installing a new oversize stud Align stud and installer tool with stud bore, then tap sliding driver until it bottoms When installer contacts stud boss on head, stud is installed to correct height



ROCKER ARM ASSEMBLY REPLACEMENT (352", 390" HYDRAULIC LIFTER ENGINES)

R moval - *CAUTION - Follow procedure listed exactly to prevent damage to valve train parts* Place No 1 piston at TDC at end of compression stroke and rotate crankshaft damper an additional 45° ("XX" on damper) Loosen right bank rocker arm shaft support bolts in sequence 2 turns at a time, starting at No 4 (rear) cylinder When bolts are loosened, remove rocker arm and shaft assembly Follow same procedure for left bank rocker arm shaft bolts, starting at No 5 (front) cylinder

Installati n - *CAUTION - To permit lifters to leak down, and to prevent damage to valve train parts, follow removal procedure in exactly the same way when installing rocker arm and shaft assemblies*

ROCKER ARM SHAFT ASSEMBLY OVERHAUL

See illustration for arrangement of parts End plugs must have cup side facing out, and oil holes in shaft must be facing downward

352", 390", 406", 427" ENGINES ROCKER ARM & SHAFT ASSEMBLY (EXPLODED)

CAMSHAFT

VALVE TIMING MARKS (ALL ENGINES)

221", 260", 289" ENGINES OILING SYSTEM

ENGINE OILING

Oil Pressure (Hot at 2000 RPM)

Engine	Oil Pressure
221", 260", 289"	35-55 lbs.
352"	35-55 lbs
390" 2 & 4-Bbl Std	35-55 lbs
390" 4-Bbl Police & Three 2-Bbl	45-70 lbs.
406", 427"	40-55 lbs.

Pressure Regulator Valve - In pump body, not adjustable. *NOTE - 406" & 427" Engines have additional Oil Pressure Safety Relief Valve assembly at rear end of main oil gallery (just above camshaft).*

ENGINE OILING SYSTEM

221", 260", 289" Engines

Force feed type with rotor type oil pump. *See illustration and note the following:*

Crankshaft & Camshaft Bearings - Oil from filter goes through passages in block to No 1 main and camshaft bearings, and to main oil gallery in right bank side of block Oil from main gallery is delivered to No. 2,3, 4,5, main bearings, and from each main bearing to each camshaft bearing by passages from main bearing webs

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated from adjacent main bearing.

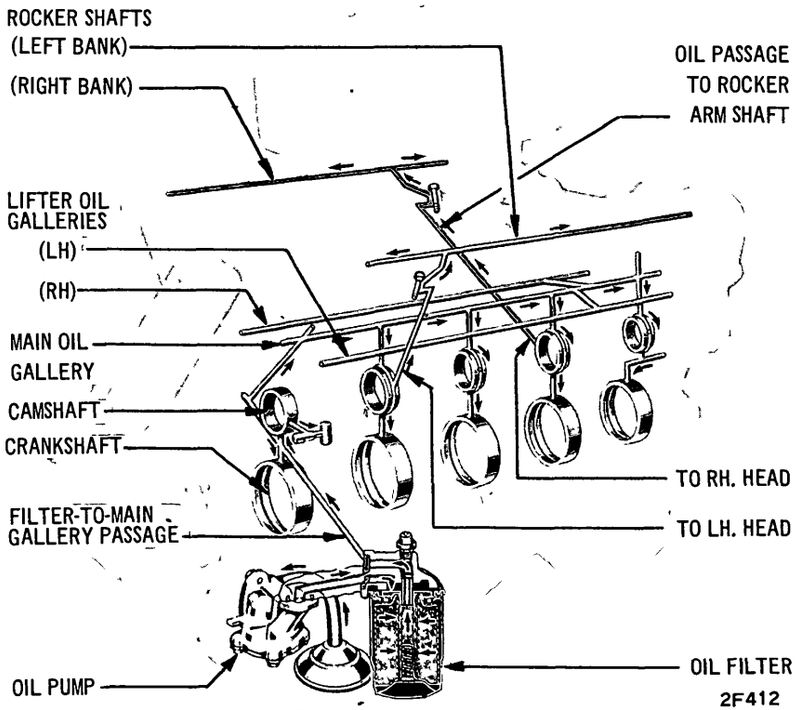
Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from drilled hole in each connecting rod lower end when this hole lines up with oil hole in crankshaft

Valve Lifters - Oil passes from main oil gallery to passages at rear of block leading to lifter galleries

Rocker Arms. Pushrods, & Valves - Lubricated by oil passing through metered hole in upper end of valve lifter, through hollow pushrods, to friction areas of rocker arms Oil drains back through holes in both ends of cylinder heads and the block.

Distributor - Lower end of drive shaft is lubricated through passage from No 1 camshaft bearing bore.

Distributor Drive Gears, Timing Chain & Sprockets, and Fuel Pump Eccentric - Lubricated by oil deflected from front camshaft bearing by an oil drip trough on cylinder front cover



Oil Filter - Full flow type mounted on left front side of engine. Filter has integral bypass valve and anti-drain back diaphragm.

352", 390", 406", 427" Engines

Force feed type with rotor type oil pump. *See illustration and note the following:*

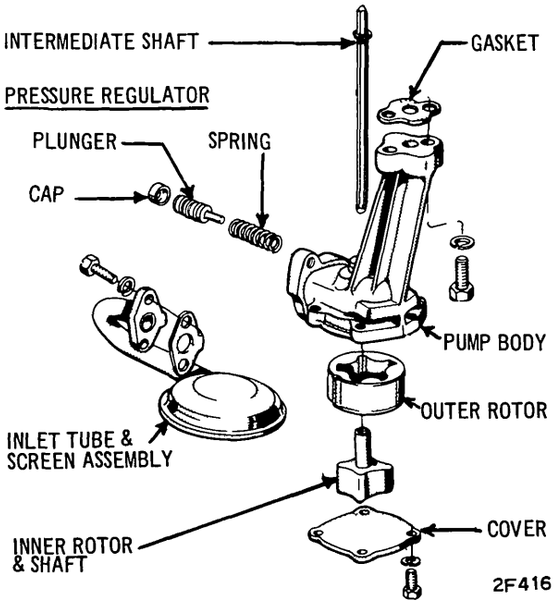
MECHANICAL LIFTER ENGINE NOTE - On engines with mechanical lifters, engine oiling system is changed

(Continued)

352", 390", 406", 427" ENGINES OILING SYSTEM

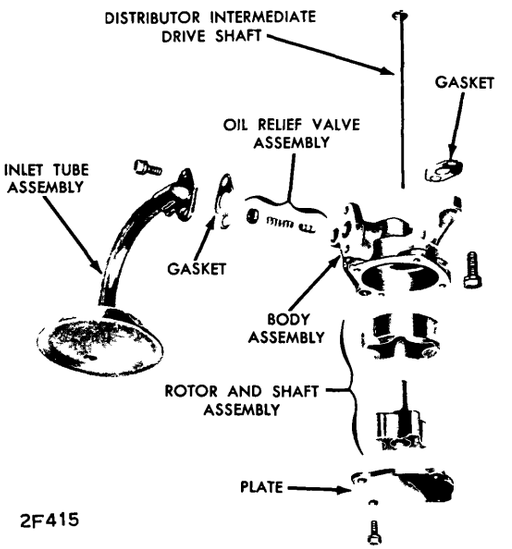
as follows 1) Jiggle pin in main oil gallery replaced by a cap plug 2) Passages from main oil galleries to right and left lifter galleries are plugged

Rck r Arms, Pushr ds, & Valves - Drilled passages in block at No 2 camshaft bearing (left bank), No 4 camshaft bearing (right bank) extend up through block and matching passages in cylinder head (passage in head is around one cylinder head bolt with offset channel in lower face of head to connect this bolt hole with passage in block) An angle passage in the head connects cylinder head bolt hole with rocker shaft support bolt hole (No 2 support bracket for left bank, No 3 bracket for right bank) Oil then flows up around bracket bolt and through an angle passage into the hollow rocker arm shaft Oil holes in shaft and arm provide lubrication for rocker arm bushings pushrod ends and valve tips (baffle under rocker shaft assembly shields valve stems from oil splash) Oil drainage down pushrods lubricates pushrod seat in lifter Excess oil in rocker chamber is returned to oil pan through drain holes at each end of cylinder head and in lifter chamber



Timing Chain & Sprockets - Plug at forward end of main oil gallery has vent hole and jiggle pin to vent air trapped in gallery Oil passing through this vent lubricates timing chain and sprockets

Distributor & Driv Gear - Lubricated through cross-passage from No 1 camshaft bearing (see illustration)



Oil Filter - Full flow type mounted on adapter at right front of crankcase Filter has integral bypass valve and anti-drain back diaphragm

OIL PUMP

Rotor type pump used on all engines See illustrations for arrangement of parts Pump cover plate screw torque is 6-9 ft lbs (All Engines) *Observe the following specifications*

221", 260", 289" ENGINES OIL PUMP (EXPLODED)

352", 390", 406", 427" ENGINES OIL PUMP (EXPLODED)

Oil Pump Specifications (All Engines)

Item	Specification
Outer Race-to-Housing	006- 012"
Rotor Endplay	0011- 0041"
Shaft-to-Housing	.0015- 0029"
Relief Valve-to-Bore	0015- 0029"

Relief Valve Spring Specifications

Engine	Lbs. Pressure	Length
221", 260", 289"	11 15-11 75	1 704"
352", 390"	9 0-9 6	1 530"
406", 427"	8 0-13 0	1 530"

ENGINE COOLING

Pressure Valve - 12-15 lb radiator filler cap (All Engines)

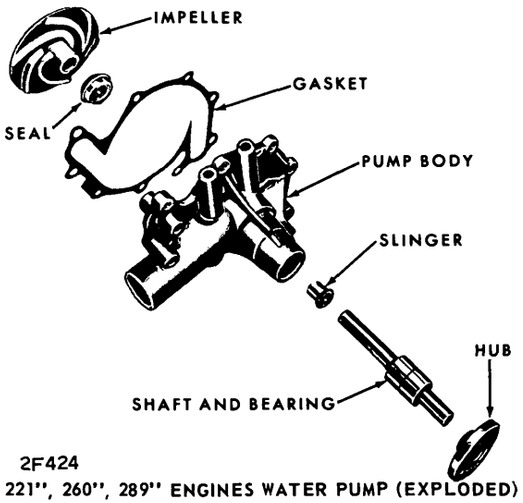
Thermostat - All Engines
Low Temperature - 155-162°F (fully open 182°F)
High Temperature - 185-192°F (fully open 212°F)

WATER PUMP

Special tool sets are available for water pump overhaul Other suitable support plates and drivers may be used providing they support and apply pressure properly to shaft, bearing, housing, and other parts *Observe the following specifications:*

Wat r Pump Specifications (All Engines)

Engine	ℂ Impeller	ℒ Hub
221", 260", 289"	030- 050"	5 150"
352", 390", 406", 427"	070- 080"	7 569"



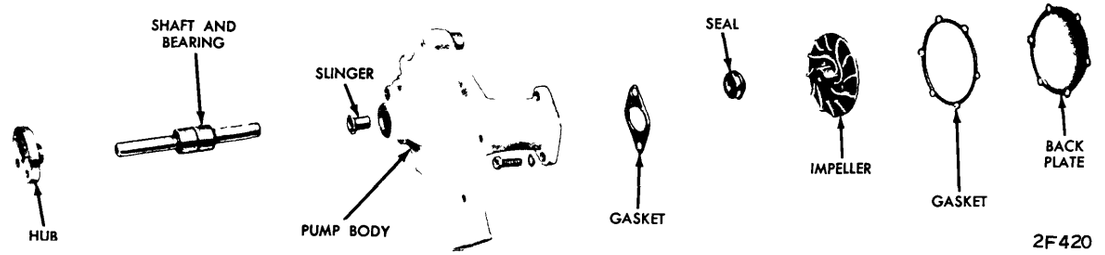
ℂ - Impeller-to-Housing Clearance
ℒ - Distance from front face of hub to pump housing mounting face

POWER BOOSTER FAN

Fluid coupling filled with silicone oil attached to water pump pulley at input side and to fan at output side A bi-metal strip on front of clutch moves out under higher temperatures and allows metal rod in center of clutch to move out This rod actuates a valve inside clutch to control amount of fluid admitted to coupling from a reserve chamber This action increases fan speed when air becomes hotter Reverse action takes place under colder temperatures

Trouble Shooting & Diagnosis - Poor cooling or noise may be caused by Actuating rod sticking, Bi-metal strip deformed or kinked, Excessive fluid leakage from clutch unit

Disassembly - Push bi-metal strip from retaining brackets and remove Clean clutch unit with rag dipped in solvent- *CAUTION - DO NOT immerse clutch unit in any kind of liquid Clean unit before removing actuating*



221", 260", 289" ENGINES WATER PUMP (EXPLODED)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

rod to prevent damage Remove actuating rod with fingers or needle-nose pliers

Inspecti n - Replace entire clutch assembly if there is excess fluid leakage or if bi-metal strip kinked or bent *NOTE - Bi-metal strips NOT interchangeable among units* Clean actuating rod bore in clutch with crocus cloth Clean rod in solvent and make sure rod moves freely in clutch bore Replace damaged rod with replacement rod *CAUTION - Replacement rod must be same length as old rod Adjust Allen screw in service rod to obtain proper length*

Reassembly - Reverse disassembly pr ocedure

352", 390", 406", 427" ENGINES WATER PUMP (EXPLODED)

Galaxie 500 & 500XL	60, 61, 62, 63, 64, 65, 66, 67, 68, 69
Station Wagon	72, 74, 76, 78

SERIAL NUMBER

Stamped on tab welded to top right side (weld flange) of dash panel in engine compartment. Also stamped under "Vehicle Warranty Number" on Car patent plate on lock face of left front door. Number carries identification data as follows:

① ② ③ ④ ⑤
3 S 63 X 100001

① - Year Model. **3** 1963.
② - Assembly Plant. *See listing below.*
③ - Car Model & Body Style Code. *See Model & Series listing above.*
④ - Engine Type. *See listing below.*
⑤ - Consecutive unit number at each assembly plant (starting with 100001 for Ford models, 500001 for Mercury models).

Assembly Plant Code Letters

A - Atlanta	**J** - Los Angeles	**T** - Metuchen
D - Dallas	**K** - Kansas City	**U** - Louisville
E - Mahwah	**N** - Norfolk	**W** - Wayne
F - Dearborn	**P** - St Paul	**Y** - Wixom
G - Chicago	**R** - San Jose	**Z** - St Louis
H - Lorain	**S** - Pilot Plant	

CAR BUILD DATE CODE

Stamped under DATE on car patent plate. Number designates day of month, letter designates month as follows: **A** January through **M** December (**I** not used).

THUNDERBIRD MODELS

Model	Series
Thunderbird	83, 85, 87, 89

MERCURY COMET MODELS

Comet	01, 02, 21, 22
Comet Custom	11, 12, 15, 17, 19, 23, 24, 26

MERCURY METEOR MODELS

Meteor	31, 32, 38
Meteor Custom	41, 42, 43, 47, 48, 49

MERCURY MONTEREY MODELS

Monterey	51, 52, 53, 54, 57
Monterey Custom	60, 62, 63, 64, 65, 66, 67, 68, 69
Station Wagon	76

Engine Code Designation

Engine	Standard	Low Compression

Fuel Tank (gals.)	⑤	⑤

① - Add 1 quart with filter change.
② - Add 1 quart for heater.
③ - 14 quarts on Galaxie
④ - Drain & Refill. 11½ quarts Dry.
⑤ - 14 (Falcon & Comet), 16 (Fairlane & Meteor), 20 (Galaxie, Monterey, T-Bird Except Station Wagon), 21 (Galaxie, Monterey Station Wagon)

FILTERS & CLEANERS

Filter or Cleaner	S rvice Interval (Miles)
Oil Filter	Replace 6000
Air Cleaner	Clean 6000, Replace 30,000
Oil Cap Filter	Clean 6000
Fuel Filter	① Replace 36,000
Power Steering Filter	Replace 36,000

① - Replace every 6,000 miles on 406", 427" Engines

REPLACING OIL FILTER

Coat gasket face of filter with oil, thread filter on bracket by hand until gasket contacts adapter surface, then tighten filter an additional ½-turn. Run engine and check for leaks. *CAUTION - Do not ov rtighten.*

SERVICING AIR CLEANER

Attach element to a ¼" drill and spin element for 2 minutes inside a splash shield set on floor. *Do not us solvent.* Inspect element for cracks or splits.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

TUNE-UP SPECIFICATIONS

COMPRESSION PRESSURE

All ..... 160-200 psi

Maximum variation between cylinders 20 psi.

VACUUM READING

All ..... 18" at idle

VALVE TAPPET CLEARANCE

All ..... Zero Lash (Hydraulic)

SPARK PLUGS

Gap ..... .032-.036"
Torque ..... 15-20 ft. lbs.

Spark Plug Type

All ..... Autolite BF-42

DISTRIBUTOR

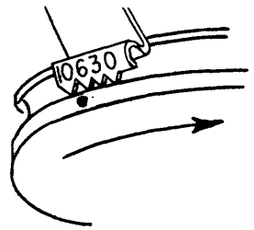
Point Gap ..... .014-.016"
Cam Angle ..... 26-28½°
Condenser Capacity ..... .21-.25 mfd
Breaker Arm Spring Tension ..... 17-20 ozs.

TUNE-UP NOTES

►*COLD ENGINE STALL OR STUMBLE CORRECTION (EARLY CARS):* May be caused by automatic choke leanness. Correct by installing new type carburetor spacer and gaskets. *CAUTION* - If new gaskets used with old spacer, gaskets must be reworked. *See "Carter AFB 4 Barr l Carburetors" in Carburetion Section.*

►*FUEL PUMP PUSHROD AND ECCENTRIC PRODUCTION CHANGE & REPLACEMENT CAUTION:* Cars after March 9, 1963 have new fuel pump drive parts which are not interchangeable individually with earlier type parts. When used together, following parts can be installed on previous engines: Fuel Pump Push Rod, Eccentric Drive Bushing and Drive Eccentric, and Eccentric Wear Plate.

►*AUTOMATIC CHOKE CAUTION:* Do not loosen center screw holding water jacket assembly to choke housing. Remove this screw only if jacket gasket is to be replaced or jacket cleaned. Slot the blade of a suitable size screwdriver to remove screw. Choke is adjusted in the usual manner without loosening center screw.



►*IDLE SPEED-UP CONTROL NOTE:* Used on air conditioned cars and operates only when air conditioner unit clutch engaged. Device is an electrical solenoid switch which operates an air valve in an external bypass system of carburetor to increase air flow below throttle plates. *NOTE* - Not necessary to operate air conditioning when adjusting Hot (Slow) Idle. When Hot Idle properly set, operation of Idle Speed-up device will give desired 800-900 RPM idle with air conditioning ON.

IGNITION TIMING

Set timing at specified idle speed with distributor vacuum line disconnected.

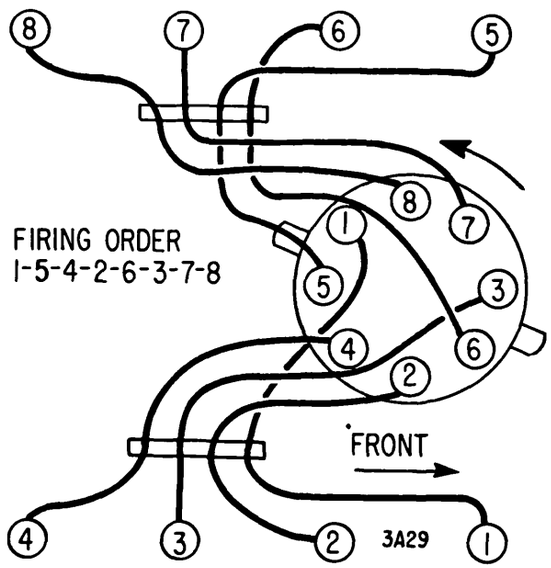
►*1963 IGNITION TIMING CAUTION: Following specifications supersede previous specifications of 8° BTDC, and must be used to avoid detonation and engine damage. DO NOT use fuel with octane rating below 98.6.*

	Normal	Minimum	Maximum
All	4° BTDC	2° BTDC	NONE

3A28

IGNITION TIMING MARKS

HOT (SLOW) IDLE RPM



With hot idle compensator valve held closed.

All, Without Air Cond. (In "Drive") 450-475
All, With Air Cond. OFF (In "Drive") 450-475

FAST IDLE

With idle adjusting screw on first (lowest) step of fast idle cam.

All (In "Drive") 675-700

FIRING ORDER

AUTOMATIC CHOKE SETTING

All ..... Ⓒ 1 Rich

Ⓒ - *See "Automatic Choke Caution" above.*

FUEL PUMP PRESSURE

All ..... 4½-6½ lbs. at 500 RPM

FUEL PUMP VOLUME

All ..... 1 pint in 20 seconds at 500 RPM

POSITIVE CRANKCASE VENTILATION SYSTEM

Disassemble and clean system every 12,000 miles.

THERMOSTATIC AIR INTAKE DUCT

Description - Thermostatically controlled carburetor air cleaner intake duct to provide heated air to intake manifold.

Testing - Place duct assembly in pan of water at temperature below 75°F (thermostat must be covered by water). Valve should be in closed "heat on" position. Heat the water slowly. At temperature of 85°F, valve should start to open. *NOTE - If valve does not start to open, hold water temperature at 85°F for eight minutes before discarding thermostat as defective.* Increase water temperature to 100°F. Valve should now be wide open in "heat off" position. *NOTE - If valve not wide open, hold water temperature at 100°F for eight minutes before discarding thermostat as defective.* If valve operation not satisfactory, remove thermostat and spring assembly and check valve shaft for binding. If valve moves freely, replace thermostat and duct assembly. If valve does not operate correctly, adjust thermostat rod as follows:

Adjustment - Increase rod length to move valve toward "heat off" position, decrease rod length to move valve toward "heat on" position.

IGNITION

DISTRIBUTOR ADVANCE SPECIFICATIONS
Lincoln C3VY-12127-A

Mechanical Advance: Test stand at 0° & 250 RPM. Vacuum Advance: Test stand at 0°, 0" Hg. & 1000 RPM.

MANIFOLD FUEL DISTRIBUTION

Carburetor right barrels feed cylinders 1,4,6,7 Carburetor left barrels feed cylinders 2,3,5,8

THROTTLE LINKAGE ADJUSTMENT

With engine at normal operating temperature, and slow idle speed correctly set, proceed as follows

1) Downshift Rod Adjustment - Loosen downshift rod locknut and disconnect rod from ball stud on bellcrank assembly, then slide spring clip off rod *NOTE - Be sure movable outer bracket of bellcrank is against stop pin on inner mounting bracket on bellcrank assembly* Hold downshift rod upward against transmission internal stop and adjust length of rod until hole in rod is aligned with ball stud on bellcrank assembly Lengthen rod one turn and position it on ball stud. Slide spring clip over end of rod to lock rod to ball stud Tighten locknut securely *CAUTION - If bellcrank outer bracket does not remain against stop pin, lengthen downshift rod an additional turn*

2) Accelerator Pedal Height Adjustment - *CAUTION - Make this adjustment at accelerator connecting link only* With engine stopped, measure distance from top of accelerator pedal to carpet Nominal measurement should be approximately 3½" Depress accelerator pedal and check detent feel and kickdown action of bellcrank Adjust height to obtain proper downshift rod operation. *NOTE - Throttle plates in carburetor must be fully opened before making this adjustment* Road test to check kickdown operation

CARBURETOR

BELT ADJUSTMENT

Belt Tension (Lbs.) With Tension Gauge T63L-8620-A

	①New Belt	②Used Belt
Alternator (Front Belt)	110-135	90-110
(Rear Belt)	105-140	85-115
Air Conditioning Compressor	120-150	90-120

① - Run belt for 5 minutes and reset tension.
② - Any belt operated 10 minutes or longer

ANTI-STALL DASHPOT ADJUSTMENT

1) With primary throttle plates closed, distance from top surface of air horn to top of dashpot plunger should be 1/8" To adjust, bend dashpot lever arm (between lever arm base and plunger) with Tool 9564-A

2) With primary throttle plates wide open, distance from top surface of air horn to top of dashpot plunger should be 7/16" To adjust, bend stop tang on opposite side of lever arm with Tool 9564-A

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

ELECTRICAL

BATTERY

12 Volt, 80 Amp Hr (20 Hr)

Battery Ground - Negative to engine block
Engine Ground - From engine (at battery ground cable connection) to body

STARTER

Lincoln C2VY-11002-A

Torque	RPM	Volts	Amperes
0 ft lbs	9500	12 0	70

Current Draw & Cranking Speed (Warm Engine) - 250 amps, 9 5 volts, 150 Engine RPM

screws attaching switch to steering column. Connect a self-powered test lamp to lower two terminals (back-up lamp) on switch. Position selector lever in "R" position and pull switch to its farthest downward position. slowly move switch upward until test lamp goes on. Tighten one switch mounting screw and move selector lever up and down without moving it out of "R" position. Test lamp should remain on. Attach test lamp lead to upper two terminals on switch and shift selector lever to "P" or "N" position. Test lamp should light. Apply a slight up and down pressure on selector lever while in "N" or "P" positions. Test lamp should not go out. Tighten switch attaching screws and connect wire connector to switch, then install vent extension, lower instrument panel cover, hood release handle, top control switch, and lower radio speaker and grille.

INSTR. CLUSTER PRINTED CIRCUIT (NO. 2)

INSTR. CLUSTER PRINTED CIRCUIT (NO. 1)

FUSE BOX

TURN SIGNAL FLASHER

Located under instrument panel to right of radio speaker opening. Accessible after speaker grille, radio support panel assembly, and speaker are removed.

STOP LIGHT SWITCH

Located on brake master cylinder. No adjustment.

HEADLIGHT SWITCH

Remove shaft and knob from switch by pushing button on switch and pulling on shaft. Remove switch retaining nut and both bezels from switch. Remove hood release handle and cable from bracket. Remove switch and disconnect wiring.

INSTRUMENT CLUSTER & SPEEDOMETER

Instrument panel contains an upper cluster and a lower cluster. Upper cluster contains temperature and fuel gauges, speedometer, all indicator lights, and clock. Upper cluster, including light bulbs, is serviced from **front** of instrument panel. Gauge Voltage Regulator and Radio Suppressor Choke Coil are located on back of clock.

Clock - Attaching screw located below clock. Remove from front.

Speedometer - Remove bezel by loosening two lower retaining screws. Remove light shields. Remove speedometer attaching screws and remove speedometer.

Speedometer Printed Circuit Board - Remove bezel by loosening two lower retaining screws. Remove the 4 screws holding speedometer housing and printed circuit board to mounting and trim plate. Remove speedometer and housing, and circuit board.

Fuel & Temperature Gaug s - Bezel attaching screw is at bottom of housing. Remove the 4 plate attaching screws and pull gauges from housing.

ENGINE

ENGINE REMOVAL

NOTE - Engine only need be removed (unnecessary to remove transmission). Be sure to support the transmission when removing engine. *In addition to the usual procedure, observe the following points when removing engine:*

1) Remove speed control unit (if equipped), and horn and bracket assembly. Remove transmission filler tube slotted bracket from right exhaust manifold. Remove transmission fluid filter (if equipped) from underbody sidemember. Remove fuel pump heat shield. Remove radiator.

2) On non-air conditioned cars, remove fan blade assembly and spacer from water pump pulley.

3) On Air Conditioned cars, remove fluid fan clutch, fan, and compressor pulley from water pump pulley as a unit. Isolate and remove compressor *(see "Ford Motor Co. Air Conditioning" in Miscellaneous Section).* Remove compressor mounting bracket.

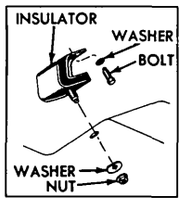
4) Remove underbody splash shield and access cover from converter housing. Remove oil filter and starter.

5) Attach lifting eyes to the rear of each exhaust manifold and in the lower front cylinder head bolt location on each cylinder head.

ENGINE LATERAL RESTRICTOR

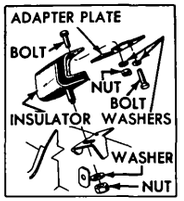
Attached between converter housing and underbody side-rail to restrict engine side movement. See "Engine Mounts" illustration for arrangement of parts. *NOTE - When assembling unit, lips of rubber bushings must be seated properly in bores of inner and out r brack ts.*

GENERAL SPECIFICATIONS



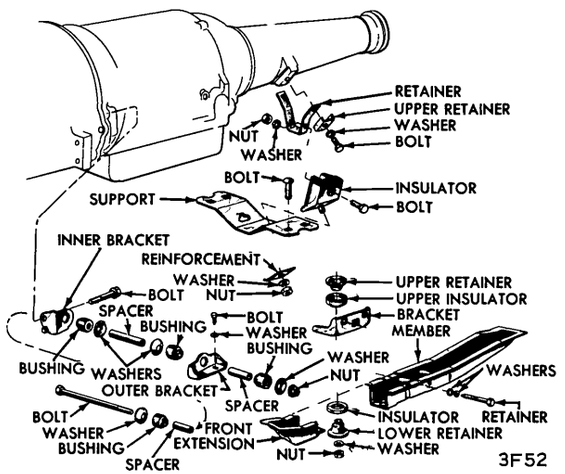
Engine	HP at RPM	Compr. Ratio	Bore	Stroke	Displac ment
All	320 at 4600	10.0-1	4.30"	3.70"	430 cu. ins.

ENGINE NOTES

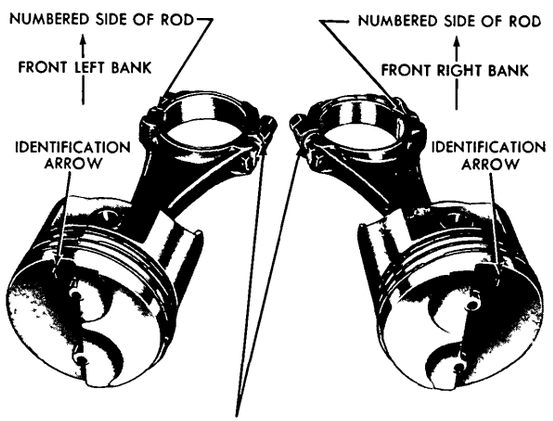


►*1963 PUSHROD COVER OIL LEAK CORRECTION:* Use new type one-piece cover bolt and washer, No. 377658-S, which has sealing material molded to underside of bolt and washer. Torque this bolt to 60-80 inch-lbs.

►*1963 ENGINE COMPARTMENT "WHINE" NOISE CORRECTION:* Noise most noticeable at 5-18 MPH and 800-1000 RPM, and may be thought to be caused by transmission front pump, power steering, etc. To check, disconnect wiring from alternator regulator. If noise stops, replace regulator. *NOTE - Regulators with yellow paint on r gulator bas hav b n modified to correct this nois .*



See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes



ENGINE FRONT SUPPORT— ALL EXCEPT CONVERTIBLE

ENGINE FRONT SUPPORT— CONVERTIBLE ONLY

ENGINE MOUNTS & LATERAL RESTRICTOR

POSITION OIL SQUIRT HOLE INWARD WITH PISTON IDENTIFICATION ARROW FORWARD TOWARD FRONT OF ENGINE. CAUTION PISTONS ARE NOT INTERCHANGEABLE FROM ONE CYLINDER BANK TO THE OTHER.

3F53

PISTON & ROD ASSEMBLY & INSTALLATION

TIGHTENING SPECIFICATIONS

ENGINE TORQUES

Bolt, Screw, or Nut	Ft. Lbs.
Cylinder Head	①
Intake Manifold	25-28
Exhaust Manifold	15-21

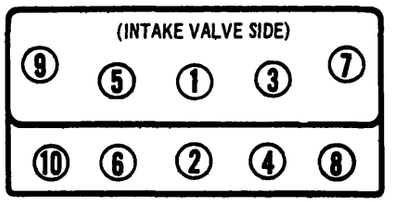
ENGINE MOUNT TORQUES

Bolt, Screw, or Nut	Ft. Lbs.
Front Insulator-to-Sidemember	45-65
Front Insulator-to-Engine	45-60
Lateral Restrictor Outer Bracket-to-Sidemember	21-29
Lateral Restrictor Inner Bracket-to-Converter	40-50
Lateral Restrictor Rod Compression Nut	20-30
Rear Crossmember Support Bracket-to-Body	20-30
Rear Crossmember-to-Bracket	10-18
Rear Insulator-to-Support & Retainer	20-30
Support Retainer-to-Transmission	④ 20-30

① - See "Cylinder Head Installation" for tightening procedure. Three different applications must be made.
② - Torque center end bolts first.
③ - If one-piece type bolt & washers used (see "Push-rod Cover Oil Leak Correction"), torque to 60-80 inch-lbs.
④ - *Excessive torque of this bolt can cause noise or vibration.*

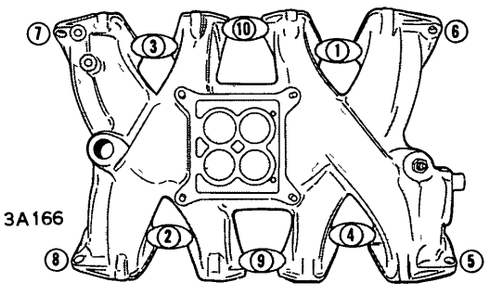
OIL PAN REMOVAL

All Models - Remove dipstick and turn crankshaft so No. 1 piston is 15° BTDC. Remove alternator splash shield and automatic transmission cooler line bracket bolt. Remove engine front support attaching pad nut, raise engine about 1", and place a ¾" wood block between insulator and underbody engine support pads. Remove both stabilizer arm bolts, washers, insulators, spacers, and nuts. Lower stabilizer arms for clearance. Remove oil pan bolts and free oil pan from block. Remove oil pump pick-up tube and screen assembly bolts, and drop assembly into oil pan. Remove oil pan.



CYLINDER HEAD INSTALLATION

Tighten cylinder head bolts progressively in sequence shown in diagram. Torque bolts 3 times around as follows:



Step	Ft. Lbs.
1	85
2	95
3	105

INTAKE MANIFOLD INSTALLATION

Torque bolts to specified torque in sequence shown in illustration.

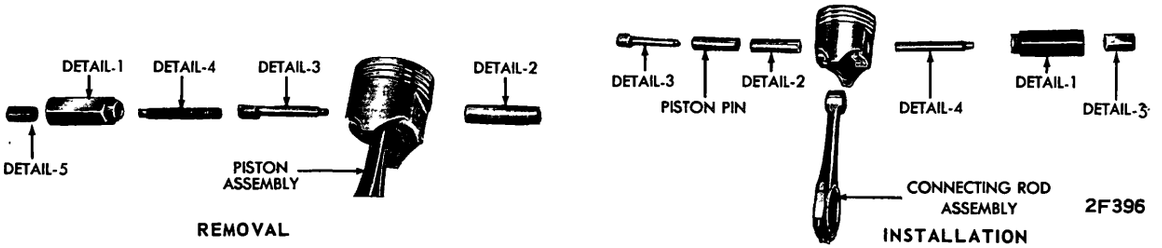
MAIN BEARING CAP INSTALLATION

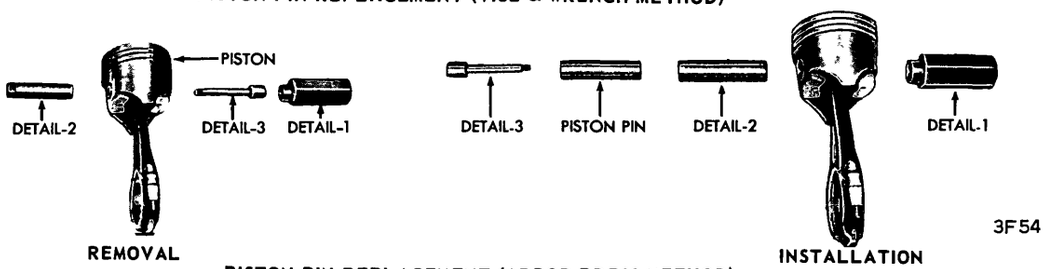
1) All Caps - Caps are numbered from front of engine and should be installed in correct position with arrow on cap pointing to front of engine.
2) Rear Cap - Coat only rear mating surface of cap with oil resistant sealer. Do not use sealer forward of side seal grooves. Install cap immediately after sealer applied so seal will not set and cause an oil leak.

REPLACEMENT BEARINGS



Standard size replacement main and connecting rod bearings available in 2 sizes marked Red and Blue for selective fit. Any combination of red and blue inserts may be used to obtain desired clearances.

THRUST BEARING ALIGNMENT



Install all bearing caps except thrust bearing cap and torque to specifications. Install thrust bearing cap with bolts finger tight. Pry crankshaft to rear of engine, then to front of engine. While holding crankshaft forward, tighten thrust bearing cap bolts to specifications. Check crankshaft endplay.

REAR MAIN BEARING OIL SEAL

NOTE - **1)** Upper seal can be replaced only after engine removed from car and with crankshaft removed.
2) When cap side seal does not compress firmly when forced into cap (cause of oil leak), an oversize seal is available for installation. DO NOT use oversize seal unless inspection shows that standard seal does not function properly.

PISTON PIN REPLACEMENT (VISE & WRENCH METHOD)

PISTON PIN REPLACEMENT (ARBOR PRESS METHOD)

PISTON PIN REPLACEMENT

Pins are a press fit in connecting rod. Use Tool 6135-F and arbor press or vise and wrench as shown in illustrations for removal and installation.
Installation & Checking Fit - Pin must be installed so it extends ¼" beyond face of piston boss. To check pin fit, install all parts of tool as for vise and wrench installation and place in a vise. Turn nut with torque wrench until pilot (Part No. 2 of tool) bottoms in anvil (Part No. 1 of tool). Minimum torque required to seat pilot is 20 ft. lbs. If less torque required, replace connecting rod.

① - Two different standard sizes, marked Red and Blue. ② - Blue. ③ - Red. ④ - Wear limit .0039".
⑤ - Wear limit .012". ⑥ - Wear limit .0038". ⑦ - Wear limit .018"

Upper & Lower Seal - *CAUTION - Use Installing & Forming Tool 6701-B and follow procedure listed exactly to prevent seal shift and oil leaks.* Preform seal by hand and install into block or cap with thumbs, seating seal at center and then working from the ends toward the center. Now place installing tool properly in block or cap as follows: Large flanged face of tool must be toward rear of engine for upper seal, and toward rear face of cap for lower seal. Tool flanges must bottom on seal groove rear flange and bearing saddle (insert removed). Hold tool firmly and strike top of tool sharply. Cut seal ends flush with block or cap. Trim frayed ends.

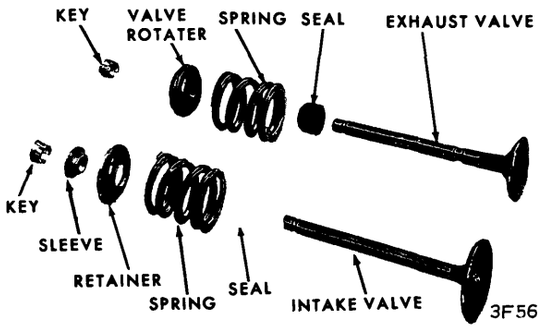
Side Seal - Dip side seals in penetrating oil and install **immediately** into grooves. *CAUTION - DO NOT use sealer. Seals expand with oil.* Tap seals firmly into position. DO NOT trim ends.
Testing Seal Installation - Squirt a few drops of oil into parting lines between cap and cylinder block from the outside. Blow compressed air against seals from the inside of block. If air bubbles appear in oil, seal leaks.

ENGINE FRONT COVER

Removal - Drain cooling system and disconnect battery. Remove radiator supply tank, fan shield, drive belts, fluid fan and pulley assembly. Remove water pump (loosen power steering reservoir bracket mounting bolts for clearance). Remove crankshaft damper. Remove power steering pump (disconnect and plug lines). Remove fuel pump heat shield and fuel pump. Remove cup type plug from top of front cover and then remove fuel pump pushrod. Remove engine front cover.
Installation - Reverse removal procedure and note the following: **1)** Power steering pump rubber insulators must be properly installed. **2)** Lips of front cover seal must maintain proper contact with power steering pump.

FRONT COVER OIL SEAL

Seal must be seated in front cover. No special tool required.



See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

VALVE SPRING INSTALLED HEIGHT

Installed height of valve spring must not exceed specifications listed in table below. Measure height from surface of cylinder head spring pad to underside of spring retainer. If height greater than specified, install .030" spacer on head under spring to bring height within limits. *CAUTION - Install spacers only if necessary and do not use more than 2 spacers (will overstress springs and overload camshaft lobes).*

Valv Spring Height Specifications

Engin	Installed Height
All . .	.1 5/8-1 21/32"

VALVE ASSEMBLIES (EXPLODED)

VALVE SPRING INSTALLATION

Spring ends must be square within 3/64". Install springs with damper (closed) coil end down toward cylinder head.

VALVE GUIDE SERVICING

To ream guides for installation of valves with oversize stems, always use reamers in sequence and reface valve seat after valve guide is reamed. Reamers are furnished .003" oversize with standard diameter pilot, .015" oversize reamer with .003" oversize pilot, and .030" oversize reamer with .015" oversize pilot.

VALVE STEM SEALS

Umbrella type seals used on all valves. Install seals with cup side down over valve guide.

HYDRAULIC LIFTERS

Remove through pushrod holes Leakdown rate is 10-80 seconds under a 50 lb load

HYDRAULIC LIFTER OPERATING RANGE CHECK

Clearance between valve stem and rocker arm should be 078- 218" with lifter fully collapsed To check operating range of lifter, proceed as follows

1) Place No 1 piston at TDC of compression stroke Following valves will be adjusted No 1, 3, 7, 8 Intake, No 1, 4, 5, 8 Exhaust Bleed lifters down with Tool 6513-K and hold collapsed Insert a 078" feeler gauge between valve stem and rocker arm If gauge enters, use standard length pushrod If gauge does not enter, use 060" **shorter** pushrod (coded White) If 218" gauge can be inserted between valve stem and rocker arm, operating range is excessive (incorrect pushrod, excessive wear on pushrods, rocker arms, or valve stems) If all other parts of valve train are within limits, install 060" **longer** pushrod (coded Yellow)

2) Repeat above procedure with No 6 piston at TDC of compression stroke and check the following valves- No 2 4,5,6 Intake, No 2, 3, 6, 7 Exhaust

ROCKER ARM ASSEMBLY

See illustration for arrangement of parts *NOTE - When assembling and installing, identification notch on rocker arm shaft must be down and to rear of engine on left bank, down and to front of engine on right bank*

VALVES

Engine	Head Diam.	Face Angle	Seat Angle	① Stem Diameter	Stem Clearance	Cam Lobe Lift

CAMSHAFT						
Engine	Journal Diameters					Bearing Clearance
	No. 1	No. 2	No. 3	No. 4	No. 5	
All	2.3243-2.3248"	2.3093-2.3098"	2.2943-2.2948"	2.2793-2.2798"	2.2643-2.2648"	ℂ .0012-.0027"

ℂ - Wear limit .005".

CAMSHAFT REMOVAL

Remove hood, air conditioning condenser (unnecessary to disconnect lines), radiator, lower center grille, engine front cover, sprockets and timing chain, rocker arm shaft assemblies, pushrods, and lifters. Remove camshaft.

CAMSHAFT ENDPLAY

Thrust to rear. Taken by thrust face of camshaft sprocket riding against front surface of cylinder block.

CAMSHAFT BEARING REPLACEMENT

NOTE - Engine must be removed from car and disassembled for bearing replacement. Use Tool 6261-F & Adapter Set 6261-AC. *Camshaft bearing journals and I.D. of bearings are stepped (largest journal and largest bearing at front). DO NOT interchange bearings. Position number of bearing is stamped on each bearing.* No. 1 bearing must be installed with notch on bearing to front of engine and facing down toward bottom of block; and bearing must be .005-.020" below front face edge of cylinder block bearing bore. On other bearings, split in bearing must be up toward top of cylinder block.

ENGINE OILING

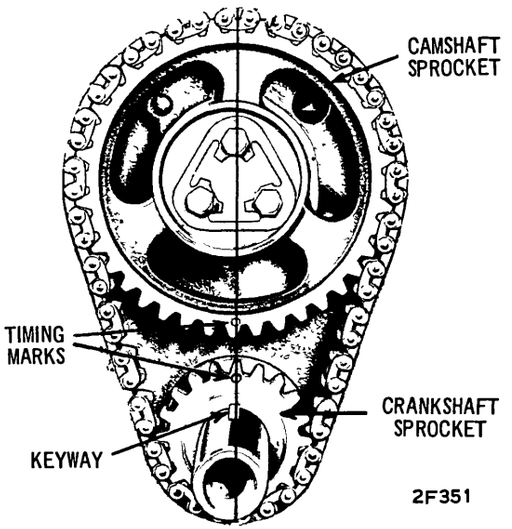
Normal Oil Pressure - 35-55 lbs. at 2000 RPM (hot).
Pressure Regulator Valve - In pump body. Not adjustable.

OILING SYSTEM

Refer to "Oiling System" illustration and note the following:

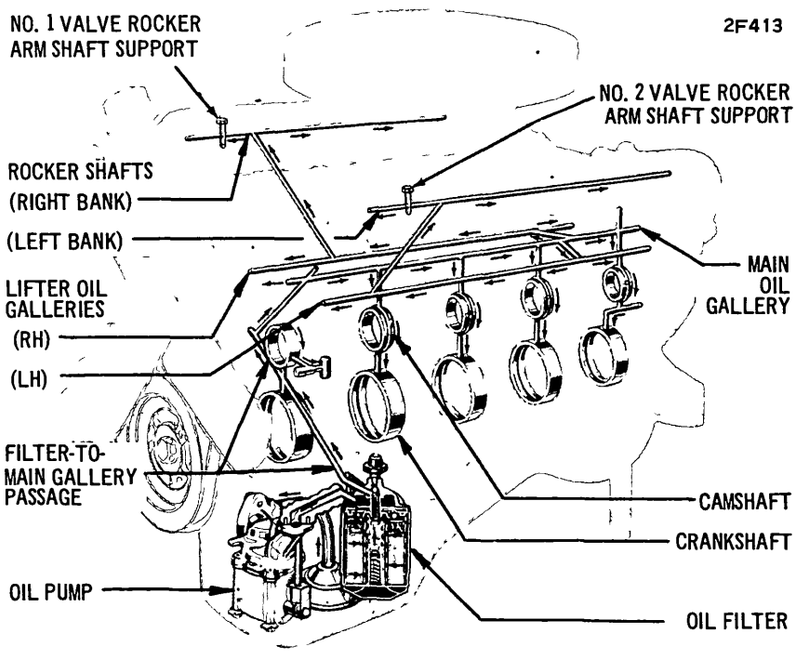
Crankshaft & Camshaft Bearings - All bearings are lubricated through vertical passages from main oil gallery (oil flow from filter is direct to main oil gallery).
Rocker Arms, Pushrods, & Valves - Drilled passages in block lead from right and left lifter oil galleries and connect with matching passages in cylinder head (passage in head is around one cylinder head bolt with offset channel in lower face of head to connect passage in block with this bolt hole). An angle passage in the head connects the cylinder head bolt with the rocker shaft support bracket hole (No. 1 support bracket for right bank, No. 2 bracket for left bank). Oil then flows up around bracket bolt and through angle passage in bracket into hollow rocker arm shaft. Oil holes in shaft and arm provide lubrication for rocker arm bushings, pushrod ends and valve tips. Oil drainage down pushrods lubricates pushrod seat in lifter. Excess oil in rocker chamber drains back into lifter chamber through holes at front and rear lower corners of head.
Timing Chain & Sprockets - Oil draining from front camshaft bearing flows onto thrust face of camshaft sprocket and is sprayed on timing chain and crankshaft sprocket.

CHECKING CAM LOBE LIFT



Check with dial indicator to specifications listed in Valve Table.

VALVE TIMING				
Engine	INTAKE		EXHAUST	
	Open (BTDC)	Close (ALDC)	Open (BLDC)	Close (ATDC)
All	ℂ 22°	ℭ 68°	ℂ 63°	ℭ 27°



ℂ - Camlift .002". ℭ - Camlift .005".

CHECKING VALVE TIMING

Install a quadrant on crankshaft damper. Remove right rocker arm assembly. Install Dial Indicator Tool 6565 and Indicator Adapter Tool 6565-AB on cylinder head using Holding Fixture Tool 4201-D. Pushrod must be in lifter socket and actuating point of indicator in same plane as pushrod movement. Make sure timing pointer is not bent. Turn engine slowly until lifter is on heel of camshaft lobe. Set indicator on zero and turn engine slowly until indicator registers cam lobe lift as shown in Valve Table above. Compare crankshaft degrees indicated on quadrant with Valve Timing Table above. Continue to rotate engine to check valve closing specifications in same manner. If reading not correct, check for bent pointer, worn timing chain or sprocket before replacing camshaft.

VALVE TIMING MARKS

ENGINE OILING SYSTEM

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

OIL PUMP

Rotor type mounted inside oil pan on lower left corner of block. Driven by distributor through an intermediate shaft. *Observe the following specifications:*

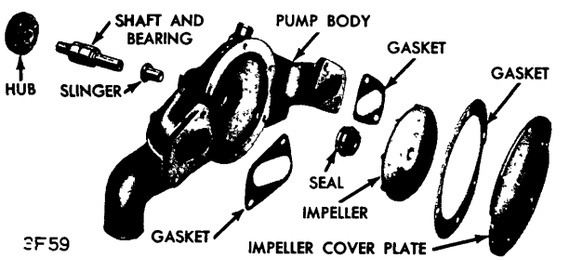
Oil Pump Specifications

Outer Race-to-Housing Clearance	.006-.012"
Rotor Endplay	.0011-.0041"
Shaft-to-Housing Clearance	.0015-.0029"
Relief Valve-to-Bore Clearance	.0015-.0029"
Relief Valve Spring Pressure	9.0-9.6 lbs. at 1.53"
Cover Plate Attaching Screw Torque	90-100 inch-lbs.

ENGINE COOLING

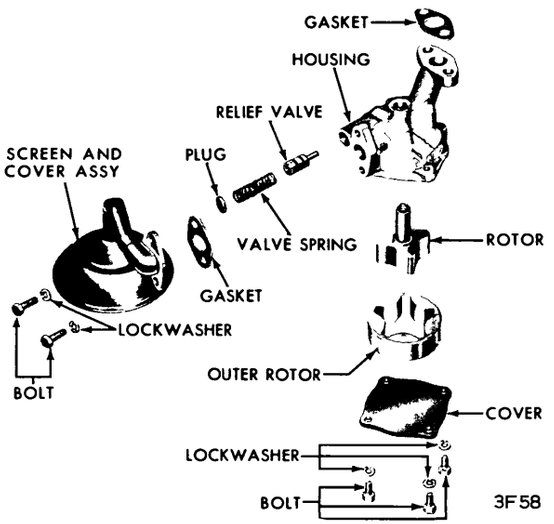
Pressure Valv - 12-15 lb. radiator filler cap.

Thermostats - As follows:
Main Thermostat (In Water Outlet Housing)
Standard - 155-162°F (fully open 182°F).
High T mp. - 185-192°F (fully open 212°F).



Cylinder Block Th rmostats - 137-142°F (fully open 162°F).

WATER PUMP



Special tool sets are available for water pump overhaul. Other suitable support plates and drivers may be used providing they support and apply pressure properly to shaft, bearing, housing, and other parts. *Observe the following specifications:*

Impeller Cl arance - .105-.115". *This is the distance the rear face of impeller is below the housing mounting face.*

Hub Dim nsi n - 7.094". *This is the distance from front face of pulley or hub to face of housing mounting legs.*

WATER PUMP (EXPLODED)

OIL PUMP (EXPLODED)

POWER SURGE FAN

Fluid coupling type mounted between fan and water pump pulley.

SAFETY CAUTION - Do not permit silicone oil to come in contact with the eyes as irritation will result.

TESTING CAUTION - Before testing, oil in unit must have minimum temperature of 65-70°F (park in heated garage overnight or operate engine at 1000 RPM for 20 minutes); and fan unit must be warm (operate for at least 5 minutes regardless of ambient air temperatures).

Testing & Trouble Shooting - *NOTE - Unit cannot be repaired and is serviced as an assembly only. If unit does not operate properly under the following test, it must be replaced.*

1) With engine stopped, fan should rotate under light finger pressure. If unit locked, replace it.

2) Mark one fan blade with chalk, connect a tachometer to engine and a timing light to No. 1 spark plug. Start engine and hold light beam at fan. Marked blade of fan should be stopped between 1700 and 1900 engine RPM. If above or below this range, replace unit.

MODEL IDENTIFICATION

SERIAL NUMBER

Stamped on right front fender apron above upper suspension arm opening. Also stamped under "Vehicle Warranty Number" on car patent plate at left front door area. Number carries identification data as follows:

① ② ③ ④ ⑤
3 Y 86 N 400001

① - Year Model. **3** 1963.
② - Assembly Plant. **Y** Wixom.
③ - Body Series Code. **82** 4-Door Special Sedan. **86** 4-Door Convertible.
④ - Engine Type. **N** 430" Std. **7** 430" Low Compression.
⑤ - Beginning vehicle number.

CAR BUILD DATE CODE

Stamped under DATE on car patent plate. Number designates day of month, letter designates month as follows: **A** January through **M** December (**I** not used).

ENGINE BUILD DATE CODE

Stamped on cylinder block in front of left cylinder head. Indicates place, year, month, day of month, and plant inspector. Not used for licensing.

CAPACITIES

Item	Capacity
Crankcase (Includes Oil Filter)	6 qts.
Cooling System (Includes Heater)	21 qts.
Automatic Transmission (Dry)	23 pints
Rear Axle	4.8 pints
Fuel Tank	21½ gals.

FILTERS & CLEANERS

Filter or Cleaner	Service Interval (Miles)
Oil Filter	Replace 6000
Air Cleaner	Clean 6000, Replace 30,000
Oil Cap Filter	Replace 12,000
Fuel Filter	Replace 6,000
Power Steering Filter	Replace 36,000

REPLACING OIL FILTER

Coat gasket with light film of oil. Screw filter onto adapter by hand until snug, then tighten ¼-turn additional. *Do not overtighten.*

SERVICING AIR CLEANER

Attach element to a ¼" drill and spin element for 2 minutes inside a splash shield set on floor. *Do not use solvent.* Inspect element for cracks or splits.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

TUNE-UP NOTES

► *1963 262" 6 CYL. ENGINE FUEL PUMP REPLACEMENT NOTE:* If fuel pump replaced because of rocker arm return spring breakage or for interference between rocker arm and lower fuel pump body, use new type pump, No. C3TZ-9350-E.

► *1958-63 292" V8 HESITATION OR STUMBLE ON ACCELERATION CORRECTION (FORD CARBS.):* Plastic accelerator pump cavity filler block, No. C30Z-9F565-A, may be installed in accelerator pump cavity if carburetor not already equipped. This filler block used in some late production 1962 trucks and in most all 1963 trucks.

► *1963 6 CYL. COLD HARD START CORRECTION (MANUAL CHOKE CARBS.):* May be caused by choke control cable being too long and interfering with pull-down rod or choke shaft lever when choke control knob pulled out. To correct, shorten cable as required and make sure cable housing extends ¼-½" beyond cable clamp at carburetor.

► *1963 6 CYL. ENGINE STALLING AT IDLE CORRECTION:* If engine stalls during hot idle operation, replace fuel inlet seat fiber gasket with new rubber-coated aluminum gasket, No. C3AZ-9569-B, and correctly adjust dry float level.

► *1963 ECONOLINE HESITATION OR SURGE CORRECTION:* Caused by too lean fuel mixture. *See "Ford 1-Barrel Carburetors" in Carburetion Section.*

HOT (SLOW) IDLE RPM

On Air Conditioned trucks, s t idle speed after operating air conditioner for 20 minutes and with unit on.

ℂ - Prefix & Suffix of number on carburetor mounting flange.
③ - Stamped on choke plate flange.
④ - At lower edge of sight plug opening ±1/16".

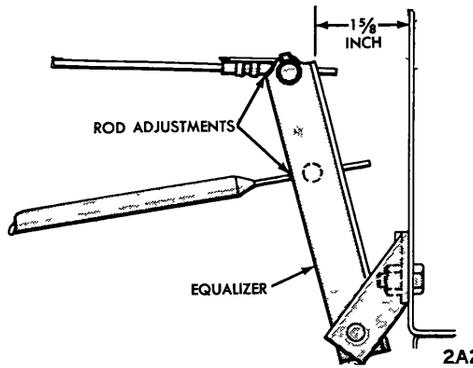
ACCELERATING PUMP

Ford 1-Bbl. - Install roll pin in "LO" hole of pump lever for operation above 50°F and/or 5000 ft. altitude. Install roll pin in "HI" hole for operation below 50°F.

Ford 2-Bbl. - *NOTE - Pump over-travel lever has four holes (No. 1 hole is nearest throttle shaft, and No. 4 hole is furthest from throttle shaft). Accelerating pump plunger lever has two holes.* Install pump operating rod in proper hole of over-travel lever as indicated in table below for various operating conditions. Install opposite end of pump rod in inner hole (closest to pump plunger) of plunger lever.

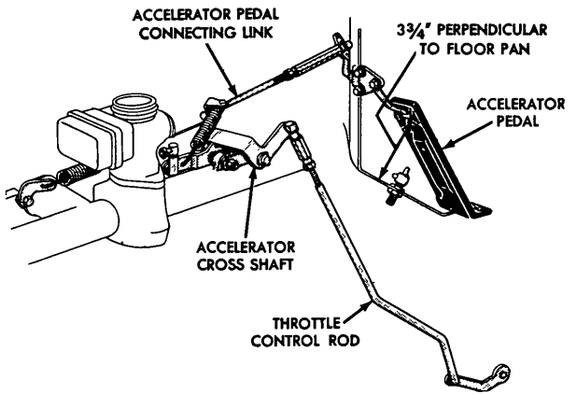
Over-Travel Lever Hole	Operating Condition
No. 1	Over 80°F and/or 5000 Ft. Alt.
No. 2	40-80°F
No. 3	Below 40°F
No. 4	Below -15°F

Holley 4-Bbl. - Align No. 1 (top) hole of pump cam with top hole of throttle lever for short stroke (warm weather or average conditions). Align No. 2 (bottom) hole of pump cam with bottom hole of throttle lever for longest stroke (cold weather operation).



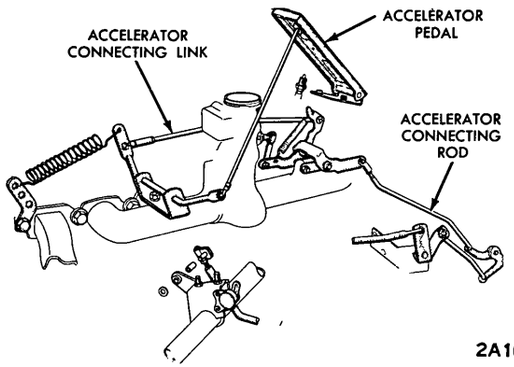
MANIFOLD FUEL DISTRIBUTION

V8 Engine - Carburetor right barrel feeds cylinders 2,3,5,8. Carburetor left barrel feeds cylinders 1,4,6,7.

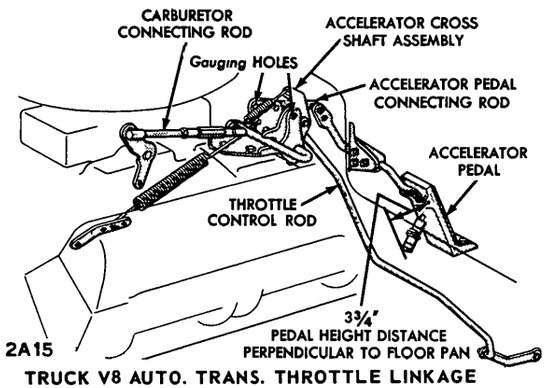


THROTTLE LINKAGE ADJUSTMENT

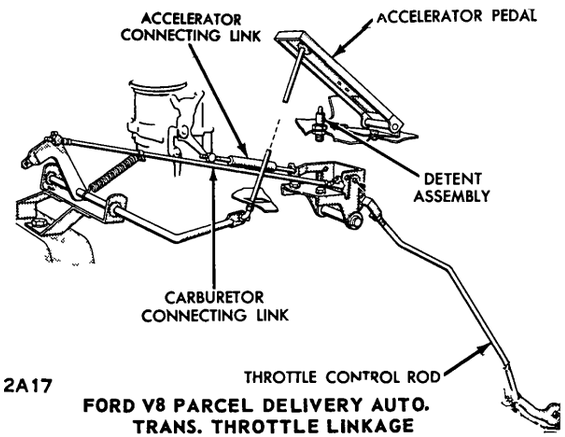
Econoline & Falcon Bus (Synchro-mesh) - Depress accelerator pedal to wide open throttle position and hold in this position while making the following adjustment. Adjust accelerator pedal connecting rod at equalizer on engine so there is 1 5/8" between upper end of equalizer and engine rear cover panel. Adjust carburetor-to-equalizer connecting rod at equalizer to obtain full throttle opening.



See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes



ECONOLINE THROTTLE LINKAGE (DETAIL)



TRUCK 6 CYL. AUTO. TRANS. THROTTLE LINKAGE

6 CYL. PARCEL DELIVERY AUTO. TRANS. THROTTLE LINKAGE

TRUCK V8 AUTO. TRANS. THROTTLE LINKAGE

FORD V8 PARCEL DELIVERY AUTO. TRANS. THROTTLE LINKAGE

6 Cyl. Cruise-O-Matic Trans. - 1) With slow idle speed correctly set and engine at normal operating temperature, stop engine and proceed as follows: Remove lock from clevis pin on upper end of throttle control rod and loosen clevis locknut. Remove clevis and pull throttle control rod upward so throttle lever will be held against internal stop in transmission. Turn throttle rod clevis until pin enters hole in lever and lengthen throttle rod 3 turns. Connect throttle control rod, tighten locknut, install clevis lock.

2) Measure accelerator pedal height from point where linkage connects to pedal to floor mat. Distance should be 3¾" (Except P Series). On P Series, measure distance from center of hole in cross shaft (for accelerator rod) to a line parallel to bottom line of bracket. Distance should be 1 7/8". To adjust, turn threaded adjusting sleeve on accelerator pedal adjusting link. Adjust pedal detent so it barely contacts pedal at full throttle.

3) Make final adjustment by pressure method (see V8 below).

V8 Cruise-O-Matic Trans. - 1) With engine at normal operating temperature, slow idle speed and anti-stall dashpot adjustments correctly made, stop engine and proceed as follows: Disconnect throttle control rod and carburetor connecting rod from accelerator cross shaft assembly and insert a ¼" gauge pin through gauging holes in cross shaft assembly. Lift carburetor connecting rod to normal operating position (maintain forward pressure so carburetor throttle lever is solidly against idle adjusting screw), and adjust connecting rod length so rod is a free fit into accelerator cross shaft assembly lever, then turn adjusting sleeve 1 full turn counterclockwise to lengthen rod. Remove gauge pin and connect rod to lever.

2) Open throttle and let linkage seek its own normal position. Gauge pin holes must be in alignment and gauge pin must enter holes freely. Adjust carburetor connecting rod again as necessary.

3) With gauge pin removed, pull upward on throttle control rod so transmission lever is against internal stop. Rotate adjusting sleeve on throttle control rod so rod fits freely in accelerator cross shaft lever, then lengthen rod 3 turns counterclockwise (approximate setting). Connect throttle control rod.

4) Adjust pedal height to 3¾" measured from floor mat to point where linkage connects to pedal (Except P Series). On P Series, center of hole in cross shaft lever (for pedal rod) should be 9/16" above horizontal. To adjust, turn sleeve on accelerator pedal connecting rod. Adjust pedal detent so it just contacts pedal at full throttle.

5) Final Pressure Adjustment - Apply parking brake and connect a pressure gauge to pressure linkage tube (in engine compartment) using Adapter T60L-7000-B so pressure gauge can be read from driver's seat. Connect a tachometer to engine. Note gauge reading at 1000 RPM. If pressure below 80 lbs., lengthen throttle control rod (rotate sleeve). If pressure is over 85 lbs., shorten rod. Tighten locknut to hold rod adjustment.

ANTI-STALL DASHPOT ADJUSTMENT

Ford 1-Bbl. - With throttle plate at idle position, turn dashpot adjusting screw outward so it does not contact diaphragm plunger assembly, then turn screw inward until it just contacts plunger assembly. Now turn screw inward an additional 3¼-3¾ turns against plunger assembly *NOTE - To correct objectionable slow return to idle, specification may be reduced to 2 turns*

Ford 2-Bbl. - With throttle plate in hot idle position and dashpot plunger fully depressed, distance from dashpot plunger to throttle shaft lever should be .060-.090". To adjust, turn dashpot or dashpot adjusting nut.

ELECTRICAL

► *1963 RECURRING RUN DOWN BATTERY CORREC TION (60 AMP LEECE-NEVILLE ALTERNATOR TRUCKS)* If current output of system is correct trouble may be caused by burned or stuck load relay contacts due to stop and go driving and subsequent high charging rate through contacts To check for current leak turn off all electrical components disconnect battery positive cable and note if spark occurs If spark occurs there is current leak To correct replace load relay contacts and remove wire from regulator "G" terminal and connect to regulator "B" terminal This removes the load relay contacts from alternator output circuit and connects alternator output terminal directly to battery *NOTE - This change made on later production trucks*

BATTERY

12 Volt Type.

Batt ry Ground - Negative

Engine Ground - Cylinder head or block, or Flywheel housing to dash or frame

STARTER

► *1963 STARTER ENGAGEMENT NOISE CORRECTION (ALL ENGINES)* Caused by misalignment of starter drive to flywheel due to tolerance build up between alignment hole in center lug of starter and mounting hole in flywheel housing To correct install starter with a shoulder bolt No 376245-S8 and lockwasher No 34847 S8 in alignment hole in center mounting lug of starter

144" Engine

Torque	RPM	Volts	Amperes
0 ft lbs	℄	12 0	70
8 ft lbs.		5 0	450

℄ - With starter on engine and engine idling
Cranking Speed - 250-290 RPM.

170" Engine

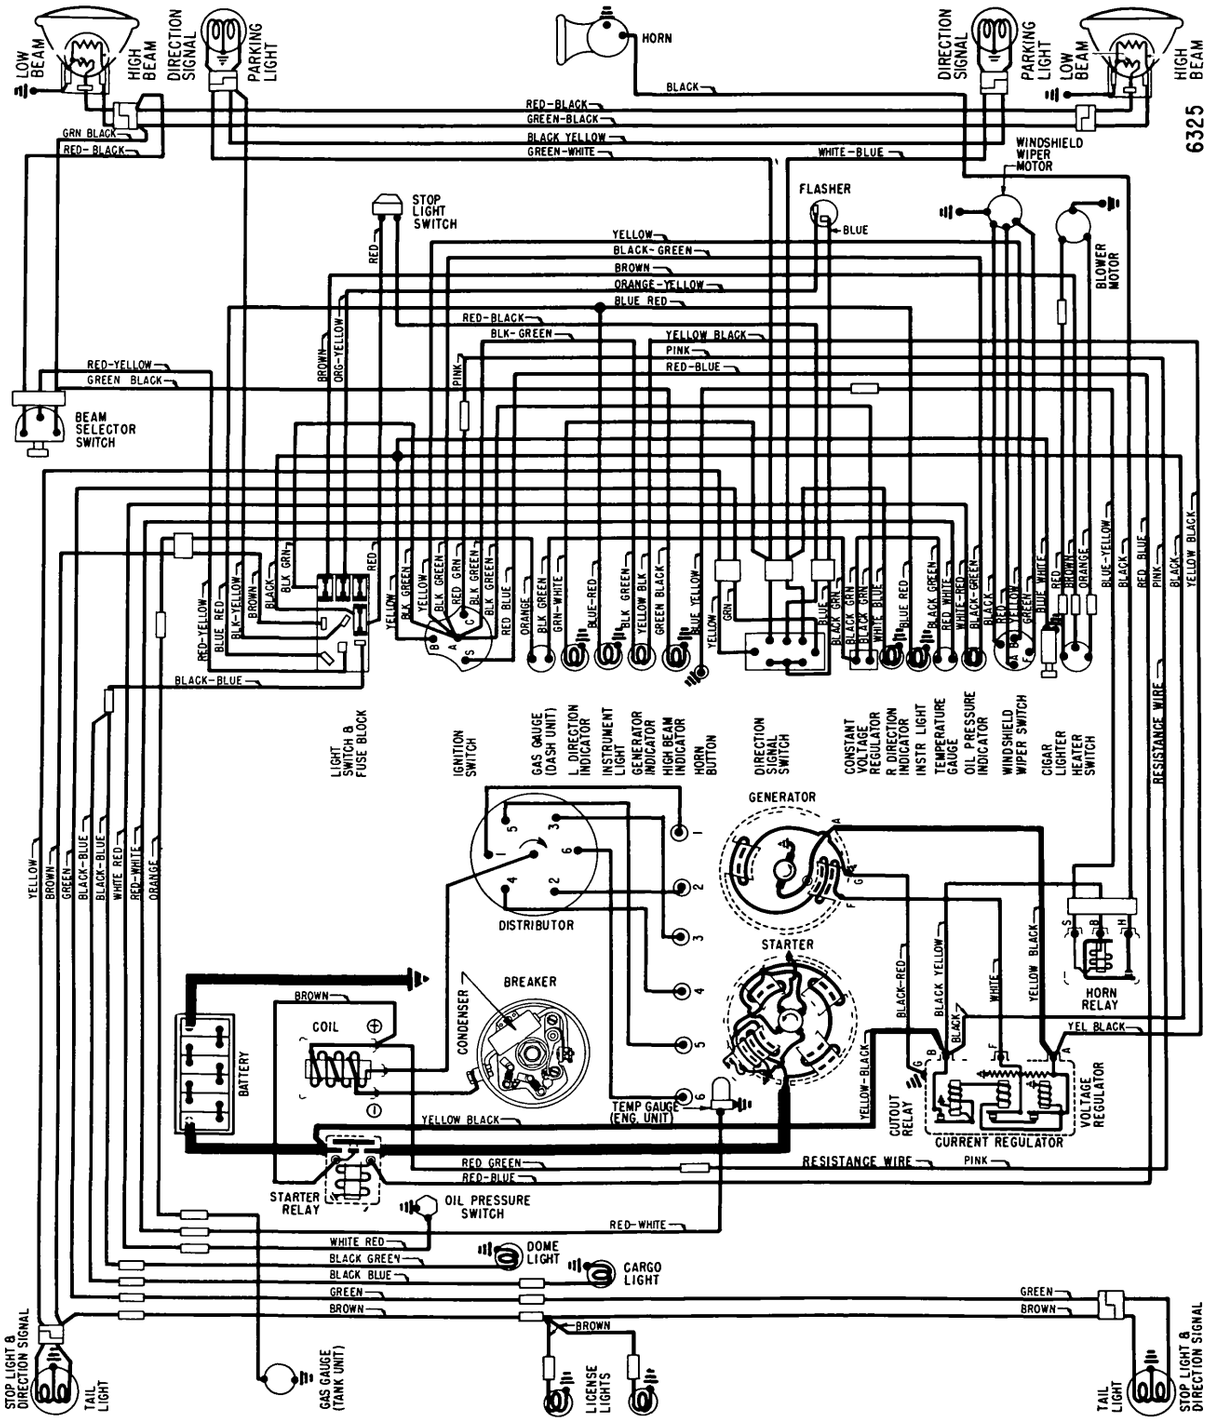
Torque	RPM	Volts	Amperes
0 ft. lbs.	℄	12 0	70
9 6 ft. lbs		5.0	500

℄ - With starter on engine and engine idling
Cranking Speed - 250-290 RPM.

223", 262", 292" Engines

Torque	RPM	Volts	Amperes
0 ft lbs	℄	12 0	110
14 8 ft lbs.		5.0	. 580

℄ - With starter on engine and engine idling
Brush Spring Tension (All Models) - 45 ozs



GENERATOR

G n rator ℄	Amper s	Volts	Gen. RPM
25 Amp	25	15 0	2610
30 Amp	30	15 0	2525
40 Amp	40	15 0	2650

℄ - Rated capacity is stamped or stenciled on unit

Brush Spring T nsi n - 20-26 ozs

Field Curr nt (All) - 1 2-1 8 amps at 12 volts & 75°F

FORD ECONOLINE WIRING DIAGRAM

ELECTRICAL (C ntinu d)

GENERATOR REGULATOR

Cutout Relay

Cuts In - 12.4-13.2 volts (25 & 40 Amp.), 12.0.12.8 volts (30 Amp.).
Cuts Out - 8 amps. (25 & 40 Amp.), 6-9 amps. (30 Amp.) reverse current.

Voltage Regulator

Setting - 14.6-15.4 volts at 75°F (all models).

Current Regulator

Setting - 23-27 amps. (25 Amp.), 28-32 amps. (30 Amp.), 38-42 amps. (40 Amp.).

ALTERNATOR

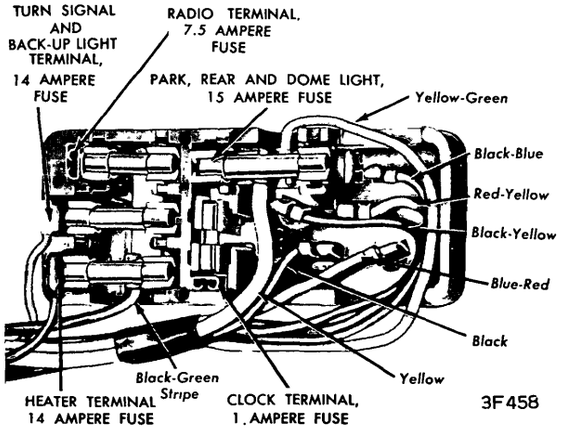
FORD

Rated Output - 42 amps. (630 watts at 15 volts).
Brush Spring Tension - 7-12 ozs.

ALTERNATOR REGULATOR

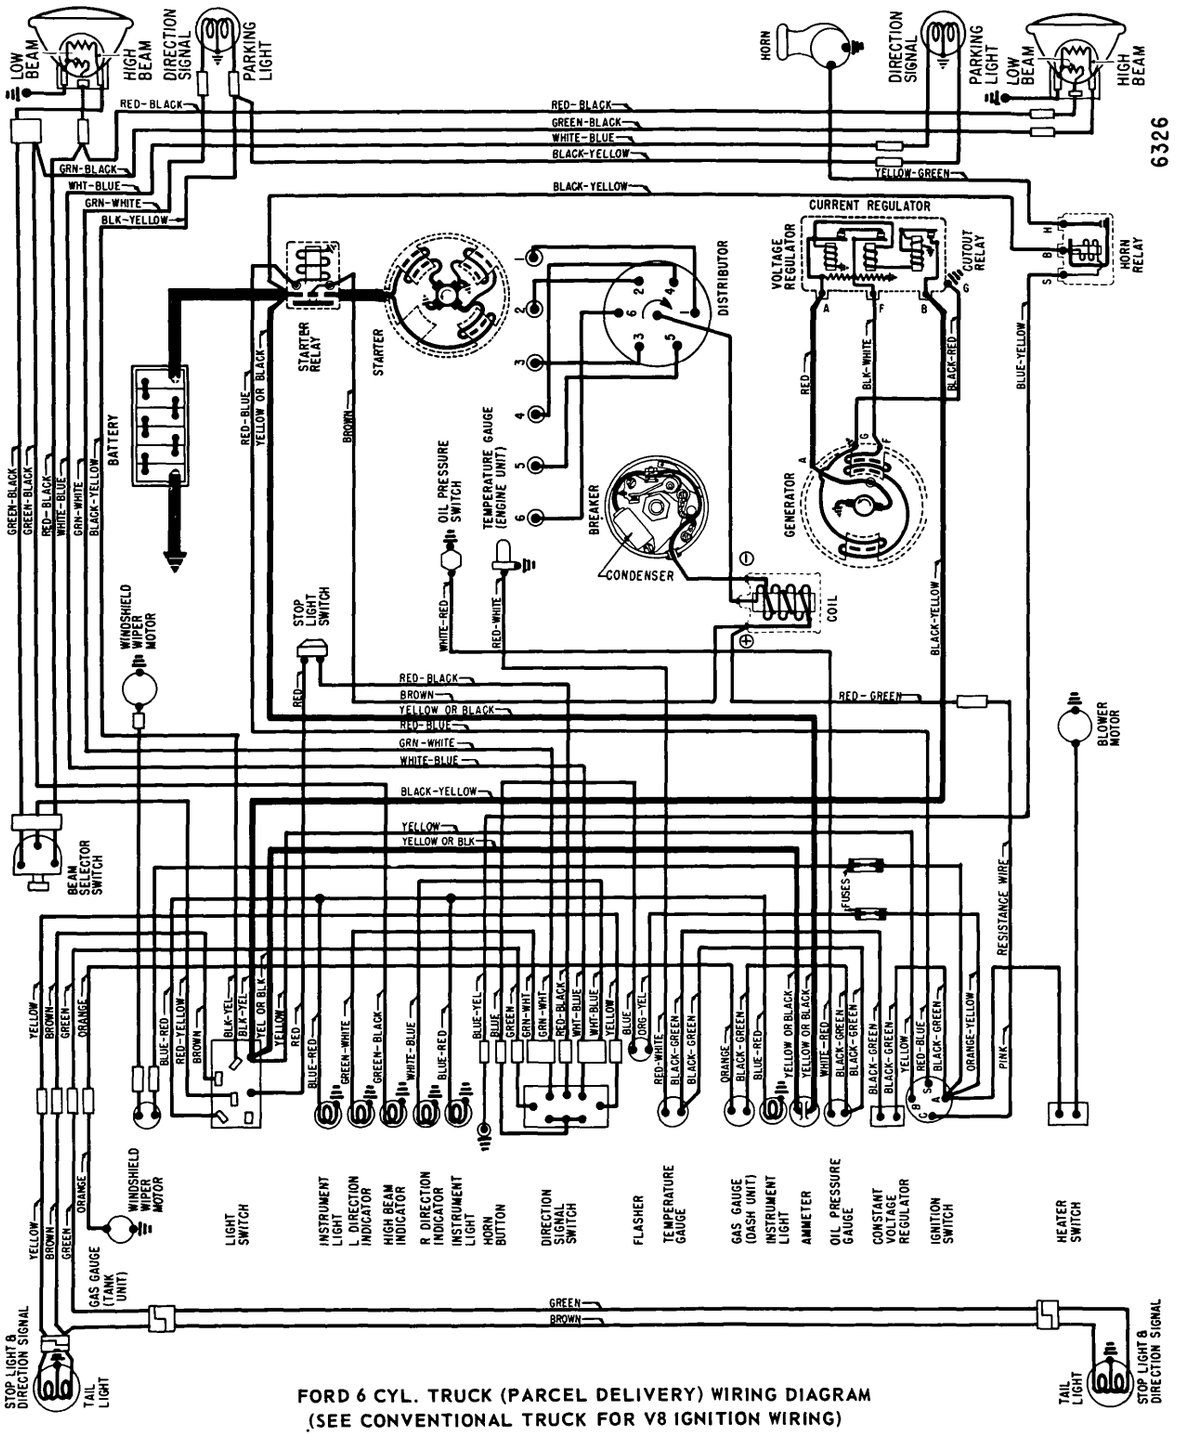
FORD
Field Relay

Closing Voltage - 3-4 volts.
Contact Gap - .015-.022". **Air Gap** - .022-.030".



Voltage Regulator

Setting - 14.1-14.9 volts at 75°F.
Contact Gap (Lower Contacts) - .010-.015".
Air Gap - .045-.052" with upper contacts closed.



FUSES & CIRCUIT BREAKERS

FUSES

1 - Fuse panel on headlight switch.
2 - In-line fuses in feed wire for the following units: Spotlight, Instrument panel light rheostat, Emergency warning flasher.
3 - Fuse on overdrive relay.

LIGHTING FUSE BLOCK

FORD 6 CYL. TRUCK (PARCEL DELIVERY) WIRING DIAGRAM
(SEE CONVENTIONAL TRUCK FOR V8 IGNITION WIRING)

ELECTRICAL (C ntinu d)

CIRCUIT BREAKERS

H adlight Circuit - Integral with headlight switch

Windshield Wip rs - Integral with wiper switch

2-Sp d Axl - On fuse panel

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH

Cruise-O-Matic Trucks - Loosen screws attaching switch to bracket on steering column then position switch so that starter circuit is closed when selector lever is in 'N' or 'P' positions *NOTE - Circuit must be open in all other positions* Tighten attaching screws and check operation in all lever positions

STOP LIGHT SWITCH

Located on brake master cylinder Not adjustable

TURN SIGNAL FLASHER

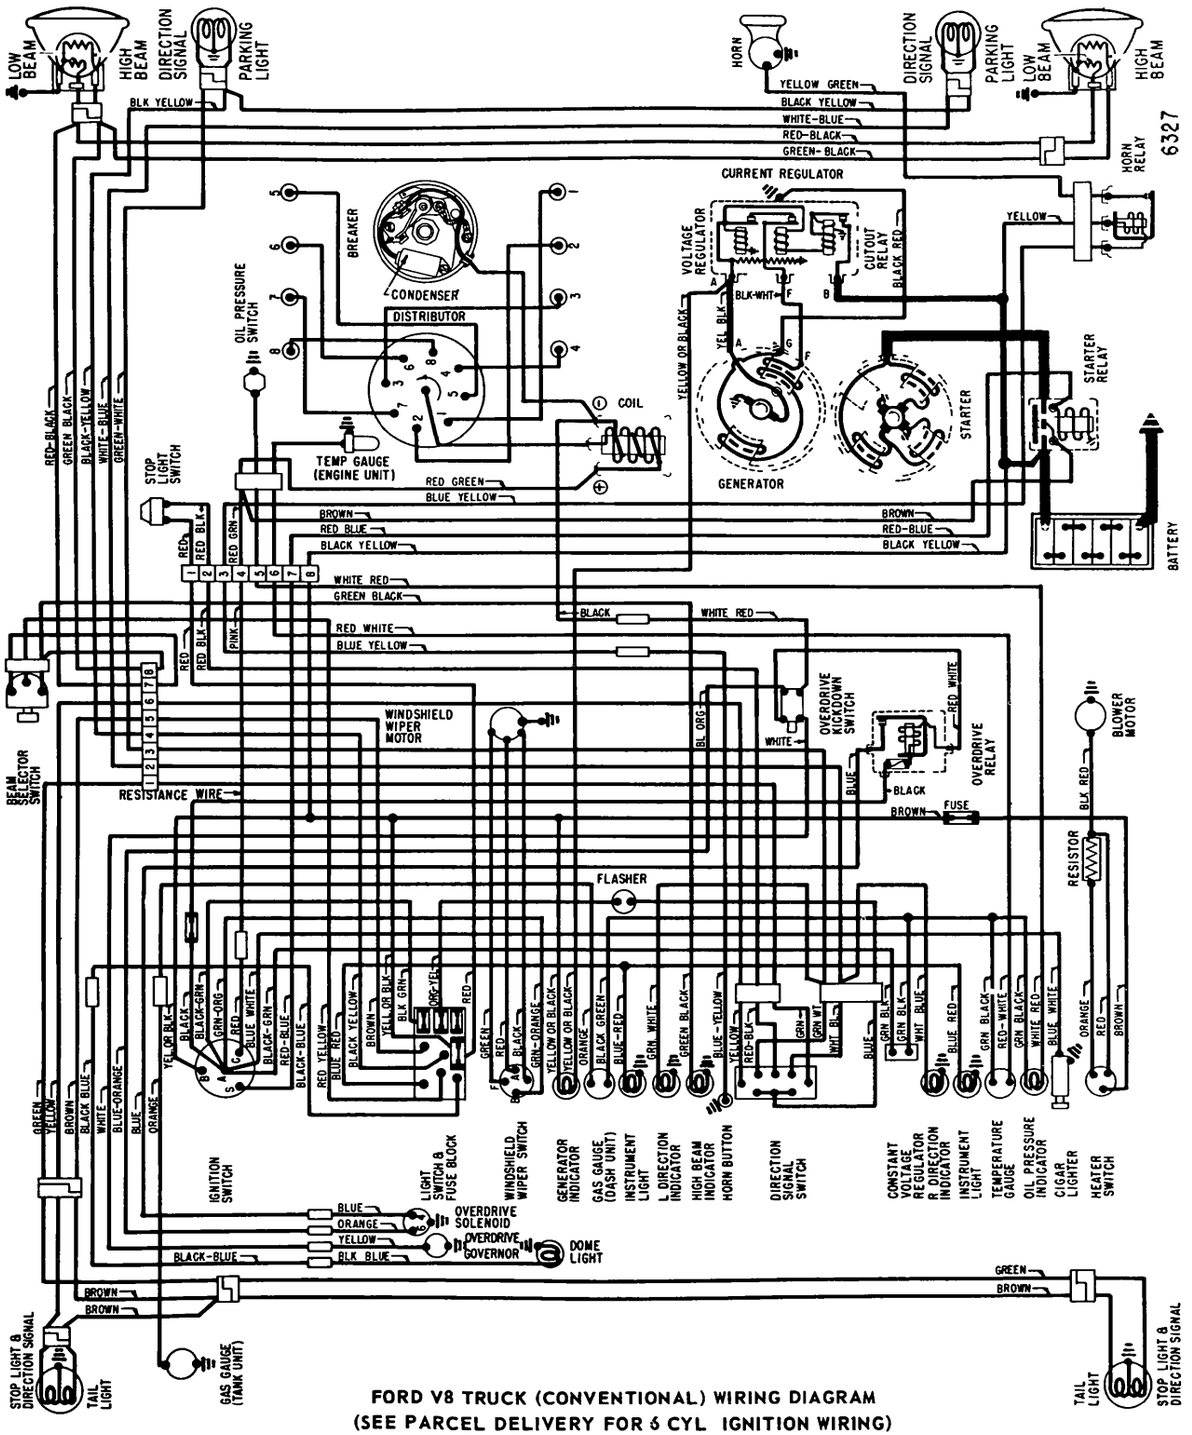
Ford Trucks - Clipped to left side of support bracket under instrument panel

Econoline - At rear top center of instrument panel

HEADLIGHT SWITCH REMOVAL

Press down on button on top of switch and remove switch knob and shaft Remove retaining bezel nut (Tool No 17470-N-51), and remove switch Separate fuse block from switch and disconnect wiring

SPEEDOMETER & INSTRUMENTS REMOVAL



Speedometer and instruments are accessible from front of instrument panel after cluster face plate attaching screws are removed

BELT ADJUSTMENT

B lt Tensi n (Lbs.) With Tension Gauge T63L-8620-A

	New Belt	ℂUsed Belt
Generator (Single Belt)	90-120	60-90
(Dual Belt-Front)	90-120	60-90
(Dual Belt - Rear)	85-135	55-100
Power Steering	120-150	90-120
Air Compressor	120-150	90-120

ℂ - Any belt operated 10 minutes or longer is a used belt

FORD V8 TRUCK (CONVENTIONAL) WIRING DIAGRAM
(SEE PARCEL DELIVERY FOR 6 CYL IGNITION WIRING)

ENGINE

ENGINE REMOVAL

Falcon & Econoline Trucks

NOTE - Following procedure is for removal of engine and transmission assembly from beneath truck Drain cooling system and crankcase, and remove air cleaner Disconnect all wires, hoses, cables and lines from engine Raise and support truck Remove propeller shaft Disconnect transmission shift rods from transmission Disconnect clutch linkage from flywheel housing and underbody Remove exhaust pipe, muffler, and tail pipe assembly Lower truck about half-way for safety Use Transmission Jack KRW-7020 and Engine Adapter T61E-6000-A or other suitable equipment and support engine and transmission assembly after securing engine to adapter Disconnect engine right and left front mounts from engine, then remove right and left support members from underbody Disconnect transmission extension from hanger bracket Lower jack and raise truck to remove engine assembly from beneath truck

Ford Trucks

F & B Series - Engine (without transmission) may be removed from above in the usual manner Observe the following Remove radiator and shroud, fan and pulley and starter Unnecessary to remove power steering pump (just disconnect hoses and let system drain) On some models, access cover provided in floor pan to remove converter or flywheel housing bolts, accelerator assembly, and other parts Be sure to support transmission and converter

C Series - Tilt the cab and drain cooling system and crankcase Remove radiator and shroud assembly, fan and air cleaner Remove all wires, cables clips, lines, and hoses from engine Remove clutch release lever retracting spring Remove starter Disconnect exhaust pipes from manifolds Remove flywheel housing inspection cover, then disconnect engine from flywheel and front mounts Be sure to support transmission With suitable lifting hooks and sling remove engine

N Series - Drain cooling system and crankcase Remove hood Disconnect all wiring from headlights, horn horn relay and voltage regulator, then remove wiring

(Continued)

ENGINE NOTES

► *1963 223" & 292" 2-BBL ENGINES EXHAUST VALVE PRODUCTION CHANGE & REPLACEMENT NOTE* New type valve, No C3AZ-6505-A, with diffused aluminum on head and face used to minimize burning and for resistance to detonation Use new type valve for service replacement on all 1961-63 engines

► *1963 TILT CAB WITH 262" 6 CYL ENGINE EXCESSIVE EXHAUST SMOKING CORRECTION* May be caused by overfilled crankcase due to incorrect dipstick being installed Make sure correct dipstick used (27 20" long from dipstick tip to tube cover cap gasket)

ENGINE IDENTIFICATION *See "Engin Code Designation" under MODEL IDENTIFICATION.*

ENGINE (C ntinued)

harness from radiator Remove fan blade assembly, then remove radiator support, radiator, grille, and grille side panels as an assembly Disconnect all wires hoses, linkage, cables, and lines from engine Remove starter Disconnect exhaust pipes from manifolds Disconnect crankcase breather reservoir from engine Disconnect engine from front mounts and flywheel raise transmission about ½" and support in position Attach suitable lifting fixtures and remove engine from above

P S ries - 1) 6 Cyl. & V8 - Drain cooling system and crankcase Remove driver's seat assembly master cylinder inspection cover, and steering column cover plates Disconnect dimmer switch wiring Remove left wheel house panel and center floor plate Disconnect right side of engine rear cover panel from right wheel house panel Disconnect engine rear cover rear flange from frame crossmember and center floor plate front bracket Remove crossmember (V8 only) Remove air cleaner from engine (leave attached to engine cover on 6 Cyl) Wedge right and left frame gussets open so rear flange of engine rear cover plate will clear the slots, then remove cover plate

2) 6 Cyl. - Remove accelerator bracket assembly and accelerator retracting spring Remove carburetor Disconnect exhaust pipe from manifold Disconnect all lines, wires, hoses, rods, and controls from engine Remove starter Remove fan blade and bracket assembly Remove radiator Disconnect engine from front mounts and from flywheel or converter housing Drain automatic transmission and disconnect converter from flywheel Raise rear of transmission Remove engine by swinging rear of engine about 30° to right then lift rear of engine to clear compartment and remove engine through right door

3) V8 - Disconnect all wires, lines, hoses pipes, and cables from engine Disconnect exhaust pipe from manifold Remove carburetor air cleaner stud Remove hand brake cable and bracket Disconnect engine front and rear supports then disconnect front universal joint from transmission Disconnect transmission and clutch controls Remove engine and transmission assembly from truck

OIL PAN REMOVAL

Ec n lin & Falcon Bus - Raise engine c mpartment cover, remove dipstick, then raise and support truck. Drain crankcase. Remove oil pan retaining screws, crank engine as necessary for clearance, then remove oil pan. Remove oil pump inlet tube and screen assembly.

F rd Truck 6 Cyl. - Drain crankcase and remove dipstick. Remove flywheel housing inspection cover. Remove oil pan retaining screws and remove oil pan.

F rd Truck V8 - Drain crankcase and remove dipstick. Remove converter housing dust cover. On C Series, place No. 1 piston at TDC. On all trucks, disconnect oil inlet tube from oil pump and remove "O" ring seal from tube. Remove oil pan retaining screws and remove oil pan.

CYLINDER HEAD

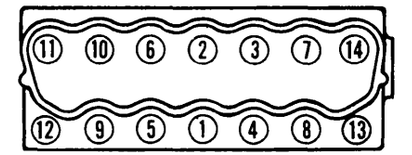
Removal - If cylinder head not equipped with locating dowels, install guide studs in front and rear cylinder head bolt holes on manifold side of head Make guide studs from 7/16 ' - 14 x 6 ' or 1/2 ' - 13 x 6 ' bolts depending on cylinder head bolt size, by cutting off bolt head tapering end and slotting for screwdriver engagement

Installation - On 144 ' 170 " engines, coat both sides of new gasket with head gasket sealer On 223 ", 262" engines gasket is "sandwich" type (steel core bonded between rubber-asbestos sheets), and sealer must **not** be used On 144", 170" engines, coat right side front and rear head bolts with sealer On 223 ", 262" engines coat all left side bolts with sealer Install head over guide studs (see 'Removal" above), install two end bolts finger tight to hold head then install remaining bolts On 292' V8 engines, install the long cylinder head bolts at the dowel locations Tighten bolts in sequence shown in diagrams in **three** steps to torque limits shown in table below **Do not disturb bolts after final step completed.**

Cylinder Head Torques (Ft. Lbs.)

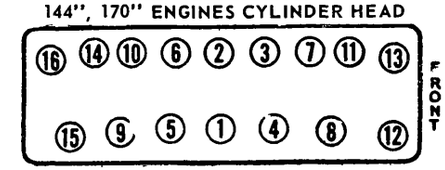
Engine	Step 1	Step 2	Step 3
144' 170'	55	65	75
223 ' 262'	95	105	115
292' 2 Bbl	55	65	75
292 ' 4-Bbl	65	70	85

FLYWHEEL INSTALLATION (144", 170" 6 CYL.)



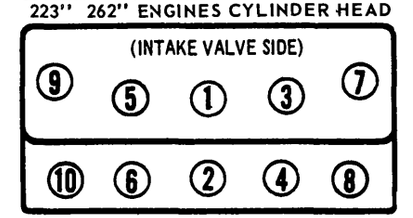
Flywheel attaching bolt holes in crankshaft flange are drilled through flange Flywheel retaining capscrews must be coated with oil resistant sealer to prevent engine oil leak at this location (May be diagnosed as a rear oil seal leak)

INTAKE MANIFOLD (292" V8)



When installing, make sure gaskets are in place and tighten manifold attaching bolts to correct torque, starting from the center bolts

EXHAUST PIPE INSTALLATION (144", 170" 6 CYL.)



Exhaust manifold studs for exhaust pipe attachment have interference threads and nuts will not hold torque if used more than once Install new nuts whenever pipe disconnected from manifold and torque nuts to 40-50 ft lbs

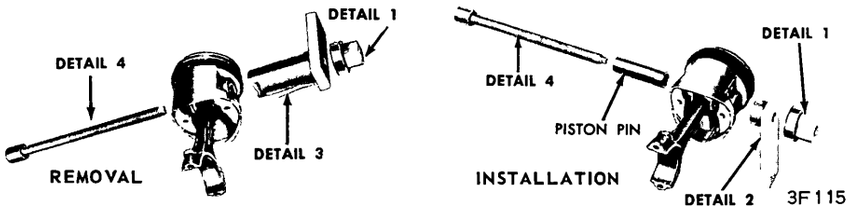
6 CYL. PISTON & ROD INSTALLATION

V8 PISTON & ROD INSTALLATION

FITTING PISTONS

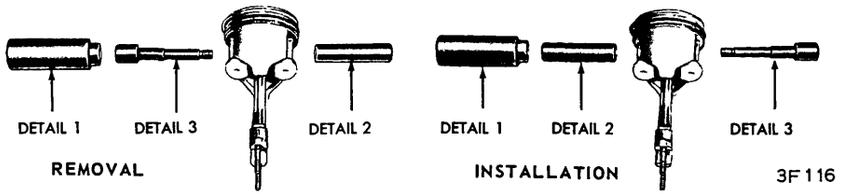
Place a length of ½" wide feeler stock (see table below for feeler thickness) between inverted piston and cylinder wall 90° from piston pin holes. Hold piston in bore so bottom of piston skirt is about 1½" below top of block and piston pin bore is parallel to crankshaft. *Feeler must extend entire length of piston.* Pull feeler from cylinder with a spring scale and note reading on scale. Specifications should agree with table below.

PISTON PIN REPLACEMENT (144", 170")



TOOL T60K-6135-A MODIFICATION - If tool not previously modified to prevent damage to piston, make following modification so piston will not be damaged when Detail 2 of tool seats against piston pin boss: Grind a 1/16" - 45° chamfer around outer edge of Detail 2.

Removal - Press pin out of piston and connecting rod using Tool T60K-6135-A and vise and wrench, or Tool 6135-J and arbor press as shown in illustrations.



Installation - Lightly coat all parts with engine oil, assemble piston and connecting rod correctly and press pin into piston and rod as follows: **1)** With Tool T60K-6135-A and vise and wrench, draw pin into assembly until pin seats in Detail 2. **2)** With Tool 6135-J and arbor press, press pin into assembly until Detail 2 is firmly seated in Detail 1. *See illustrations.*

144", 170" ENGINES PISTON PIN REPLACEMENT (VISE & WRENCH METHOD)

144", 170" ENGINES PISTON PIN REPLACEMENT (ARBOR PRESS METHOD)

MAIN BEARING CAP INSTALLATION

1) All Caps - Caps are numbered from front of engine and should be installed in correct position with arrow on cap pointing to front of engine.

2) 6 Cyl. Rear Cap - Coat only rear mating surface of cap with oil resistant sealer. Do not use sealer forward of oil slinger groove (144", 170"), forward of side seal grooves (223", 262"). Install cap immediately after sealer applied so sealer will not set and cause an oil leak.

REPLACEMENT BEARINGS

Standard size replacement main and connecting rod bearings available in 2 sizes marked Red and Blue for selective fit. Any combination of red and blue inserts may be used to obtain desired clearances.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

THRUST BEARING ALIGNMENT

Install all bearing caps except thrust bearing cap and torque to specifications. Install thrust bearing cap with bolts finger tight. Pry crankshaft to rear of engine, then to front of engine. While holding crankshaft forward, tighten thrust bearing cap bolts to specifications. Check crankshaft endplay.

REAR MAIN BEARING OIL SEAL

NOTE - Upper seal can be replaced only with crankshaft removed from engine.

Upper & Lower Seal - *CAUTION - Use Installing & Forming Tool as indicated in table below, and follow procedure list d exactly to prevent seal shift and oil leaks.* Preform seal by hand and install into block or cap (or retainer) with thumbs, seating seal at center and then working from the ends toward the center. Now place installing tool properly in block or cap (or retainer) as follows: Large flanged face of tool must be toward rear of engine for upper seal, and toward rear face of cap (or retainer) for lower seal. Tool flanges must bottom on seal groove rear flange and bearing saddle. (insert removed). Hold tool firmly and strike top of tool sharply. Cut seal ends flush with block or cap (or retainer). Trim frayed ends.

Side Seals (223", 262", 292") - Dip side seal in penetrating oil and install **immediately** into grooves. *CAUTION - DO NOT use sealer. Seals expand with oil.* Tap seals firmly into position. DO NOT trim ends. *292" SEAL RETAINER NOTE* - Coat entire mating surface of seal retainer with oil resistant sealer before installing retainer.

Testing Seal Installation - Squirt a few drops of oil into parting lines between cap (or retainer) and cylinder block from the outside. Blow compressed air against seals from the inside of block. If air bubbles appear in oil, seal leaks.

Crankshaft Rear Seal Installing Tool

Engine	Tool No.
144", 170"	T60K-6701 or 6701-D
223", 262", 292"	T52L-6701-AGD or 6701-A

Engine Front Cover Aligning Tool

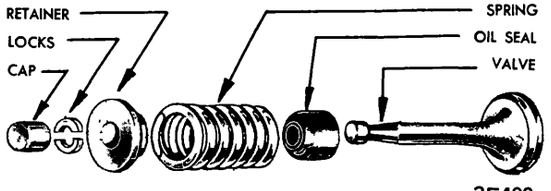
Engine	Tool No.
144", 170"	T61K-6019-A
223"	T58P-6700-B
262", 292"	T52L-6059-AAE

ENGINE FRONT COVER OIL SEAL

Remove old seal with punch and clean recess in cover. Drive new seal in cover with tool listed in table below until seal is fully seated and make sure spring is positioned properly in seal.

Front Cover Seal Installing Tool

Engine	Tool No.
144", 170"	T60K-6700-A
223", 262", 292"	T52L-6700-BEE



ENGINE FRONT COVER

Removal - Drain cooling system and crankcase. On P Series, remove hood, then remove grille, headlights, parking lights, wind deflector and hood lower weatherstrip as an assembly. Remove accelerator cross shaft. On all trucks, remove radiator, fan shroud, fan, spacer, brackets, pulleys, and damper. On V8 trucks, remove fuel pump, disconnect engine front mounts and raise engine slightly. On all trucks, remove oil pan and flywheel housing inspection cover. Remove engine front cover.

Installation - Use Pilot (alignment tool) as indicated in table below to center cover on crankshaft. Push in on tool and tighten cover bolts to specifications. Reverse removal procedure to complete the installation.

FREE TURNING VALVE CAP CLEARANCE CHECK

Clearance between end of valve stem and inside surface of cap with valve locks and spring retainer installed should be .0002-.004" measured with Tool 6513-CE-2. Lap open end of cap if clearance more than .004".

FREE-TURNING VALVE ASSEMBLY

EXHAUST VALVE SEAT INSERT INSTALLATION

Counterbore the recess in head about .001-.002" below old counterbore depth to clean recess. Clean all chips and oil from recess. Chill new oversize insert and tool in dry ice for ½ hour. Place insert on tool with small radius on outer edge facing outward, pilot tool in guide and drive insert into recess until fully seated. DO NOT peen around insert. Reface insert. *CAUTION - Installation must be made quickly after tool and insert are removed from dry ice.* Inserts should have .0015-.004" interference fit.

►*292" 4-BBL. ENGINE EXHAUST VALVE CAUTION:* Exhaust valves on this engine are sodium cooled. Use extreme care when disposing of valves to prevent fire or explosion.

VALVES

Engine	Head Diam.	Seat Angle	Face Angle	Seat Width	Stem Diameter	Stem Clearance	Cam Lobe Lift

① - Also furnished .003", .015", .030" Oversize. ② - Wear limit .0045".
③ - Wear limit .0055". ④ - Wear limit .005".

VALVE GUIDE SERVICING

To ream guides for installation of valves with oversize stems, always use reamers in sequence and reface valve seat after valve guide is reamed. Reamers are furnished .003" oversize with standard diameter pilot; .015" oversize reamer with .003" oversize pilot; and .030" oversize reamer with .015" oversize pilot.

VALVE STEM SEALS

Cup type seals used on all valves. Install seals with cup side down over valve guide.

INITIAL VALVE LASH ADJUSTMENT (AFTER OVERHAUL)

6 Cylinder Engines - Adjust intake and exhaust valves of each cylinder in firing order with each piston at TDC of compression stroke.

V8 Engines - 1) Place No. 1 piston at TDC of compression stroke. Adjust following valve clearances: No. 1, 4, 5 Exhaust; No. 1, 2, 7 Intake.

2) Turn crankshaft ½-turn or 180° (No. 4 piston at

(Continued)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

TDC). Adjust following valve clearances: No. 6 & 8 Exhaust; No. 4 & 5 Intake.

3) Turn crankshaft ¾-turn or 270° from second position above (No. 3 piston at TDC) and adjust following valve clearances: No. 2, 3, 7 Exhaust; No. 3, 6, 8 Intake.

ROCKER ARM ADJUSTING SCREW NOTE - If torque required to turn self-locking adjusting screw is less than 3 ft. lbs., install new standard or .002" oversize screws. If minimum 7 ft. lbs. torque cannot be obtained with oversize adjusting screw, replace rocker arm and adjusting screw assembly.

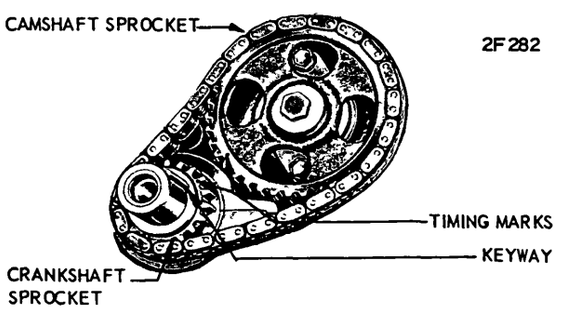
ROCKER ARM ASSEMBLY OVERHAUL

See illustration for arrangement of parts. End plugs must have cup side facing out, and oil holes in shaft must be facing downward. When installing, make sure that inlet line "O" ring seals are in place, and that support end of outlet pipe enters locating hole in shaft to position shaft properly.

VALVE SPRING INSTALLED HEIGHT

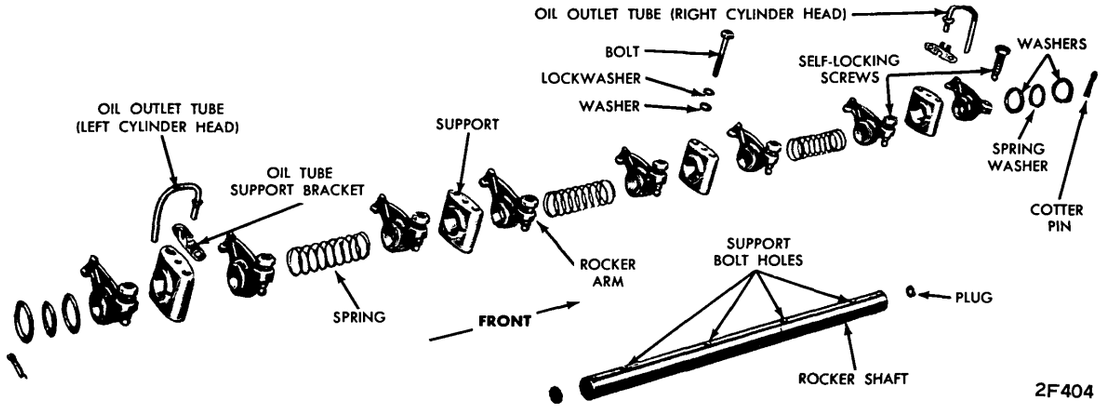
Installed height of valve spring must not exceed specifications listed in table below. Measure height from surface of cylinder head spring pad to underside of spring retainer. If height greater than specified, install .030" spacer on head under spring to bring height within limits. *CAUTION - Install spacers only if necessary and do not use more than 2 spacers (will overstress springs and overload camshaft lobes).*

Valve Spring Height Specifications



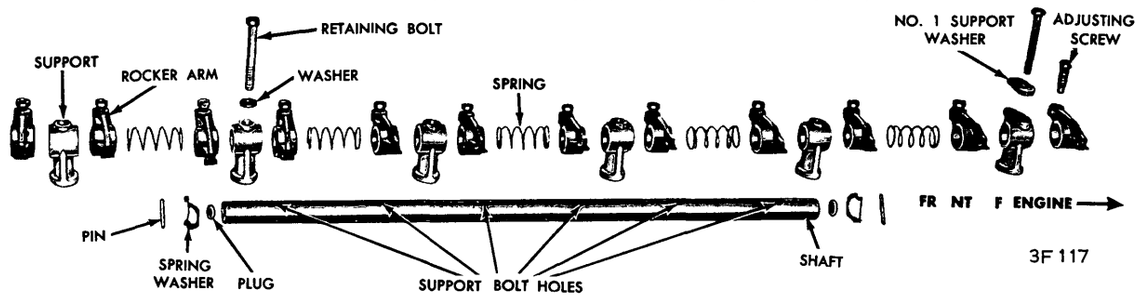
Engine	Installed Height
144", 170"	1 9/16 - 1 39/64"
223"	1 3/4 - 1 25/32"
262"	1 5/8 - 1 11/16"
292"	1 3/4 - 1 25/32"

VALVE SPRING INSTALLATION



Spring ends must be square within .068" (262"), .072" (Others). Install springs with damper (closed) coil end down toward cylinder head.

VALVE TIMING



See illustration for alignment of sprocket marks, and Valve Table for Camshaft Lobe Lift.

CAMSHAFT REMOVAL

Falc n & Econ line Trucks - Engine must be removed from truck to replace camshaft.

F rd Trucks - Camshaft can be removed with engine installed in truck after removal of radiator and grille, and other appropriate parts.

CAMSHAFT BEARING REPLACEMENT

144", 170" - Tool T52L-6261-CEE & Adapter Set T60K-6250-A are available. No. 1 & No. 4 bearings are not interchangeable with each other or with any other bearing. No. 1 bearing must be installed .115-.125" below front face of bearing bore in block. No. 4 bearing has two oil holes and must be installed so forward edge of bearing is 24¾"±1/64" from thrust plate mounting surface of block

223", 262", 292" - Tool T52L-6261-CEE & Adapter Set T54L-6250-B are available. No. 1 bearing is not interchangeable with other bearings. No. 1 bearing must be installed .005-.020" below front face of cylinder block. No. 3 bearing has 2 oil holes.

CAMSHAFT END THRUST

Taken by thrust plate and spacer behind camshaft sprocket.

CHECKING CAM LOBE LIFT

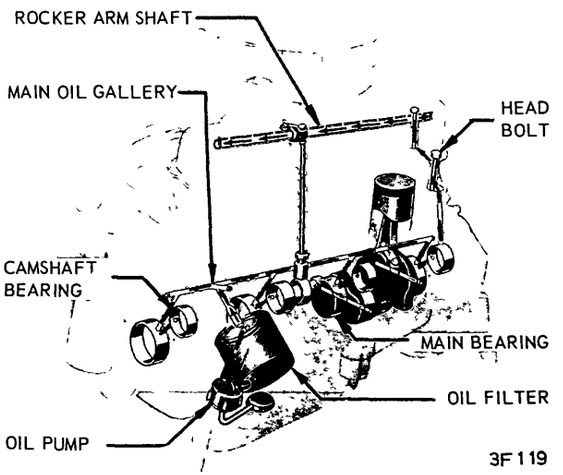
Check with dial indicator to specifications listed in Valve Table.

ENGINE OILING

Normal Oil Pressure - 35-55 lbs. at 2000 RPM (Hot).

Pressure Regulator Valve - In pump body. Not adjustable.

ENGINE OILING SYSTEM



144" 170" Engines

Force feed type. Rotor type oil pump used. *See illustration and note the following:*

Timing Chain & Sprockets - Lubricated by splash from oil pan.

Rocker Arms, Pushrods & Valve Stems - Oil from lower hole in rear camshaft bearmg flows around grooved rear camshaft journal and out through upper hole in rear camshaft bearing through vertical passage in block and around left rear corner cylinder head bolt to oil port at rear rocker arm shaft bracket pad. Oil then flows around this bracket bolt to hollow rocker arm shaft, and is distributed to each rocker arm for rocker arm, pushrod and valve tip lubrication. Excess oil is discharged from the rocker arm shaft at front shaft bracket. Oil from rocker chamber runs down pushrods to lubricate pushrod seat and lifter and drains back into the oil pan through cored openings in the block.

Oil Filter - Full flow type mounted externally on left front corner of engine. Filter has integral bypass valve and anti-drain back diaphragm

144", 170" ENGINES OILING SYSTEM

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

223", 262" Engines

Force feed type with rotor type oil pump. *See illustration and note the following:*

Timing Chain & Sprockets (Or Timing Gears) - Lubricated through drilled passage in front end of block which directs oil from front camshaft bearing to crankshaft sprocket (camshaft journal has flat which registers with bearing supply hole and timing chain lubrication hole once in each revolution). Oil slinger on front end of crankshaft also throws oil onto chain.

Rocker Arms, Pushrods, & Valves - Drilled passage in No. 3 (rear intermediate) camshaft journal feeds oil at reduced pressure to drilled passage in block. A tube extending up through block and cylinder head directs this oil to the No. 6 (rear) rocker shaft bracket and into the hollow rocker arm shaft. Oil then flows through drilled passages in rocker arm to lubricate rocker arm bushing, pushrod socket and valve tip. Oil drainage from rocker arm drains down pushrods for valve lifter lubrication. Excess oil from rocker arm shaft flows through outlet pipe at No. 1 (front) rocker shaft bracket. This pipe terminates at drilled hole in lifter chamber directly above distributor drive shaft for distributor and drive gear lubrication (see below).

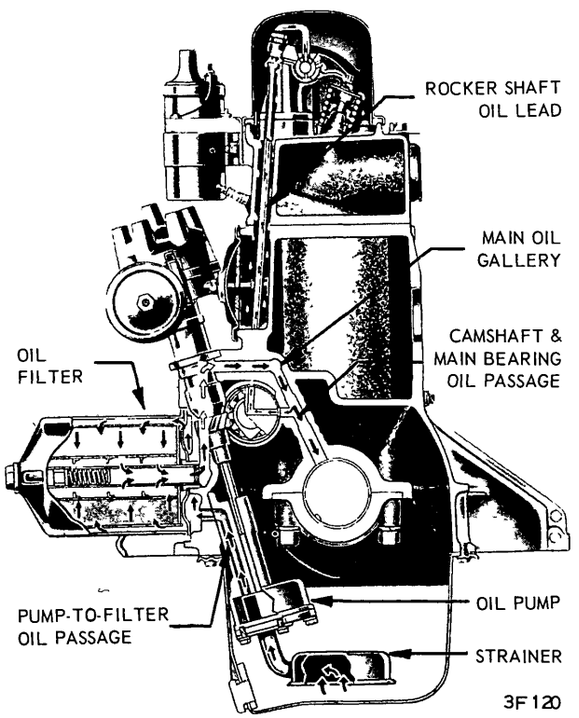
Valve Lift r & Fu l Pump Ecc ntric - Oil drainage from rocker arm flows down pushrods into lifter chamber for valve lifter and pushrod seat lubrication. A drilled hole in the lifter chamber floor directly above fuel pump eccentric on camshaft provides lubrication for the eccentric. A return hole at rear of lifter chamber allows oil to drain back into the crankcase.

Distributor & Drive Gear - Oil return pipe from rocker arm shaft terminates at drilled hole in lifter chamber. This hole is directly above distributor drive gear on camshaft and gears are lubricated by this return oil. A transverse passage in the block at the oil return pipe location in the lifter chamber directs drain oil to relieved section of distributor housing. Oil holes in housing direct oil to distributor lower bushing and drive gear.

Oil Filter - Full flow type mounted on pad on right side of crankcase. Filter has integral bypass valve and anti-drain back diaphragm.

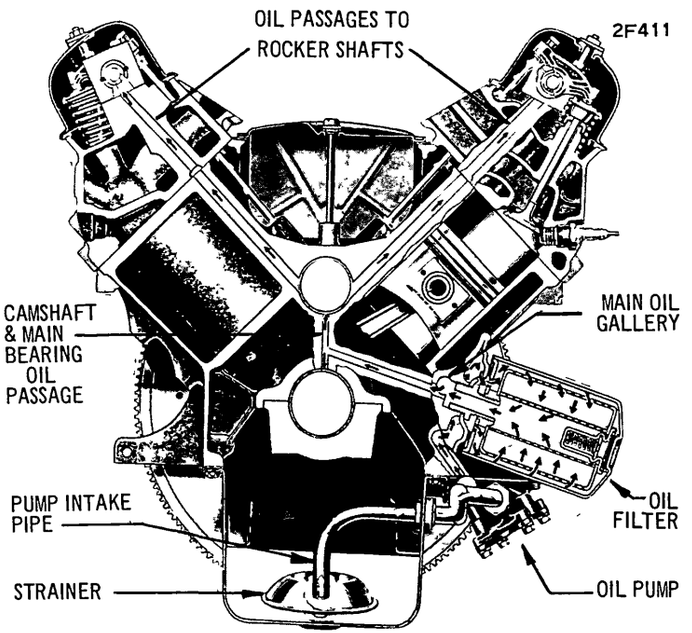
292" Engines

Force feed type with rotor type oil pump. *See illustration and note the following:*



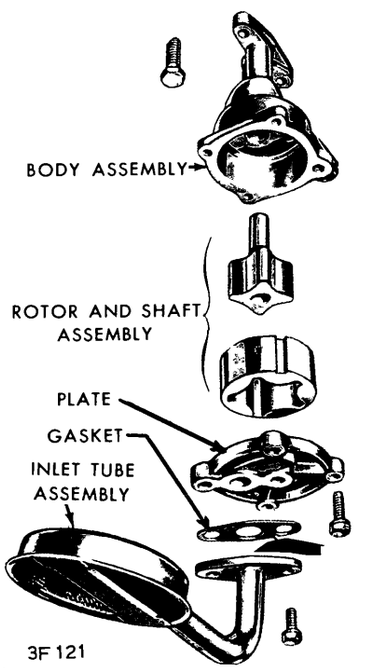
Rocker Arms, Pushrods, & Valves - Drilled passages in block at No. 3 camshaft bearing extend up through block and matching passages in cylinder heads (with offset formed by channel on lower face of head) and oil then flows up through drilled passage in No. 2 rocker shaft support bracket (Right Bank), No. 3 rocker shaft support bracket (Left Bank) to hollow rocker arm shaft. Oil holes in shaft and rocker arm provide lubrication for rocker arm bushing, pushrod ball end and valve tip. Oil drainage from rocker arm drains down pushrods for valve lifter lubrication (below). Excess oil from rocker shaft flows through outlet pipe at No. 1 rocker shaft bracket (Right Bank), No. 4 rocker shaft bracket (Left Bank) for timing chain and distributor lubrication (see below).

Valve Lifters & Pushrod Seats - Oil drainage from rocker arm flows down pushrods into lifter chamber for valve lifter and pushrod seat lubrication. Oil for this purpose is also supplied by rocker shaft outlet pipes which terminate in lifter chamber. Oil in lifter chamber is returned to oil pan through large opening at rear of chamber. This oil lubricates distributor drive gear.



Distributor, Intermediate Shaft & Bushing - Lubricated by oil supplied through drilled passage from No. 5 camshaft bearing (camshaft journal is drilled and oil flows through this passage from camshaft bearing oil hole to distributor oil passage). *NOTE* - Distributor drive gear is lubricated by oil return from lifter chamber to oil pan through large opening at rear of lifter chamber.

Timing Chain & Sprockets - Oil return from right bank rocker chamber (outlet pipe at No. 1 rocker shaft bracket) is channeled by trough in lifter chamber to hole in front cylinder block wall through which the oil is directed on timing chain and sprockets. Oil slinger on crankshaft also throws oil on timing chain.



Oil Filter - Full-flow type mounted on pad on left side of crankcase. Filter has integral bypass valve and anti-drain back diaphragm in filter mounting recess.

MODEL IDENTIFICATION

SERIAL NUMBER

Stamped under "Warranty Number" on truck patent plate. Also stamped in various locations on truck frame and body members. Number carries identification data as follows:

① ② ③ ④
F10 F U 325001

① - The letter and first two digits of series and model designation. *See table below.*
② - Engine type. *See table below.*
③ - Assembly plant. *See table below.*
④ - Consecutive unit number starting with 325001 for August, 1962 through 459999 for September, 1963.

Series & Model Designation

Letter	Type	Letter	Type
E	Econoline & Falcon Bus	C	Tilt Cab
F	Conventional Cab	P	Parcel Delivery
B	School Bus	N	Cab Over Engine

Number	Size
100, 250, 350, 400	Light Duty Models
500, 550, 600	Medium Duty Models

Carter AFB 3503S,SA,78S,79S⑧	⑥	⑦	Centered

① - With air horn inverted, gasket in place, measure from gasket to lower (sharp) edge of float seam at outer end

② - Air horn upright, gasket in place, measure from gasket to bottom of float

③ - With air horn inverted, gasket in place, measure between gasket and top of float at heel (1 11/32' primary, 1 3/8" secondary); Float Toe measurement taken between gasket and center of dimple on side of float at toe end (9/16" primary, 3/8" secondary)

④ - 1 7/16" (primary), 1 1/4" (secondary) with air horn upright, power piston fully extended, gasket in place, measured from gasket to center of dimple on side of float at toe end

⑤ - 1 9/16" (primary), 1 9/32" (secondary) with air horn upright, power piston fully extended, gasket in place, measured from gasket to center of dimple on side of float at toe end

⑥ - 7/32" (solid seat, Gauge T109-106), 3/16" (resilient seat, Gauge T109-28) ±1/64"; with air horn inverted, gasket in place, measured between gasket and top of float at outer end

⑦ - 23/32" ± 1/16" with air horn upright, gasket in place, measured between gasket and top of float at outer end

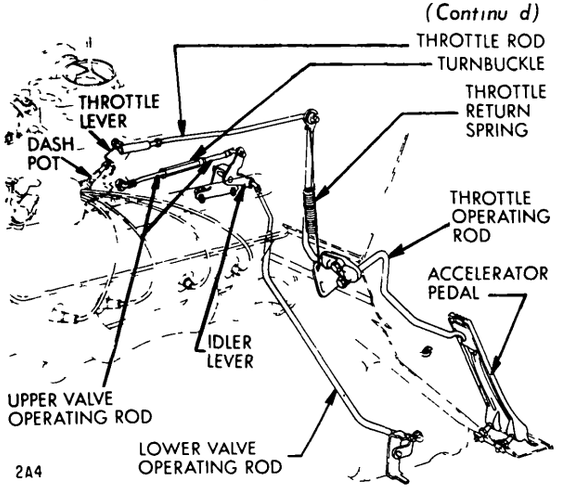
⑧- Primary and Secondary

ACCELERATING PUMP SETTING

Special Series	Seasonal Setting
Rochester 2GC	Outer Hole (Normal)
Rochester 4GC①	Center Hole (0-60°F)
① - Buick Special & Skylark only	Outer Hole (Above 60°F)
	Inner Hole (Below 0°F)

MANIFOLD FUEL DISTRIBUTION

V6 Engine - Left barrels feed cylinders on left bank; right barrels feed cylinders on right bank



215" Aluminum V8 Engine - Right barrels feed cylinders 2-3-5-8, left barrels feed cylinders 1-4-6-7

401", 425" V8 Engines - Right barrels feed cylinders 1-4-6-7, left barrels feed cylinders 2-3-5-8

THROTTLE LINKAGE ADJUSTMENT

All Models - 1) On automatic transmission models, move throttle lever to wide open position and make sure carburetor-to-transmission linkage does not prevent throttle from opening fully If necessary, adjust carburetor-to-transmission linkage first (see below)

(Continued)

AUTO. TRANS. THROTTLE LINKAGE (TYPICAL)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

2) On all transmissions, disconnect rear of throttle rod from operating lever, then place throttle in wide open position and press accelerator pedal to floor. End of throttle rod must be **1/16" short** of entering hole in lever. Adjust as necessary, then connect rod to lever. *NOTE - Throttle should be at wide open position just as accelerator pedal strikes floor mat.*

CARBURETOR-TO-TRANSMISSION LINKAGE ADJUSTMENT

Automatic Transmission Models - 1) Move upper end of idler lever (located on engine) forward against pressure of valve spring in transmission.

2) On Buick (Exc. Buick Special), throttle lever on carburetor should make contact with stator lever just as throttle reaches wide open position. To adjust, rotate turnbuckle on transmission operating rod.

3) On Buick Special, move throttle lever to wide open position. Transmission idler lever (located on engine) and the throttle lever should reach their stops at the same time. To adjust, rotate turnbuckle on transmission operating rod as necessary.

ANTI-STALL DASHPOT ADJUSTMENT

Automatic Transmission Cars - 1) With engine at operating temperature, open throttle to clear fast idle cam, then rotate cam to extreme fast idle position and allow throttle to close against cam.

2) Adjust dashpot to just touch throttle lever.

3) With selector lever in Drive and brakes applied, jab accelerator pedal and release quickly. If engine stalls, move dashpot towards throttle lever. Move dashpot away from throttle lever if too much time required for throttle to come to fully closed position.

ELECTRICAL

BATTERY

12 Volt.
Capacity

Series	Amp. Hrs. (20 Hr.)
4000	44
4100, 4300	61
All Others	70

Battery Ground - Negative to right front corner of block (Special), to cylinder head (others).

Engine Ground - Rear of right cylinder head to dash (Special), each cylinder head to dash (others).

STARTER

Delco-Remy 1108303

Delco-Remy No.	Amperes	Volts	RPM
1100631	25	14.0	2000
	35	14.0	5000
1100623	28	14.0	2000
	40	14.0	5000
1100622	32	14.0	2000
	50	14.0	5000

Field Current - 1.9-2.3 amps at 12 volts and 80°F (All models)

►*TURN SIGNAL & HIGH BEAM INDICATOR LIGHTS ERRATIC BEHAVIOR CORRECTION:* Securely ground the ground wire (black) from instrument cluster. Wire grounded at buzzer mounting screw (401" 425" V8 Engines), at pedal mounting bracket screw (Others).

ALTERNATOR REGULATOR

►*REGULATOR NOISE CORRECTION:* Install later production regulator Delco-Remy No. 1119515 (interchangeable with No. 1119512).

Delco-Remy 1119512, 515

Field Relay

Air Gap - .015"

Closing Voltage - 1.5-2.7 volts.

Voltage Regulator

Air Gap - .067" with lower contacts just touching.

Point Gap - .014" with lower contacts just touching.

Setting - 13.5-14.4 volts (upper contacts), 1.4 volts (lower contacts) at 125° ambient temperature.

FUSES & CIRCUIT BREAKERS

FUSE BLOCK

Located under left side of instrument panel. Cigar lighter fuse located back of cigar lighter.

IN-LINE FUSES

Rear Window Defroster in wiring connector near switch.
Guide-Matic Amplifier in wiring connector near amplifier.
Antenna Motor in wiring connector near switch.

CIRCUIT BREAKERS

40 Ampere - Power window, seat, vent, top. Located in left shroud panel. Also circuit breaker in each motor.

15 Ampere - Headlights and front parking lights. Located in lighting switch.

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH

Switch is mounted on steering column behind instrument panel, or in console at lower end of shift lever (Wildcat & Riviera with floor mounted shift lever).

Steering Column Mounted Switch - Starter should operate in Neutral and Park only. To adjust, place selector lever in Neutral and insert a 3/32" drill through gauging hole in operating lever and in switch body. *CAUTION - Do not allow lever to move out of position.* If drill will not enter holes or is not parallel to centerline of steering column, loosen switch mounting screws and move switch as necessary for proper alignment. Tighten screws and check starter operation in Neutral and Park positions.

Floor Mounted Switch - To adjust, loosen switch mounting screws, hold gearshift lever against neutral stop, align holes in switch and in lower end of gearshift lever (use a tapered punch or pin), tighten switch mounting screws. Check starter operation. Starter should operate only in Neutral and Park positions.

LIGHTING SWITCH REMOVAL

Disconnect battery ground cable, unplug multiple connector from switch. Pull switch knob out to last notch and depress spring-loaded latch button on left side of switch while pulling rod and knob assembly out of switch. Remove switch escutcheon and remove switch from instrument panel.

SPEEDOMETER REMOVAL

Buick Special & Skylark - Remove instrument cluster assembly (see below), then remove speedometer from cluster.

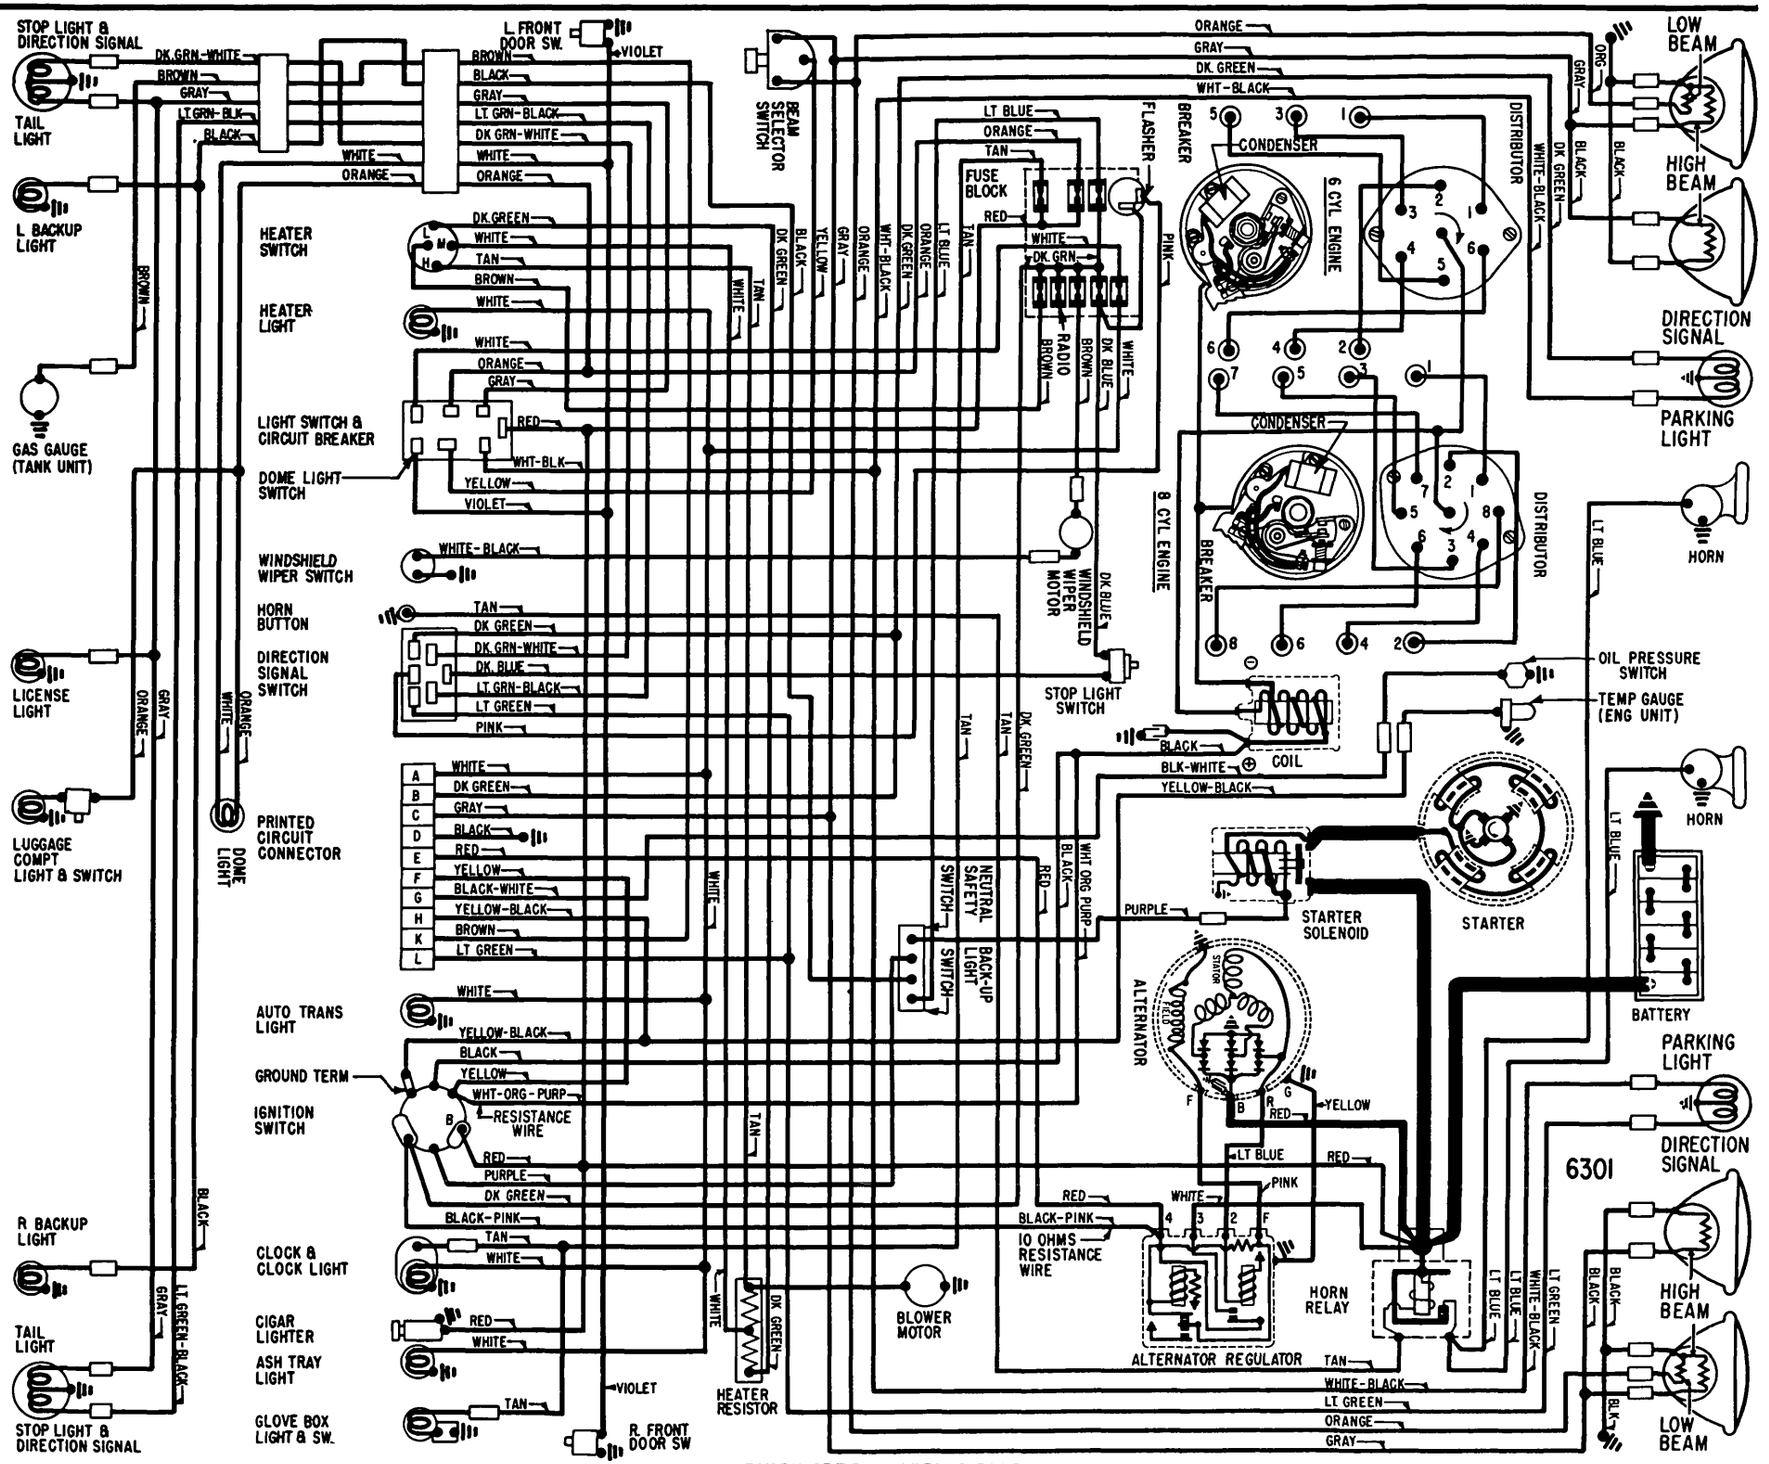
Buick (exc. Special & Skylark) - Speedometer can be removed from cluster assembly without removing cluster.

INSTRUMENT CLUSTER REMOVAL

►*NOTE* - It is necessary to remove instrument cluster to replace printed circuit.

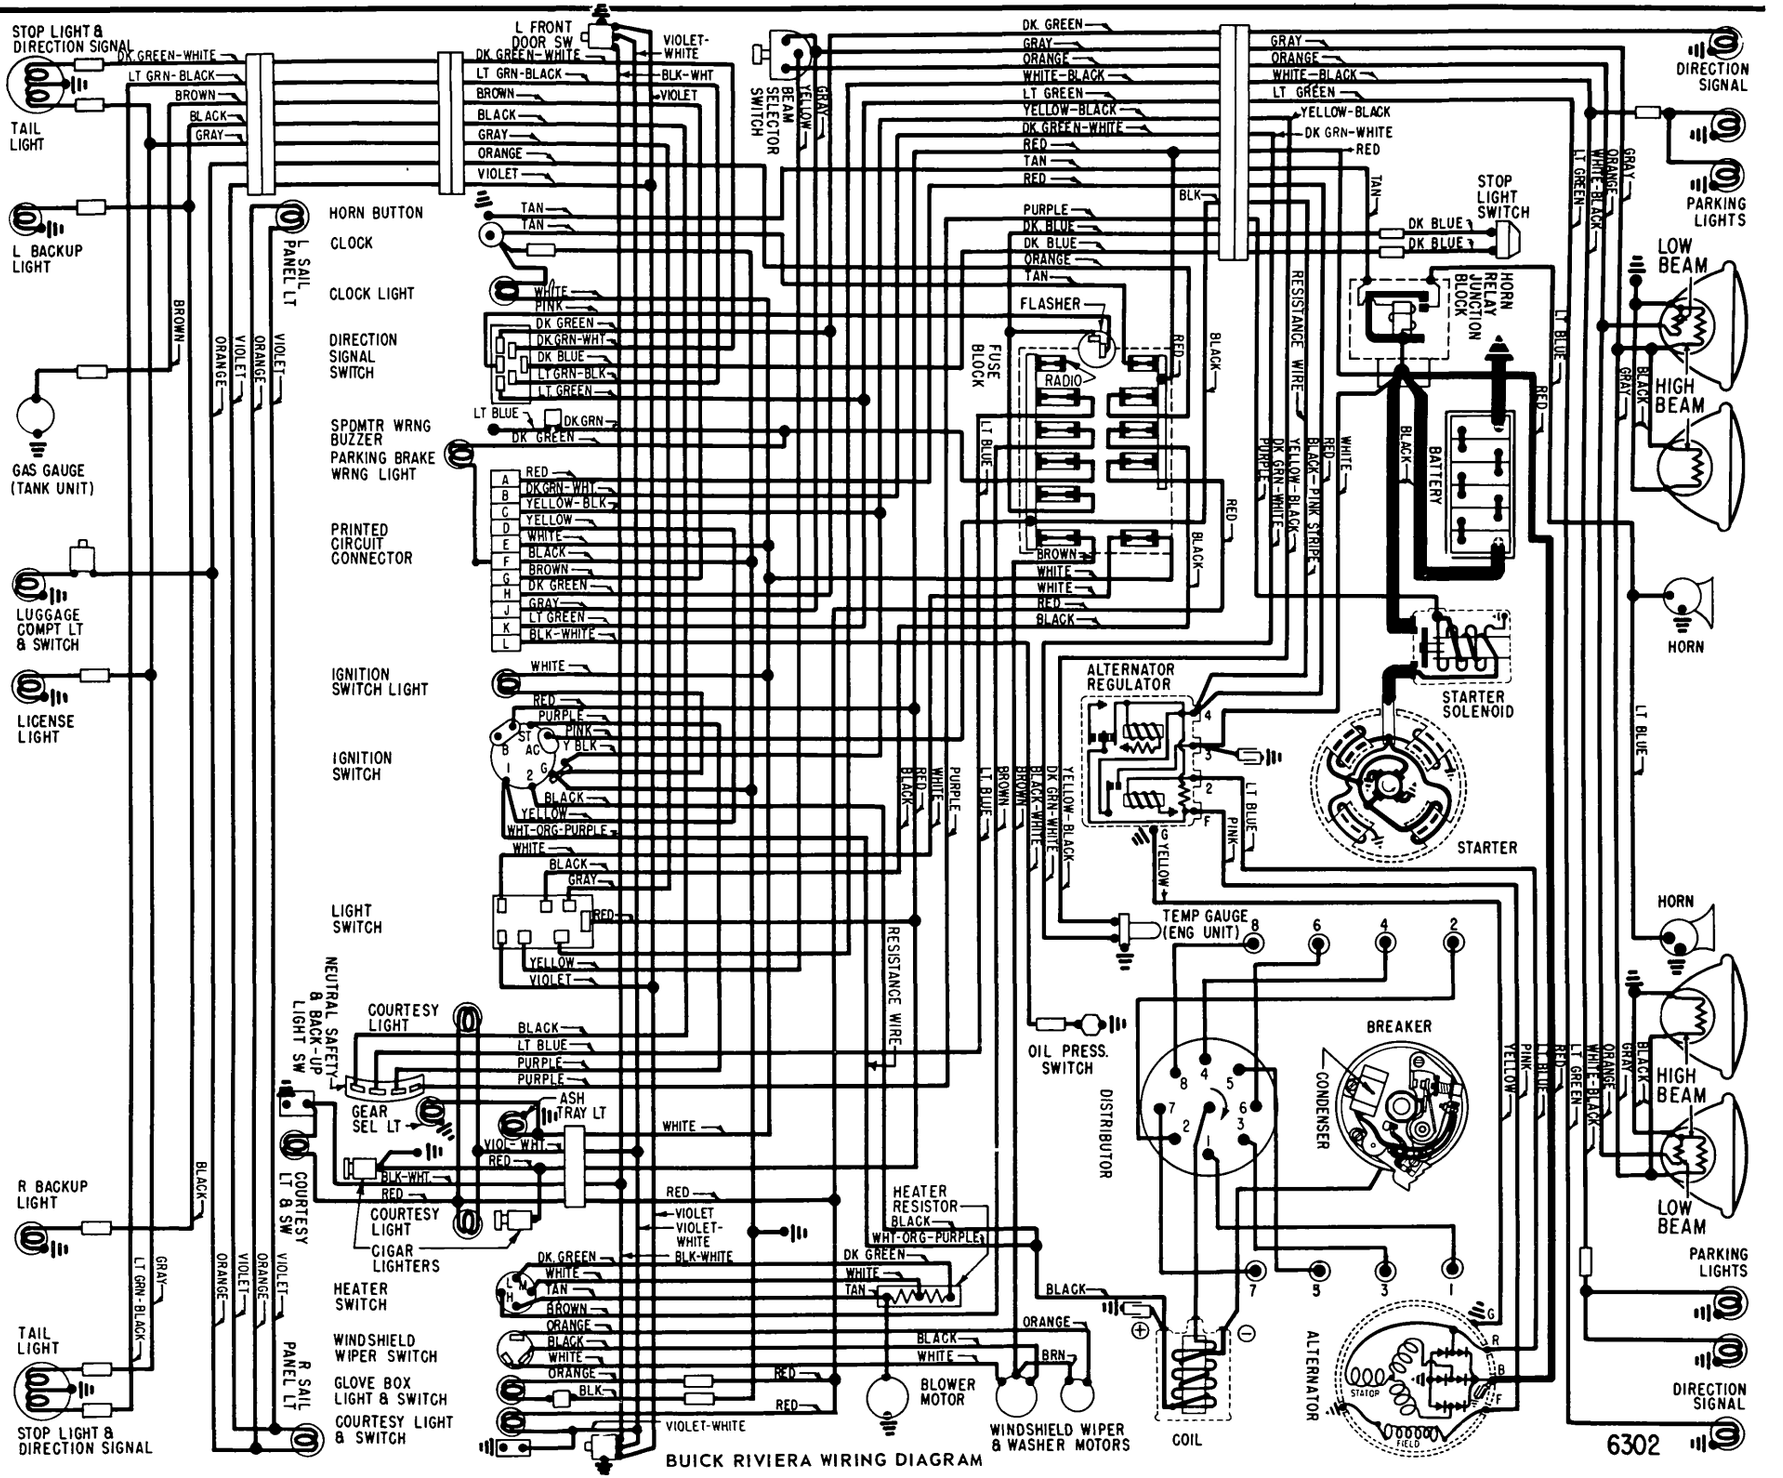
Buick Special & Skylark - Disconnect battery ground cable. Remove cluster hood, then remove three cluster retaining stud nuts from under instrument panel. Disconnect speedometer cable and printed circuit plug. Unplug clock connector, light, and ground wire. Remove cluster.

Buick (exc. Special & Skylark) - Disconnect battery ground cable. Remove control panel and trim plate from center of instrument panel, then remove right and left lower access doors. Disconnect all wires. Disconnect speedometer cable, left and right vent control cables, buzzer or cruise control wiring, and speedometer reset knob. Remove upper left moulding and exposed screws. Remove nuts from studs on lower edge of cluster. Remove two screws from steering column support and lower complete column. Remove instrument cluster assembly.



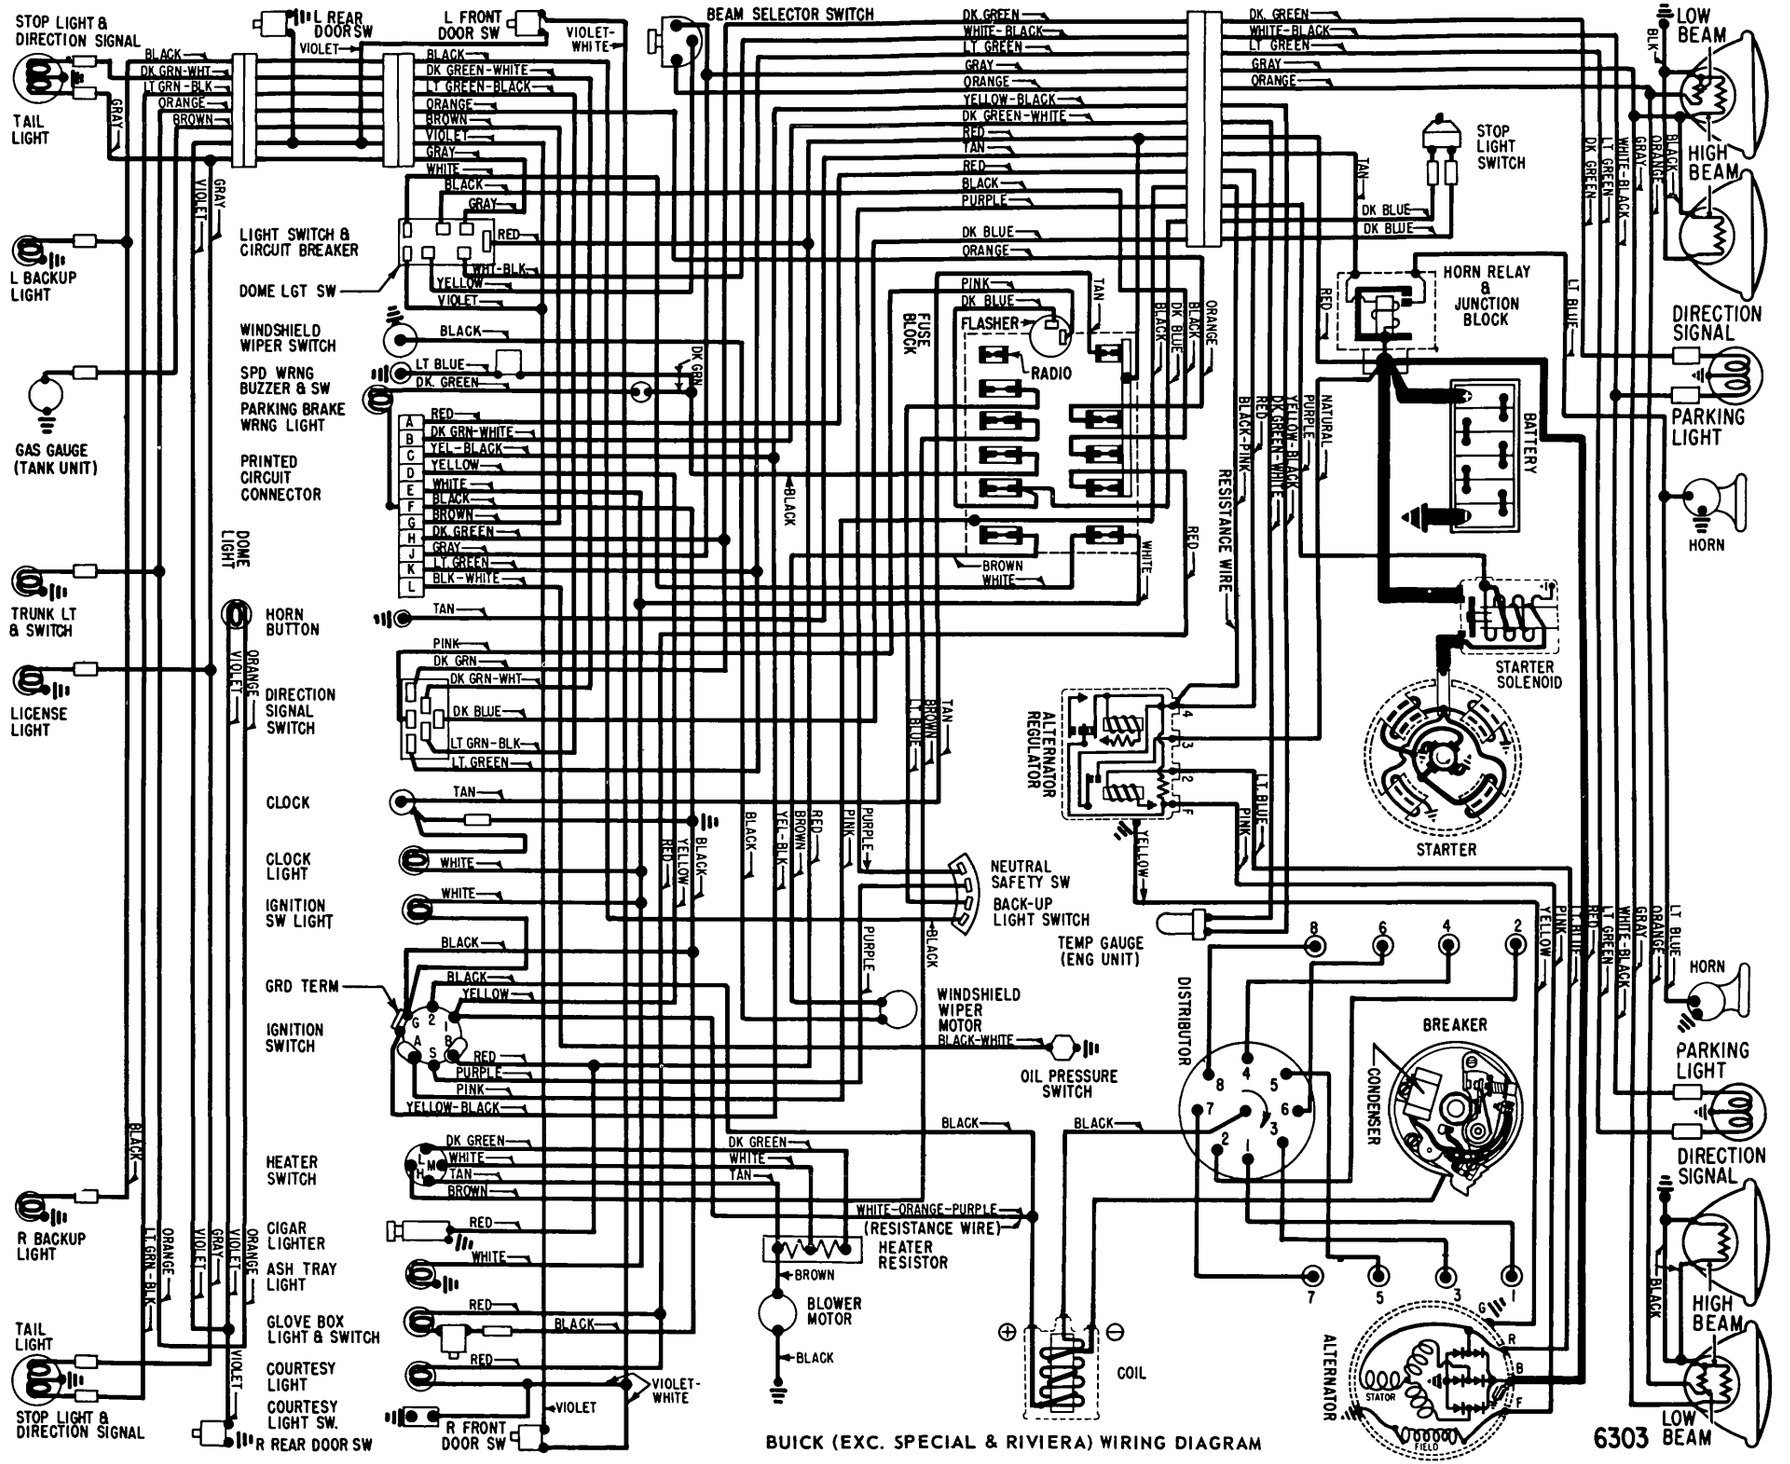
STOP LIGHT SWITCH

Located in brake master cylinder. Replace when necessary.



TURN SIGNAL FLASHER

Located on fuse block under left side of instrument panel.



See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

425" V8	340 at 4400	10 25-1	4 3125"	3 640"	425 cu ins

① - 265 at 4400 RPM on Regular Gas Option. ② - 9.0-1 on Regular Gas Option.

ALUMINUM ENGINE CAUTIONS

Extreme caution must be used when working with aluminum engines to prevent damage by scratching, nicking, or scoring *NOTE the following:*

1) Do not drop or slide machined parts
2) Do not use gasket cement except as indicated under Cylinder Head Installation
3) Lubricate bolts and screws entering any aluminum part Use "Buick Special Thread Lubricant"
4) Tighten bolts and nuts to specified torque DO NOT OVERTIGHTEN Torque values are for clean, lubricated threads

ALUMINUM ENGINE THREAD REPAIR

"Heli-Coil" tools and inserts should be used when repairing damaged aluminum engine threads

ENGINE NOTES

► *RIGHT ROCKER ARM COVER NOISE OR KNOCK (EARLY 401" V8 ENGINES) CORRECTION:* Knock in right rocker arm cover (noticeable at 1200-1500 RPM) can be corrected by installation of extra gasket under rocker arm cover *NOTE - Later production engines have thicker (.200") gasket to eliminate knock.* Torque cover bolts to 3-5 ft lbs Check for oil leaks

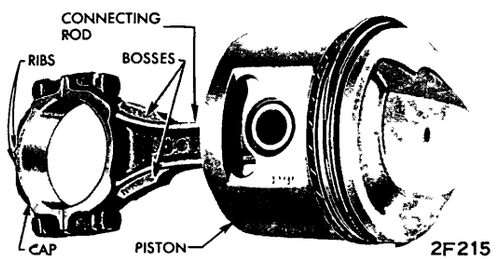
► *REPLACEMENT CYLINDER HEAD GASKET (215" V8 ENGINES):* Special laminated head gasket furnished for replacement will correct gasket failures Clean gasket surfaces of head and block and install new gasket DO NOT use sealer, shellac, or other coatings on gasket Dip all cylinder head bolts in Perfect Seal No 980465 before installation *See Cylinder Head Installation*

► *CAMSHAFT KNOCK CORRECTION (V6 & 215" V8 ENGINES):* Can be corrected by installing spring-loaded camshaft thrust button on forward end of shaft See CAMSHAFT for installation data *This spring-loaded thrust button installed in production on later engines.*

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

►*MINIMUM FUEL REQUIREMENTS FOR FOREIGN TRAVEL:*

All Engines Compr. Ratio	Octane Requirement Motor Method	Research Method
7.6-1	74	83
8.75-1	85	93
8.8-1	85	93
9.0-1	85	93
10.25-1	90	99
11.0-1	90	99



If satisfactory fuel cannot be obtained for 8.75-1 and 9.0-1 engines, install a .045" thick head gasket. To lower compression ratio of other engines, install lower compression ratio piston and pin assemblies.

OIL PAN REMOVAL

198" V6, 215" Al. V8 Engines - 1) Raise car and drain oil. Disconnect steering idler arm bracket-to-crossmember attaching bolts, then remove lower flywheel housing.

2) Remove oil pan bolts and lower pan enough to remove oil pump pipe and screen-to-cylinder block bolts.

3) Rotate crankshaft for maximum clearance of forward end of oil pan. Move front of pan to right and lower pan through opening between crossmember and steering intermediate shaft.

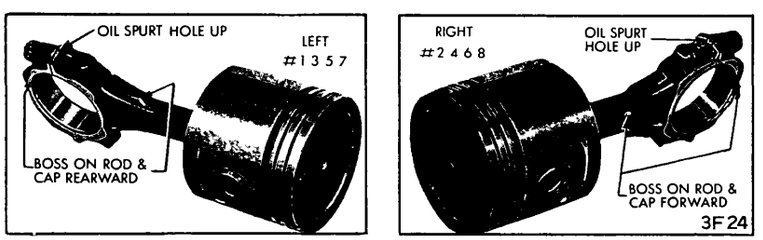
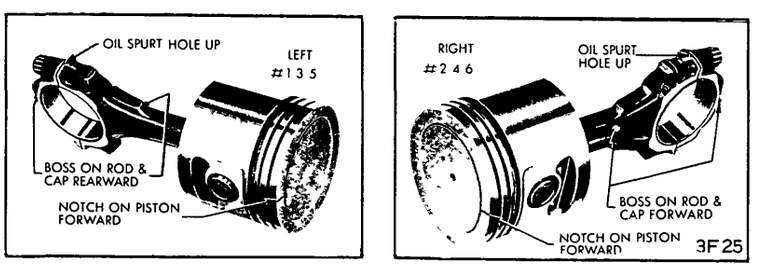
① - Measured at top of skirt. ② - Finger push fit with parts at 70°F.
③ - Press fit. *See Piston Pin Removal below.* ④ - Measured ¼" from top of piston skirt.
⑤ - .015-.055" on 425" engine.

PISTON PIN REPLACEMENT



Use special tools J-8754 and J-8355 (V6 & Aluminum V8), J-6047 (Cast Iron V8).

Removal - Place support in press with full radial face up and install spring in support. Place piston assembly in press with driver inserted in pin. Press out pin.



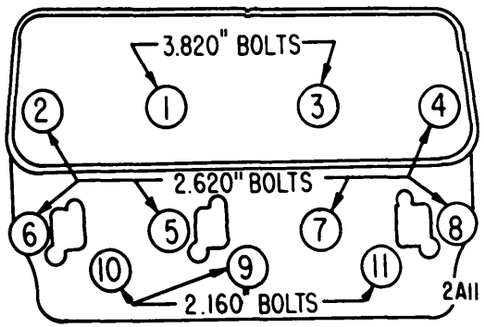
Installation - Place pilot and spring in support and position support so pilot is located in piston pin bore. Place piston assembly in press. Coat pin and connecting rod lightly with lubriplate and place driver in pin. Press pin into position (pin will bottom against pilot).

FITTING PISTONS

Measure piston at right angle to piston pin just below oil ring groove. Measure cylinder 1½-2" from top of bore. *See table for specifications.*

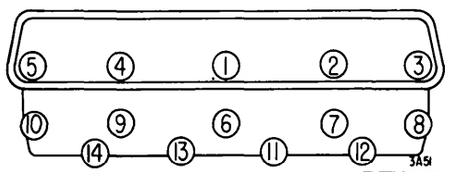
215" ALUMINUM V8 PISTON & ROD ASSEMBLY

198" V6 PISTON & ROD ASSEMBLY



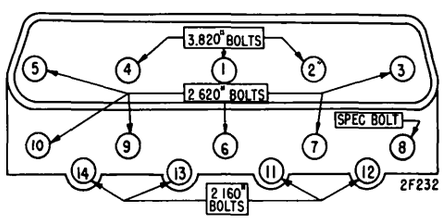
See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

CYLINDER HEAD REMOVAL



401", 425" V8 Engines - All cylinder head bolts and pushrods cannot be removed with head in place. When removing head, pull pushrods part way out and tape in place. These same pushrods must be in head before head installation.

CYLINDER HEAD INSTALLATION



Tighten cylinder head bolts a little at a time, three times around in sequence shown in diagram. Final torque should be to specifications (see Tightening Specifications table).

V6 CYLINDER HEAD TIGHTENING SEQUENCE

401", 425" V8 CYLINDER HEAD TIGHTENING SEQUENCE

215" AL. V8 CYLINDER HEAD TIGHTENING SEQUENCE

VALVE SPRING INSTALLATION

Single spring used on all valves (198" V6, 215" Al. V8); inner and outer springs used on all valves (401" V8). Install with closed coil ends toward cylinder head.

VALVE SPRING INSTALLED HEIGHT

Measure from spring seat on head to underside of valve spring retainer. *See "Valve Closed" spring length in specification table.*

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

Engine	MAIN BEARINGS				CONNECTING ROD BEARINGS		
	Journal Diam.	Clearance	Thrust Brg.	Endplay	Journal Diam.	Clearance	③ Sideplay
198" V6	① 2.2992"	② .0005-.0021"	No. 2	.004-.008"	2.000"	② .0002-.0023"	.006-.014"

401" V8	① 2.498-2.499"	② .0005-.0021"	No. 3	.004-.008"	2.249-2.250"	② .0002-.0023"	.005-.012"

① - Out-of-round limit .003". ② - Wear limit .003". ③ - Total both rods.

CRANKSHAFT REAR OIL SEAL INSTALLATION

Crankshaft must be removed to replace fabric seal in crankcase. Place new seal in groove in cap and force down with hammer handle until seal projects above groove not more than 1/16". Cut ends of seal flush with cap surface. Replace seal in crankcase in same manner. Neoprene seals are placed in sides of bearing caps. These seals are slightly longer than grooves in cap; **do not cut seals to length.** Lubricate seals and install in cap with upper ends protruding about 1/16". After cap installed, force seals up into cap with blunt instrument to provide seal at parting line between cap and case.

TIMING CHAIN COVER REMOVAL

198" V6, 215" AL. V8 - Remove radiator, fan, pulley and belts. Remove crankshaft pulley and reinforcement, and harmonic balancer. On power steering cars, remove pump bracket bolts and move pump out of way. On all cars remove fuel pump, generator and brackets. Remove distributor cap (pull spark plug wires off rocker arm cover brackets) and swing cap and wires out of way. Disconnect distributor primary wire and remove distributor (Note position of rotor for reinstallation). Loosen and slide thermostat bypass front hose clamp rearward. Remove attaching bolts and remove cover assembly and gasket.

401", 425" V8 - Remove radiator core, shroud, fan belt, fan and pulley. Remove vibration damper. Remove all attaching bolts. *NOTE - Do not remove water pump from chain cover.* Remove cover and manifold carefully, to avoid damage to lower crankcase gasket.

FRONT OIL SEAL REPLACEMENT

198" V6, 215" AL. V8 - Use a punch to drive out old seal and shedder from front to rear of cover. To install, coil new packing around opening so ends are at top. Drive in shedder with punch. Stake shedder in place at least three places. Use hammer handle to size packing until balancer hub can be inserted through opening.

401", 425" V8 - After removing braided fabric packing and pressing steel shedder out of chain cover, work new packing into shedder. Drive shedder into recess in cover with installer J-5250-1. Push packing expander J-5250-2 through seal to expand packing into place and size opening for crankshaft. Apply a thin coat of vaseline to packing.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

VALVE GUIDES

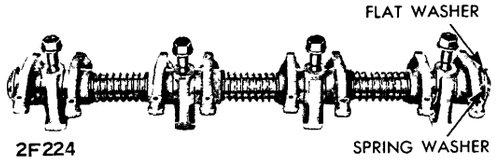
Pressed in head (V8); integral with head (V6). If valve stem to guide clearance excessive (see table), service as follows:

198" V6 Engine - Ream guides to .004" Oversize and install .004" Oversize valve.

215" Al. V8 Engine - Drive old guide out from combustion chamber side with Tool J-267. Lubricate and install new guide from top of head using Tool J-8813. Guide is correctly positioned when tool bottoms. After installation, finish ream new guides.

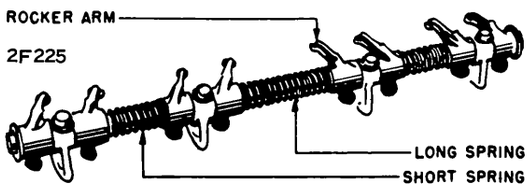
401", 425" V8 Engines - Drive guide from combustion chamber side with Tool J-269. Place valve guide aligner Tool J-5240-2 over valve guide hole in head, insert valve guide (either end down), and use installer Tool J-5240-1 and hammer to drive new guide down into head until shoulder on installer bottoms on top of aligner. Finish ream new guides with Tool J-129-3.

VALVE STEM INSTALLED HEIGHT



Height of valve stem tip above spring seat on head should be 1.825" (V6 & 215" V8), 1.540" (401" & 425" V8). If height raised more than .050" above this figure by valve grinding, reduce stem height by grinding end of valve stem or replace valve.

►*ROCKER ARM COVER GASKET OIL LEAK CORRECTION:* Gasket adhesive becomes pliable when engine warms. To correct, install new rubber composition gasket as follows: Apply thin coat of Buick Epoxy Adhesive, Group 0.423, Part No. 1360016, or equivalent to gasket surface around each end to about 2" in from ends. Also apply adhesive at the center on each side. Install gasket and cover and torque mounting screws to specifications.

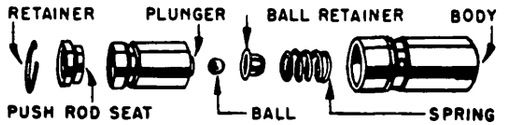


ROCKER ARM ASSEMBLY

198" V6, 215" AL. V8 Engines - Assemble springs, rocker arms and brackets as shown in diagram. *NOTE - Two types of rocker arms are used, and valve ends of rocker arms slant away from brackets.* Install spring washer, flat washer, and cotter pin on each end of shaft in order. Install bolts with plain washers through brackets and shaft so notch in one end of shaft is up and at front (right hand shaft) up and at rear (left hand shaft). *NOTE* - Vent pipe oil baffle is mounted under rear bolts on right rocker arm and shaft assembly.

401", 425" V8 Engines - *See illustration for parts location.* Install longer spring at center of shaft and install rocker arm with offset (slant) toward center of shaft (two types of rocker arms used). Turn shaft so notch in one end of shaft is upward or toward top of bracket and install bolt through bracket and shaft to maintain this position.

V6, AL. V8 ROCKER ARM ASSEMBLY



401", 425" V8 ROCKER ARM ASSEMBLY

HYDRAULIC LIFTER SERVICE

If lifter or parts damaged, replace entire assembly.

Leakdown Rate - Using Hydraulic Lifter Test Fluid (Kent-Moore J-5268) with test fixture J-5790 (198" V6, 215" AL. V8), J-5095 (401", 425" V8), test lifter as follows: Place lifter (top side up) in sleeve. Lifter must be covered by fluid during test. Remove all air from lifter (operate lifter plunger). Operate lifter plunger an additional 10 strokes and if even 1 stroke shows weak resistance replace check ball and repeat operation. Next, remove weight arm to allow lifter plunger to raise to its retainer, then lower weight arm to rest on ram roller. As pointer starts moving upward, start rotating fluid cup by turning handle once every two seconds. Leakdown rate (time between marks on scale) must be between 12 and 60 seconds. A doubtful lifter should be checked three or four times before replacing.

Installation - Oil assembly. Lifter should drop of its own weight into bore.

HYDRAULIC VALVE LIFTER (ALL) 2F226

CAMSHAFT

Engine	Journal Diameters 1	2	3	4	5	℄ Bearing Clearance
V6	1.755-1.756"	1.725-1.726"	1.695-1.696"	1.665-1.666"	.....	.0005-.0035"
V8 (All)	1.785-1.786"	1.755-1.756"	1.725-1.726"	1.695-1.696"	1.665-1.666"	.0005-.0035"

℄ - Wear limit .0015-.004".

VALVE TIMING

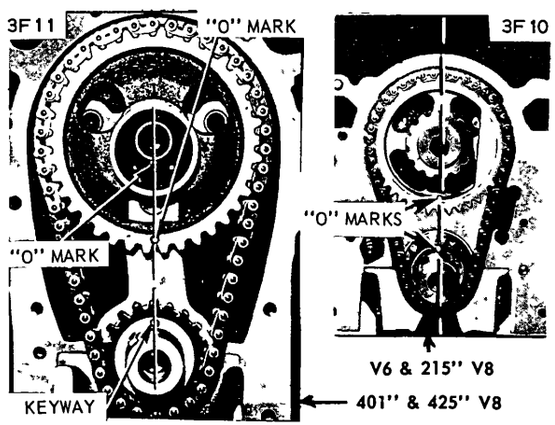
Engine	Intak Open (BTDC)	Intak Close (ALDC)	Exhaust Open (BLDC)	Exhaust Close (ATDC)
198" V6	18°	82°	62°	38°
215" Al. V8 (2-Bbl.)	29°	71°	67°	33°
(4-Bbl.)	30°	75°	68°	37°
401" V8	28°	87°	76°	46°
425" V8	29°	81°	71°	48°

CAMSHAFT BEARING REPLACEMENT

Bearings must be line-reamed after installation and should not be replaced if serviceable. Polish camshaft journals and remove burrs from bearings. Clearance should be within limits of .0015-.004".

CAMSHAFT END THRUST

V6 & 215" V8 Engines - Thrust is to the rear and is taken by sprocket hub. Later production engines have spring-loaded thrust button assembled on camshaft bolt. *See Thrust Button installation data.*



401" & 425" V8 Engines - Thrust is to the rear and is taken by sprocket hub.

CAMSHAFT THRUST BUTTON INSTALLATION

V6 & 215" V8 Engines - Thrust button can be installed on early engines to correct camshaft knock as follows: Remove timing chain cover. Remove camshaft retaining bolt and washer, replace this washer with special washer furnished in thrust button kit (washer has slot for spring tang). Install special washer and retaining bolt, tighten bolt to specifications. Install spring over head of bolt with tang on spring in washer slot, position thrust button on spring with formed end of spring engaging groove in button, reinstall cover.

TIMING CHAIN DAMPER (V6 ENGINE)

Damper used on each span of chain between sprockets (damper on slack side of chain is spring-loaded). Dampers need not be removed for timing chain removal and installation if spring-loaded damper is held away from chain.

VALVE TIMING MARKS

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

Oil Pressure (401" V8 Eng.) - 40 psi at 1600 RPM.

Oil Pressure (V6 & Al. V8 Engs.) - 33 psi at 2400 RPM.

Oil Pressure (425" V8 Eng.) - 40 lbs. at 2400 RPM.

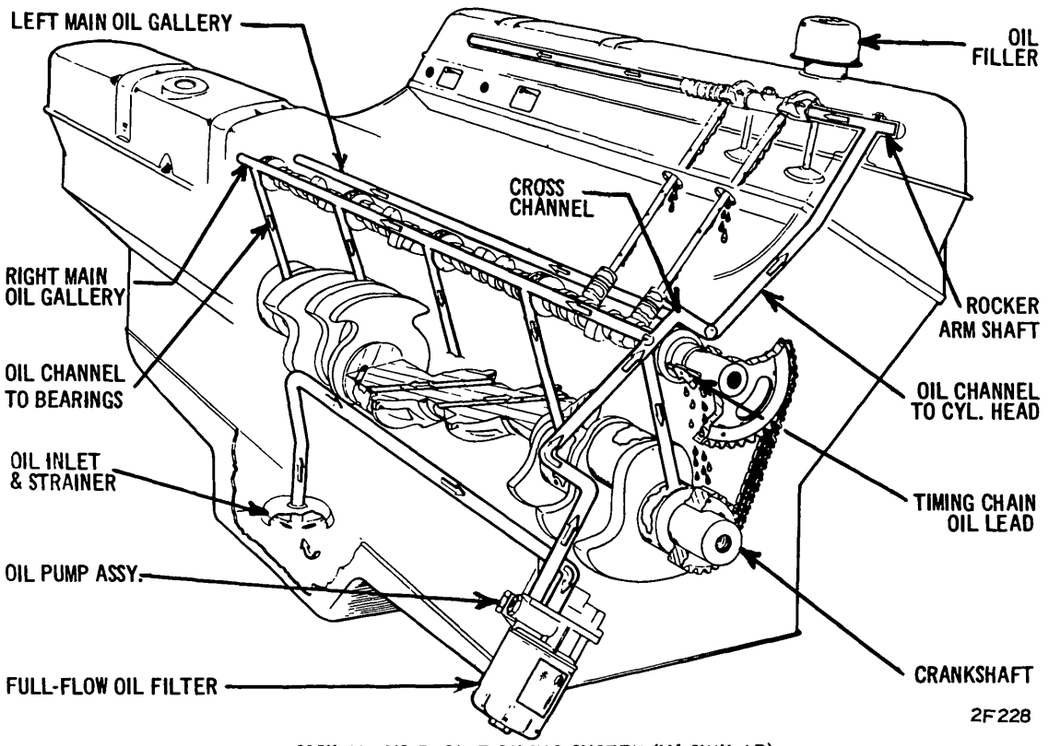
Pressure Regulator Valve - Located in oil pump cover (V6 & Al. V8 Engs.); in oil pump body (401" V8). Not adjustable.

ENGINE OILING SYSTEM

V6 & 215" V8 Engines

See *illustration.* Gear oil pump located in timing chain cover, draws oil through screen and pipe assembly (or over top of screen if clogged) and a drilled passage in crankcase connecting, to drilled passage in timing chain cover. All oil is discharged from pump to cover assembly. Spring loaded relief valve (in cover) limits oil pressure to a maximum of 33 lbs. per square inch. A bypass valve (in cover) opens when filter becomes clogged (4½-5 lbs. pressure difference between filter inlet and outlet) to bypass unfiltered oil directly to oil galleries in engine. Oil from filter (mounted on oil pump cover) supplies oil through oil pump cover and drilled passages in crankcase to two main oil galleries that run full length of the crankcase.

Crankshaft & Camshaft - Both crankshaft and camshaft are supplied oil through drilled passages in crankcase, from right main oil gallery.



Connecting Rod & Pistons - Main bearings supply oil through drilled passages in crankshaft to connecting rod bearings. Pistons and cylinder walls are lubricated by oil forced through small notch in connecting rod bearing parting surface that registers with hole in crankshaft every revolution. Piston pins are lubricated by splash.

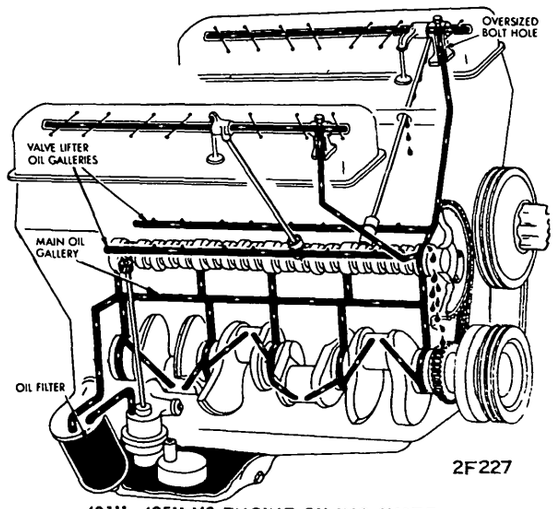
Timing Chain & Sprockets - Drilled holes in camshaft connect front camshaft bearing to key slot in front of camshaft. Oil flows from camshaft journal into keyslot over woodruff key in space between key and camshaft sprocket and fuel pump eccentric. A relief in forward end of fuel pump eccentric allows oil to escape between eccentric and camshaft distributor gear. Oil strikes distributor gear once each camshaft revolution, supplying lubrication to timing chain and sprockets.

Hydraulic Lifters - Full pressure lubrication is supplied hydraulic lifters from cutouts in lifter bores in main oil galleries.

Rocker Arms, Valves and Pushrods - These items receive oil from main oil galleries through drilled holes in front of cylinder block and head, leading up from forward end of corresponding main oil gallery. Hole in head ends beneath front rocker arm shaft bracket. A notch cast in base of bracket allows oil to flow up inside bracket (between bracket and bolt) to hollow rocker arm shaft (plugged at both ends). Each rocker arm receives oil through hole in underside of shaft. Grooves in arm provide lubrication to bearing surfaces. Oil is metered to pushrod seat and valve stem through holes drilled in rocker arm. Excess oil returns to oil pan through passages in cylinder head and block.

ENGINE OILING

215" AL. V8 ENGINE OILING SYSTEM (V6 SIMILAR)



401" & 425" V8 Engines

See *illustration.* Gear type oil pump inside crankcase (at rear end) draws oil from crankcase sump through screen (or over top of screen if clogged) and delivers it through oil passages in pump body and crankcase to full flow filter. By-pass ball type valve in filter base opens to by-pass filter element when clogged or when difference in oil pressure between inlet and outlet ports is 4½-5½ lbs. Oil from filter passes into main oil gallery (full length of crankcase below camshaft) and through drilled passages in crankcase at full pressure to all crankshaft and camshaft bearings, where it is distributed to all moving parts of engine.

Crankshaft, Connecting Rods & Pistons - Holes drilled in crankshaft carry oil from main bearings to connecting rod bearings. Pistons and cylinder walls are lubricated by oil forced through squirt hole in parting surface of connecting rod that registers with hole in crankshaft at each revolution of crankshaft. Pistons are lubricated by splash.

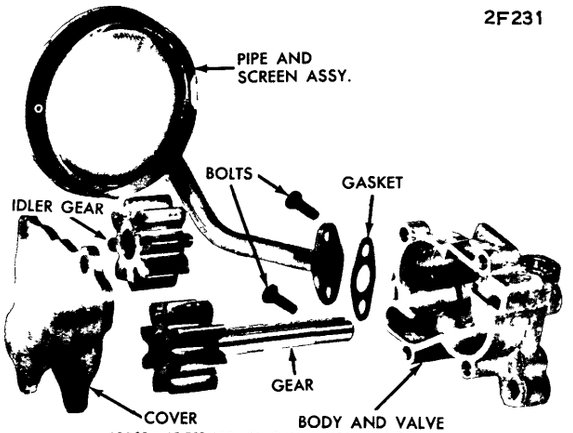
Camshaft, Sprockets, Lifters - Oil from front camshaft bearing, flows down front face of crankcase to drop on sprocket that transfers it to chain. Oil holes in

(Continued)

401", 425" V8 ENGINE OILING SYSTEM

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

crankcase and camshaft front bearing align with groove in camshaft bearing journal which meters flow of oil from main gallery to valve lifter oil galleries in each bank of cylinders. The full length of cylinder bank oil gallery cuts into lower sides of all valve lifter guide holes to supply low pressure oil to each lifter.



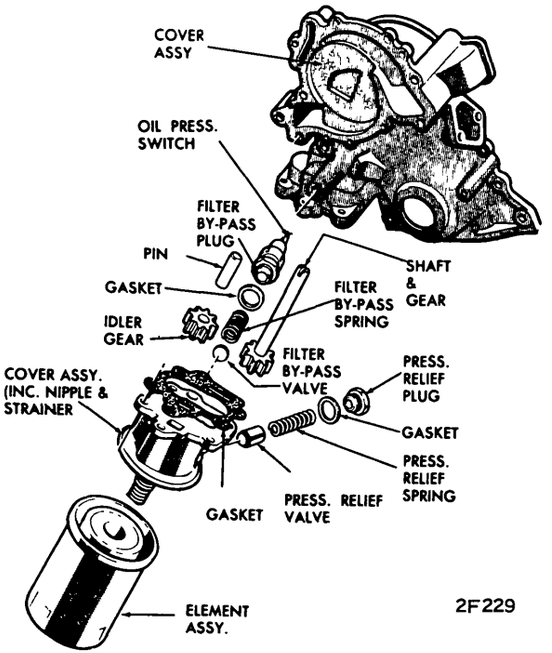
Rocker Arms, Valves & Pushrods - These items receive low pressure oil from valve lifter gallery through connecting passages drilled in front end of cylinder block and head. Oil passage in cylinder head ends in a counterbored recess surrounding front rocker arm shaft bracket bolt. Oversize bolt hole in bracket permits oil to flow into hollow rocker arm shaft (plugged at each end). Holes in rocker arm shaft allow oil to flow to each rocker arm. Oil is metered to pushrod ball seat and to valve stem through drilled holes in rocker arm. Excess oil drains off and returns to oil pan through pushrod opening in cylinder head and block.

OIL PUMP INSTALLATION

CAUTION - Because pump will not prime itself with air in cavity, remove gears and fill gear pocket with petrolatum, then force gears into cavity.

198" V6, 215" AL. V8 Engines - Lubricate relief valve before installation and tighten relief valve and bypass valve caps to specifications (see Tightening Specifications table). Place straightedge across gears; clearance between gasket surface of chain cover and straightedge should be .0018-.0058". If less, check timing chain cover for wear. Install gasket and tighten cover-to-timing chain cover bolts to specifications.

►*V6 OIL PUMP CAUTION:* DO NOT remove bypass valve (staked in place).



401", 425" V8 ENGINE OIL PUMP

►*OIL PUMP COVER INSTALLATION CAUTION (Buick Special Police Cars):* Spacer must be installed between oil pump cover gasket and spacer gasket. Cover must be installed with switch away from alternator.

401", 425" V8 Engines - Install gear, shaft, and idler assembly into pump body with chamfered end of idler gear teeth away (inward) from cover. Using straightedge across pump body, check clearance between gears and straightedge. Clearance should be .0005-.005". To install, first pack pump (see Caution above), then install cover and bolts. Torque to specifications.

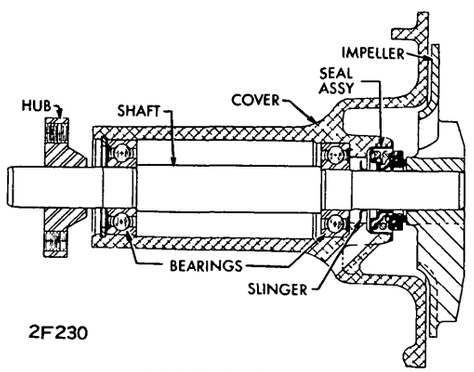
NOTE - If pump shaft tends to bind as bolts are tightened, tap body with mallet to free shaft. Shaft must be free of bind when bolts are tight.

V6, ALUMINUM V8 ENGINE OIL PUMP

ENGINE COOLING

Thermostat (V6 & Al. V8 Engs.) - Located in forward (outlet) end of intake manifold. Pellet type. Opens at 167-172°F.

Thermostat (401" V8 Eng.) - Located in water manifold above pump. Pellet type. Opens at 167-172°F.



Thermostat (425" V8 Eng.) - Located in water manifold above pump. Pellet type. Opens at 180°F.

Pressure Valve - 15 lb. radiator filler cap .

WATER PUMP

Pump shaft bearing is a shrink fit in the aluminum housing. Housing, shaft and bearing, and hub are serviced as an assembly. Check pump bearings for roughness and endplay and replace assembly if bearings not serviceable. Pump seal can be replaced as follows:

Seal Replacement - Support impeller and shaft on anvil to prevent shock load on bearings, crack impeller in several places with a chisel and remove it from shaft. Use punch inserted through vent hole to drive old seal and sleeve out of housing. Clean pump housing carefully *(CAUTION - Do not use solvent which might destroy bearing lubricant).* Press new seal assembly in housing using a piece of thick wall tubing of correct diameter. Coat face of carbon washer and impeller hub with rust preventive oil (Seco or equivalent), support hub end of shaft and press new impeller on shaft until clearance between impeller and pump housing is .025-.050" (V6 & 215" V8), .035-.040" (401" & 425" V8).

WATER PUMP (ALL)

TORQUE SENSITIVE FAN CLUTCH (AIR CONDITIONED CARS)

401" & 425" Engines - Fan is driven through a temperature sensitive fan clutch assembly. Flow of silicone governing fan speed is controlled by an adjustable temperature sensitive coil. At low temperatures, fan speed is limited to 800-1200 RPM. At air temperature of 80°F, the temperature sensitive coil opens a port allowing increased flow of silicone which allows maximum fan speed of 2100 RPM. Clutch is serviced as an assembly.

Adjustment - Normal setting of temperature sensitive coil is with coil end in center slot of tab. Adjust by bending tab just enough to move coil end to left hand slot (colder cut-in), or right hand slot (hotter cut-in). Bend tab back after making adjustment.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

FILTERS & CLEANERS

	① Service Interval
Oil Filter	Replace every Oil Change
Air Cleaner (Except Riviera)	Clean every 12,000 miles
(Riviera)	Replace every 12,000 miles
Breather Cap	Clean and reoil every 12,000 miles
Fuel Filter (V6)	Clean every 12,000 miles
(Al. V8 2-Bbl.)	Clean every 12,000 miles
(Al. V8 4-Bbl.)	Replace every 12,000 miles
(401", 425" V8)	Clean every 24,000 miles

① - Clean or replace more often if necessary.

AIR CLEANER CLEANING CAUTION

Remove element from mesh support, wash in kerosene, and squeeze out. DO NOT WRING ELEMENT. Wrap in dry, clean cloth and gently squeeze out solvent. Reoil element, squeeze out excess (element should just be damp with oil) and reinstall with edges of element over support.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

COMPRESSION PRESSURE

All at cranking speed (throttle open)..... 165-185 psi
All at 1000 RPM..... 212-230 psi

Maximum variation between cylinders less than 20 psi.

VALVE TAPPET CLEARANCE

All ..... Hydraulic

SPARK PLUGS

Gap (All) ..... .035"
Torque (All) ..... 25 ft. lbs.

Spark Plug Type

All Engines ..... AC 44

AM/FM RADIO CAR NOTE: AC Type R44 plugs used on first cars and may improve radio performance in fringe reception areas.

DISTRIBUTOR

Point Gap (All)..... .016" (Correct when Cam Angle 30°)
Cam Angle ..... 28-32° (set to 30°)
Condenser Capacity ..... .18-.23mfd
Breaker Arm Spring Tension ..... 19-23 ozs.

IGNITION TIMING

Set at 480 RPM with vacuum line disconnected and opening taped.

All .....5° BTDC

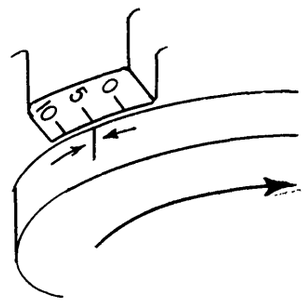
HOT (SLOW) IDLE RPM

All, in "D", Air Cond. ON 480

NOTE - Observe the following when setting idle speed:
1) Disconnect parking brake vacuum hose at diaphragm and connect vacuum gauge to this hose (gauge will register when selector lever in "D").
2) Loosen front and rear throttle valve rod locknuts at carburetor throttle lever trunnion.
3) Hold idle compensator valve closed during adjustment.
4) Idle Air Bypass type carburetor. Both the idle air, and idle mixture screws must be adjusted.

TUNE-UP SPECIFICATIONS

COLD (FAST) IDLE RPM



All (Idle Screw on Second Step of Cam)..... 1700-1750
With selector lever in neutral.

AUTOMATIC CHOKE SETTING

All ..... 1 Rich

FUEL PUMP PRESSURE & VOLUME

Pressure (All) at Cranking Speed ..... 5½-6½ psi
Volume (All) 1 pint minimum in 17 strokes at cranking speed.

ACCELERATING PUMP SETTING

	Seasonal Setting
Rochester	None
Carter	Upper Hole (Normal)
	Other Holes (Special Conditions)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

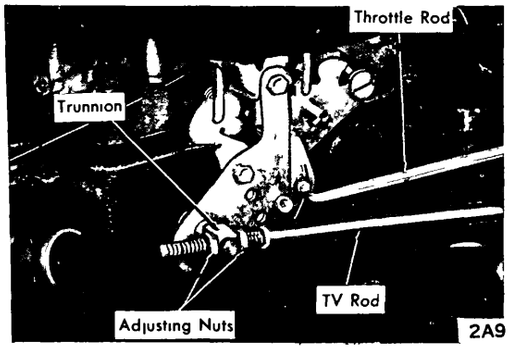
THROTTLE LINKAGE ADJUSTMENT (THROTTLE VALVE ROD ONLY)

NOTE - The following adjustment may be made when the throttle valve rod only was disengaged (as for carburetor removal) and all other parts of the linkage have not been disturbed

With engine running and clearance at throttle return check, loosen both throttle valve rod locknuts Make sure carburetor is at hot idle position Push end of throttle valve rod to rear of car so transmission throttle lever is against stop in transmission, and hold rod in position Turn front locknut against trunnion until all slack taken up, then tighten nut 3 full turns Tighten rear nut Stop engine

THROTTLE LINKAGE ADJUSTMENT (COMPLETE ADJUSTMENT)

1) Remove clip from carburetor throttle rod trunnion, then remove trunnion from relay bracket lever (at front of dash).



2) Place ¼" drill shank through gauging hole in relay lever and dash relay bracket. With engine running set throttle lever to Hot Idle position (Air Cond. turned OFF).

3) Adjust carburetor throttle rod trunnion for free entry into dash relay lever, then install trunnion and clip.

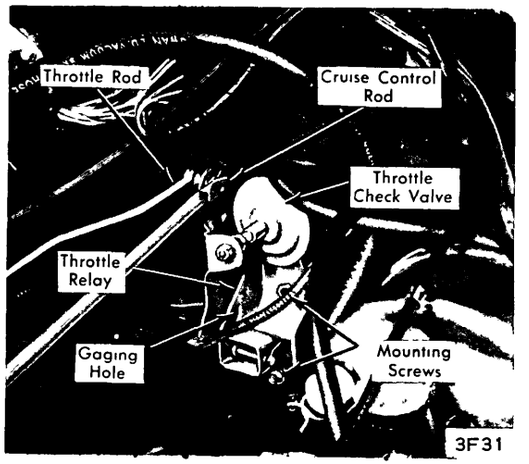
4) Push end of transmission throttle valve rod toward rear of car to position it against its stop. Bring front jam nut on throttle valve rod against trunnion to remove slack. **Tight n nut 3 full turns.** Tighten rear jam nut.

ACCELERATOR PEDAL HEIGHT ADJUSTMENT

Remove cotter pin from trunnion on inner side of pedal arm and remove trunnion from arm. Adjust trunnion up or down as required to obtain wide open throttle with pedal fully depressed.

THROTTLE LINKAGE ADJUSTMENT

IDLE SPEED-UP CONTROL ADJUSTMENT



Air Conditioned Cars - 1) With engine at normal operating temperature, turn air conditioner ON and place selector lever in Neutral.

2) Adjust idle speed to 900-950 RPM by loosening locknut on diaphragm shaft and turning nut to obtain specified RPM. Tighten locknut.

BELT ADJUSTMENT

With Belt Tension Gauge Tool J-7316 applied midway between pulleys, tension should read as follows:

Belt	New	Used
Alternator	100	70
Power Steering Pump	100	70
Air Cond. Compressor	100	70

THROTTLE RETURN CHECK & THROTTLE RELAY LEVER

THROTTLE RETURN CHECK ADJUSTMENT

1) With engine idling (be sure throttle check plunger does not contact throttle relay lever), open throttle wide momentarily to allow manifold vacuum to drop and throttle check plunger to come out.

2) Let throttle snap shut and note delay caused by throttle check. If engine races, throttle check plunger is too long. If engine stalls, plunger is too short.

3) Adjust plunger screw as necessary for proper operation. *NOTE* - With engine running, there should be approximately .190" clearance between throttle check plunger and relay.

ELECTRICAL

BATTERY

12 Volt, 70 Amp. Hr. (20 hr. rate)

Starter should operate only when selector lever is in "N" or "P" To adjust switch, loosen switch mounting screws, place selector lever in "N", and insert a 090- 094" pin (No 90 drill) in adjusting hole in switch cover Rotate switch counterclockwise until slider block inside switch bears against pin Tighten mounting screws and remove pin

STOP LIGHT SWITCH

Mounted on brake pedal support bracket under instrument panel To adjust, loosen switch mounting nut and adjust switch position so stop lights are on when brake pedal is depressed ½"

LIGHTING SWITCH REMOVAL

With instrument panel upper cover removed (see below), disconnect wiring from switch Depress spring-loaded knob and rod release button on bottom of switch and pull out knob and rod assembly With a 7/32" Allen wrench, remove knob and sleeve assembly, then remove switch and escutcheon assembly

IGNITION SWITCH REMOVAL

Ignition switch may be removed after steering column lower cover removed (see below)

CRUISE CONTROL SELECTOR REMOVAL

With upper instrument panel cover removed (see below), disconnect feed wire at control selector assembly Disconnect bowden cable from power unit regulator (under hood) Attach a 5' length of wire or heavy string to end of cable at power unit, and pull cable through cowl grommet from inside car with the selector assembly Remove string *NOTE - When installing, make sure cable not bent or kinked Do not connect cable to power unit until after selector assembly installed and secured in position*

INSTRUMENT PANEL BULB REPLACEMENT

All instrument cluster bulbs are accessible from under dash after steering column lower cover removed (see below)

FUEL & TEMPERATURE GAUGE REMOVAL

Remove upper instrument panel cover (see below), scribe mark radio speaker position, then move speaker to one side Disconnect wire terminal and bulb retainer assembly Remove radio dial light Remove gauges

INSTRUMENT CLUSTER & SPEEDOMETER

NOTE - Removal procedures below are the sequence of operation for cluster and/or speedometer removal

1) Upper Instrument Panel Cover - Disconnect battery, and remove right and left windshield garnish moldings Remove Cruise Control 'on-off" button (press fit), then remove control escutcheon Remove screws holding upper panel cover to lower panel (3 screws above instrument cluster assembly, 2 screws at inside top of glove box) Raise upper panel cover enough to disconnect map light and Guide-Matic connectors Pull cover rearward to disengage 4 hooks at front of cover then remove cover *NOTE - When installing, remove end cover from upper cover to install Cruise Control selector properly*

2) Steering Column Lower Cover - Remove the 4 screws which attach the upper end of the lower cover *NOTE - Larger screw at upper end of cover has 8 points and must be removed with a ¼" eight point socket to prevent damage to screw head* Disconnect convertible top wiring connector from top control switch (if equipped) Remove the 5 screws holding lower end of cover, then remove cover

3) Instrument Cluster - Remove radio speaker Disconnect speedometer and odometer cables Remove ignition switch light bulb socket Remove instrument cluster mounting screws and all other cluster bulb sockets Remove cluster assembly

4) Speedometer - Remove cluster lens and retainer from cluster casing Remove shift indicator and dial from cluster Remove speedometer

ENGINE

GENERAL SPECIFICATIONS

Engine	HP at RPM	Compr. Ratio	Bore	Stroke	Displacement
All	325 at 4800	10.5-1	4 00"	3.875"	390 cu. ins.

►*1963 ENGINE DIPSTICK TUBE INSTALLATION NOTE* - To insure correct oil level reading after installing a new dipstick tube, tube must be bent ½" away from bearing cap at a point 2¾" from bottom of tube

►*OIL PAN GASKET INSTALLATION CAUTION* To prevent oil leaks, special oil pan gasket installation procedures **must be used** as detailed under 'Oil Pan Installation below

ENGINE SPECIFICATION MARKS

Following marks indicate variations in engine specifications

1) Suffixes to engine unit number (located on rear part of crankcase behind intake manifold) as follows "L C " indicates Low Compression specifications * indicates 010" oversize pistons as standard

2) Identification letters stamped on valve lifter compartment cover rail next to lower inside edge of cylinder head indicate piston and cylinder bore size Letters are in groups of two for adjacent cylinders midway between the cylinders Letters are "A" through "M" (less "F", "G", "I") Sizes range from 4 0000-4 0002" to 4 0018-4 0020" (cylinder size), and 3 9995-3 9997" to 4 0013-4 0015" (piston size) in steps of 0002" Double letters ("AA", "BB") indicate cylinder bore 010" over the diameter indicated by a single letter

ENGINE REMOVAL

NOTE - Engine may be removed without removing transmission Observe the following points when removing engine

1) Remove radiator (unnecessary to disturb air conditioning condenser) Disconnect air conditioning compressor and move to one side (unnecessary to disconnect lines or purge system) Remove fan blade assembly, pulley, and all belts Disconnect power steering pump and move aside (unnecessary to disconnect hoses) Remove starter

2) Support transmission at front end

3) Raise engine with a 3-point suspension as follows Use adapter plates or eye bolts at the 2 center cylinder head bolts in lower row on each head Attach a chain or hoist to water outlet pipe *NOTE - Chain at water outlet pipe must be as tight as possible to prevent engine from tilting forward*

4) Remove engine by lifting upward and pushing forward to disengage all dowels and studs Use extreme care to prevent damage to flex plate

① - Retorque after engine at normal operating temperature

② - Various bolt sizes and torques *See Separate Illustrations*

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

CYLINDER HEAD REMOVAL

Observe the following:

1) On Air Cond. cars, right rocker arm assembly must be removed with cylinder head because of interference between rear rocker arm mounting bolt and blower motor and inlet assembly. If desired, blower motor and inlet assembly may be disconnected from cowl and moved aside to provide clearance.

2) Remove cylinder heads with exhaust manifold attached.

CYLINDER HEAD INSTALLATION

Tighten all bolts finger tight. Starting from center row and working outward and toward each end, tighten cylinder head cap screws to 75 ft. lbs.

OIL PAN REMOVAL

1) Disconnect battery positive cable and drain oil.

2) Disconnect wires from starter solenoid and remove starter assembly from flywheel housing.

3) Remove exhaust manifold pipe from manifolds, remove heat control valve, and swing exhaust pipe out of way.

4) Remove idler arm support mounting screws from frame side member and lower support.

5) Remove capscrew holding transmission rear cooler pipe clamp to upper flywheel cover plate. Remove nut holding front cooler pipe clamp to right front oil pan locating stud and remove clamp from stud.

6) Remove upper flywheel cover plate-to-flywheel housing and oil pan attaching screws and nuts and remove cover plate.

7) Remove oil pan-to-cylinder block and engine front cover attaching screws and nuts and remove oil pan.

OIL PAN INSTALLATION

CAUTION - Carefully observe special gasket installation procedures below to prevent oil leaks. Procedures supersede previous recommendations.

1) Cement gasket to both sides of oil pan.

2) Install pan end seals on ends of pan by pulling locating tangs on seal through locating holes in pan. Be sure seals are firmly positioned with ends of each seal properly located in cut-out notches in side gaskets.

3) Using rubber cement, seal all 4 corner notch openings.

4) Clean notches in cylinder block where ends of oil pan rear end seal fit, and fill this cavity with Transmission Cooler Hose Cement, No. 1098993.

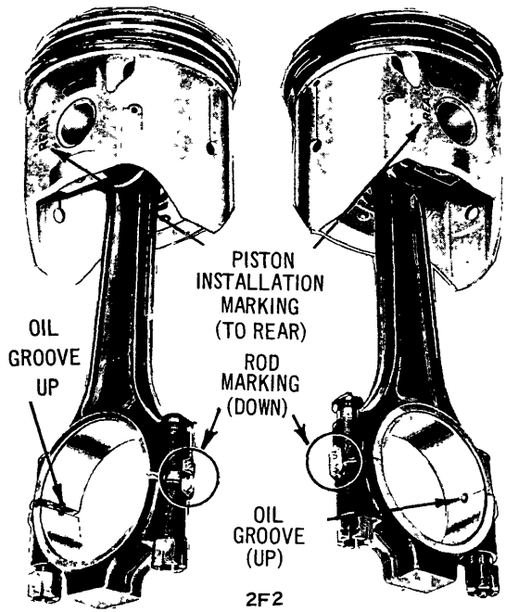
5) Install oil pan by reversing removal procedure.

PISTONS, PINS, RINGS

Engine	PISTON Clearance	PINS Piston Fit	PINS Rod Fit	RINGS Ring	RINGS End Gap	RINGS Side Clearance
All	①② .0003-.0008"	② .00005-.00015"	⑤ Press Fit	Compr. Oil	③ .013-.032" ③ .015-.061"	.0022-.0035" ④

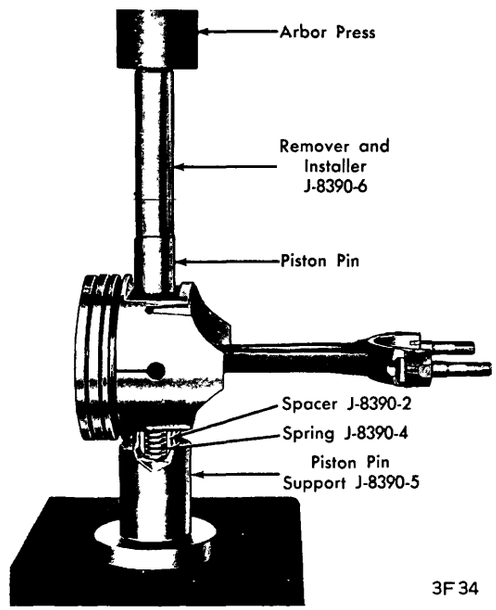
① - Measured at top of skirt. ② - Parts at 70°F. ③ - Measured in 4.00" cylinder bore.
④ - None, 3-piece side sealing type. ⑤ - See *"Piston Pin Replacement"* for procedures and tools.

FITTING PISTONS



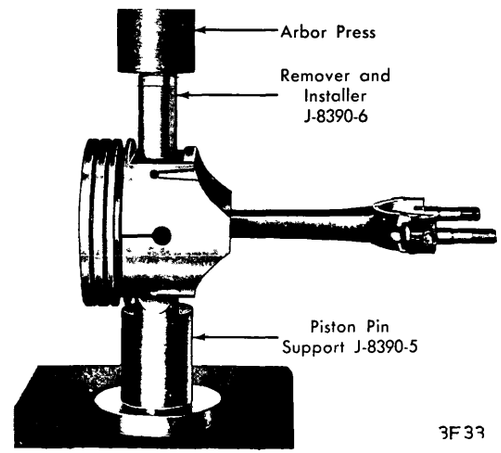
Measure pistons 3/16" below upper cross slot and 1/4" to either side of vertical slot. Measure cylinders 1 1/8" from top of bore, crosswise to cylinder block.

PISTON PIN REPLACEMENT



Use Tool Set J-8390 to remove and install piston pins as shown in illustrations. When removing, place piston on support with "Rear" mark upward. *TOOL NOTE - New tool parts, No. 5 & 6 are necessary for 1963 pistons.* For proper assembly of piston and rod, see "Piston & Rod Installation" illustration.

RING INSTALLATION

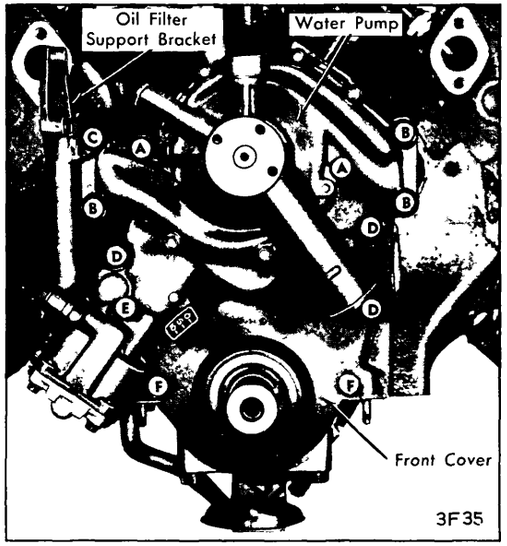


Chamfered inner corner of each compression ring must be toward top of piston.

RIGHT (2-4-6-8) LEFT (1-3-5-7)
PISTON & ROD INSTALLATION

PISTON PIN INSTALLATION

PISTON PIN REMOVAL



See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

MAIN BEARING INTERCHANGEABILITY

Original main bearing inserts are of different materials. Do not interchange bearing halves made of different material.

THRUST BEARING ALIGNMENT

Align thrust bearing surfaces after new bearing installed as follows: Install bearing cap screws finger tight, then tap crankshaft fore and aft to limit of its travel several times (tap on counterweight only). Tighten bearing cap screws to specified torque.

Key	Size	Torque
A	5/16-18x3-1/4	10 foot-pounds
B	3/8-16x3-5/8	15 foot-pounds
C	3/8-16x3-7/8	15 foot-pounds
D	5/16-18x2-1/8	10 foot-pounds
E	5/16-18x2-1/2	10 foot-pounds
F	5/16-18x1	10 foot-pounds

ENGINE FRONT COVER ATTACHING BOLT LOCATIONS & TORQUE SPECIFICATIONS

VIBRATION DAMPER REPLACEMENT

Vibration damper is a press fit on crankshaft. Remove and install with suitable pullers (front end of crankshaft has threaded hole under cork plug for puller installation). Use air pressure to hold a piston on its compression stroke to prevent crankshaft turning. *CAUTION - To prevent damper from seizing to crankshaft, lubricate bore of damper with hypoid lubricant before installation.*

ENGINE FRONT COVER

1) Remove radiator, oil pan, fan blade assembly, distributor, and fuel pump.
2) Reposition the following units in the engine compartment without disconnecting lines and hoses: Air Conditioning Compressor, Power Steering Pump, Alternator.
3) Lower the stabilizer bar from the frame.
4) Remove vibration damper. Remove oil filter assembly from support bracket, and remove water outlet pipe from cylinder heads Disconnect fuel filter from bracket on oil filler tube.
5) Remove front cover.
To install, reverse removal procedure and tighten attaching screws as shown in illustration (various size screws and torques). *CAUTION - Before installing oil filter assembly, fill oil passages in filter support bracket with oil so oil pump will prime itself when engine started.*

FRONT COVER OIL SEAL REPLACEMENT

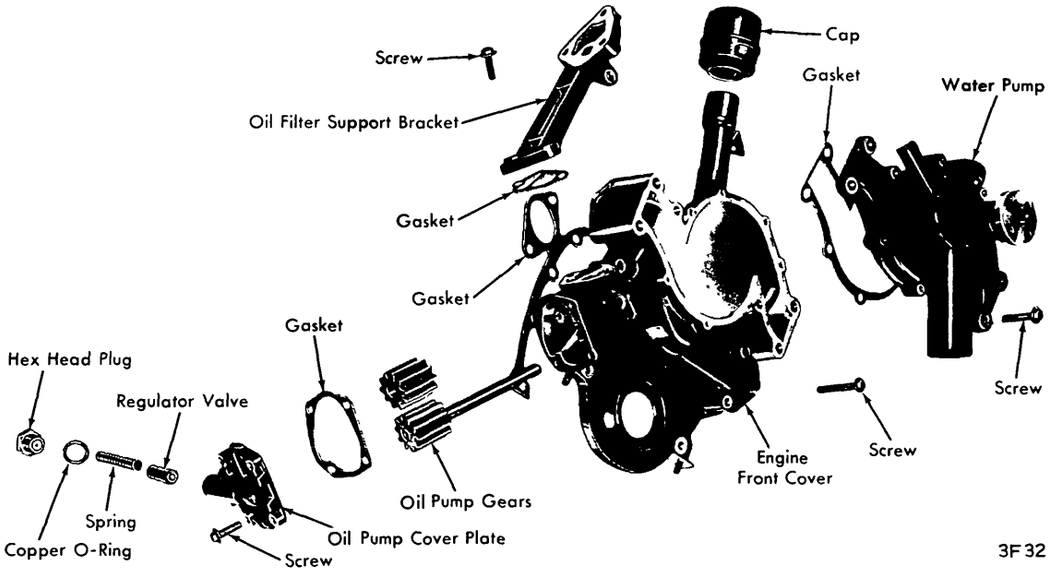
Remove old seal with pliers. Install seal with Support, J-21150-2 (chamfered edge on inside bore of tool up), and Installer, J-21150-1.

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

	MAIN BEARINGS				CONNECTING RODS		
Engine	Journal Diam.	Clearance	Thrust Brg.	Endplay	Journal Diam.	Clearance	① Sideplay
All	3.00"	② .0008-.0029"	No. 3	③ .001-.007"	④ 2.2488-2.2493"	⑤ .0005-.0021"	.008-.014"

① - Total both rods. ② - Wear limit .0045". ③ - Wear limit .010". ④ - Out-of-round limit .00025"
⑤ - Wear limit .0035".

REAR MAIN BEARING OIL SEAL REPLACEMENT



CAUTION - **1)** Seal halves are pre-lubricated with a film of wax. Do not damage this film. **2)** Do not use silicone on seal when installing or seal will leak. For easier installation, use Lubriplate. **3)** Do not press on lips of seal during installation. **4)** Use a tool made of shim stock to dimensions shown in illustration as a "shoe horn" in block and bearing cap to prevent outer diameter of seal from scraping against sharp edges as seal is installed.

Upper Half - Slide seal into cylinder block with lip facing forward, rotate seal into position, and be sure seal protrudes evenly on both sides.

CADILLAC OIL SEAL INSTALLING TOOL

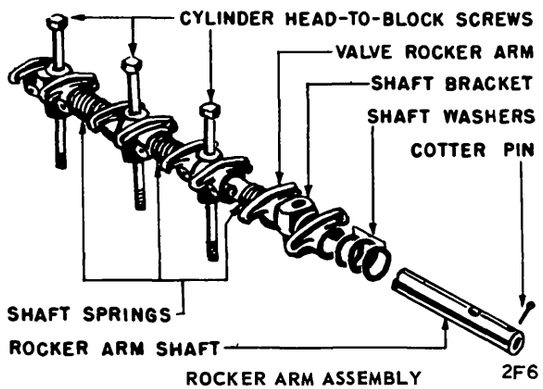
Lower Half - Install seal in bearing cap with lip facing forward, and with one end of seal over ridge and flush with split line. Seal must protrude evenly on both sides. Apply .010" thick film of rubber cement to mating surfaces of block and cap. *NOTE - Keep rubber cement off seal.* Install bearing cap.

ENGINE FRONT COVER (EXPLODED)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

VALVES							
Engine & Valve	Head Diameter	Face Angle	Seat Angle	Seat Width	Stem Diameter	Stem Clearance	Valve Lift
All Intake	1.875"	44°	45°	℄ 1/16"	.3415-.3425"	ℭ .0005-.0025"	.450"
Exhaust	1.50"	44°	45°	℄ 1/16"	.3415-.3420"	ℭ .0010-.0025"	.450"

℄ - Normal. Cars driven at high speeds 1/16-3/32"; at low speeds in city, 3/64-1/16". ℭ - Wear limit .005".



VALVE SPRINGS & LIFTERS				
	SPRINGS			LIFTERS
	Pressure (Lbs.)			
Engine	Valve Closed	Valve Open	Free Length	Clearance
All	60-65 at 1.946"	155-165 at 1.496	2.250"	.0005-.0020"

VALVE STEM-TO-GUIDE CLEARANCE

If hole gauge not available, use .005" brass shim 1/16" wide in valve guide bore. Tip of shim should extend toward pushrod side of head and no more than 1/4" into guide. If valve stem will enter guide, clearance is excessive.

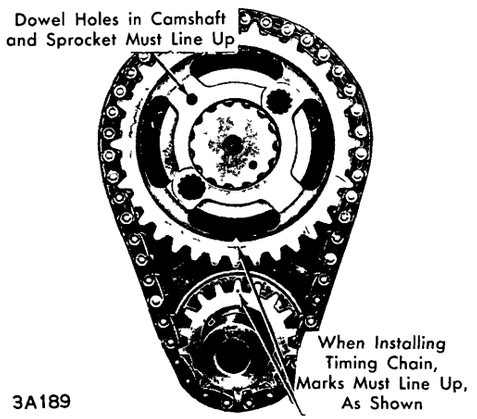
ROCKER ARM SHAFT WEAR CHECK

Measure rocker arm shaft diameter in center of rocker arm wear pattern. If this diameter more than .003" smaller than shaft diameter in an adjacent, unworn section, replace shaft.

ROCKER ARM ASSEMBLY

VALVE TIMING				
	INTAKE		EXHAUST	
Engine	Open (BTDC)	Close (ALDC)	Open (BLDC)	Close (ATDC)
All	39°	105°	85°	59°

VALVE STEM SEALS



"O" ring type installed in lower groove of valve stem on all valves. To install seal, place spring retainer over valve stem and spring, compress spring, install seal in lower groove, install valve keepers, release spring. Check oil seal for leakage with suction cup on retainer.

VALVE GUIDES

Pressed in head from combustion chamber side. To remove, drive out guide from combustion chamber side with Valve Stem Guide Remover Tool J-3062. To install guide, position Driver Tool J-3066-2 through Gauging Block Tool J-6535. Slide guide on installer pilot (lubricate outer surface of guide) and be sure longest chamfer end of guide enters bore first from combustion chamber side. Drive guide into head until shoulder on installer contacts plate on cylinder head.

VALVE SPRING INSTALLATION

Place spring over valve stem with closed coil end against cylinder head.

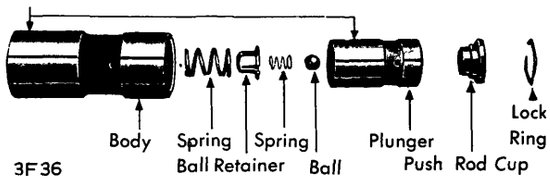
VALVE TIMING MARKS

VALVE SPRING INSTALLED HEIGHT

Measure from spring seat on head to underside of spring retainer. *See "Valve Closed" spring length in specification table.*

HYDRAULIC LIFTER LEAKDOWN RATE CHECK (ON ENGINE)

Use Leakdown Rate Tester J-3074 to check for faulty lifters without disassembling engine. This tool uses a feeler gauge between rocker arm and valve stem which causes valve spring pressure to force oil out of lifters. When lifter has leaked down enough for valve to seat, a spring on tool which is compressed against valve spring retainer, ejects feeler gauge. Lifters which leak down quickest (pop out tool fastest) are faulty. Check lifters in the following order: *NOTE - Insert tool quickly to avoid unnecessary leakdown.*



1) With No. 1 piston at firing position, check:

No. 1 Exhaust	No. 7 Exhaust
No. 1 Intake	No. 2 Exhaust
No. 3 Intake	No. 4 Intake
No. 3 Exhaust	No. 8 Intake
No. 5 Intake	No. 8 Exhaust

2) With No. 6 piston at firing position, check:

No. 5 Exhaust	No. 4 Exhaust
No. 7 Intake	No. 6 Exhaust
No. 2 Intake	No. 6 Intake

Plunger And Body Are Fitted Pairs And Must Not Be Mismated.

HYDRAULIC VALVE LIFTER (EXPLODED)

CAMSHAFT			
Engine	Clearance	Wear Limit	Cam Lift
All	.001-.0022"	.004"	.273"

CAMSHAFT REMOVAL

Camshaft may be removed with engine installed in car. *See "General Motors Air Conditioning" in Miscellaneous Section for air conditioning condenser removal.*

CAMSHAFT BEARING REPLACEMENT

Camshaft bearings may be replaced with engine installed in car after removal of camshaft, transmission, and crankshaft. *NOTE - If Replacer Tool J-3063 is available, No. 5 bearing may be removed without removing rear welch plug.*

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE OILING

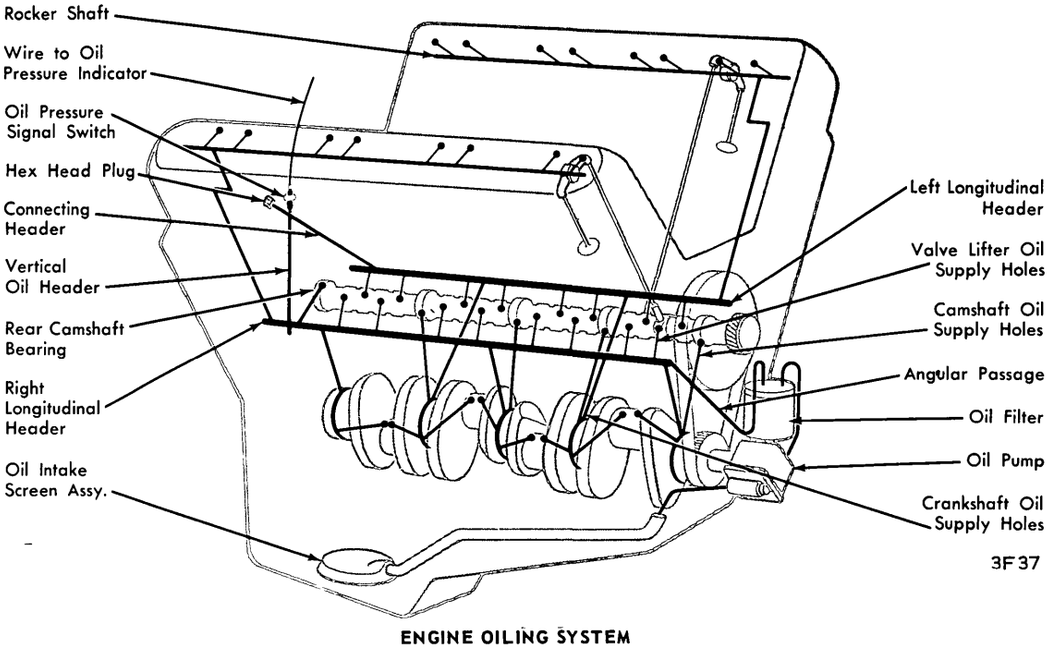
Oil Pressure - 30-35 lbs. at 30 MPH. Average pressure at idle is 10 lbs.

OIL PUMP

Located in engine front cover. Engine front cover must be removed for oil pump servicing. To remove pump, remove cover plate and gears. Pressure regulator valve located in oil pump cover, and is not adjustable.

Oil Pump Specifications

Gear Backlash	.008-.012"
Gear Shaft-to-Bore Clearance	.0010-.0025"
	wear limit .005"
Gear-to-Body Clearance	.003-.005"
	wear limit .005"
Gear Endplay	.001-.004"
	wear limit .006"
Press. Reg. Valve-to-Bore Clearance	.0020-.0035"
	wear limit .005"
Press. Reg. Valve Spring	
Free Length	2.77-2.89"
Pressure	6 1/4-6 3/4 lbs. at 1 7/16"



ENGINE OILING SYSTEM

Refer to "Engine Oiling System" illustration. The right longitudinal header is fed directly from the full-flow oil filter and oil pump. The left longitudinal header is fed from vertical oil header at rear of right longitudinal header and a connecting header. Upper end of vertical header contains oil pressure sending switch and upper end of connecting header is closed by a hex head plug.

Crankshaft, Connecting Rods & Pistons - Nos. 1,3,5 main bearings are lubricated from right longitudinal header. Nos. 2 & 4 main bearings are lubricated from left longitudinal header. Connecting rod bearings are lubricated through drilled holes in crankshaft from adjacent main bearing. Groove in connecting rod bearing cap provides lubrication for cylinder walls, pistons, and piston pin.

Camshaft Bearings & Lifters - All camshaft bearings except No. 5 (rear) are lubricated through passages in block from same main bearing oil lead. No. 5 bearing is lubricated directly from right longitudinal header. Each valve lifter is supplied with oil through individual passages from longitudinal header. Drain hole at right rear of valve lifter compartment returns oil to crankcase.

Rocker Arms, Valves & Pushrods - Oil is supplied to rocker arm shaft on right bank from rear end of right longitudinal header through a vertical branch in cylinder block and head. The left rocker arm shaft is supplied through a vertical branch in cylinder block and head at front end of left longitudinal header. Rocker arm shafts are plugged at each end. One hole in bottom of rocker arm shaft intersects a 45° groove and supplies oil evenly under loaded area of each rocker arm. The other hole is mismatched with an angular passage in the arm and meters oil to the pushrod end of the arm for lubrication of the pushrod surface in the arm. From this point oil flows down to the opposite end of the arm for valve tip lubrication.

ENGINE OILING SYSTEM

ENGINE COOLING

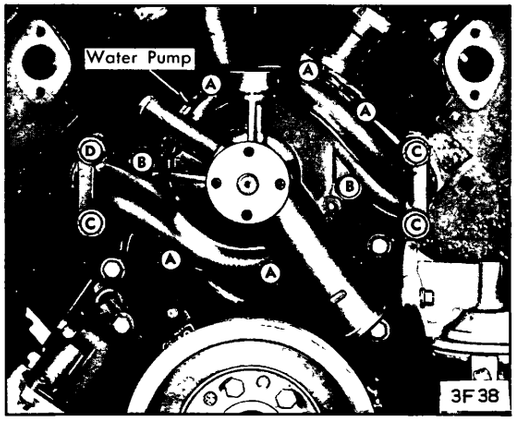
THERMOSTAT

Located in water outlet pipe. Starts to open 172-177°F. Fully open 198°F.

PRESSURE VALVE

Radiator filler cap. 13½-16½ lb. type.

FLUID FAN CLUTCH



Thermostatically controlled type. Fan fully engaged when car speed is above 70 MPH. Not adjustable. Service by replacement only.

WATER PUMP

Mounted on engine front cover. All service is by replacement only as pump cannot be overhauled.

Removal -Remove water pump after oil filter and support bracket, and water outlet pipe are removed (unnecessary to remove radiator).

Installation - Reverse removal procedure and observe the different screw sizes and torque specifications as shown in illustration.

Key	Size	Torque
A	1/4-20x1-1/4	5 foot-pounds
B	5/16-18x3-1/4	10 foot-pounds
C	3/8-16x3-5/8	15 foot-pounds
D	3/8-16x3-7/8	15 foot-pounds

WATER PUMP ATTACHING BOLT LOCATIONS & TORQUE SPECIFICATIONS

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

MODEL IDENTIFICATION

Series Designation

Series	Body Style	Body Code
62	Sedan DeVille (4 Window)	B
62	Sedan DeVille (4 Window Park Avenue)	D
62	Eldorado	E
62	Convertible Coupe	F
62	Sixty-Two Coupe	G
62	Coupe DeVille	J
62	Sixty-Two Sedan (6 Window)	K
62	Sedan DeVille (6 Window)	L
60	Fleetwood Sixty Special	M
62	Sixty-Two Sedan (4 Window)	N
75	Fleetwood "75" Sedan	R
75	Fleetwood "75" Limousine	S
68	Commercial Chassis	Z

ENGINE SERIAL NUMBER

Located on left side of cylinder block between welch plugs above edge of oil pan and on upper left-hand side of No. 1 crossmember just forward of radiator.

① ② ③
63 L 000001

① - Model year. 1963.
② - Body style. *See Series Designation below.*
③ - Beginning Engine Serial Number.

ENGINE UNIT NUMBER

*Located on rear portion of crankcase behind intake manifold. Not used for licensing. NOTE - "L.C." suffix indicates low compression specifications. Mark * indicates .010" Oversize pistons as standard.*

① ②
36X 000001

① - Indicates Model Series. *See Below.*
② - Starting engine number (numerical sequence).

Series	Prefix No.
All Except 68, 75 (Less Air Cond.)	36X
68, 75 (Less Air Cond.)	37X
All Except 68, 75 (With Air Cond.)	36K
68, 75 (With Air Cond.)	37K

FILTERS & CLEANERS

	① Service Interval
Oil Filter	Replace element every 6000 miles
Air Cleaner	Replace element every 30,000 miles
Breather Cap	Clean and reoil at every Oil Change
Fuel Filter	Replace every 6 months

① - Clean or replace more often if conditions warrant.

OIL FILTER INSTALLATION

1) Before installing oil filter assembly, fill oil passages in filter support bracket with engine oil so oil pump will prime itself when engine started.

2) Screw filter onto stud of filter base **by hand** until gasket touches filter base, then tighten an additional 2/3 turn. DO NOT overtighten.

CAPACITIES

	Refill Capacity
Water (Exc. 75 Ser.)	① 17¼ qts.
(75 Series)	① 19¾ qts.
Crankcase	② 4 qts.
Fuel	③ 26 gal.
Transmission	④ 18 pts.
Rear Axle	5 pts.

① - Includes heater. Add 1 qt. with Air Cond.
② - Add 1 qt. with filter change.
③ - 21 gal. on Park Avenue and Commercial Chassis.
④ - Includes converter.

CRANKCASE CAPACITY CAUTION (EARLY 1963 CARS): To prevent foaming or excessive oil consumption, oil level should be checked only before engine is started or 10-15 minutes after engine stopped and oil should be added only when level reaches "Add One Quart" mark on dipstick. On early 1963 cars, if oil level is more than 3/16" above or below "Full" mark after exactly 4 qts. of oil installed in an empty crankcase, grind off old full mark and remark dipstick with a file or chisel.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

COMPRESSION PRESSURE

4 & 6 Cylinder Engines ..... 130 psi

At cranking speed with throttle wide open; maximum variation between cylinders 20 psi.

VALVE TAPPET CLEARANCE

4 & 6 Cylinder Engines ..... Hydraulic

LIFTER ADJUSTMENT (ENGINE RUNNING)

With engine warm and idling, back off rocker arm stud adjusting nut until rocker arm starts to clatter against valve stem, then turn nut down until clatter just stops This is "Zero Lash" Now turn nut an additional 1/4-turn and wait until engine runs smoothly Continue to turn nut down in 1/4-turn increments until nut has been turned down 1 full turn from "Zero Lash" *CAUTION - Make adjustment slowly so lifter will adjust itself and prevent engine damage*

SPARK PLUGS

Gap (4 & 6 Cylinder Engines) ..... .035" (.033-.038")
Torque (4 & 6 Cylinder Engines) ..... 25 ft. lbs.

Spark Plug Type

4 & 6 Cylinder Engines (Standard) ..... AC 46N
(Colder) ..... AC 44N

DISTRIBUTOR

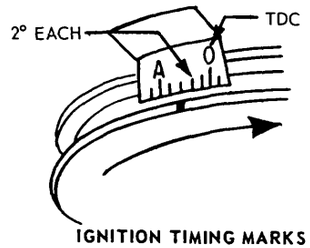
► *CAM ANGLE SETTING CAUTION:* Cam angle must be set with distributor on engine

Point Gap (4 & 6 Cyl. Engs.) .019" (New); .016" (Used)
Cam Angle (4 & 6 Cyl. Engs.) ..... 31-34°
Breaker Arm Spring Tension (All) ..... 19-23 ozs
Condenser Capacity (4 & 6 Cyl. Engs.) ..... .18-.25 mfd.

HOT (SLOW) IDLE RPM

4 & 6 Cylinder Engines (Synchro-mesh) 500
(Auto. Trans. in Drive) 500

IDLE SPEED-UP CONTROL ADJUSTMENT (CHEVY II AIR CONDITIONED CARS)



Idle control unit is used on all air conditioned cars Adjust unit after making correct idle speed adjustment With air conditioning OFF, turn idle control adjustment bolt to obtain .01" clearance between bolt head and throttle tang After warming engine, turn air conditioning ON, then turn adjustment bolt again to obtain correct idle speed

IGNITION TIMING

Set at 500 RPM with vacuum line disconnected.

4 Cyl. Eng. ..... 4° BTDC (Range 4-10° BTDC)
6 Cyl. Eng. (Chevy II) ..... 8° BTDC (Range 8-12° BTDC)
(Chevrolet) .. 4° BTDC (Range 2-8° BTDC)

TUNE-UP SPECIFICATIONS

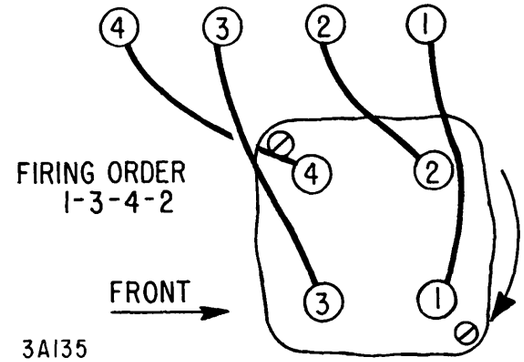
3A137

IGNITION TIMING MARKS

FUEL PUMP PRESSURE & VOLUME

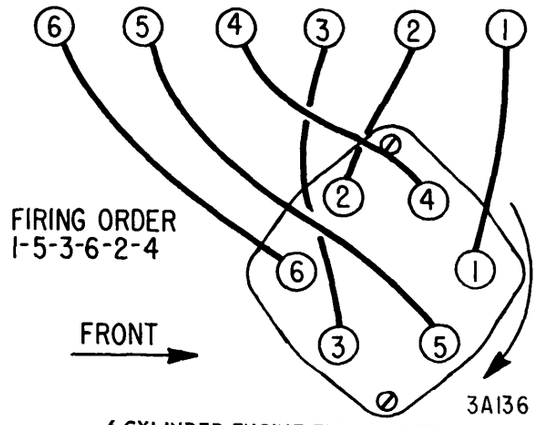
Pressure (4 & 6 Cylinder Engines) ..... 3½-4½ psi
Volume (4 & 6 Cylinder Engines) 1 pt. in 30-45 seconds.

MANIFOLD HEAT CONTROL



Automatic thermostatic type with counterweight in exhaust manifold outlet Valve must operate freely

CRANKCASE VENTILATION VALVE



Check for proper operation at every oil change and replace valve when necessary To test valve, remove valve from rocker arm cover (leave hose attached), plug valve end, and read RPM change A change of less than 50 RPM indicates a defective valve (replace valve)

TUNE-UP NOTES

► *SIX CYL ENGINE PART THROTTLE SURGE CORRECTION (EARLY CARS).* On carburetors date coded before "A3A", this condition can be corrected by installing new Main Metering Jets Carburetors date coded "A3A" or later have these new jets. *See "Rochester Single Barrel B, BC, BV Carburetors" in Carburetion Section*

	Lock	4.3	270-310

ℂ - Includes Solenoid.
Brush Spring Tension - 35 ozs (1107260); 40 ozs. (1107259).

ALTERNATOR

Delco-Remy No.	Volts	Amps.	Alt. RPM
1100628	14 0	25	2000
		35	5000
1100629	14.0	28	2000
		40	5000
1100630	14.0	21	2000
		30	5000
1100633	14 0	32	2000
		50	5000
1117765	14.0	18	1100
		62	6500

ALTERNATOR REGULATOR

Delco-Remy 9000595 (1117765 Alternator), 1119512 (Other Alternators).

Field Relay

Point Gap - 030 ' (1119512), 027" (9000595).
Air Gap - 015"
Closing Voltage - 2 3-3 7 volts (9000595); 1 5-2 7 volts (1119512)

Voltage Regulator

Setting - 13 5-14 4 volts at 125°F (1119512); 13.2-14 2 volts at 125°F (9000595)
Air Gap - 067" (1119512); 075" (9000595).

FUSES & CIRCUIT BREAKERS

FUSE BLOCK

Located under dash panel.

IN-LINE FUSE

Overdrive fuse in wiring harness on engine side of dash.

CIRCUIT BREAKERS

40 Ampere - Hydraulic top motor.
15 Ampere - Headlights, high beam indicator, parking lights. Integral with headlight switch.

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH

Steering Column Mounted Selector Lever - Located on steering column mast jacket under instrument panel. To adjust, place selector lever in Neutral and loosen screws securing switch retainer. While holding ignition switch in start position, adjust position of neutral safety switch until engine starts cranking. Hold switch in this position and tighten retaining screws. Check adjustment by placing selector lever in Neutral and Park positions and cranking engine.
Floor Mounted Selector Lever - Located on left side of transmission case and linked to transmission manual control lever. To adjust, vary length of bell-crank-to-switch control rod. A swivel is provided at one end of rod for adjustment.

DIRECTION SIGNAL FLASHER LOCATION

On fuse block located on left side of firewall in drivers compartment *NOTE* - Flasher on Chevrolet Impala and Nomad Station Wagon is "3 bulb type" (all others are "2 bulb type").

STOP LIGHT SWITCH ADJUSTMENT

Switch located under dash in contact with brake pedal. To adjust, position switch so light operates when pedal depressed 5/8" from fully released position.

LIGHTING SWITCH REMOVAL

Pull control knob to ON position. Depress switch shaft retainer button on switch. Remove knob and shaft assembly. Remove retaining ferrule and escutcheon, then remove switch assembly. Disconnect multiple connector. *NOTE* - Use screwdriver inserted in side of switch to pry plug from switch.

INSTRUMENT CLUSTER CONSOLE REMOVAL

On Chevy II cars, loosen upper retaining clamp and slide upper mast jacket upward, then loosen lower clamp and drop mast jacket and steering wheel down. On all cars disconnect speedometer cable and remove console-to-instrument panel screws. Lean console forward onto mast jacket. Remove individual instruments as required. Remove console as a unit by unsnapping all wire connectors. *CAUTION* - When installing, be sure to attach single ground washer on one of the nine console attaching screws.

SPEEDOMETER CLUSTER REMOVAL

Remove instrument cluster console (see above), then disconnect electrical connectors and attaching screws. Remove speedometer.

BELT ADJUSTMENT

SPECIFICATIONS

70-80 lbs. using strand tension gauge Tool J-7316. To adjust, move generator or idler pulley.

ENGINE

GENERAL SPECIFICATIONS

Engine	HP at RPM	Compression Ratio	Bore	Stroke	Displacement
4 Cyl. (Chevy II)	90 at 4000	8.5-1	3.875"	3.25"	153 cu. ins.
6 Cyl. (Chevy II)	120 at 4400	8.5-1	3.563"	3.25"	194 cu. ins.
6 Cyl. (Chevrolet)	140 at 4400	8.5-1	3.875"	3.25"	230 cu. ins.

ENGINE REMOVAL

Chevy II - Engine and transmission must be removed as a unit as follows:
1) Drain all systems, and disconnect hoses, wires, and linkages Remove radiator.
2) Remove exhaust pipe.
3) On Auto. Trans. cars, remove transmission oil filler tube and plug opening.
4) Disconnect clutch cross shaft bracket at frame, and disconnect clutch pushrod, spring, and pedal linkage.
5) Secure engine (attach hoist to cylinder head bolt holes)
6) Remove drive shaft by removing universal joint U-bolts. Plug end of transmission extension housing.
7) Disconnect steering linkage idler arm bracket from right side rail and lower linkage.
8) Disconnect speedometer cable and transmission control rod linkage lower ends.
9) Loosen engine front mount bolts and lift engine slightly, then remove front mount bolts, nuts, washers
10) Remove transmission crossmember and free transmission rear mounting. *CAUTION - Unless sufficient weight has been removed from crossmember, transmission extension or crossmember may suddenly swing down.*
11) Remove engine and transmission as a unit.

Chevrolet 6 Cyl. - Remove engine and transmission as a unit as follows:
1) Drain all systems, and disconnect all wires, hoses, and linkages. Remove radiator and fan blades.
2) Drain transmission if propeller shaft opening plug not available Remove propeller shaft and plug opening.
3) Disconnect clutch linkage, speedometer cable, clutch linkage at cross shaft (Synchro-mesh Trans.).
4) Remove clutch cross shaft engine bracket
5) Attach lifting device, remove front mount through bolts, raise engine slightly (take weight off front mounts), then remove rear mount bolts.
6) Remove engine and transmission as a unit

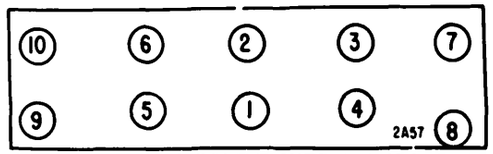
See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

CYLINDER HEAD INSTALLATION

Coat cylinder head bolts with sealing compound and tighten to specifications in sequence shown in diagram

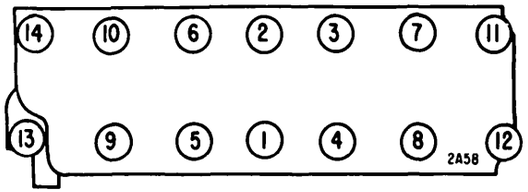
OIL PAN REMOVAL

Chevy II - 1) Drain crankcase, disconnect battery, remove starter.



2) Disconnect steering idler arm bracket at right frame side rail and swing steering linkage down for clearance. On 6 Cyl. cars remove front crossmember (let stabilizer bar hang down while removing crossmember on station wagons).

3) On all cars remove oil pan attaching bolts and remove oil pan. *NOTE* - When installing oil pan, install screws into timing gear cover last as they are installed at an angle and holes will line up after other oil pan bolts are installed.



TIGHTENING SPECIFICATIONS

CHEVY II	Ft. Lbs.
Cylinder Head	90-95
Manifold (2 Center) Clamp Bolts	25-30
Manifold (Outer) Clamp Bolts	15-20
Int Man to Exh Man Nuts	15-30
Oil Pan (Size 1/4"-20)	6 1/2-7 1/2
(Size 5/16" - 18)	12 1/2-15
Main Bearing Caps	45-55
Flywheel	50-65
Fan Blade to Hub	5-6
Crankshaft Pulley to Hub (4 Cyl)	15-20
Connecting Rod Caps	30-35
Camshaft Thrust Plate	6-7 1/2
Rocker Arm Cover	3-4
Engine Front Cover	6 1/2-7 1/2
Water Pump	13-17
Water Outlet	18-23
Thermostat Housing to Cyl Head	25-30
Oil Pump	9-11
Oil Pump Cover to Body	5-6
Oil Filter	*Hand Tight*
Clutch Housing Cover Plate	6 1/2-7 1/2
Clutch Housing to Crankcase	28-38

CHEVROLET 6 CYLINDER	Ft. Lbs.
Cylinder Head	90-95
Intake Manifold	25-35
Exhaust Manifold (Two center bolts)	25-30
(Others)	15-20
Oil Pan (Corner bolts)	12 1/2-15
(Other screws)	6-7 1/2
Main Bearing Caps	100-110
Flywheel	55-65
Crankshaft Pulley	15-20
Connecting Rod Caps	35-45
Rocker Arm Support Bracket	25-30
Rocker Arm Cover	*20-25 Inch Lbs*

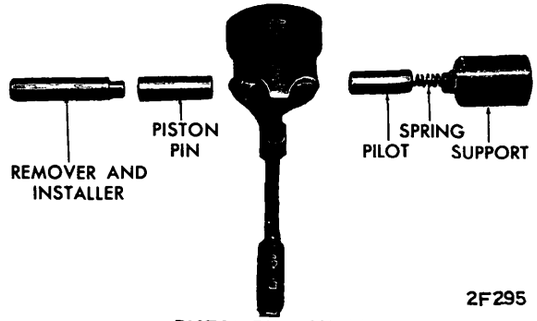
Water Pump	25-35
Oil Pump Cover	6-9
Clutch Housing	45-55

4 CYLINDER HEAD BOLT TIGHTENING SEQUENCE

6 CYLINDER HEAD BOLT TIGHTENING SEQUENCE

Chevrolet 6 Cylinder with Synchro-mesh - 1) Drain radiator and oil pan.
2) Disconnect gas tank line at fuel pump and radiator hoses at radiator.
3) Remove clutch housing-to-engine block bolt.
4) Raise engine and rotate crankshaft to align distributor rotor between Nos. 3 and 5 plug wires (No. 6 crankthrow part way up).
5) Remove starter assembly and flywheel front cover plate.
6) Remove front mount through-bolts. *CAUTION* - DO NOT REMOVE or loosen rear mount.
7) Install Tool J-6978 onto harmonic balancer (use as crankshaft extension for jacking engine).
8) Jack engine as high as possible with left side of clutch housing flange riding in body tunnel and right side just clearing tunnel and riding against firewall. *NOTE* - Engine will raise at necessary angle to remove pan
9) Remove engine front mount frame bracket on right side and remove oil filter.
10) Remove oil pan screws and lower pan to frame. *NOTE - Oil pan gaskets can be replaced if desired at this point.*
11) Remove oil pump, then remove oil pan by sliding and rotating front of pan to right of engine, then rearward, down, and out at an angle to left corner (rear) of engine.

Chevrolet 6 Cylinder with Powerglide - 1) Drain radiator and crankcase, then remove gas tank line at fuel pump and hoses at radiator.
2) Remove clutch housing-to-engine block bolt above dowel pin on each side.
3) Rotate crankshaft to place distributor rotor between Nos. 3 and 5 plug wires (No. 1 crankthrow part way up).
4) Raise vehicle and remove converter cover pan and starter assembly.
5) Remove front mount through bolts. *CAUTION* - DO NOT REMOVE or loosen rear mount bolts.
6) Disconnect transmission modulator line at modulator (so line not crimped in tunnel).
7) Install Tool J-6978 onto harmonic balancer (used as crankshaft extension for jacking engine).
8) Raise engine as high as possible with rocker arm cover resting on firewall. *NOTE* - Vacuum modulator line will be snug, not crimped, in tunnel and accelerator linkage should be free.
9) Remove oil pan screws and lower pan to frame.
10) Remove oil pump and screen assembly, then remove pan downward and rearward. Oil pan front seal curvature should straddle front main bearing cap then rear of oil pan will clear flywheel.



PISTONS, PINS, RINGS

Engine	℄ PISTON Clearance	PISTON PIN ℗ Piston Fit	PISTON PIN Rod Fit	PISTON RINGS Ring	End Gap	Side Clearance
4 Cyl.	.0006-.0010"	.00015-.00025"	Press Fit	Compr. Oil	.010-.020" .015-.055"	0020- 0035 Snug
6 Cyl.	.0006-.0010"	.00015-.00025"	Press Fit	Compr. Oil	.010-.020" .015-.055"	.0020-.0035" Snug

℄ - Measure 2.44" from top of piston ℗ - Wear limit .0011".

PISTON PIN REMOVAL & INSTALLATION

Removal - Install pilot of Tool J-9510 on piston pin Install piston and rod assembly on support and place assembly in an arbor press Press pin out of rod **Installation** - Using Tool J-9510 (see illustration) position rod in piston so that flange or heavy side of rod (at bearing end) will be to front of piston (cast depression in top of piston head) Install pin on installer and pilot spring and pilot in support Install piston and rod on support (indexing pilot through piston and rod) Using an arbor press, start pin into piston and press on installer until pin pilot bottoms Check pin for freedom of movement in piston bore

PISTON PIN ASSEMBLY

FITTING PISTONS

Use .0015" x ½" ribbon feeler (part of Tool J-5513). With piston and cylinder clean and dry, insert feeler and inverted piston into cylinder until center of piston pin is flush with top of cylinder block, with feeler 90° from piston pin hole. Pull required to withdraw feeler should be 7-18 lbs.

PISTON & ROD INSTALLATION

Cast depression in piston head towards front of engine. Oil hole in rod towards camshaft (flange or heavy side of rod must face front of engine).

VALVE SPRING INSTALLED HEIGHT

Installed Height - If height greater than 1 23/32" (measured from top of spring seat in head to top of valve spring shield) install 1/16" spacer under spring at spring seat. *CAUTION* - Installed height must not be less than 1 21/32".

VALVE GUIDES

Integral with cylinder head. For oversize valve stem, ream to next oversize with Tool Set J-7049.

VALVE STEM SEALS

"O" Ring type used on all valves. Installed in lowest groove on upper part of stem below locks and against cap.

ROCKER ARM STUD REPLACEMENT

Damaged rocker arm studs may be replaced with standard size studs. Loose studs should be replaced with .003" or .013" Oversize studs after reaming stud holes with Tool J-5715 (.003"), Tool J-6036 (.013"). Remove old stud with Tool J-5802 (with installing nut and flat washer). Ream hole if necessary, then coat press-fit area of stud with hypoid axle grease. Install new stud with Tool J-6880. Tool should bottom on head.

HYDRAULIC LIFTER SERVICE

If lifter parts found defective, replace lifter. Fill lifter with SAE 10 oil before installation. *NOTE - It is not necessary to remove ball check valve from plunger for cleaning.*

HYDRAULIC LIFTER ADJUSTMENT (AT ENGINE OVERHAUL)

Use distributor rotor position for determining when lifter is on base circle of cam. With rotor pointing to No. 1 cylinder (points open), turn adjusting screw down until all lash is removed (check pushrod side-play). Turn screw down an additional 1 full turn and tighten locknut. Repeat on other valve for that cylinder. Continue to adjust valves for each cylinder using firing order sequence. *NOTE - If lifters are noisy, see "Lifter Adjustment (Engine Running)" under TUNE-UP.*

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

Engine	MAIN BEARINGS				CONNECTING ROD BEARINGS		
	① Journal Diam.	Clearance	Thrust Brg.	② Endplay	① Journal Diam.	Clearance	Sideplay
4 Cyl.	2.2978-2.2988"	.0008-.0034"	No. 5	.002-.006"	1.999-2.000"	.0007-.0027"	.008-.014"
6 Cyl.	2.2978-2.2988"	.0008-.0034"	No. 7	.002-.006"	1.999-2.000"	.0007-.0027"	.008-.014"

① - Out-of-round and taper limit .001". ② - .009" wear limit.

REAR MAIN BEARING OIL SEAL

Can be replaced with crankshaft in engine. *NOTE - Always replace upper and lower seal as a unit.* Drain crankcase and remove oil pan. Remove oil seal from groove, prying from bottom (with small screwdriver). Clean crankshaft surface and install well lubricated seal in bearing cap groove (keep oil off parting line surface) and gradually push until seal is rolled into place (use hammer handle). To replace upper half of seal, use a small hammer and brass pin punch to tap one end of seal until it protrudes enough to be removed with pliers. Install new seal by rolling seal into groove. *NOTE - Lip of seal faces front of engine.* Install bearing cap and torque cap bolts to specifications.

CRANKSHAFT PULLEY (4 CYL.)

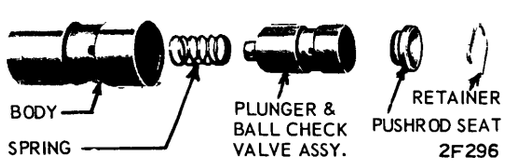
Removal - Remove radiator core and shroud as a unit. Remove belt and pulley. Install suitable puller tool on hub using two 3/8" x 2" and one 5/16" x 2" bolts. **Installation** - Coat hub seal contact area with engine oil, position hub on crankshaft (key aligned) and drive hub onto shaft with Tool J-5590 (or suitable tool) until hub bottoms against crankshaft gear. *NOTE - Crankshaft extends through hub and tool must be used to ensure seating hub properly on shaft.* Install pulley and tighten mounting bolts securely.

HARMONIC BALANCER (6 CYL.)

Removal - Remove radiator and belt. Remove balancer with suitable puller (use tapped holes in balancer face).

Installation - Coat balancer hub seal contact area with engine oil, assemble Tool J-8792 on balancer (see Tool Note below), position balancer on crankshaft (key aligned) and drive balancer onto shaft until it bottoms against crankshaft gear. Remove tool.

TOOL J-8792 NOTE - This tool also used on V8 engines (different set-up) and must be used exactly as follows for use on 6 Cyl. Engines: Thread Driver into Clamp on deep finger side of clamp (side marked V8), insert pilot in end of driver on opposite side of clamp with smaller end in toward clamp, secure pilot with machine screw. Install tool assembly on balancer with shallow fingers of clamp engaging pulley rim on balancer.



FRONT OIL SEAL INSTALLATION

Remove crankshaft pulley (4 Cyl.), harmonic balancer (6 Cyl.). See above. Drain oil and remove pan. Remove timing gear cover and gasket. Pry oil seal out of cover from front with large screwdriver. Install new seal with lip (open side of seal) toward inside of cover and drive or press seal into place with Tool J-0995 (cover removed), or Tool J-8340 (cover in place).

VALVES

Engine & Valve		Head Diam.	Face Angle	Seat Angle	Seat Width	① Stem Diameter	Stem Clearance	④ Valve Lift
4 Cyl.	Intake	1.715-1.725"	45°	46°	1/32-1/16"	.3410-.3417"	.0010-.0027"	.3973"
	Exhaust	1.495-.1.505"	45°	46°	1/16-3/32"	.3410-.3417"	③.0015-.0032"	.3973"
6 Cyl. Engs. Chevy II	Intake	1.715-1.725"	45°	46°	1/32-1/16"	.3410-.3417"	.0010-.0027"	.3350"
	Exhaust	1.495-1.505"	45°	46°	1/16-3/32"	.3410-.3417"	③.0015-.0032"	.3350"
Chevrolet	Intake	1.715-1.725"	45°	46°	1/32-1/16"	.3410-.3417"	.0010-.0027"	.3350"
	Exhaust	1.495-1.505"	45°	46°	1/16-3/32"	.3410-.3417"	.0015-.0032"	.3350"

① - Standard size. ③ - Measured at center. ④ - Measured at valve stem.

HYDRAULIC VALVE LIFTER

VALVE SPRINGS & LIFTERS

Engine	Valve Spring Pressure (Lbs.)		Free Length
	Valve Closed	Valve Open	
4 Cyl.	① 84-92 at 1.66"	① 166-176 at 1.33"	2.03"
6 Cyl.	84-92 at 1.66"	166-176 at 1.33"	2.03"

① - Includes damper.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

CAMSHAFT

CAMSHAFT			
Engin	℄J urnal Diam ter	Endplay	Cam Lobe Lift
All	1.8687-1.8692"	.001-.005"	.1914"

℄ - Out-of-round limit .001".

CAMSHAFT REMOVAL

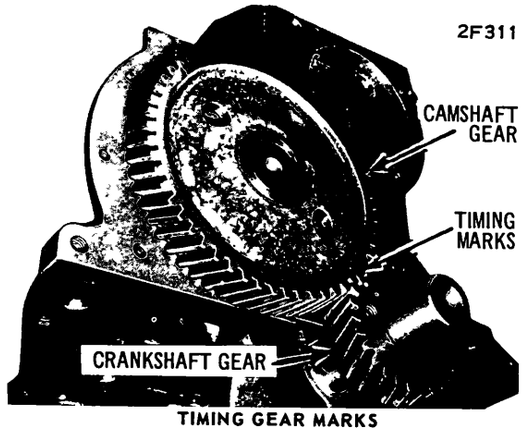
Drain crankcase and radiator. Remove radiator and grille. Remove rocker arm cover, rocker arm shaft assembly, coil, valve side cover, pushrods, and lifters. When removing distributor, note position of rotor. Remove vibration damper (6 Cyl., see above), crankshaft pulley (4 Cyl., see above). Remove oil pan and engine front cover (see above). Remove camshaft thrust plate screws and remove camshaft and gear. *CAUTION - Support shaft to prevent bearing damage.*

CAMSHAFT ENDPLAY

Taken by thrustplate between camshaft sprocket and camshaft gear.

CAMSHAFT LOBE LIFT CHECK

1) Remove valve rocker cover, gaskets, rocker arms and balls.
2) Attach Tool J-8520 to stud, then position clamp and indicator with ball socket adapter of Tool J-8520 to pushrod. *NOTE* - Pushrod must be in lifter socket.
3) Rotate crankshaft slowly in direction of rotation until lifter is on heel of cam lobe. At this point, Pushrod will be at lowest position.
4) Set dial indicator to zero, then rotate crankshaft slowly or attach an auxiliary starter switch and "bump" engine over until pushrod is in fully raised position. *NOTE - Ground primary wire on coil before cranking.*
5) Total lift on indicator should be .1914". To check reading for accuracy, continue to rotate engine until dial indicator reads zero.



CAMSHAFT BEARING REPLACEMENT

Use suitable tools for removal and installation and note the following:
Front Bearing - Front bearing must be driven approximately 1/8" behind front of cylinder block to uncover oil hole to timing gear oil nozzle.
Rear Bearing - Rear bearing installed position is flush with inner edge of rear cam bearing bore in block.

TIMING GEAR SERVICE

Gears are press fit on camshaft and crankshaft. Use suitable tools for removal and installation.
Camshaft Gear Removal - Use support sleeve in back of gear and press shaft out of gear. *CAUTION* - Thrust plate must be positioned so no damage will result (by woodruff key in shaft) while shaft is being pressed out of gear.
Camshaft Gear Installation - Support shaft directly back of front bearing journal and install gear spacer ring and thrust plate. Install woodruff key in shaft keyway. Press camshaft gear onto shaft until it bottoms against gear spacer ring. End clearance of thrust plate should be .001-.005". Install camshaft assembly in block. Line-up gear teeth (see illustration), then push camshaft into position. Install camshaft thrust plate-to-block screws and tighten securely. Gear runout should not exceed .004" (camshaft), .003" (crankshaft). Backlash between timing gear teeth should be .004-.006". *CAUTION* - Press on hub only when installing gear.

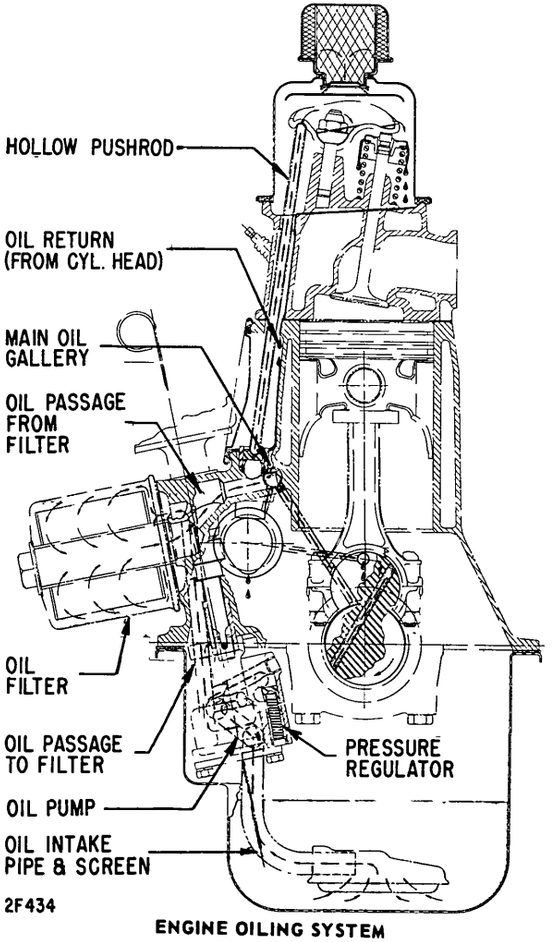
6 Cyl.	34°	86°	68°	52°

TIMING GEAR MARKS

ENGINE OILING

ENGINE OILING SYSTEM



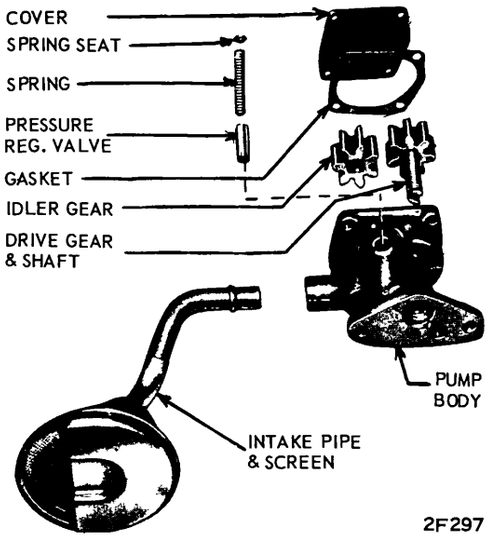
Oil pump mounted on right lower flange of crankcase in oil pan draws oil from pan through a floating screen and delivers oil through passage in pump body and crankcase to full flow filter on right side of engine. Oil flows from filter to main oil gallery in block and is distributed as detailed below. Pressure regulator valve is located in oil pump and a bypass valve is located in filter base.

Crankshaft & Camshaft Bearings - Each main and camshaft bearing is fed oil by a passage extending through crankcase webs from main oil gallery.

Connecting Rods & Pistons - Oil is delivered from each main bearing to adjacent connecting rod bearing through drilled passages in crankshaft. A hole in connecting rod sprays oil onto cylinder walls for piston and pin lubrication, when holes in rod and journal index. Oil hole in rod is towards camshaft side of engine.

Valve Lifters - Main oil gallery intersects lifter bores and lifters are supplied with oil directly from gallery. Lifter has metering valve directly below hole in pushrod seat to permit oil to pass into hollow pushrod.
Rocker Arms & Valve Stems - Oil passes up through hollow pushrods to a hole in upper end of pushrods that matches hole in rocker arm. Oil sprayed from this hole and across rocker arm lubricates valve stem tip. Oil in rocker arm chamber drains down through pushrod holes to valve lifter chamber, then returns to crankcase through drain holes.
Timing Gears - Lubricated by oil flow from nozzle pressed in front face of block above crankshaft gear. Oil is fed to nozzle through cross-passage from front camshaft bearing.
Distributor Drive Gear - Lubricated by oil drainage from valve lifter compartment (drain hole directs oil onto gears).

Normal Oil Pressure - 30-45 psi at 1500 RPM.
Pressure Regulator Valve - Located in oil pump body. Not adjustable.



ENGINE OILING SYSTEM

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

OIL PUMP

Removal & Disassembly - Remove oil pan (see above). Disassemble pump and inspect parts for wear. Replace entire unit if parts worn or defective.

Reassembly & Installation - Reverse removal procedure. *CAUTION* - Do not use gasket on pump mounting flange.

ENGINE OIL PUMP

DISTRIBUTOR DRIVE SHAFT LOWER BEARING

Bushing pressed into lower side of cylinder block (with or without thrust washer at upper end) and serves as lower bearing for distributor shaft (inside diameter), and as pilot for oil pump shaft (outside diameter). Replace bushing (and thrust washer) when distributor shaft-to-bushing clearance exceeds .0035".

Removal - Use Tool J-9534 and slide hammer to remove bearing. Drive out thrust washer with suitable drift.

Installation - Drive new thrust washer into place with Tool J-9535. Using Tool J-9535 with driver-bolt in driver handle, install driver into new bushing from large inside diameter. Drive bushing into position. *NOTE - Proper position of bushing is determined when tool bottoms against cylinder block.* Withdraw tool from bushing. If bushing seizes on installer arbor, remove tool with slide hammer. Bushing will not be damaged and tool is designed for this purpose.

FILTERS & CLEANERS

	① Service Intervals
Oil Filter	Replace every 6000 miles
Air Cleaner	Clean every 12,000 miles
Breather Cap	Clean and re-oil every oil change
Fuel Filter	Replace if carburetor floods

① - Replace or clean more often if necessary

ENGINE COOLING

Thermostat - Pellet type (170°F) located in cylinder head water outlet.

Pressure Valve - 13 psi radiator filler cap.

WATER PUMP

See illustration for arrangement of parts. Use suitable drivers and supports when overhauling water pump. Mark position of hub on shaft before disassembling pump so hub can be reinstalled in same position. Observe the following when reassembling pump: Seal outer flange must bottom against pump body. Press hub on shaft to same mark made at disassembly or use special Hub Locating Gauge J-9583. Press impeller on shaft so there is .010-.035" clearance between impeller vanes and pump body.

ENGINE WATER PUMP

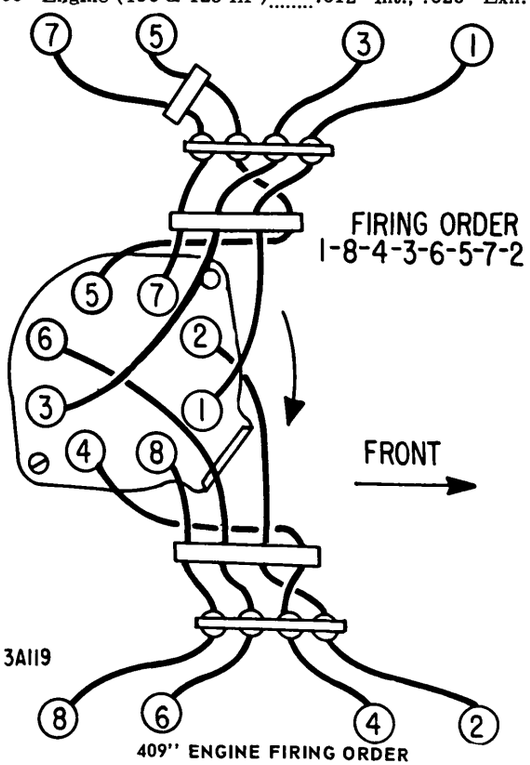
TUNE-UP SPECIFICATIONS

ENGINE IDENTIFICATION

Engines may be identified by suffix letters following engine number stamped on pad at top front of right cylinder bank directly forward of right rocker cover as follows:

Letter Suffix	Engine Displacement	Horsepower
CB,CD,CL,D,DK	283"	195
R,RA,S,SA,RC,SC	327"	250
RB,RK,SB,SG,RD,SD	327"	300
RE	327"	340
RF	327"	360
QA	409"	400
QB	409"	425
QC,QG	409"	340

COMPRESSION PRESSURE



With plugs removed and throttle wide open.

283" Engine	150 psi
327" Engine (250 & 300 HP)	160 psi
327" Engine (340 & 360 HP)	150 psi
409" Engine	150 psi

Maximum variation between cylinders 20 psi (except Corvette); 15 psi (Corvette).

VALVE TAPPET CLEARANCE

283" Engine	Hydraulic
327" Engine (250 & 300 HP)	Hydraulic
327" Engine (340 & 360 HP)	.008" Int.; .018" Exh.
409" Engine (340 HP)	Hydraulic
409" Engine (400 & 425 HP)	.012" Int.; .020" Exh.

409" ENGINE FIRING ORDER

LIFTER ADJUSTMENT (ENGINE RUNNING)

With engine warm and idling, back off rocker arm stud adjusting nut until rocker arm starts to clatter against valve stem, then turn nut down until clatter just stops. This is "Zero Lash". Now turn nut an additional ¼-turn and wait until engine runs smoothly, continue to turn nut down in ¼-turn increments until nut has been turned down **1 full turn** from "Zero Lash". *CAUTION - Make adjustment slowly so lifter will adjust itself and prevent engine damage.*

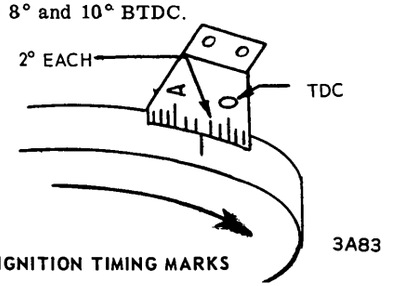
SPARK PLUGS

Gap (All)	.035"
Torque (All)	20-25 ft. lbs.

Spark Plug Type

283" Engine	(Standard)	AC 45
	(Colder)	AC44
327" Engine	(Standard)	AC 44
	(Colder)	AC 43
	(Hotter)	AC 45
409" Engine	(Standard)	AC C43N
	(Colder)	AC C42N
	(Hotter)	AC C44N

DISTRIBUTOR



Point Gap (All)	.019" (new); .016" (used)
Cam Angle (All)	28-32° (30° preferred)
Breaker Arm Spring Tension (All)	19-23 ozs.
Condenser Capacity (All)	.18- 25 mfd.

IGNITION TIMING

Set at idle with vacuum line disconnected.

283" Engine	4° BTDC (Range 4-8° BTDC)
327" Engine (250 HP)	4° BTDC (Range 4-10° BTDC)
327" Engine (300 HP)	8° BTDC (Range 6-12° BTDC)
327" Engine (340 & 360 HP)	10° BTDC
409" Engine (340 HP)	①6° BTDC
409" Engine (400 & 425 HP)	12° BTDC

① - Supersedes 8° and 10° BTDC.

IGNITION TIMING MARKS

HOT (SLOW) IDLE RPM

Engine	①Synchro-mesh	②Auto. Trans.
283" Engine	475	450
327" Engine (250 & 300 HP)	475	450
327" Engine (340 HP)	750	
327" Engine (360 HP)	850	
409" Engine (340 HP)	500	475
409" Engine (400 & 425 HP)	750	

① - In Neutral. ② - In Drive.

COLD (FAST) IDLE RPM

Rochester Carburetors..Correct when Hot (Slow) Idle set.
Carter Carburetors 1750

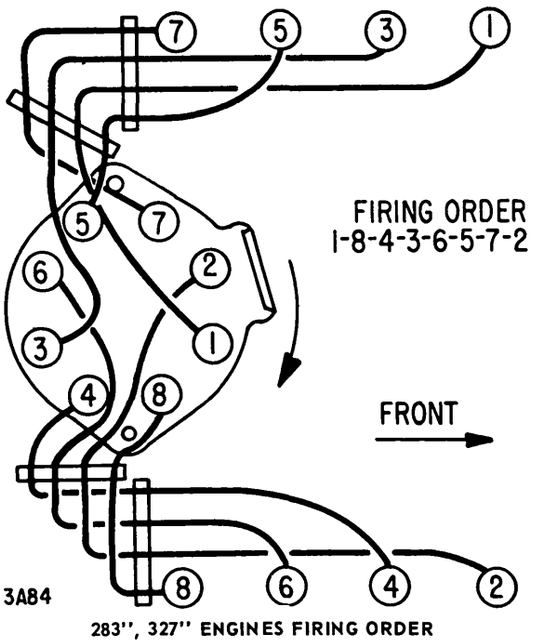
AUTOMATIC CHOKE SETTING

Engine	Synchro-mesh	Auto. Trans.
283"	1 Lean	Centered
327" (250 HP except Corvette)	Centered	Centered
327" (300 HP except Corvette)	1 Lean	Centered
327" (250 HP Corvette)	Centered	Centered
327" (300 HP Corvette)	1 Lean	1 Lean
327" (340 HP Corvette)	1 Lean	
409" (340 HP)	Centered	Centered
409" (400 HP)	2 Lean	
409" (425 HP)	2 Rich	

FUEL PUMP PRESSURE

283" & 327" Engines	5¼-6½ lbs
409" Engine	7¼-8½ lbs.

FUEL PUMP VOLUME



All Engines . . . . 1 Pt. in 30-45 seconds.

MANIFOLD HEAT CONTROL

Heat control valve and thermostatic coil assembly located between right exhaust manifold and crossover pipe (single exhaust), exhaust pipe (dual exhaust). Not used on fuel injection Corvette. If valve sticks, free up with GM Manifold Heat Control Valve Solvent or equivalent

CRANKCASE VENTILATION VALVE

Check operation of valve at every oil change and replace when necessary. *CAUTION - Do not change valves from one size engine to another.* To test valve, disconnect hose at valve on carburetor base, block valve opening and note engine RPM change. A drop of less than 50 RPM indicates a defective valve.

283", 327" ENGINES FIRING ORDER

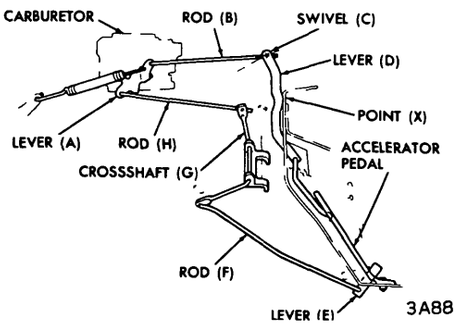
① - With air horn inverted, gasket in place, measure from gasket to lower (sharp) edge of float seam at outer end

② - With air horn upright, gasket in place, measure from gasket to lowest point of float

③ - 1 17/32" (primary), 1 19/32" (secondary) with air horn inverted, gasket in place, measured from gasket to highest point of float

④ - With air horn inverted, gasket in place, measure from gasket to highest point on float heel (1 1/2" primary, 1 5/16" secondary), Float Toe measurement made between gasket and center of dimple on side of float at toe end (13/16" primary, 1/2" secondary)



⑤ - 1 1/2" (primary), 1 1/8" (secondary) with air horn upright, gasket in place, measured from gasket to center of dimple on side of float at toe end

⑥ - 7/32" (solid seat), 3/16" (resilient seat) All ± 1/64" measured with air horn inverted, gasket in place, needle valve seated, from top of float at outer end to air horn gasket

⑦ - **Primary:** 7/32" (solid seat, Gauge T109-283), 3/16" (resilient seat, Gauge T109-222) **Secondary:** 9/32" (solid seat, Gauge T109-284), 1/4" (resilient seat, Gauge T109-223)

⑧ - 2" ± 1/16" (primary and secondary) with air horn upright, gasket removed, measured from bowl cover to lowest point of floats

⑨ - Primary and Secondary Floats

CORVETTE AUTOMATIC TRANSMISSION THROTTLE LINKAGE

MANIFOLD FUEL DISTRIBUTION

Carburetor left barrels feed cylinders 1,4,6,7; right barrels feed cylinders 2,3,5,8.

THROTTLE LINKAGE ADJUSTMENT

283", 327" (Exc. Corvette), 409" (Exc. Dual AFB) Automatic Transmission - 1) *See illustration.* With rod "C" in place, thread end of rod "E" half way through swivel and install other end in lever "A".

2) With lever "A" in wide open position, move cross shaft assembly "D" forward against its stop. Adjust swivel on rod "E" until it freely enters cross-shaft assembly "D". Fix swivel in cross-shaft.

3) Check adjustment by placing linkage in idle position and returning to wide open position. Push downward on lever "C" and note if rod "E" deflects. If rod deflects or lever "A" will not reach wide open position, repeat above adjustment.

4) Depress accelerator pedal until lever "B" contacts .02-.06" spacer. Rotate lever "A" to wide open, then adjust swivel in rod "G" for free entry into lever "A" and install rod into lever.

Corvette Automatic Transmission - 1) *See illustration.* Place lever "A" in wide open position and pull rod "H" forward against its stop. Adjust swivel on rod "H" for free entry into lever "A". Readjust swivel 3 turns (lengthens rod). Secure rod in lever "A".

2) With carpet removed, depress accelerator pedal so lever "D" contacts point "X" on toe panel. With pedal depressed, and lever "A" rotated to wide open, adjust swivel on rod "B" for free entry into lever "D". Rotate swivel 2 additional turns toward carburetor.

3) To check adjustment, place linkage in idle position, return to wide open (rotate lever "A") then push down on lever "E". If rod "H" deflects or lever "A" will not reach wide open, repeat above adjustment.

409" (with Dual AFB Carbs.) Synchro-mesh Transmission - 1) Remove carpet, air cleaner, and both throttle pull-back springs. Disconnect front carburetor rod at rear carburetor.

2) With throttle at wide open (rear carburetor), accelerator pedal should be ½-¾" from toe board (measure at middle of pedal).

3) To adjust, disconnect accelerator rod at carburetor and adjust swivel so it freely enters hole in carburetor throttle lever. Connect and secure accelerator rod with retainer clip.

4) With both carburetors at wide open throttle, the front carburetor throttle rod trunnion eye should slide freely over accelerator rod pin.

5) To adjust, loosen trunnion locknut and adjust trunnion and tighten locknut while holding front throttle rod hex head at front carburetor.

6) If linkage properly adjusted, front carburetor will begin to open when rear carburetor is at about half-throttle.

Air Gap (9000595) - 075"

FUSES & CIRCUIT BREAKERS

FUSE BLOCK

Located under dash panel.

IN-LINE FUSE

Overdrive fuse in wiring harness of engine side of dash. Headlamp motor switch on Corvette.

CIRCUIT BREAKERS

40 Ampere - Hydraulic top motor.
15 Ampere - Headlights, high beam indicator, parking lights. Integral with headlight switch.

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH

Steering Column Mounted Selector Lever - With selector lever in Neutral, loosen screws securing neutral safety switch retainer to steering column (just below dash). While holding ignition switch in "Start", adjust position of switch until engine cranks. Hold switch in this position and tighten retainer screws. Engine should crank in Neutral and Park.
Floor Mounted Selector Lever - Vary length of bell-crank-to-switch control rod. A swivel is provided at one end for adjustment.

LIGHTING SWITCH REMOVAL

Pull control knob to ON position Depress switch shaft retainer button on switch Remove knob and shaft assembly Remove retaining ferrule and escutcheon, then remove switch assembly Disconnect multiple connector *NOTE* - Use screwdriver inserted in side of switch to pry plug from switch

DIRECTION SIGNAL FLASHER LOCATION

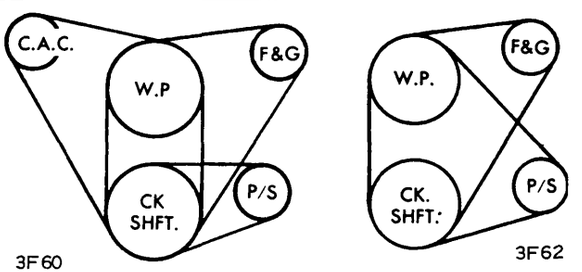
On fuse block located on left side of firewall in drivers compartment *NOTE* - Flasher on Chevrolet Impala and Nomad Station Wagon is "3 bulb type" (all others are "2 bulb type")

STOP LIGHT SWITCH ADJUSTMENT

Switch located under dash in contact with brake pedal To adjust, position switch so light operates when pedal depressed 5/8" from fully released position

INSTRUMENT CLUSTER CONSOLE REMOVAL

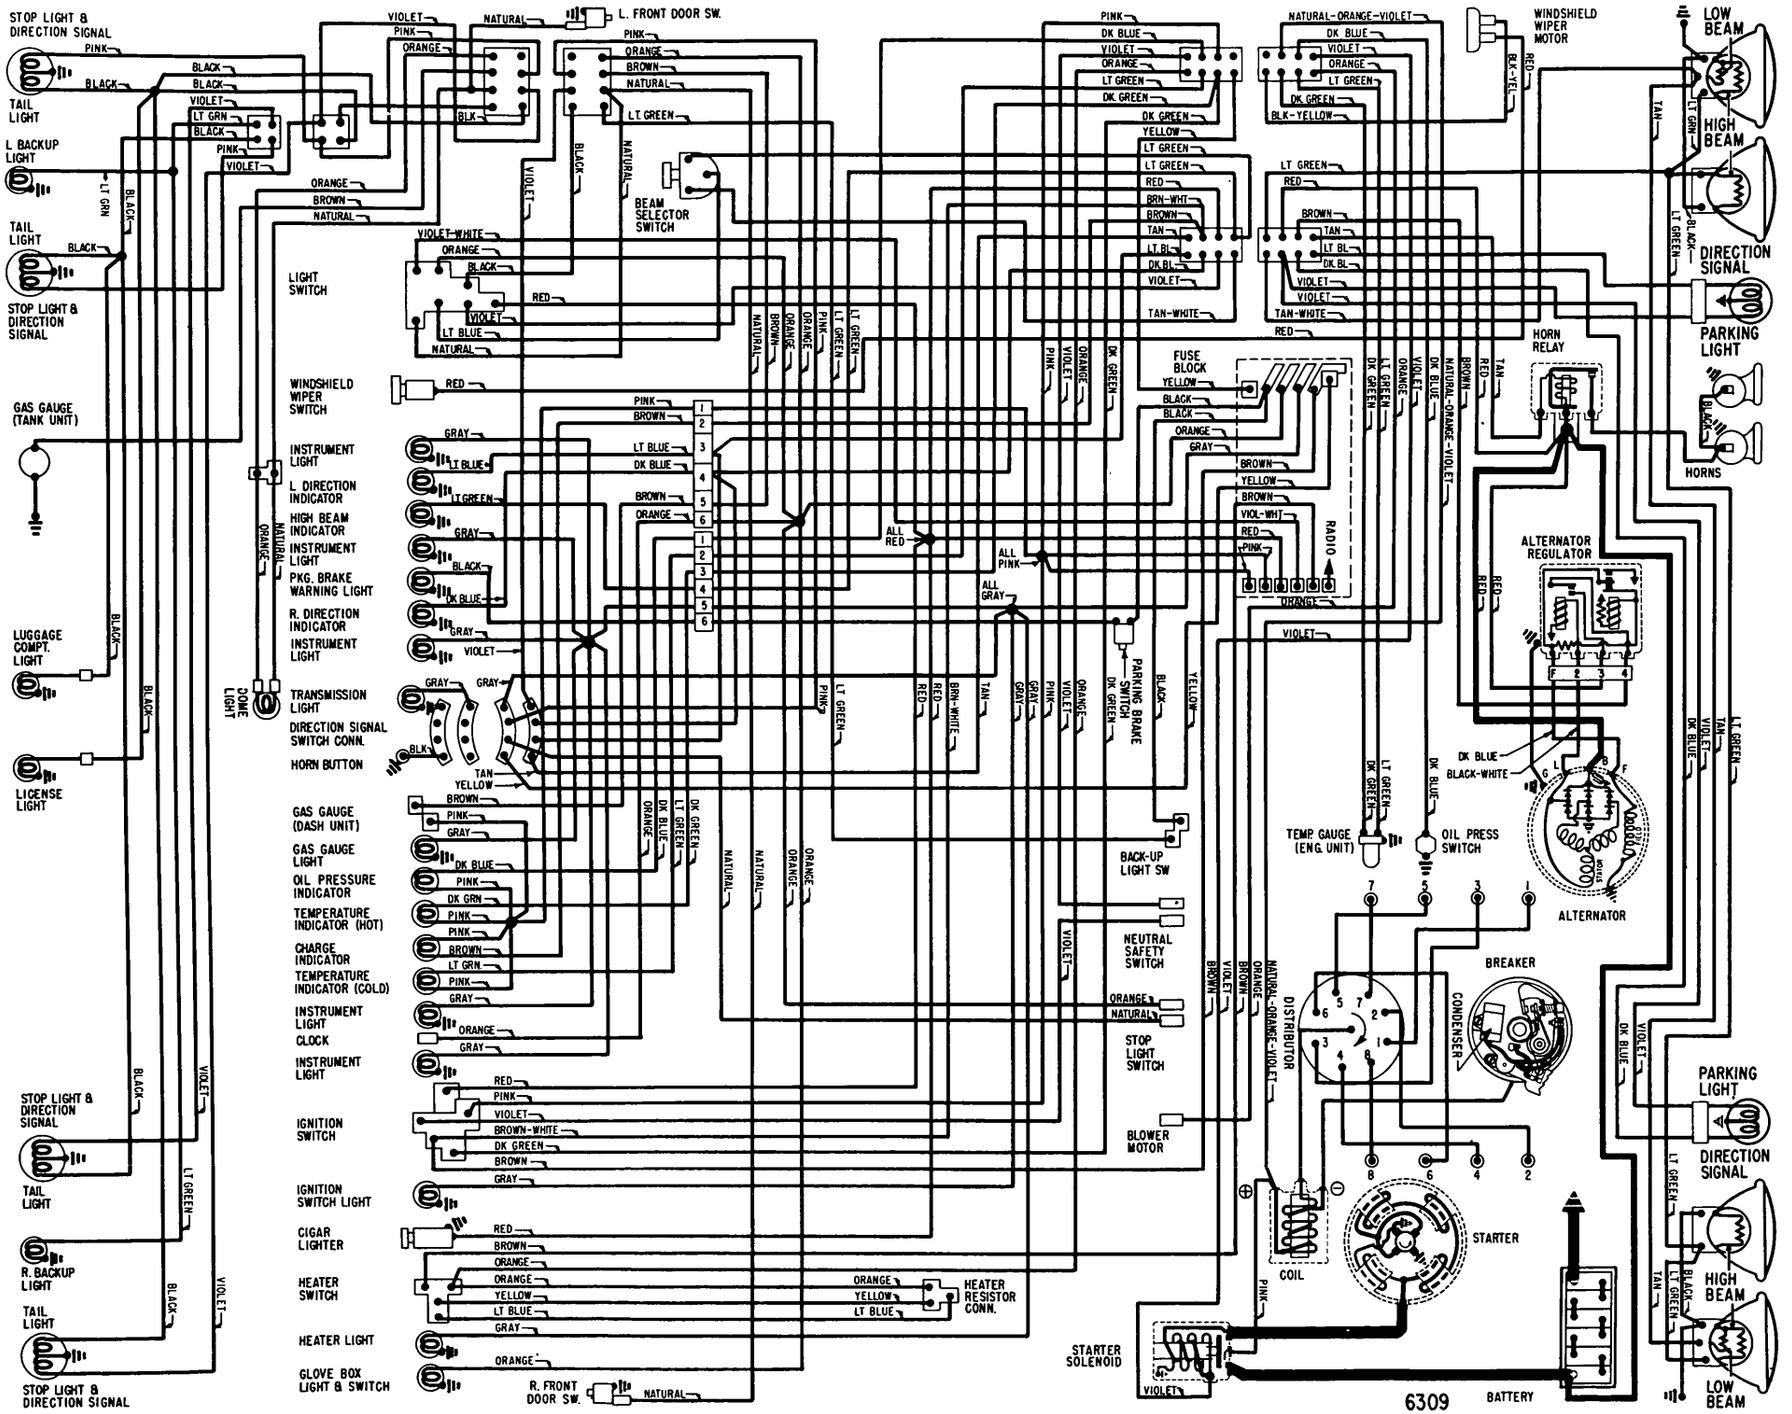
Chevrolet (except Corvette) - Disconnect speedometer cable and remove console-to-instrument panel screws Lean console forward onto mast jacket Remove individual instruments as required Remove console as a unit by unsnapping all wire connectors *CAUTION* - When installing, be sure to attach single ground washer on one of nine console attaching screws



Corv tte - 1) Remove mast jacket assembly Disconnect tachometer drive cable at distributor
2) Disconnect cowl vent control cable brackets and headlamp panel control switch from cluster
3) Remove lighting switch (see above)
4) Remove ignition switch, then disconnect ignition switch lamp support at instrument panel
5) Disconnect parking brake lever support bracket at cowl crossmember
6) Disconnect oil pressure line at gauge, then remove lead wires from ammeter, wiper switch, cigar lighter Disconnect trip odometer at mast jacket support
7) Remove instrument cluster-to-dash retaining screws and pull cluster assembly slightly forward and remove speedometer cable, tachometer cable, cluster ground wire, fuel gauge lead wires and indicator and cluster illuminating lamps

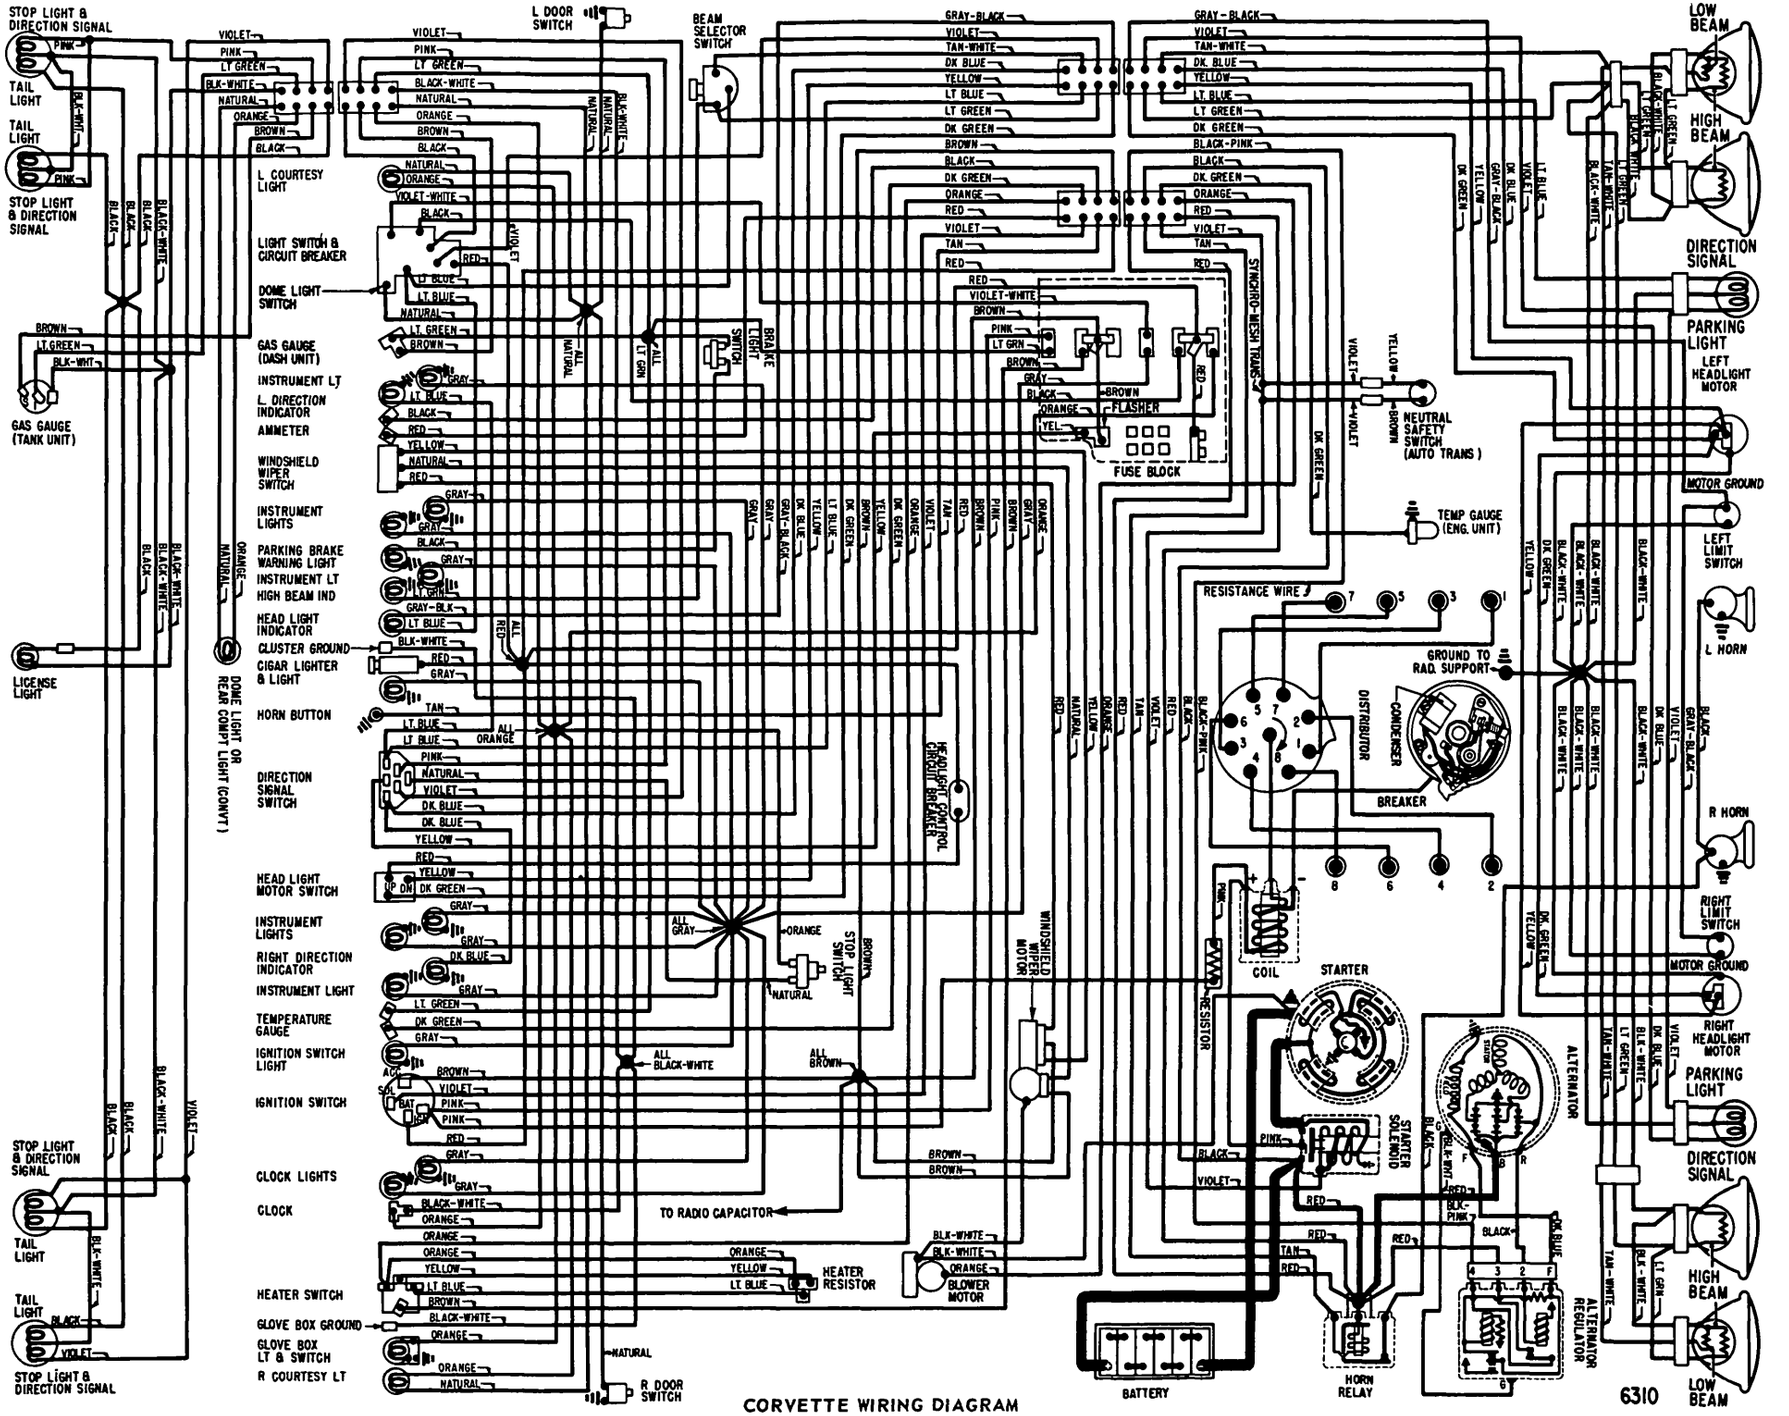
SPEEDOMETER REMOVAL

Instrument cluster console must be removed (see above) Disconnect any electrical connectors and remove attaching screws Remove speedometer



BELT ADJUSTMENT

70-80 lbs. midway between water pump and generator pulleys. Measure with a Strand Tension Gauge.



ENGINE DRIVE BELTS

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

(One AFB)	400 at 5800	11.0-1	4 5/16"	3.5"	409 cu. ins.
(Two AFB)	425 at 6000	11.0-1	4 5/16"	3.5"	409 cu. ins.

ENGINE REMOVAL (Except CORVETTE & 409" ENGINE)

1) Drain systems and remove hood.
2) Remove radiator (on Auto. Trans. cars, disconnect and plug cooler lines).
3) Remove battery, all wires, air cleaner and filter.
4) Disconnect fuel and vacuum lines.
5) Remove exhaust pipe to manifold bolts. Disconnect carburetor control rods at bellcrank, clutch control bellcrank, and transmission rods.
6) Remove automatic transmission filler tube (plug opening). Disconnect speedometer cable, propeller shaft, and remove overdrive solenoid.
7) Remove exhaust crossover pipe and manifold heat control valve.
8) Install hoist, disconnect clutch idler shaft bracket, raise engine slightly and remove all engine and transmission mounting bolts. Remove engine and transmission as a unit.

ENGINE REMOVAL (CORVETTE & 409" ENGINE)

1) Drain systems, remove hood, air cleaner (cover carburetor) and remove air cond. compressor from engine mounting (tie to fender near battery).

TIGHTENING SPECIFICATIONS

Bolt or Nut	283", 327" - Ft. Lbs.	409"
Cylinder Head	60-70	60-70

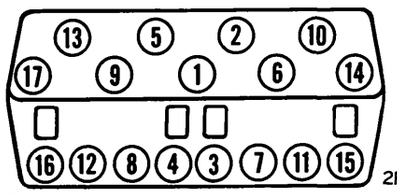
Oil Pump Cover	6-8	6-8
Oil Filter	20-25	20-30
Clutch Housing	25-35	25-30

ℂ - Tighten two center bolts to 25-30 ft. lbs.
② - 60-70 ft. lbs. on Corvette.

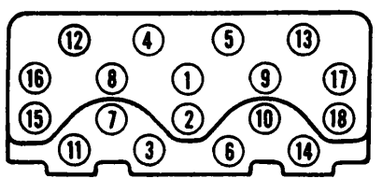
2) Disconnect all cables, wires, straps, leads, lines, hoses and linkages (throttle control rod at pedal bellcrank).
3) Remove fan and pulley assembly, radiator and shroud as an assembly.
4) Remove power steering pump mount bolts and swing pump into opening behind left headlight (or disconnect pump lines and plug ends).
5) Remove distributor cap and cover distributor.
6) Disconnect power brake pedal pushrod at brake cylinder pushrod pin, then dismount unit and move to side against fender. *CAUTION* - Fluid line may be damaged if unit pushed downward or twisted.
7) Raise vehicle and place on jack stands.
8) Remove rocker arm covers and install hoist. Remove clutch cross shaft (frame bracket end first, then slide it off engine ball stud).
9) Disconnect exhaust pipes at manifold flange.
10) Remove fuel pump then front mount through bolts.
11) Disconnect transmission TV rod at bellcrank (Powerglide); place floor jack under transmission.
12) Remove converter underpan (Powerglide), flywheel cover bolts (Synchro-mesh). Remove clutch housing-to-engine bolts. Install holding bracket on converter (Powerglide).
13) Move engine upward and forward alternately (also raise transmission jack) to slide engine from clutch gear shaft, then raise and guide engine from vehicle.

OIL PAN REMOVAL



283" & 327" Engines (Except Corvette) - 1) Raise front of vehicle, drain crankcase and radiator, and disconnect hoses at radiator and battery ground strap at engine.
2) Disconnect clutch pedal pushrod at clutch pedal control, and disconnect intermediate lever and shaft.
3) Remove clutch pedal control, intermediate lever and shaft assembly at frame mounting bracket (leave shaft assembly attached to engine).
4) Remove carburetor feed pipe at fuel pump and remove pump. Remove accelerator control rod from its lever.
5) Remove power brake vacuum hose at manifold, and remove power steering pump.
6) Remove transmission lower control rods at shift levers.
7) Remove exhaust pipe flange-to-exhaust manifold nuts and gasket. Lower exhaust pipe and muffler assembly.
8) Remove oil filter. Remove starter.
9) Loosen transmission mounting bolts. Remove nut, washer and long bolt from each front mounting.
10) Turn crankshaft so harmonic balancer keyway slot is at bottom of engine (indexes crankshaft counterweights so baffle in oil pan will clear).
11) Raise engine about 3" (may be raised from below at harmonic balancer) so oil pan will clear frame crossmember. *CAUTION - Raise engine until transmission housing contacts underbody to pan. Be sure fan blade and shroud clear as required.*
12) Remove oil pan bolts then tilt pan as required for removal.

Corvette - 1) Disconnect cables at battery. Raise vehicle and drain oil.
2) Remove starter and flywheel (or converter) underpan.
3) On 340 and 360 Horsepower engines, disconnect steering linkage idler at frame and lower the linkage (for clearance of pan to bearing cap mounted oil baffle plate).
4) Remove oil pan screws and remove pan.



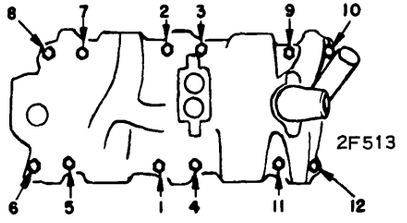
409" Engine - 1) Remove engine from vehicle.
2) Remove starter, then remove oil pan.

CYLINDER HEAD INSTALLATION

283" & 327" Engines - Use a good head gasket paste on steel head gaskets, install gasket and head on dowel pins in block, coat all cylinder head bolt threads with suitable oil and water thread sealing compound (G.M. Perfect Seal or equivalent), tighten all bolts finger tight (*CAUTION - Intermediate length bolts used in Nos. 14 & 17 positions*). Torque all bolts evenly, a little at a time, in sequence shown in diagram to correct torque listed. Retorque cylinder head bolts after engine warmed up.
409" Engine - Same as for other engines except that two head gaskets used with each cylinder head.

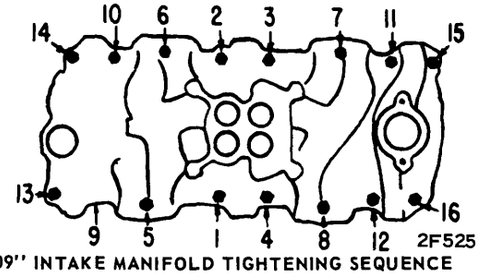
2F512
283", 327" CYLINDER HEAD TIGHTENING SEQUENCE

2F524
409" CYLINDER HEAD TIGHTENING SEQUENCE



See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

INTAKE MANIFOLD INSTALLATION



Install end seals on block On 283" and 327" engines, ridges on seals must engage edge of block with tabs extending outward Install side gaskets on cylinder heads using sealing compound around water passages Install manifold being careful not to displace gaskets and seals (See 283" & 327" Engine Tool Note below), tighten manifold bolts evenly in sequence shown in diagram to correct torque as listed

►*283" & 327" ENGINE MANIFOLD INSTALLING TOOL*

A wooden dowel can be installed in distributor mounting hole to guide manifold straight down on block which will prevent displacing of end seals and gaskets Fabricate this dowel from 1 5/16" round stock, 3 3/4" long, with 3/4" section at lower end reduced to 1 7/32" diameter (to fit distributor mounting hole) and upper end tapered to 1 1/8" (to engage mounting hole in manifold) Remove dowel after manifold installed

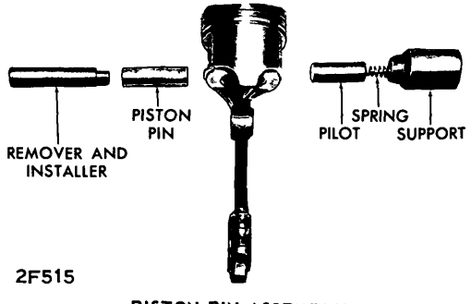
① - Measured at center of piston skirt ② - Wear limit 001" ③ - Press Fit *See "Piston Pin Removal"*

PISTON PIN REPLACEMENT

See Illustrations Use Tool J-9510 (283", 327" Engines), Tool J-6994-5 (409" Engine) When installing pin, press pin into piston until pilot bottoms in support

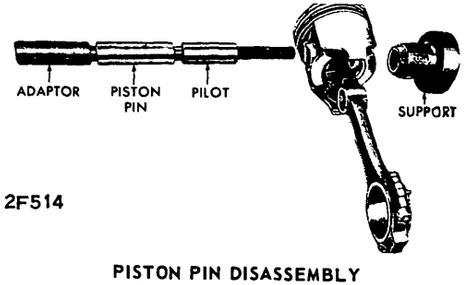
FITTING PISTONS

Use piston fitting scale (J-5513 or similar) with 1/2" wide feeler stock of correct thickness (see table below) inserted between piston and cylinder wall 90° from pin boss Pull to withdraw feeler should be within limits indicated in table



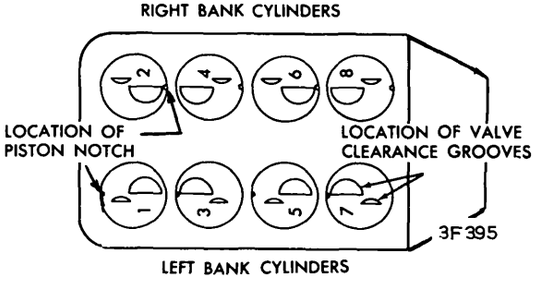
Engine	Feeler Thickness	Lbs.Pull
283"	0015"	4-6
327" (250 & 300 HP)	0015"	7-17
327" (340 & 360 HP)	004"	11-18
409"	004"	7-17

PISTON & ROD INSTALLATION



283" & 327" Engs. - Rods are numbered Install rod so that flange or heavy side of rod at bearing end will be toward FRONT of piston (marked by notch in piston head and "F" mark on piston strut) on Nos 1,3,5,7 Flange of rod at bearing end must face to REAR of piston head on Nos 2,4,6,8 Install piston and rod assembly with notch in piston head and "F' mark on piston strut to front of engine (Oil holes in rods will face center of engine)

409" 340 HP Engine - Pistons have valve reliefs on head and offset pin bore and are stamped "L" or "R" on strut designating cylinder bank in which used Pistons of same configuration are paired (symmetrically opposite) and stamped numbers on head denote this pairing 1,8, 5,2, 6,3, 7,4 Arrow on piston head must point toward front of engine Rods are installed in piston in same manner as on other engines See 283" & 327" Engine data above



409" 400 & 425 HP Engines - Pistons have valve reliefs on head but piston pin bore is not offset Two types of pistons used **1)** Cyl 1, 4, 5, 8, **2)** Cyl 2, 3, 6, 7 When correctly installed in engine, notch on rim of piston head will be toward rear of engine (Right Bank), front of engine (Left Bank) *See Illustration* Rods are installed in piston in same manner as on other engines (see 283" & 327" Engine data above)

PISTON PIN ASSEMBLY

PISTON PIN DISASSEMBLY

409" HIGH COMPRESSION ENGINE PISTON INSTALLATION

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

REAR MAIN BEARING OIL SEAL

Remove oil pan then proceed as follows

Cap Seal - Remove bearing cap and pry out old seal with screwdriver Lubricate new seal (except parting surface) and roll seal into place without damaging bead of seal with seal tangs

Block Seal - Use small drift to start seal out until it can be removed with pliers Lubricate new seal (except parting surface) and gradually push seal in with hammer handle until seal rolls into place DO NOT CUT seal with seal retainer tang when installing

HARMONIC BALANCER

Removal (All Engines) - Remove battery, fan belt, fan and pulley Remove radiator and fan shroud Remove pulley bolts from balancer and remove crankshaft pulley Install Puller Tool J-6978, using bolts in tapped holes in balancer face Remove balancer

Installation (Chevrolet except Corvette) - Coat seal contact area of balancer hub with engine oil, assemble special Balancer Installer Tool J-8792 (see TOOL NOTE below) on balancer with fingers hooked over balancer rim and tighten threaded driver finger tight *CAUTION - This is necessary to prevent balancer pulling apart* Start balancer on crankshaft with keyway aligned with key in shaft Use soft hammer to drive balancer in place until it bottoms on shoulder on shaft (or spacer installed on shaft on 409" Engines)

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

Engine	MAIN BEARINGS				CONNECTING ROD BEARINGS		
	Journal Diam.	Clearance	Thrust Brg.	Endplay	Journal Diam.	Clearance	② Sideplay
283"	2 2978-2 2988"	0008- 0034"	No 5①	002- 006"	1 999-2 000"	0007- 0028"	008- 014"
327"	2 2978-2 2988"	0008- 0034"	No 5①	002- 006"	1 999-2 000"	0007- 0028"	008- 014"
409"	(1-4) 2 4980-2 4990" (5) 2 4977-2 4987"	0009- 0025" 0018- 0034"	No 5	004- 012"	2 1988-2 1998"	0009- 0030"	015- 021"

① - Wear limit 009" ② - Total both rods

TOOL NOTE - Tool No J-8792 also used on Chevy II 6 Cyl Engines (different set-up) and must be assembled exactly as follows for use on V8 Engines

1) Thread driver in clamp on shallow finger side (opposite side from V8 mark on clamp)
2) Insert pilot in end of driver on opposite side of clamp with large end in toward clamp
3) Secure pilot with machine screw
4) Install tool assembly on balancer with deep fingers of clamp engaging balancer rim

Installation (Corvette) - Coat front cover seal area on balancer with engine oil Position balancer on crankshaft (keyway aligned) On 250 & 300 HP Engines, drive balancer on crankshaft with Tool J-5590 until it bottoms on crankshaft gear On 340 & 360 HP Engines, pull balancer on using suitable length bolt and spacers in threaded crankshaft *NOTE - On 340 & 360 HP Engines, a spacer is located between balancer hub and crankshaft shoulder for belt alignment*

FRONT COVER OIL SEAL INSTALLATION

Chevrolet (except Corvette) - Remove radiator, harmonic balancer, and water pump Remove front cover Pry out old seal with screwdriver Install new seal so open end of seal is to inside of cover and drive it into position with Tool J-996

Corvette - Remove hood, radiator, and harmonic balancer With cover still on engine, pry out old seal with screwdriver (do not damage seal surface on crankshaft) Install new seal so open end of seal is to inside of cover and drive it into position with Tool J-8340

VALVES

Engine & Valve		Head Diam.	Face Angle	Seat Angle	Seat Width	① Stem Diameter	Clearance	② Valve Lift

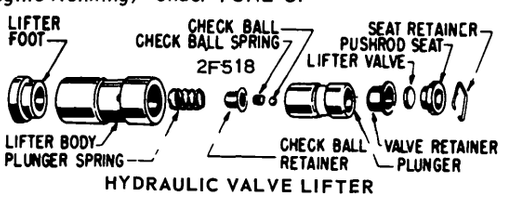
① - Standard size ② - Measured at valve stem ③ - 1/16" on Corvette ④ - 3/32" on Corvette

ROCKER ARM STUD REPLACEMENT

Removal - Remove old stud by placing Spacer Tool J-5802-1 over stud, adding flat washer and nut and turning nut down to remove stud



Installation - Ream stud hole for correct size stud using Reamer J-5715 for 003" Oversize or J-6036 for 013" Oversize stud Coat press fit part of stud with hypoid lubricant and use Tool J-6880 to install stud in head Tool should bottom on head

HYDRAULIC LIFTER ADJUSTMENT (AT ENGINE OVERHAUL)

With No 1 cylinder at TDC firing position, adjust Exhaust Valves 1-3-4-8 and Intake Valves 1-2-5-7 as follows

1) Back off rocker arm stud adjusting nut until there is play in pushrod, then tighten nut until pushrod-to-rocker arm clearance is just removed
2) Tighten nut an additional 1 turn (places lifter plunger in center of its travel)
3) Crank engine 1 complete revolution so No 6 cylinder is at TDC firing position and adjust Exhaust Valves 2-5-6-7 and Intake Valves 3-4-6-8 in same manner

NOTE - If lifters are noisy, see "Lifter Adjustment (Engine Running)" under TUNE-UP

HYDRAULIC VALVE LIFTER

VALVE GUIDES

Integral with cylinder head Ream to next oversize and install valve with oversize stem if valve stem clearance excessive *(see Valves Table).*

VALVE STEM OIL SEAL

"O" ring type used Set valve spring and damper in place with closed coil end of spring against cylinder head Install shield on spring Place rotator (if used) in position and install cap Compress spring and install oil seal in lower groove of stem Install valve locks and release spring Locks should seat in upper groove on stem

HYDRAULIC VALVE LIFTER

Replace if any parts worn or damaged When installing, fill lifter with engine oil, work plunger up and down, then refill with oil

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

VALVE SPRING INSTALLED HEIGHT

1 23/32" measured from spring seat (or top of shim) to top of valve spring shield. If specifications exceeded, install a 1/16" spacer under spring to bring within limits. *CAUTION* - Never shim spring to give installed height of less than 1 21/32".

CAMSHAFT

Engin	①Journal Diameter	Cam Lobe Lift Intake	Exhaust
283"	1.8687-1.8692"	.2658"	.2658"
327"(250,300 HP)	1.8687-1.8692"	.2658"	.2658"
327"(340,360 HP)	1.8687-1.8692"	.2625"	.2665"
409" (340 HP)	1.8687-1.8692"	.2288"	.2354"
409"(400,425 HP)	1.8687-1.8692"	.2896"	.2963"

① - Out-of-round limit .001".

CHECKING CAMSHAFT LOBE LIFT

Remove rocker arms and balls. Attach Tool J-8520 to adapter or stud and adjust dial indicator to seat in pushrod cup. *NOTE - Be sure pushrod is seated in lifter socket.* Rotate crankshaft slowly until lifter is on heel of cam lobe (pushrod will be in lowest position). Zero dial indicator and slowly "bump" engine over until pushrod is in fully raised position. *CAUTION - Ground primary wire on coil, when cranking engine.* Compare total lift on dial indicator with specifications (*see Camshaft Table*). Continue to rotate engine until indicator reads Zero (checks accuracy of dial indicator).

CAMSHAFT REMOVAL

All Engines - Camshaft can be removed with engine in vehicle by first removing radiator, grille, intake manifold, front cover, etc. Remove camshaft and gear assembly by pulling out through front of block. *NOTE* - Support shaft so as not to damage camshaft bearings.

ENGINE OILING

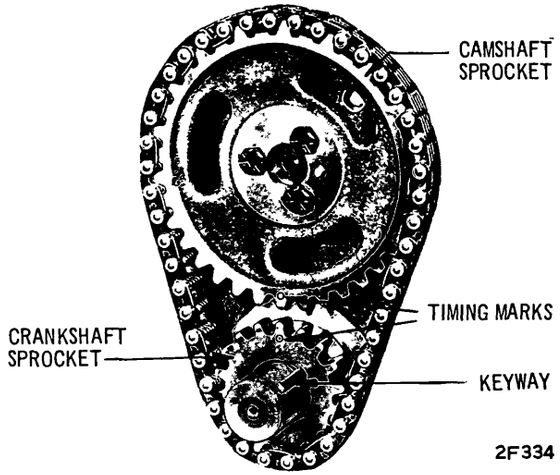
Normal Oil Pressure - 40 psi at 2000 RPM (Exc. 409" & Corvette); 50 psi at 2000 RPM (409" Eng. & Corvette).
Pressure Regulator Valve - In oil pump body. Not adjustable.

ENGINE OILING SYSTEM

Description (283", 327" Engines) - Positive pressure lubrication provided to all main, camshaft, and connecting rod bearings and to all valve lifters and rocker arms. Three horizontal oil galleries located in "V" at center of engine and distribute oil under pressure to all parts. *See illustration.*
Valve Lifters - Oil passage from rear camshaft bearing supplies oil to lifter galleries. Both mechanical and hydraulic lifters intersect the gallery. Recess in mechanical lifter permits oil to pass into lower end of pushrod. A larger passage in rear camshaft bearing permits more oil pressure for lubrication of hydraulic lifters. Hydraulic lifters contain an inertial valve which opens permitting oil to pass to hollow pushrods.
Rocker Arms and Valve Stems - Oil passes up through hollow pushrods to a hole in upper end that matches hole in rocker arm. Oil sprayed out this hole and across rocker arm lubricates valve stem tip.

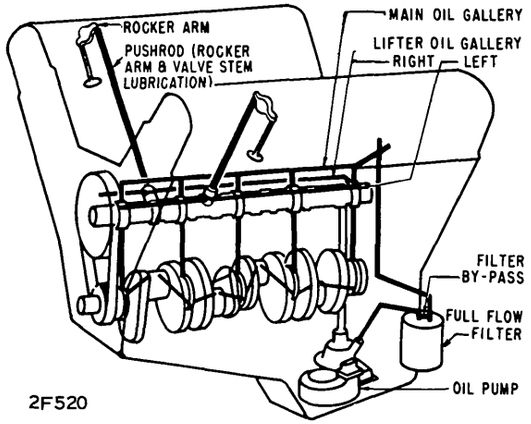
VALVE SPRINGS & LIFTERS

Engine	SPRINGS Pressure (Lbs.) Valve Closed	Valve Open	Free Length	LIFTERS Diameter	Clearance
283"	①78-86 at 1.660"	①170-180 at 1.260"	2.08"		
327"	②78-86 at 1.660"	②170-180 at 1.260"	2.08"		
409" (340 HP)	③84-92 at 1.660"	④166-176 at 1.330"	2.03"		
(400,425 HP)	①130-138 at 1.68"	①273-285 at 1.290"	2.06"		



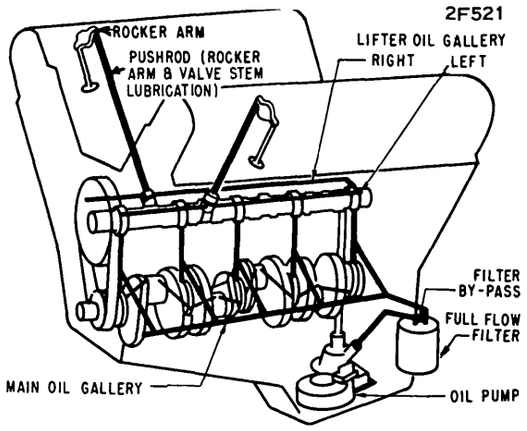
① - Includes damper. ② - Damper 5-10 lbs. ③ - Inner spring 20-24 lbs. at 1.488"
④ - Inner spring 55-61 lbs. at 1.106".

CAMSHAFT BEARING INSTALLATION



All Engines - Install front bearing first. This bearing will act as guide for Installer tool and center the No. 2 and 3 bearings being pulled into place. *CAUTION - Use care when installing rear bearing due to smaller size of oil pressure holes in rear bearing.* When installing end plug, install flush to 1/32" deep to maintain level surface on rear of cylinder block.

VALVE TIMING



Engine	INTAKE Open (BTDC)	Close (ALDC)	EXHAUST Open (BLDC)	Close (ATDC)
283"	32°30'	87°30'	74°30'	45°30'

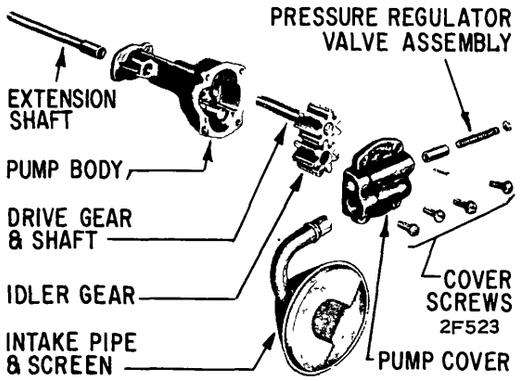
409"(400,425 HP)	110°	154°	193°	143°

VALVE TIMING MARKS

283", 327" ENGINES OILING SYSTEM



409" ENGINE OILING SYSTEM

Description (409" Engine) - Engine lubrication system same as 283", 327" Engines except as follows: Oil pump delivers oil through passage in rear main bearing cap to filter mounting pad at left side of engine. Passage from filter pad leads to horizontal main oil gallery running full length of engine. Oil from main gallery delivered through diagonal passages to vertical passages leading up to camshaft and down to crankshaft bearings. *See illustration.*

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE OIL PUMP ASSEMBLY

Assemble drive gear and shaft in body, install idler gear (smooth side to cover). Install pickup screen and pipe on cover (if removed) but DO NOT twist or collapse suction tube. Install cover and tighten screws to specifications (shaft must turn freely). Assemble collar end of extension shaft assembly over pump drive shaft. Assemble pump and extension shaft to rear main bearing cap. Align slot in extension shaft, install rear main bearing cap bolt and tighten to specifications. *NOTE* - Bottom of screen must be parallel to pan rails.

ENGINE OIL PUMP (ALL)

ENGINE COOLING

Thermostat - Pellet type located in intake manifold water outlet. Opens at 177-183°F (Exc. Corvette), 167-172°F (Corvette).

Pressure Valve - 13 psi radiator filler cap.

WATER PUMP SERVICING

Disassembly - Remove back plate and gasket. Support hub in press and press shaft out of hub (use 1/2" x 2" pin). Support pump in press (use blocks under pump body) and press shaft and impeller out of pump. *CAUTION - Apply pressure to outer race of bearing only.* Place Tool J-5855 in press, support impeller on seal surface, press shaft out using 1/2" x 2" pin.

Reassembly - **1)** Install shaft and bearing assembly in pump body from front side (283", 327" Engines), from rear side (409" Engine). Install until bearing is flush with front of pump body. *CAUTION* - Apply pressure only on outer race of bearing.

2) Coat outer diameter of new seal with sealer and press on outer flange with Tool J-5590 until seal bottoms with outer flange against pump body.

3) Press hub onto shaft to original position.

4) Support pump on hub and install impeller. *NOTE* - Vane to pump body clearance should be .010-.035"

5) Install cover and gasket, tightening screws diagonally.

AIR CONDITIONING FLUID FAN

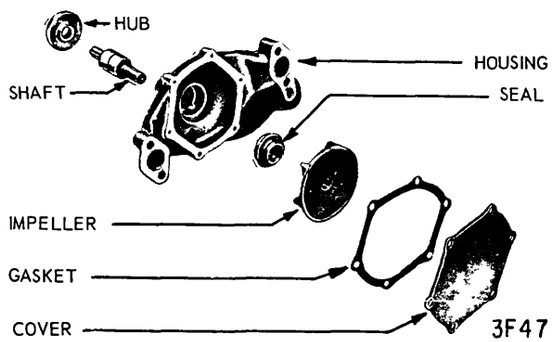
Silicone fluid in clutch assembly limits maximum fan speed to 3200 RPM. Temperature sensing modulator device limits fan speed to 1000 RPM until temperature reaches 140°F, then fan speed increases to 3200 RPM.

FILTERS & CLEANERS

	℃ Service Interval
Oil Filter	Replace every 6000 miles
Air Cleaner (Paper Element)	Replace when necessary
(Polyurethane)	Clean element every 12,000 miles
Breather Cap	Clean and re-oil at Oil Change
Fuel Filter (in Carb. Inlet)	Replace when necessary
(Fuel Bowl Type)	Replace every 12,000 miles
(In-line Filter)	Replace every 12,000 miles

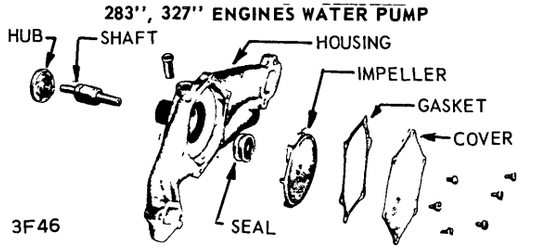
℃ - Replace or clean more often if necessary.

AIR CLEANER CLEANING CAUTIONS



Paper Element Type - Not serviceable. Replace if dirty or damaged.

Polyurethane Type - Remove element from support screen and clean in suitable solvent (kerosene, etc.) Squeeze out all solvent, soak in engine oil, then squeeze out excess oil in clean, dry cloth.



CAPACITIES

Engine	283",327"	409"	Corvette

SERIAL NUMBER

Located on plate on left front body hinge pillar (Except Corvette); on rear side of right pillar brace under glove box (Corvette).

℃ ② ③ ④
3 1611 J 100001

℃ - Model year. **3** 1963.
② - Model identification. *See above.*
③ - Assembly Plant. *See below.*
④ - Beginning serial number at each plant (Chevrolet and Corvette separate).

Assembly Plant Designation

A - Atlanta	**K** - Kansas City	**R** - Arlington
B - Baltimore	**L** - Los Angeles	**S** - St. Louis
F - Flint	**N** - Norwood	**T** - Tarrytown
G - Framingham	**O** - Oakland	**W** - Willow Run
J - Janesville		

ENGINE NUMBER

Located on pad just forward of right cylinder head.

℃ ② ③
F 1210 D

℃ - Engine plant. **F** Flint. **T** Tonawanda.
② - Month and Day built. **1210** is December 10th.
③ - Engine, transmission, special equipment code letter. *See below.*

Engine Code Suffix Letters

Letter Suffix	Engine Displacement	Horsepower
CB, CD, CL, D, DK	283"	195
R, RA, S, SA, RC, SC	327"	250
RB, RK, SB, SG, RD, SD	327"	300
RE	327"	340
RF	327"	360
QA	409"	400
QB	409"	425
QC, QG	409"	340

► *For Tune-Up Data on mod ls with 235" & 261" 6 Cyl Engines, s e 1962 Final Data*

ENGINE IDENTIFICATION

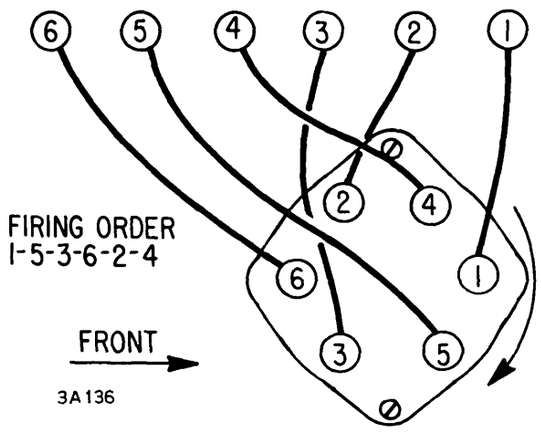
Identified by suffix letters of 'Engine Production Code Number' stamped on right side of engine at rear of distributor (4 & 6 Cyl) just forward of right hand cylinder head (V8) as follows

Engine	ℂ First Suffix Letter
153' 4 Cyl	F
235" 6 Cyl	J
261' 6 Cyl	L
230" 6 Cyl	N
292" 6 Cyl	P
283" V8	M

ℂ - Second suffix letter indicates transmission and accessory options or model application

COMPRESSION PRESSURE

At cranking speed, all plugs removed, throttle wide open Maximum variation between cylinders 20 lbs



153 ' 4 Cyl	130 lbs
230 ' 292" 6 Cyl	130 lbs
283" V8	140 lbs

VALVE TAPPET CLEARANCE

153' 4 Cyl	Hydraulic
230 292' 6 Cyl	Hydraulic
283' V8	Hydraulic

HYDRAULIC LIFTER ADJUSTMENT (WITH ENGINE RUNNING)

With engine at normal operating temperature and running at idle speed, back off rocker arm stud adjusting nut until rocker arm starts to clatter against valve stem, then turn nut down until clatter just stops This is "zero lash" position Now turn nut an additional ½-turn and wait until engine runs smoothly Continue to turn nut down in ¼-turn increments until nut has been turned down 1 full turn from "zero lash" position *CAUTION - Make adjustment slowly so lifter will adjust itself and prevent engine damage*

6 CYLINDER 230" & 292" ENGINES FIRING ORDER

TUNE-UP SPECIFICATIONS

SPARK PLUGS

Gap (All)	035'
Torque (All)	20-25 ft lbs

Spark Plug Type

153' 4 Cyl 230' 6 Cyl	AC 46N
292' 6 Cyl	AC C42N
283' V8	AC 44

DISTRIBUTOR

153" 4 Cyl., 230", 292" 6 Cyl

Point Gap & Cam Angle must be adjusted with distributor on engine because of single bearing design of distributor

Point Gap (All)	.019' New 016" Used
Cam Angle (All)	31-34° (33° preferred)
Condenser Capacity (All)	18- 25 mfd
Breaker Arm Spring Tension	19-23 ozs

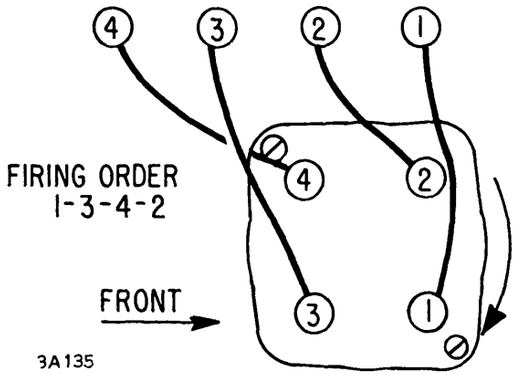
283" V8

Gap	016' (30° Cam Angle)
Cam Angle	30°±2°
Condenser Capacity	18- 25 mfd
Breaker Arm Spring Tension	19-23 ozs

IGNITION TIMING

Set timing with engine at idle speed, and with distrib utor vacuum line disconnected and plugged Degrees given are BTDC

153' 4 Cyl	4°
230 ' 292' 6 Cyl	4°
283 ' V8	4°



IGNITION TIMING (P SERIES)

On P Series (Forward Control & Step-Van), to avoid injury and for ease in setting ignition timing, special procedure required as follows

Use timing tab on oil pan front rail (to left of engine centerline for 4 Cyl to right of engine centerline for 6 Cyl) *Do not use timing tab on right side of front cover* Connect timing light to **No 2** spark plug wire Two men required, with man underneath truck holding timing light and directing man on top to rotate distributor as required

HOT (SLOW) IDLE RPM

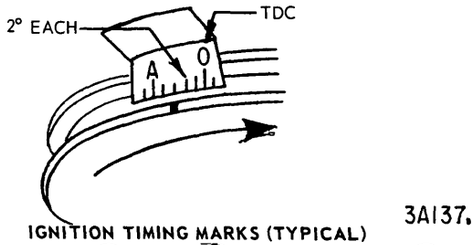
Synchro-mesh (All Engines)	450-500
Powerglide in ' D" (All Engines)	450-500

4 CYLINDER ENGINE FIRING ORDER

FAST IDLE RPM

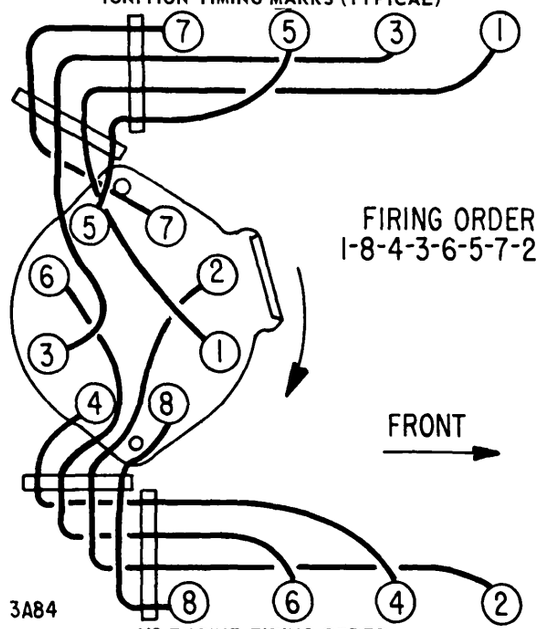
No adjustment Fast idle speed will be correct when hot (slow) idle correctly set

FUEL PUMP PRESSURE & VOLUME



Pressure (153" 4-Cyl)	3½-4½ lbs at 450-1000 RPM
(230", 292" 6 Cyl)	3½-4½ lbs at 450-1000 RPM
(283" V8)	5¼-6½ lbs at 450-1000 RPM
Volume (All)	1 Pint in 30-45 Seconds

MANIFOLD HEAT CONTROL VALVE



Automatic thermostatic type with counterweight in ex-exhaust manifold Valve must operate freely

CLOSED CRANKCASE VENTILATION

Check operation of valve at regular tune-up intervals as follows Connect tachometer and vacuum gauge as for idle speed and mixture adjustment With engine at idle speed remove valve from rocker cover (4 & 6 Cyl) disconnect hose at valve on carburetor base (V8) Block open end of valve and note engine speed change If engine speed drops less than 50 RPM, valve is faulty and should be replaced

IGNITION TIMING MARKS (TYPICAL) 3A137.

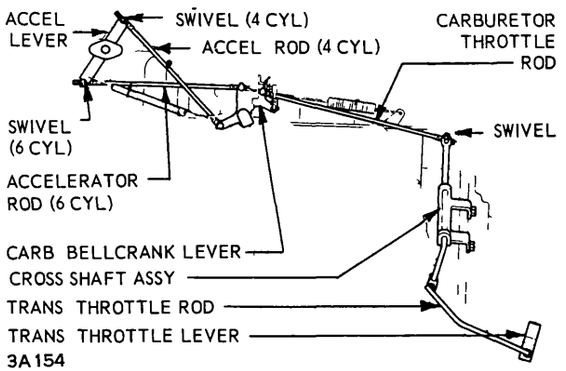
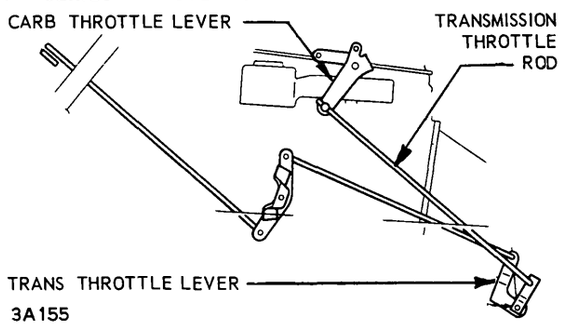
ACCELERATING PUMP

Carter "YF", Rochester "B" & "2G" - No seasonal adjustment



THROTTLE LINKAGE ADJUSTMENT

POWERGLIDE TRANS. TRUCKS



C-10 & 20 Series 6 Cyl. - 1) Disconnect transmission throttle rod from carburetor bellcrank lever Place carburetor throttle lever in wide open throttle position, push down on transmission throttle rod so transmission throttle lever is against internal stop in transmission, and adjust swivel on upper end of transmission throttle rod for free entry into carburetor bellcrank lever Check adjustment by returning linkage to idle position, then to wide open throttle position Push downward on transmission throttle lever If transmission throttle rod deflects repeat adjustment

2) Disconnect accelerator connecting rod from carburetor bellcrank lever Depress accelerator pedal to within 10 ' of toe pan, rotate carburetor bellcrank lever to wide open throttle position, and adjust swivel

(Continued)

P10 SERIES 4 & 6 CYL. POWERGLIDE THROTTLE LINKAGE

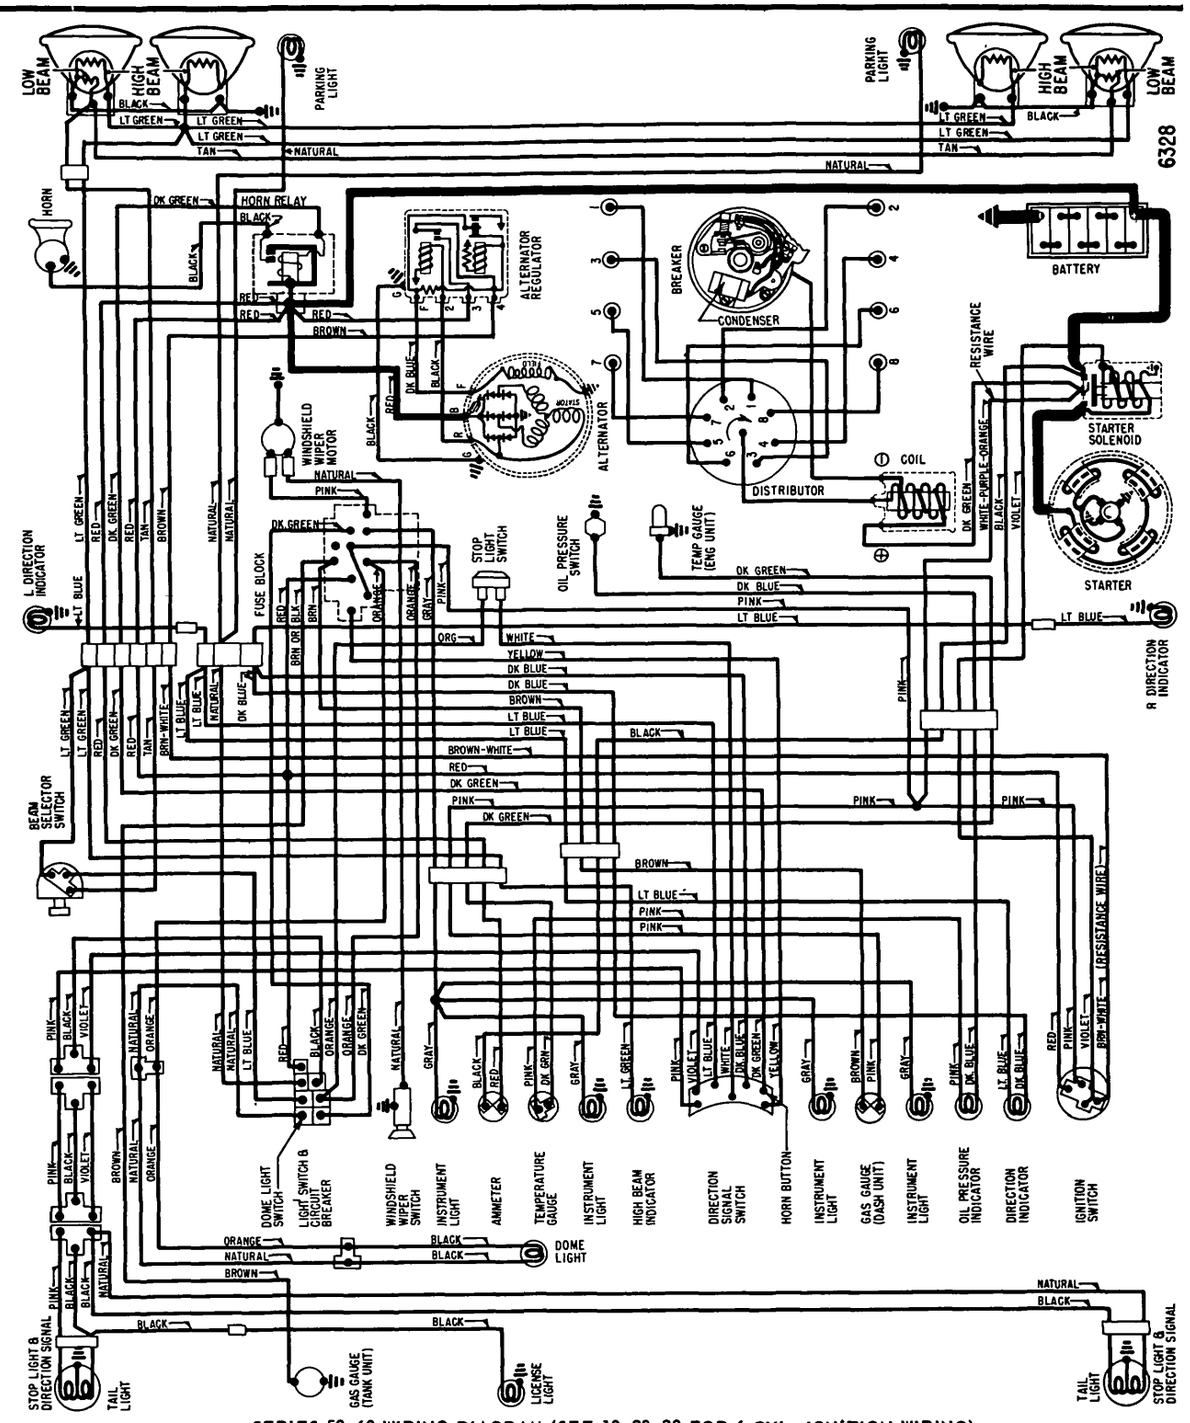
P20 & 30 SERIES 6 CYL. POWERGLIDE THROTTLE LINKAGE

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

on accelerator connecting rod for free entry into carburetor bellcrank lever. Release, then depress accelerator pedal. Carburetor throttle lever must reach wide open position. If not, repeat adjustment.

C-10 & 20 S ries V8 - 1) Disconnect transmission-to-cross shaft lever rod at carburetor throttle lever. Place carburetor in wide open throttle position, pull transmission-to-cross shaft lever rod forward until stopped by transmission internal stop, then turn rod in swivel so rod freely enters carburetor throttle lever. To check adjustment, place linkage in idle position, then return to wide open throttle. Push downward on transmission throttle lever. If linkage deflects, or carburetor throttle lever is not at wide open position, repeat adjustment.

2) Disconnect accelerator connecting rod from carburetor throttle lever, depress accelerator pedal to within .10" of toe pan, and rotate carburetor throttle lever to wide open position. Adjust swivel on accelerator connecting rod for free entry into carburetor throttle lever. Recheck adjustment and make sure that carburetor throttle lever reaches wide open position.



P-10 Series 4 or 6 Cyl. - 1) Disconnect transmission-to-cross shaft lever rod at carburetor bellcrank lever, place carburetor in wide open position, pull transmission-to- cross shaft lever rod forward until stopped by transmission internal stop, then turn rod in swivel for free entry into the carburetor bellcrank lever. To check adjustment place linkage in idle position, then return to wide open throttle. Push downward on transmission throttle lever. If linkage deflects, or carburetor throttle lever is not at wide open position, repeat adjustment. 2) Disconnect accelerator connecting rod from accelerator lever, depress accelerator pedal fully, rotate carburetor bellcrank lever to wide open throttle position, and adjust swivel on accelerator connecting rod for free entry into accelerator lever. Release, then depress accelerator pedal and check that carburetor throttle lever is at wide open position. If not, repeat adjustment.

P-20 & 30 Seri s 6 Cyl. - Disconnect transmission throttle rod from carburetor throttle lever. With carburetor throttle lever in wide open position, and with transmission throttle lever rotated counterclockwise against transmission internal stop, adjust swivel on transmission throttle rod for free entry into throttle lever, then shorten rod 1 full turn of swivel. To check adjustment, place linkage at idle position, then return to wide open throttle. If transmission throttle lever can still be rotated counterclockwise (not on internal stop), shorten transmission throttle rod an additional 1 full turn of swivel .

BELT ADJUSTMENT

Fan & Power Steering Belts .....①75 lbs. ±5 lbs.
Air Cond. Compressor Belt ..... ② 1/2-3/4" deflection

① - Using Belt Tension Gauge.
② - Under 15 lbs. load.

		50	5000
1117765 ℂ	14 0	18	1100
		62	6500

ℂ - If checked without regulator, output should be 5-10% higher than specified

ALTERNATOR REGULATOR

Delco-R my 9000595 (1117765 Alt.), 1119512 (Others)

Field Relay

Closing Voltage - 1 5-2 7 volts (1119512), 2 3-3.5 volts (9000595).
Contact Gap - 030" (1119512), 027" (9000595)
Air Gap - 015" (All)

Voltage Regulator

Voltage Setting (1119512) - 13.5-14.4 volts at 125°F operating on upper contacts. 1-.4 volt lower operating on lower contacts.
Voltage Setting (9000595) - 13.2-14.2 volts at 125°F
Contact Gap (1119512) - .014" (upper contacts) with lower contacts just closed.
Air Gap (1119512) - .067" with lower contacts just touching.
Air Gap (9000595) - .075"

FUSES & CIRCUIT BREAKERS

Headlight Circuit - 15 amp. circuit breaker integral with headlight switch
2-Speed Rear Axle (Eaton) - 10 amp circuit breaker in engine compartment.
Ammeter - 3AGC fuse in holder at engine harness bulkhead connector in engine compartment.
Other Circuits - Fuse block beneath dash panel on left side.

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH

Powerglide Trans. Trucks - With selector lever in "N", loosen switch attaching screws, hold ignition switch in "Start" position and adjust position of switch until engine begins cranking. Hold switch in this position and tighten attaching screws. Check adjustment for engine cranking in "N" and "P". Engine must not start in any other position.

STOP LIGHT SWITCH

Located on brake pedal support bracket. Adjust switch so stop lights go on at 5/8" pedal pad travel.

HEADLIGHT SWITCH REMOVAL

With switch in ON position, depress switch shaft retainer button on top of switch and remove knob and shaft Remove switch ferrule retaining nut, then remove switch by pulling downward from rear of instrument panel.

TURN SIGNAL FLASHER

Located at fuse block beneath dash panel on left side.

INSTRUMENT CLUSTER & SPEEDOMETER

All instruments may be serviced after cluster removed from instrument panel. To remove cluster, disconnect all wiring, cables, hoses, and pipes from back of cluster Remove cluster housing-to-dash panel attaching screws, then remove cluster from front of panel.

ENGINE

►*For Engine Data on models with 235" & 261" 6 Cyl. Engines, see 1962 Final Data.*

ENGINE IDENTIFICATION

See "Engine Code Suffix Letters" under MODEL IDENTIFICATION.

ENGINE REMOVAL

4 & 6 Cylinder Engin s

All (Except Step Van) - *NOTE - On Synchro-mesh trucks, remove transmission before removing engine. On Powerglide trucks, leave transmission and converter in vehicle (support transmission and tie converter in place).* Drain cooling system and crankcase Remove hood. Remove air cleaner. Disconnect all lines, hoses, pipes, and linkages from engine Remove radiator and shroud, and fan. On Low Cab Forward models, remove front end sheet metal. On all models, disconnect power steering pump and lay to one side (unnecessary to disconnect hoses). Remove rocker covers and clutch cross shaft Disconnect engine from front and rear mounts (and from converter and housing on Powerglide models), then remove engine.
Step Van - Remove engine box (remove accelerator pedal), driver's seat, and floor panel between stepwells Disconnect all lines, hoses, pipes, and linkages from engine Remove battery and clutch cross shaft. Support engine, remove transmission, then remove engine through door.

GENERAL SPECIFICATIONS

Engine	ℂHP at RPM	Compr. Ratio	Bore	Stroke	Displacement
153" 4 Cyl.	75 at 4000	8.5-1	3 7/8"	3 1/4"	153 cu. ins
230" 6 Cyl	② 120 at 3600	8.5-1	3 7/8"	3 1/4"	230 cu. ins.
292" 6 Cyl.	147 at 3600	8.0-1	3 7/8"	4 1/8"	292 cu. ins.
283" V8	145 at 4200	8.5-1	3 7/8"	3"	283 cu. ins.

ℂ - Certified Net Horsepower. Stamped on truck rating plate. ② - 100 at 3200 RPM with economy carburetor option.

V8 Engines

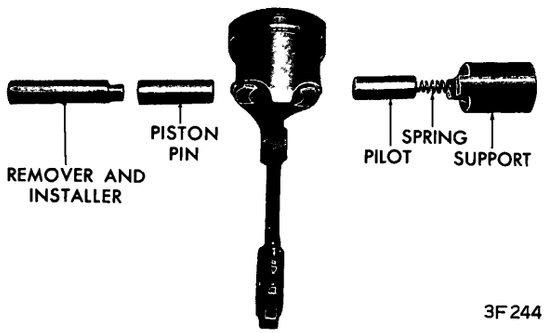
Remove transmission, drain cooling system and crankcase Remove air cleaner, radiator, and shroud Disconnect all lines, hoses, pipes, and linkages from engine. Disconnect power steering pump and lay to one side (unnecessary to disconnect hoses) Remove rocker covers. Remove fan, spacer, and pulley Disconnect engine from mounts and remove engine

OIL PAN REMOVAL

153" 4 Cyl., 230", 292" 6 Cyl. (Except Series C10, 20, 30 with 292" 6 Cyl.) - Raise and support truck, then drain crankcase. On Powerglide models, disconnect battery cables and remove starter. Remove oil pan bolts and remove oil pan.

Series C10, 20, 30 with 292" 6 Cyl. - Raise and support truck, drain crankcase, and remove starter on Powerglide models Disconnect engine front mounts. Remove radiator Raise engine and place a short piece of 2 x 4 wood block between front mounts and frame brackets Remove oil pan bolts and pan.
283" V8 - Raise and support truck, drain crankcase, remove dipstick and tube. Remove oil pan bolts and pan

CYLINDER HEAD INSTALLATION



Coat cylinder head gasket with a good grade of sealer, and also use sealer on threads of all cylinder head bolts. Tighten cylinder head bolts a little at a time in sequence shown in diagram to correct torque specifications.

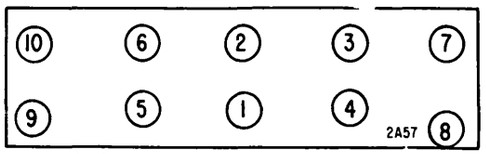
See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

INTAKE MANIFOLD INSTALLATION

4 & 6 Cyl. Engines - Torque center clamp bolts to 25-30 ft lbs , and end bolts to 15-20 ft lbs

283" V8 Engines - Tabs on rear end seal must face to outside of engine Use sealing compound around water passages on cylinder head gaskets Install a pilot in distributor mounting hole in block so manifold will be correctly aligned and to avoid pushing end seals out of place Tighten manifold attaching bolts to correct torque in sequence shown in diagram

PISTON PIN INSTALLATION



PISTON PIN REPLACEMENT

All piston pins are a press fit in connecting rod Use Tool Set J-9510 for removal and installation Remove pin using tool support and pilot Install pin as shown in illustration, using an arbor press

PISTON & ROD INSTALLATION

153" 4 Cyl., 230", 292" 6 Cyl. - Install pistons and rods in engine so cast depressions in piston head are to front of engine and oil hole in connecting rod is to camshaft side of engine

283" V8 - Install rod on piston so that flange or heavy side of rod at bearing end will be toward front of piston (marked by cast depression in piston head and 'F' mark on piston strut) on pistons 1, 3, 5, 7, and flange on rod to rear of piston on pistons 2 4,6,8 Install piston and rod assembly into cylinder bore with cast depression and "F" mark on piston strut to front of cylinder block Numbers on rods and bearing caps must be on same side Oil hole in connecting rod will then be toward center of engine

FITTING PISTONS

153" 4 Cyl., 230", 292" 6 Cyl. - With piston and cylinder clean and dry, insert 0015' x ½' ribbon feeler and inverted piston into cylinder until center of piston pin is flush with top of cylinder block, with feeler 90° from piston pin hole Pull required to withdraw feeler should be 7-18 lbs

283" V8 - Using same procedure as listed above for 153' 4 Cyl , & 230', 292" 6 Cyl , pull to withdraw feeler should be 4-6 lbs

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

① - 0008- 0024" (Rear), 0003- 0019" (Others)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

MAIN BEARING REPLACEMENT

Bearing inserts with oil holes are the upper halves of bearings. Install bearing caps with arrow on cap pointing to front of engine.

THRUST BEARING ALIGNMENT

With all main bearing cap bolts (except rear cap) tightened to specified torque, tighten rear cap bolts to 10-12 ft. lbs. Tap crankshaft to rear, then to front to align cap and bearing, then tighten cap bolts to specifications.

REAR MAIN OIL SEAL REPLACEMENT

Both upper and lower halves of seal may be replaced without removing crankshaft. Both halves of seal must be replaced as a unit. Sealing lip of seal must be well lubricated with engine oil before installation. *Keep oil off seal parting line surface as it is glue treated.*

CRANKSHAFT PULLEY INSTALLATION (4 CYL.)

Pulley is press fit on crankshaft. Use Puller J-6978 or equivalent to remove. To install, use Tool J-5590. Crankshaft extends slightly through pulley hub and a hollow tool is necessary to install pulley completely into bottomed position. *NOTE - To properly position timing mark, the two 3/8" and one 5/16" holes must be matched on hub.*

VIBRATION DAMPER REPLACEMENT (6CYL. & V8)

Damper is press fit on crankshaft. Puller J-6978 is available for this operation.

ENGINE FRONT COVER REPLACEMENT

Front cover may be removed after radiator, pulley, and vibration damper are removed. Use a suitable alignment tool to center cover when installing to prevent damage to seal and to seat seal properly.

FRONT COVER OIL SEAL REPLACEMENT

1) Front Cover Installed - After vibration damper or pulley removed, pry seal out with large screwdriver, being careful not to damage crankshaft. Install seal with open end (lip) of seal toward inside of cover, and drive into position with Tool J-8340.

2) Front Cover Removed - Pry out old seal with screwdriver. Install new seal with open end (lip) of seal toward inside of cover and drive into place with Tool J-0995 (4 & 6 Cyl.), J-996 (V8).

VALVE SPRING INSTALLED HEIGHT

Installed height of valve spring from spring seat (or shim) on cylinder head to top of valve spring shield should not be greater than maximum shown in table below. If height greater, install 1/16" shim under spring at cylinder head to bring height within limits. *Installed height must not be less than minimum specified.*

Valve Spring Height Specifications

Engine	Installed Height
153" 4 Cyl.	1 21/32-1 23/32"
230", 292" 6 Cyl.	1 21/32-1 23/32"
283" V8	1 21/32-1 45/64"

VALVE GUIDE SERVICING

153" 4 Cyl., 230", 292" 6 Cyl. - Valves with oversize stems are furnished for intake and exhaust valves in .003", .015", .030" oversizes. Use the 3/8" diameter reamers from Reamer Set J-7049 (J-7049-7 Std., J-7049-4 .003" oversize, J-7049-5 .015" oversize, & J-7049-6 .030" oversize) as necessary.

283" V8 - Valves furnished with .003", .015", .030" oversize stems. If clearance excessive, use Reamer Set J-5830 to ream valve guide holes for next oversize valve as necessary.

ROCKER ARM STUD REPLACEMENT

Studs with damaged threads may be replaced with standard size studs. Loose studs should be replaced with .003" or .013" oversize studs after reaming stud holes with Tool J-5715 (.003"), J-6036 (.013"). Remove old stud by placing Tool J-5802 over stud, installing nut and flat washer and removing stud by turning nut. Ream hole for oversize if necessary, then coat press-fit part of stud with hypoid axle lubricant. Install new stud using Tool J-6880. Tool should bottom on head (stud will be installed to correct height).

VALVES

Engine	Valve	Head Diam.	Face Angle	Seat Angle	Seat Width	Stem Diam.	Stem Clearance	Valve Lift
153" 4 Cyl.	Intake	1.715-1.725"	45°	46°	1/16-3/32"	.3410-.3417"	.0010-.0027"	.3970"

230" 6 Cyl.	2.03"	84-92 at 1.66"	166-176 at 1.33"	.....	.....
292" 6 Cyl.	2.08"	78-86 at 1.66"	170-180 at 1.26"	.....	.....
283" V8	2.08"	78-86 at 1.66"	170-180 at 1.26"	.....	.....

VALVE STEM SEALS

Used on all valves on all engines. Seal must be flat (not twisted) in groove.

HYDRAULIC LIFTERS

See illustration for arrangement of parts. Unnecessary to remove ball check valve from plunger when cleaning.

HYDRAULIC VALVE LIFTER (EXPLODED)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

CAMSHAFT END THRUST

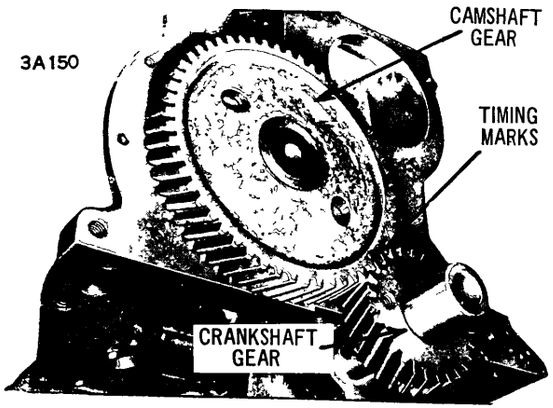
153" 4 Cyl., 230", 292" 6 Cyl. - Controlled by thrust plate between camshaft gear and cylinder block.

283" V8 - Camshaft rear thrust taken by camshaft sprocket riding on front face of cylinder block.

CHECKING CAM LOBE LIFT

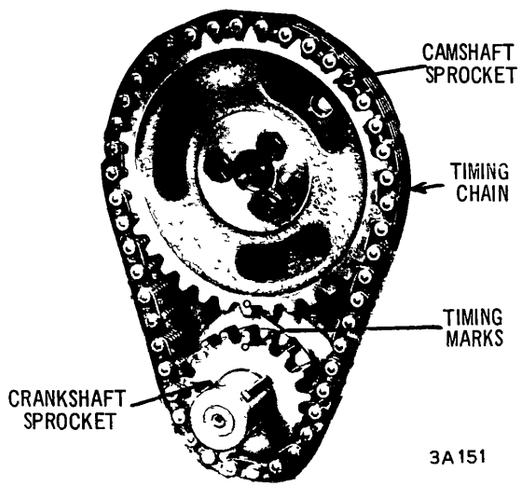
Check with dial indicator to specifications listed in Camshaft Table.

CAMSHAFT REPLACEMENT



Camshaft may be removed after radiator, grille, front end sheet metal (on appropriate models), and other necessary parts are removed. When installing a new camshaft, one 16 oz. can of "E.O.S". (Engine Oil Supplement, No. 3755788) should be added to crankcase and 2 or 3 ozs. of oil supplement poured directly on camshaft. Molybdenum Disulphide ("Molykote" or equivalent) should be applied to the foot of each valve lifter. The oil supplement may be left in engine until next regular oil change.

CAMSHAFT BEARING REPLACEMENT



Engine must be removed from truck and at least partially disassembled to replace camshaft bearings. Make sure all bearing oil holes are perfectly aligned with holes in block. On 4 & 6 Cyl. Engines, No. 1 bearing must be installed 1/8" below front face of cylinder block to uncover oil hole for timing gear oil nozzle. Also, rear bearing must be installed flush with inner edge of rear cam bearing bore in block.

CAMSHAFT

Engine	Journal Diameter	Bearing Clearance	Camshaft Endplay	Cam Lobe Lift
153" 4 Cyl	1.8687-1.8692"	.0015-.0035"	.001-.005"	Int. & Exh. .227"

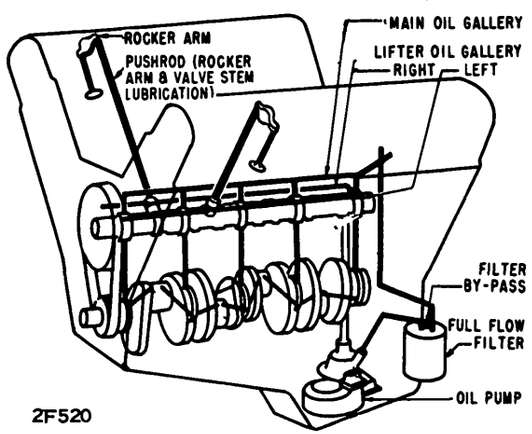
292" 6 Cyl.	1.8687-1.8692"	.0015-.0035"	.001-.005"	Int. & Exh. .228"
283" V8	1.8687-1.8692"	.0015-.0035"	.....	Int. & Exh. .2658"

4 CYL. & 230", 292" 6 CYL. VALVE TIMING MARKS

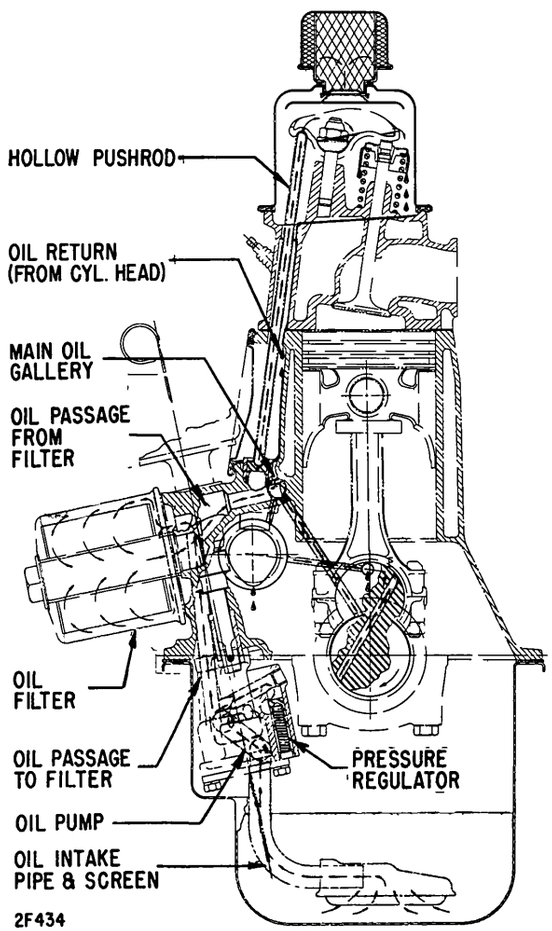
V8 283" VALVE TIMING MARKS

ENGINE OILING



Normal Oil Pressure - 35 lbs. (153" 4 Cyl., 230", 292" 6 Cyl.), 45 lbs. (283" V8) at 2000 RPM.
Pressure Regulator Valve - In pump body, not adjustable.

ENGINE OILING SYSTEM



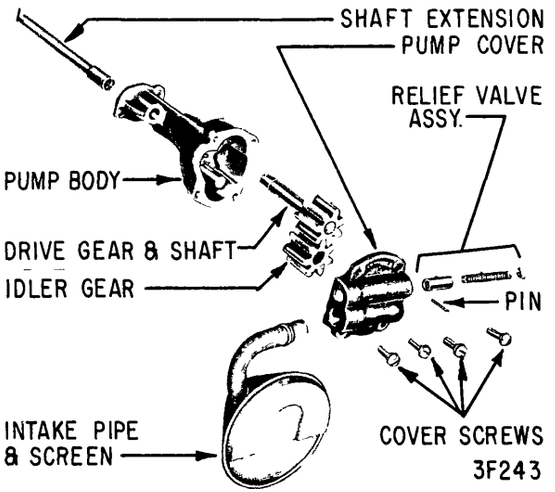
4 & 6 Cyl. Engines
Refer to illustration and note the following:
Timing Gears - Lubricated by oil flow from nozzle pressed in front face of block above crankshaft gear. Oil is fed to nozzle through cross-passage from front camshaft bearing.
Distributor Drive Gear - Lubricated by oil drainage from valve lifter compartment (drain hole directs oil onto gears).
Oil Filter - Full-flow type mounted on right side of engine. Bypass valve located in filter base.

283" V8 Engine
Refer to illustration and note the following:
Valve Lifters - Oil passage from rear camshaft bearing

(Continued)

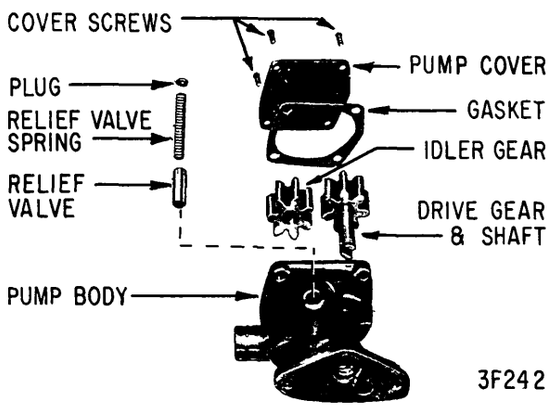
283" V8 ENGINE OILING SYSTEM

4 CYL. & 6 CYL. ENGINES OILING SYSTEM



See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

supplies oil to lifter oil galleries. All lifters intersect the gallery. Lifters contain an inertia valve which opens permitting oil to pass to hollow pushrods.



Oil Filter - Full-flow type mounted on left side of crankcase. Bypass valve located between filter and mounting pad.

OIL PUMP

See illustrations for arrangement of parts. Gear type pump mounted inside crankcase (4 & 6 Cyl.), on rear main bearing cap (283" V8). Inspect all parts for excessive wear or damage. Cover attaching screw torque is 6-9 ft. lbs.

V8 ENGINE OIL PUMP (EXPLODED)

4 & 6 CYL. ENGINES OIL PUMP (EXPLODED)

DISTRIBUTOR DRIVE SHAFT LOWER BEARING (4 & 6 CYL. ENGINES)

Bushing pressed into lower side of cylinder block (with or without thrust washer at upper end) and serves as lower bearing for distributor shaft (inside diameter), and as pilot for oil pump shaft (outside diameter). Replace bushing (and thrust washer) when distributor shaft-to-bushing clearance exceeds .0035".

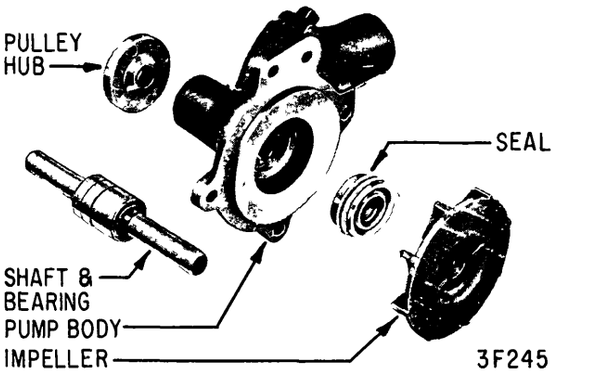
Removal - Use Tool J-9534 and slide hammer to remove bearing. Drive out thrust washer with suitable drift.

Installation - Drive new thrust washer into place with Tool J-9535. Using Tool J-9535 with driver-bolt in driver handle, install driver into new bushing from large inside diameter. Drive bushing into position. *NOTE - Proper position of bushing is determined when tool bottoms against cylinder block.* Withdraw tool from bushing. If bushing seizes on installer arbor, remove tool with slide hammer. Bushing will not be damaged, and tool is designed for this purpose.

ENGINE COOLING

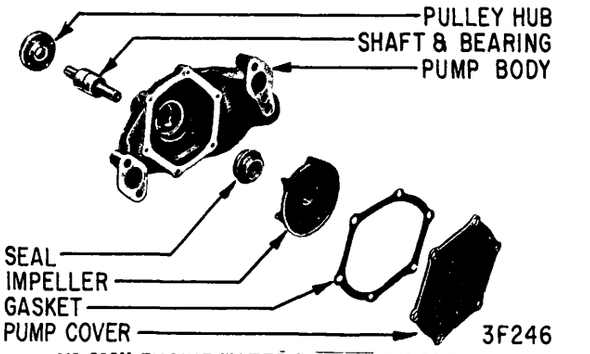
Pressure Valve - Radiator filler cap. 7 lb. or 13 lb. type, depending on truck model, engine, transmission, and other components.

Thermostat - 170° or 180° type used.



WATER PUMP

See illustrations for arrangement of parts. Be sure to use suitable drivers and supports when overhauling water pumps. Mark position of hub on shaft before disassembling pump so hub can be installed in same position. When reassembling pump, observe the following: Seal outer flange must bottom against pump body. Press hub on shaft to same mark made at disassembly, or use special Hub Locating Gauge as listed in table below. Press impeller on shaft so there is .010-.035" clearance between impeller vanes and pump body.



Pulley Hub Locating Gauge

Engine	Gauge No.
153" 4 Cyl.	J-9583

Synchro-mesh 3-Speed (Chevrolet)	2
(Borg-Warner)	2¾
4-Speed (Chevrolet)	6¼
Powerglide (Quarts)	Refill 4½
	② Dry 10½

Ⓒ - Includes Filter. Filter Capacity: ½ qt. (4 Cyl.), 1 qt. (Others). 2 qt. type optional on 292" 6 Cyl.
② - Includes Torque Converter.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

MODEL IDENTIFICATION

Body Type	Rating	Series
Conventional Cab, Panel, Cowl only	½-2 Ton	C10,20,30,50,60
Low Cab Forward	1½-2 Ton	L50,60
Forward Control & Step Van	½-1 Ton	P10,20,30
4-Wheel Drive Panel	½-¾ Ton	K10,20
Tilt Cab	2 Ton	T60
School Bus	1½-2 Ton	S50,60

SERIAL NUMBER

Stamped on a plate attached to left front body hinge pillar (except Flat Face Cowl), on left side of dash (Flat Face Cowl). Number includes following identification data:

① ② ③ ④ ⑤
S 3 C383 T 100001

① - **S** indicates 1-Ton model with ¾-Ton Special rating plate; or 2-Ton model with 1½-Ton Special rating plate. **H** indicates Heavy Duty 2-Ton model.
② - Model Year. **3** 1963.
③ - Series Designation. **C383** a model of C30 Series.
④ - Assembly Plant. *See listing below.*
⑤ - Beginning vehicle number at each assembly plant.

Assembly Plant Designation

A - Atlanta	**K** - Kansas City	**S** - St. Louis
B - Baltimore	**L** - Los Angeles	**T** - Tarrytown
F - Flint	**N** - Norwood	**W** - Willow Run
G - Framingham	**O** - Oakland	
J - Janesville	**R** - Arlington	

ENGINE NUMBER

"Engine Production Code Number" stamped on right side of engine at rear of distributor (4 & 6 Cyl.), just forward of right hand cylinder head (V8). Number includes following identification data:

① ② ③ ④
F 12 10 N

① - Engine Assembly Plant. **F** Flint. **T** Tonawanda.
② - Month of Manufacture. **12** December.
③ - Day of Manufacture. **10** Tenth.
④ - Engine Type. *See listing below.*

Engine Code Suffix Letters

Engine	①First Suffix Letter
153" 4 Cyl.	F
235" 6 Cyl.	J
261" 6 Cyl.	L
230" 6 Cyl.	N
292" 6 Cyl.	P
283" V8	M

① - Second suffix letter indicates transmission and accessory options, or model application.

FILTERS & CLEANERS

Filter or Cleaner	Service Interval (Miles)
Oil Filter (1 Qt. Type)	Replace Each Oil Change
(2 Qt. Type)	Replace 8,000
Carb. Air Cleaner	
Polyurethane Type	Clean 6,000
Oil Bath Type	Clean As Required
Front Axle Air Vent (4-Wheel Drive)	Clean 1,000
Transfer Case Air Vent (4-Wheel Drive)	Clean 1,000
Air Compressor	Clean 5,000
Fuel Filters	Replace 5,000

SERVICING AIR CLEANERS

Polyurethane Types - Clean element in kerosene, squeeze dry, then dip in engine oil and squeeze to remove excess oil. Wrap element in a clean, dry cloth and squeeze out remaining oil. *Do not shake or wring element.*

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

TUNE-UP SPECIFICATIONS

ENGINE IDENTIFICATION

Identified by suffix letters of "Engine Production Code Number" stamped on top of engine block just forward of generator-oil filter adapter as follows:

Engin	Suffix Letters
Standard ①	YC, YL, Z, ZD, V, W
Monza P.G. ②	ZH
Hi Perf. ③	YN, YM, ZF, ZG
Spyder ④	YR

① - Trade Name: Turbo-Air.
② - Monza Series with Powerglide.
③ - Trade Name: Super Turbo-Air.
④ - Trade Name: Supercharged Spyder.

AIR CONDITIONED ENGINE ACCESS

For access to engine for tune-up and other engine service on air conditioned cars without disconnecting refrigerant lines or purging system, use the following procedure:

1) Remove compressor mounting bracket pivot bolt nut and compressor-to-adjusting bracket attaching parts. Remove compressor belt. Disconnect wiring from compressor. Remove triangular bracket from front of compressor. Work mounting bracket pivot bolt forward until threaded end of bolt is out of compressor rear mounting boss. Reposition compressor in engine compartment.
2) Remove compressor belt, then remove condenser and shroud assembly-to-bracket attaching screws. Carefully lift assembly from engine and rotate toward right rear of car as far as refrigerant lines will permit.

COMPRESSION PRESSURE

At cranking speed, all plugs removed, throttle wide open. Maximum variation between cylinders 20 psi.

All ..... 130 psi

VACUUM READING

All ..... 14-18" at idle

VALVE TAPPET CLEARANCE

All ..... Hydraulic

HYDRAULIC LIFTER ADJUSTMENT (WITH ENGINE RUNNING)

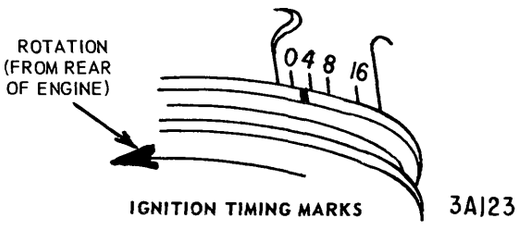
With engine at normal operating temperature and running at idle speed, back off rocker arm stud adjusting nut until rocker arm starts to clatter against valve stem, then turn nut down until clatter just stops. This is "zero lash" position. Now turn nut an additional ¼-turn and wait until engine runs smoothly. Continue to turn nut down in ¼-turn increments until nut has been turned down 1 full turn from "zero lash" position. *CAUTION - Make adjustment slowly so lifter will adjust its If and prevent engine damage.*

SPARK PLUGS

Gap (All)	.035"
Torque (All)	20-25 ft. lbs.

Spark Plug Type

Std. Engine	AC 46FF
Monza P.G. & Hi Perf.	AC 44FF
Spyder (Std.)	AC 44FF
(Competition)	AC 42FF



DISTRIBUTOR

Point Gap (All)	.019" New, .016"Used
Cam Angle (All)	31-34° (33° Preferred)
Breaker Spring Tension (All)	19-23 ozs.
Condenser Capacity (All)	.18-.25 mfd

IGNITION TIMING

Set timing with engine at idle speed, and with distributor vacuum line disconnected (except on Spyder). Degrees given are BTDC except as noted.

Engine or Trans.	Standard Setting	Allowable Range
S.M. Trans. (Exc. Hi Perf. Eng.)	4°	4-10°
Auto. Trans. (All Engines)	13°	13-18°
Hi Perf. Engine	13°	13-18°
Spyder Engine	24°	NONF

IGNITION TIMING MARKS 3A123

HOT (SLOW) IDLE RPM

Synchro-mesh (Std Engine) ①	500
(Hi Perf. Engine) ①	600
(Spyder Engine)	850
Powerglide (in "D") ①	500

① - After setting idle speed on Air Cond. cars, adjust Idle Speed-up Control.

IDLE SPEED-UP CONTROL ADJUSTMENT (AIR CONDITIONED CARS)

After idle speed correctly set (air conditioner OFF), turn idle control adjusting bolt to obtain .01" clearance between bolt head and throttle tang. Bring engine to normal operating temperature, turn air conditioner ON, and turn adjusting bolt again to obtain specified idle speed

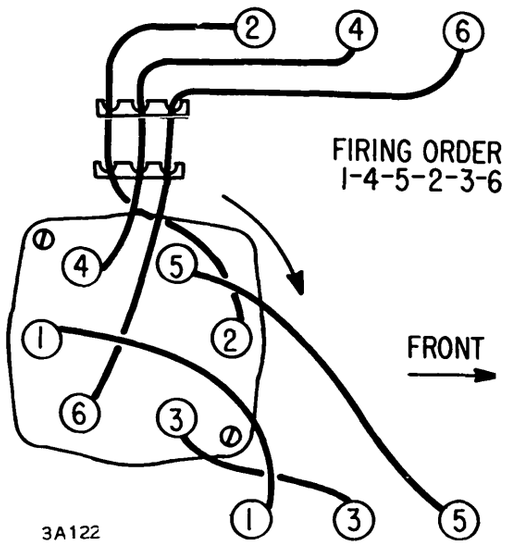
FAST IDLE RPM

Rochester "H" Carb.	See text
Carter "YH" Carb.	Not specified

AUTOMATIC CHOKE SETTING

Rochester "H" Carb.	See text
Carter "YH" Carb.	1 Lean

FUEL PUMP PRESSURE & VOLUME



Pressure	4-5 lbs. at Idle to 1000 RPM
Volume	1 Pint in 30-45 Seconds

MANIFOLD HEAT CONTROL VALVE

None used.

CLOSED CRANKCASE VENTILATION

Check operation of valve at every oil change as follows: Connect tachometer and vacuum gauge as for idle speed and mixture adjustment. With engine at idle speed, disconnect ventilation hose at air cleaner side of valve, block opening of valve and note engine speed change. If engine speed drops less than 50 RPM, valve is faulty and should be replaced.

③ - *See "Carburetor Synchronization & Adjustments" below.*

ACCELERATING PUMP

Rochester "H" & Carter "YH" - No seasonal adjustment

ACCELERATOR LINKAGE ADJUSTMENT

Passenger Cars (Except Spyder) - *Refer to illustration, and proceed as follows:* Remove mudguard over idler lever "A" on transmission, then disconnect swivel "D" from lever "A". Disconnect swivel "B" from left carburetor cross shaft lever "E". Pull rod "C" to wide open throttle (through detent on Powerglide and against stop on Synchro-mesh) and turn lever "E" to wide open throttle position (carburetor throttle lever against the stop). Adjust swivel "B" to align with hole in lever "E", then lengthen rod "C" by backing off swivel 5 full turns. Position accelerator pedal by placing a block of wood 1" thick (Synchro-mesh). 1½" thick (Powerglide) between pedal and floor mat. Hold lever "A" in wide open throttle position and turn swivel "D" to align with hole in lever "A". Install mudguard. This procedure provides proper clearance between accelerator pedal and floor mat at wide open throttle. *PROCEDURE NOTE - After above adjustment completed, proceed with carburetor synchronization, idle speed and mixture, and other adjustments as listed below.*

Spyder - With engine at normal operating temperature (or with air cleaner removed to block choke valve open), proceed as follows: Disconnect accelerator rod swivel from cross shaft lever and make sure throttle lever is against idle speed screw. Angle between throttle lever rod and bellcrank should be 126°. Adjust by changing length of throttle lever rod. Pull accelerator rod rearward against bellcrank stop on transmission, then rotate cross shaft lever to full throttle position (carburetor throttle lever against stop boss on flange). Adjust accelerator rod swivel so it just enters hole in cross shaft lever, then connect swivel to lever and install retaining clips. *NOTE - Swiv l pin sh uld be just short of cross shaft lever h l rather than just past, or linkage will be bent.* Move linkage from idle to full throttle and check that carburetor throttle lever operates correctly with no bind

Corvair "95" Trucks - *NOTE - Make carburetor cross shaft linkage adjustment as d tailed below, then proceed as follows:* Place a 3/4" spacer between floor mat and upper end of accelerator pedal and block pedal against spacer. Rotate carburetor cross shaft lever for wide open throttle position, then unsnap accelerator cable adjustment rod clip and rotate adjusting rod to remove all slack from cable. Install clip. Return accelerator pedal and carburetor cross shaft to idle position and disconnect return spring from accelerator pedal lever. Clearance between accelerator lever and cable shield with lever arm held up to remove freeplay should be 1/8". Adjust by moving shield in desired direction, then tighten mounting screws. Install pedal return spring (cable shield should not act as a pedal lever stop) Cable in engine compartment should now have some slack at idle to allow engine to return to idle speed. *PROCEDURE NOTE - On Pow rglid models, proceed with "Thr ttl Valv Linkag Adjustment" below. On Synchro-m sh mod ls, proceed with idle speed and mixture, and th r adjustments as detailed below.*

Throttle Valve Linkage Adjustm nt - After accelerator control linkage adjustment correctly made (see above), disconnect throttle valve rod at carburetor cross shaft lever and rotate cross shaft to wide open throttle position. Pull throttle valve rod so throttle valve is through the detent and adjust swivel on rod to just enter hole in cross shaft lever, then lengthen rod 5 full turns and connect to lever. *Proceed with idl speed and mixture, and other adjustm nts as d tailed below.*

CARBURETOR SYNCHRONIZATION & ADJUSTMENTS (EXCEPT SPYDER)

PROCEDURE NOTE - Make acc l rator and throttl valve linkage adjustments (s abov), th n mak following adjustments exactly in th order list d.

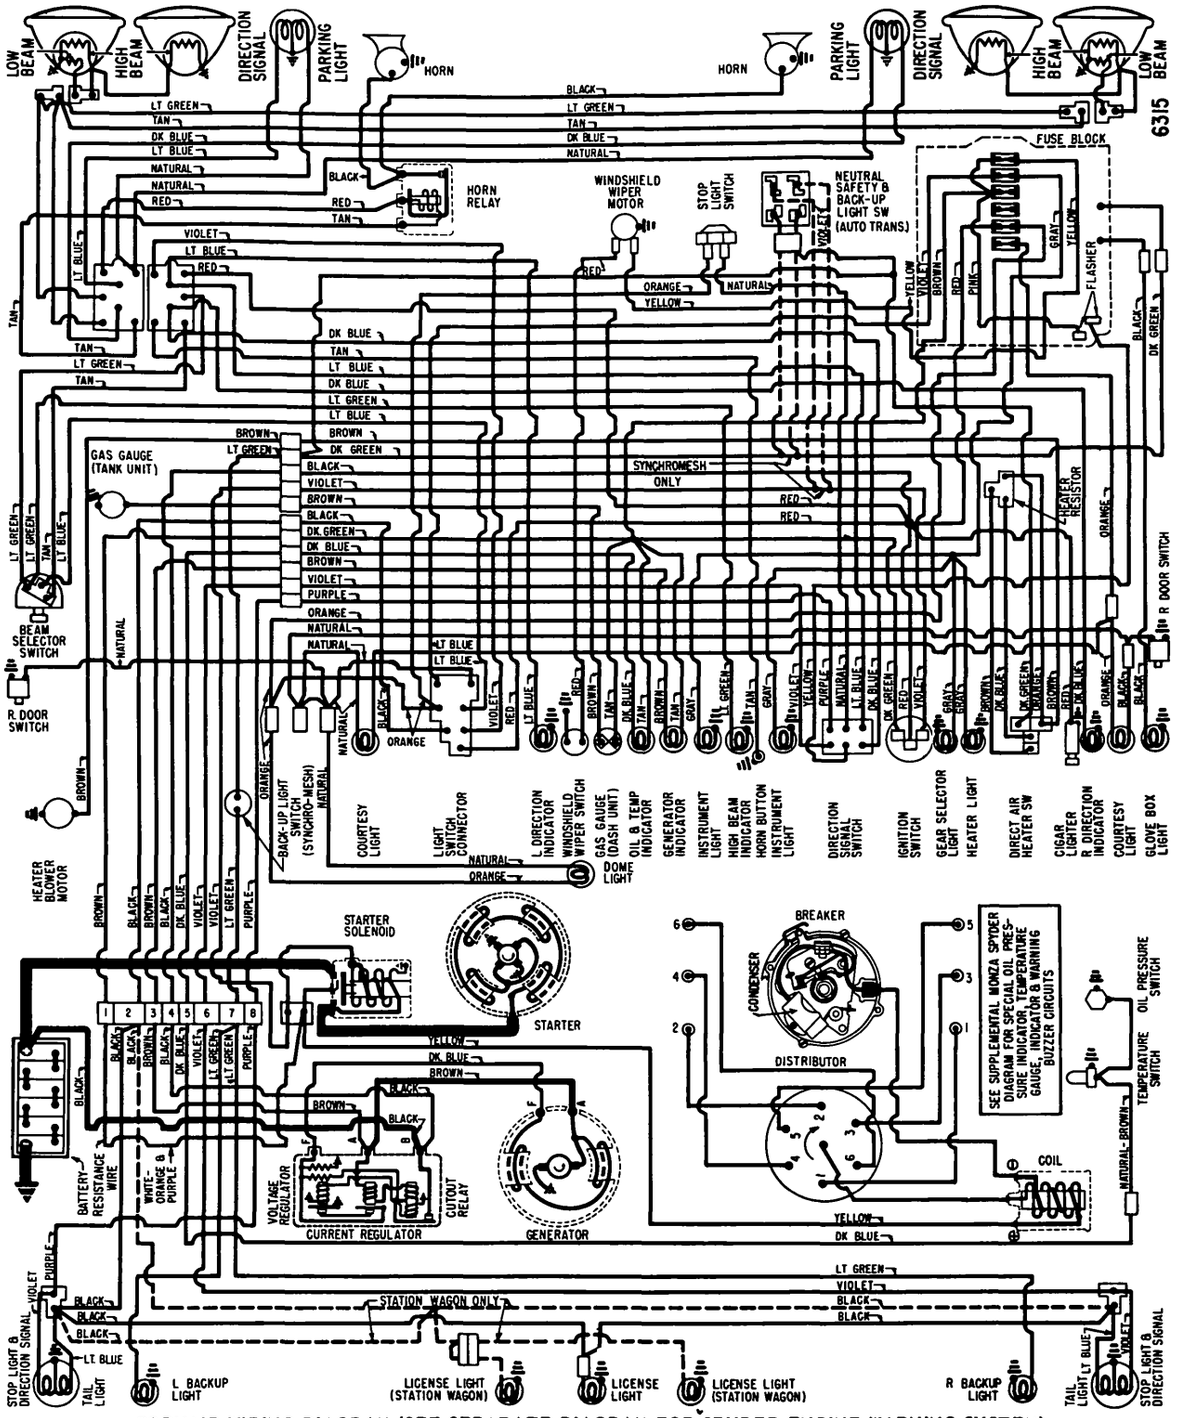
Synchronization (Cross Shaft Adjustm nt) - Make following adjustments on each carburetor in sequence with both throttle rods disconnected at cross shaft, choke control rods disconnected at choke levers, and engine off: Back off idle speed screw from throttle lever and open choke valve so throttle lever does not ride fast idle cam. Insert a .003" feeler gauge between idle speed screw and throttle lever, turn screw in until it just contacts gauge, and then 1½ additional turns to

(Continued)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

set throttle valve. Turn idle mixture screw out 1½ turns from a lightly seated position. Connect right carburetor throttle rod to cross shaft lever. On left carburetor, rotate cross shaft (with accelerator rod) so right carburetor throttle valve is completely closed. Adjust throttle rod in swivel so rod freely enters hole on cross shaft lever, then shorten rod 1 full turn and connect to lever. *NOTE - It may be necessary to hold choke valve open so fast idle cam is clear of throttle lever.*

Preliminary Idle Mixture & Speed Adjustment - Bring engine to normal operating temperature, make sure ignition timing is correct, connect a vacuum gauge to adapter on vacuum balance tube, and a tachometer to engine. Adjust idle speed screw on each carburetor as close to 500 RPM (Powerglide in "D"), 600 RPM (Hi Perf. Engine with Synchro-mesh) as possible. Adjust idle mixture screws for highest steady vacuum.



Vacuum Balance Check - Remove choke diaphragm hose from each carburetor base adapter and connect equally calibrated vacuum gauges to each adapter. *CAUTION - Do not turn tubing in carburetor body.* With engine running at idle speed, note difference in vacuum at each carburetur. If difference 1" or less, carburetors are synchronized. If difference more than 1", adjust left carburetor throttle rod 1 turn (up to increase left carburetor vacuum, down to decrease vacuum). *Adjust by disconnecting rod at cross shaft and rotating in swivel. NOTE - Higher vacuum reading preferred on right carburetor (spark advance side). CAUTION - Move cross shaft by grasping accelerator rod only or geometry and synchronization will be upset. Remove gauges and replace choke diaphragm hoses.*

Final Idle Mixture & Speed Adjustment - *Make sure air cleaners are installed.* Connect vacuum gauge to vacuum balance tube adapter and adjust idle speed and mixture screws on each carburetor for highest steady vacuum reading between 14-18". *NOTE - On Air Conditioned cars, adjust Idle Speed-up Control next (see "Tune-Up Specifications").*

Fast Idle - *Make this adjustment after idle speed correctly set.* Stop engine and place throttle lever on second highest step of fast idle cam. Bend tang on throttle lever to obtain .078" clearance between idle speed screw and throttle lever. Recheck idle speed.

Choke Vacuum Diaphragm - With diaphragm arm squarely against diaphragm, clearance between lower edge of choke valve and wall of air horn should be .160-.175". Disconnect and bend diaphragm link to adjust. *NOTE - Throttle lever fast idle tang should rest on second highest step fast idle cam. Bend outer choke shaft lever tang to adjust.*

Choke Rod Adjustment - Stop engine and disconnect choke control rod at choke shaft lever. With choke valve held closed, pull control rod up against stop in thermostat bracket and adjust control rod until it freely enters hole in choke shaft lever, then lengthen rod 2 full turns. *CAUTION - Turn rod in vertical portion only, do not crank at offset part.* Check choke position after engine at operating temperature. Choke valve should be open and fast idle cam clear of throttle lever.

CORVAIR WIRING DIAGRAM (SEE SEPARATE DIAGRAM FOR SPYDER ENGINE WARNING SYSTEM)

ELECTRICAL

BATTERY

12 Volt

Battery Ground - Negative. to body and generator.
Engine Ground - Left and right sides of engine to body.

STARTER

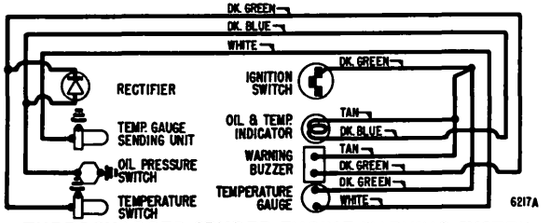
Delco-Remy 1108306, 307

Torque	RPM	Volts	① Amperes
0 ft. lbs.	6750-10500	10.6	58-80
	Lock	4.0	280-320

① - Includes Solenoid.
Brush Spring Tension - 35 ozs. minimum.

STARTER REMOVAL

NOTE - Following procedure is recommended as easiest method of removal and installation. Disconnect battery and raise and support car. Disconnect rear throttle control rod from transmission bellcrank, and from carburetor cross shaft. Disconnect starter solenoid wires (use ¼" drive midget socket set). With a 3/8" drive, 9/16" shallow socket on a 9" extension with ratchet, remove **upper** starter mounting bolt. Then remove lower bolt. Pull starter forward and remove from engine compartment.



GENERATOR

Delco-Remy No.	Amperes	Volts	Gen. RPM
1102226, 227	30	14.0	2240
1105135	35	14.0	1730

Field Current - 1.69-1.79 amps. (1102226, 227) 2.73-3.0 amps. (1105135) at 12 volts and 80° F.
Brush Spring Tension - 28 ozs.

GENERATOR INSTALLATION

CAUTION - If preload on generator exists, end frame will break. To prevent this condition, use following installation procedure exactly. Tighten generator-to-adapter bolts to 15-22 ft. lbs. and loosely assemble mounting bracket-to-generator bolt and nut (at commutator end of generator). Bracket must be able to move. Tighten generator bracket-to-cylinder head bolts finger tight. Now tighten bracket bolt at commutator end of generator to 8-11 ft. lbs. Tighten front bracket-to-cylinder head bolt to 15-22 ft. lbs. and rear bolt to same torque.

TURBOCHARGED SPYDER ENGINE WARNING SYSTEM

GENERATOR REGULATOR

Delco-Remy 1119001E (30 Amp.), 1119604 (35 Amp.)

Cutout Relay

Cuts In - 11.8-13.5 volts (1119001E), 11.8-13.0 volts (1119604).
Contact Gap - .020".
Air Gap - .020" with contacts just closed.

Voltage Regulator

Setting (1119001E) - 13.8-14.7 volts at 125°F.
Setting (1119604) - 13.8-14.6 volts at 125°F operating on upper contacts, .1-.3 volt lower operating on lower contacts.
Contact Gap (1119604) - .016" (upper contacts) with lower contacts just touching.
Air Gap - .075" (1119001E), .080" (1119604) with armature pressed down to point where contacts just touch.

Current Regulator

Setting - 27.0-31.0 amps. (1119001E), 31.0-35.5 amps. (1119604) at 125°F ambient temperature.
Air Gap - .075" with armature pressed down to point where contacts just touch.

FUSES & CIRCUIT BREAKERS

Headlight Circuit - 15 amp. circuit breaker integral with headlight switch.
Air Conditioner Circuit - Two 15 amp. fuses in gray wires near ignition switch.
Other Circuits - Fuse block beneath dash panel.

BELT ADJUSTMENT

Blower Belt ..... ② 3/8-7/16" deflection or ① 75±5 lbs.
Air Cond. Belt ..... ③ 1/2-3/4" deflection

① - Using a tension gauge.
② - With moderate thumb pressure.
③ - Under 15 lb. load.

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH

Loosen two switch mounting screws and place transmission selector lever in "N" position. Turn ignition switch to "Start" position, then move neutral switch fore and aft until engine begins to crank. Secure switch in that position. Recheck to make sure engine will not start with transmission selector lever in any position other than "N"

STOP LIGHT SWITCH

Located under instrument panel. Adjust switch in mounting bracket so electrical contact is made when brake pedal depressed ½-¾" from fully released position.

TURN SIGNAL FLASHER

Located on fuse block beneath instrument panel.

LIGHTING SWITCH

To remove switch, disconnect battery ground cable and pull switch to ON position. Depress switch shaft retaining button (top of switch under instrument panel) and remove shaft and knob. Remove switch retaining ferrule and bezel and remove switch.

INSTRUMENT CLUSTER

Passenger Cars - *NOTE - On Spyder mod ls, instrument cluster must be removed for access to individual instruments. On other models, individual bulb sockets and fuel gauge may be removed without removing cluster.* Disconnect battery ground cable and disconnect connectors from back of cluster. Pull wiring harness out of retaining clips on cluster. Disconnect speedometer cable. Remove lighting switch (see above). Remove cigarlighter attaching nut from behind panel and remove lighter. Lower the mast jacket and steering wheel, or remove steering wheel. Remove the 11 instrument panel attaching screws (2 screws attach from rear), and remove cluster, instrument center panel and seal by pulling straight out and turning slightly to clear transmission range selector.
Greenbrier & Trucks - Disconnect battery ground cable. On Powerglide trucks, remove "C" clip holding transmission cable assembly to transmission control assembly. Remove cable assembly attaching nut from control support arm. Move selector lever to "Low". On all trucks, remove speedometer cable and cluster attaching screws. Remove cluster from instrument panel, disconnect cluster wiring and remove from truck. *NOTE - When installing, Powerglide selector lever must be in full DOWN position.*

ENGINE

ENGINE IDENTIFICATION

See "Engine Code Suffix Letters" under MODEL IDENTIFICATION.

CYLINDER & BEARING NUMBERING

All reference to engine and components is to position installed in car. FRONT of engine is flywheel end toward front of car, REAR of engine is accessory drive end toward rear of car. Crankshaft and camshaft bearings are numbered from rear of car (No. 1 bearing is at accessory drive end of engine). *Engine rotation, viewed from rear of car, is counterclockwise.*

GENERAL SPECIFICATIONS

Engine	HP at RPM	Compr. Ratio	Bore	Str ke	Displacement
Standard ①	80 at 4400	8.0-1	3.4375"	2.60"	145 cu. ins.
Monza P.G. ②	84 at 4400	9.0-1	3.4375"	2.60"	145 cu. ins.
Hi Perf. ③	102 at 4400	9.0-1	3.4375"	2.60"	145 cu. ins.
Spyder ④	150 at 4400	8.0-1	3.4375"	2.60"	145 cu. ins.

① - Trade Name: Turbo-Air. ② - Monza Series with Powerglide.
③ - Trade Name: Super Turbo-Air. ④ - Trade Name: Supercharged Spyder.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE (Continued)

ENGINE DESCRIPTION

6 Cyl., horizontally opposed, overhead valve, air-cooled aluminum engine of same design used previously. Cylinders are individual cast iron type with integral cooling fins. The crankcase is vertically divided into halves through the centerline of crankshaft and camshaft. Crankcase must be separated for service on either crankshaft or camshaft. Camshaft journals ride directly on machined base metal of crankcase and bearing inserts are not used. Camshaft exhaust valve lobes are twice the width of intake lobes and actuate a pair of exhaust valve lifters.

ALUMINUM ENGINE SERVICING

Extreme caution must be observed when working on aluminum engines to prevent damage by scratching, nicking, or scoring. Carefully note the following:

1) Do not drop or slide machined surfaces on bench or floor.
2) Do not use gasket cement unless specifically indicated.
3) Lubricate all bolts or screws entering an aluminum part with Permatex No. 404 Anti-Seize Compound (or equivalent) to prevent thread seizure and damage.
4) Tighten bolts and nuts to the specified torque. DO NOT OVERTIGHTEN. Torque values are for clean lubricated threads.

ALUMINUM THREAD REPAIR

A thread repair kit, Part No. 3780960, is available for repairing stripped or damaged threads in aluminum parts.

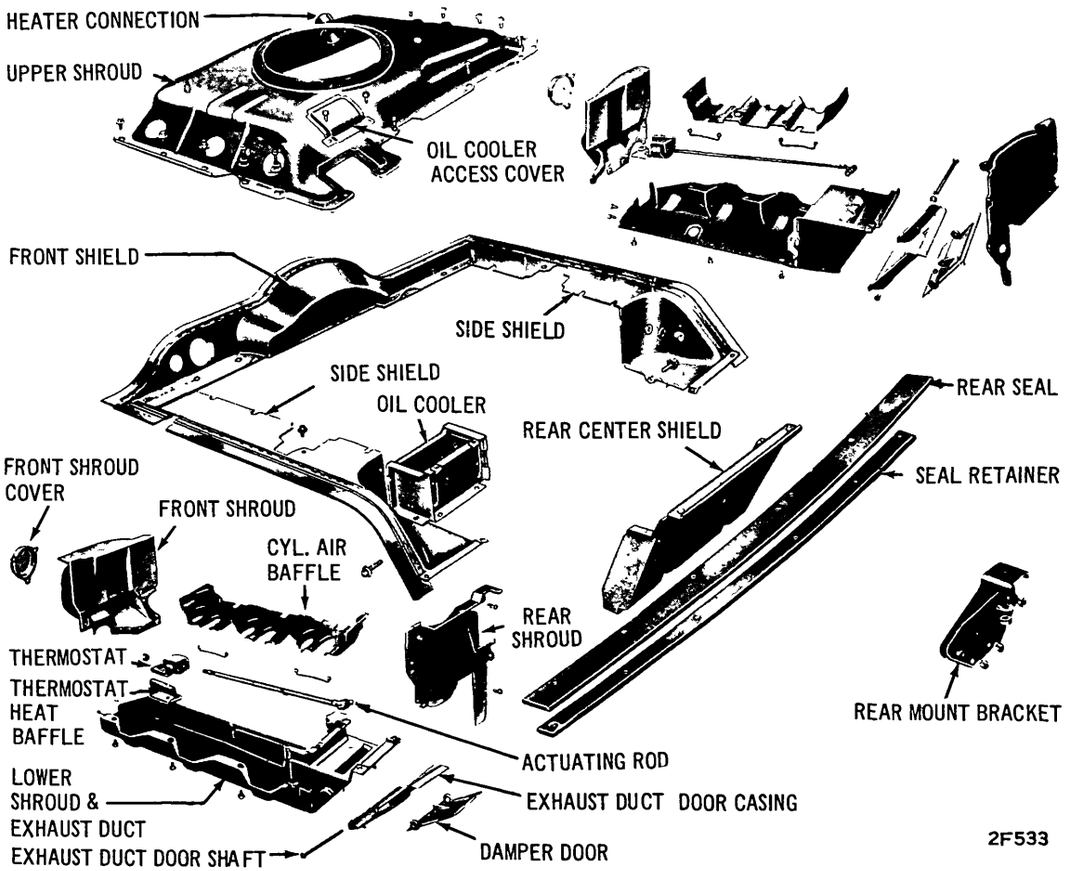
POWER TRAIN

POWER TRAIN REMOVAL

Complete assembly (engine, transmission, rear axle) must be removed from car as a unit. To separate transaxle from engine, see "Corvair Transaxle" in Transmission Section. On Spyder (Supercharged), first remove supercharger and carburetor assembly, and disconnect manifold pressure tube at manifold and thread through front shield as engine is raised or lowered. Proceed as follows:

Passenger Cars

1) Remove spare tire (coupe & sedan), engine access cover (station wagon). Remove carburetor air cleaners. Disconnect air heater return air hose. Remove engine-to-body front seal retainer. Disconnect left carburetor return spring and throttle rod at cross shaft. Disconnect main choke cable at firewall.
2) Make the following electrical disconnections: Battery positive terminal cable, generator ground strap and leads to voltage regulator, ignition leads from starter motor harness connector, right and left engine-to-body ground straps, coil and oil and temperature switch wires.
3) Raise car on hoist and remove battery cable and ignition leads from starter solenoid. Remove engine rear grille and skid plate, rear and side seal engine retainers. Disconnect parking brake spring from cross-member. Pull choke cable forward to clear front engine mount. Disconnect accelerator control rods at idler lever and push lever-to-carburetor rod into engine compartment. Disconnect fuel line and speedometer cable. Disconnect air heater flexible hoses from engine. Disconnect gasoline heater fuel line.
4) Remove axle shafts (see Rear Axle Section), and pull universal joints from differential carrier.
5) On Synchro-mesh cars, disconnect shift tube coupling at transmission shifter shaft, then loosen coupling clamp nut and push shift tube coupling into tube until clear of engine front mount. Disconnect clutch return spring and clutch pull rod. Remove clutch cross shaft from front mount. Unfasten clutch cable sheath clamp from engine front mount and drop clutch cable and cross shaft clear of power train. Remove back-up light switch from 4-speed transmission housing (switch is below normal oil level).
6) On Powerglide cars, disconnect transmission shift cable from transmission case. Rotate transmission



(Continued)

ENGINE NOTES

► *CAMSHAFT REPLACEMENT NOTE:* When camshaft is being replaced, manufacturer recommends that a 16 oz. can of Engine Oil Supplement, No. 3755788, be added to crankcase (pour 2 or 3 ozs. directly on camshaft if possible). Also, apply molybdenum disulphide ("Molykote" or equivalent) to foot of each valve lifter when camshaft installed (especially important on high performance engines).

► *TURBOCHARGED ENGINE NON-INTERCHANGEABILITY:* Because of specially designed parts in this engine, DO NOT remove supercharger and attempt to install on another engine.

► *1960-63 EXHAUST VALVE REPLACEMENT RECOMMENDATIONS:* On Pass. Cars, where exhaust valve life is unsatisfactory, manufacturer recommends that exhaust valves (and keys) furnished for Turbocharged engines be installed on all engines. On Trucks, use 1963 stellite exhaust valves with rotators for service replacement on 1961-62 engines to increase valve life.

CORVAIR ENGINE SHROUDING (TYPICAL)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

throttle valve lever fully counterclockwise and remove cable from transmission case. Remove transmission filler tube (use a container to catch oil).

7) Position a hydraulic transmission jack stand under engine assembly, using Tool J-7894 (adapter), and lock tool in place with attached locking knob and additional bolt and nut. Remove cotter pins and castellated nuts from front engine mount (at transmission) and from rear engine mount *NOTE* - If front mounting bracket and shims are removed from transmission, the same amount of shims removed must be replaced Rear "toe-in" will be affected if shims are changed Lower power train gradually and watch for possible interference at rear mount and left rear lower control arm. Remove exhaust pipe and muffler assembly.

Trucks

Procedure is same as for passenger cars except as noted below:

On Synchro-mesh trucks, disconnect clutch return spring at clutch housing and at pull rod idler lever. Remove clutch cable retainer from engine front mount, then remove pull rod clevis, idler lever and cable clevis. On Powerglide trucks, disconnect transmission oil cooler lines at transmission.

ENGINE SERVICE

CRANKCASE & CYLINDER HEAD STUD REPLACEMENT

Coat stud threads with anti-seize compound (see "Service Cautions" above), and install into cylinder head or crankcase with special detail of Tool J-8354 to projected length as follows: *NOTE - Measure projected length from shoulder of tool (installed on stud) to surface of crankcase or cylinder head.*

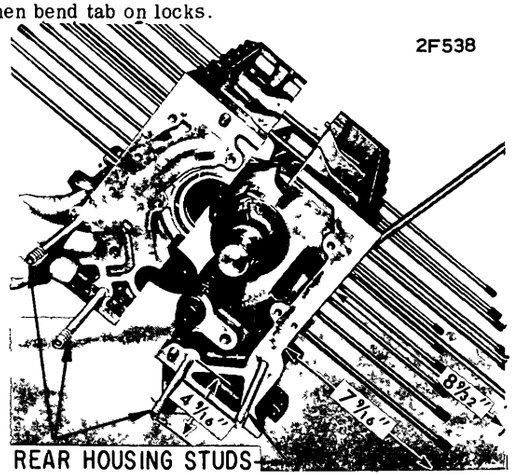
CYLINDER STUD TORQUE NOTE - Maximum torque should be 30 ft lbs., minimum torque 10 ft. lbs. If under 10 ft. lbs , install either .003" or .006" oversize studs as necessary

Stud	Projected Length	Tool Detail
Carb. Mounting (Outboard)	4 3/16"	2
Carb. Mounting (Inboard)	1 5/8"	2
Exhaust Manifold	31/32"	3
Cylinder (Long - Upper)	8 9/32"	1
Cylinder (Short - Lower)	7 9/16"	1
Rear Housing Mounting	4 9/16"	3
Distributor Holding	1 1/8"	

EXHAUST MANIFOLD SLEEVE REPLACEMENT

CAUTION - Remove sleeves from cylinder head only if absolutely necessary. Remove sleeves by turning gradually with a pipe wrench **Do not** pry or tap sleeves to remove. To install, coat new sleeves with anti-seize compound (see above) Insert sleeves into dry ice for about 10 minutes and at same time heat cylinder head to 200°F (do not use open flame). Remove sleeves from dry ice and tap into cylinder head bores making sure sleeves are true with bores. *NOTE - Replacement sleeves furnished Std., 002", & .010" Oversize.*

TIGHTENING SPECIFICATIONS



►*TIGHTENING CAUTION: Due to use of aluminum crankcase, rear housing, cylinder heads, and other parts, bolt and stud torques must be held as close as possible to specifications in table below to avoid overstress of base metal parts and stripped threads.*

	Inch-Lbs.	Ft. Lbs.
Cylinder Head		ℂ 35
Exhaust Manifold		23-27
Rocker Arm Stud		ℂ 35
Rocker Arm Stud Nut	55-125	
Rocker Arm Cover	30-50	
Oil Pan	40-60	
Oil Cooler		8-12
Oil Cooler Adapter		7-13
Oil Cooler Shroud	60-80	
Oil Pump Cover	60-80	
Oil Filter & Gen. Adapter		7-13
Connecting Rod Caps		20-26
Crankcase Rear Housing		7-13
Crankcase Halves (7/16")		42-48
Crankcase Halves (5/16")		7-13
Crankcase Cover		7-13
Drive Flange or Flywheel		20-26
Flywheel Housing		20-30
Engine Rear Mount Bolt		50-60
Engine Rear Mount Bracket Nut		40-50
Engine Front Insulator-to-Frame		25-35
Engine Front Mount Bracket-to-Trans.		20-30
Engine Front Insulator-to-Bracket		60-80
Engine Rear Shrouds	60-80	
Skid Plate-to-Rear Housing		20-30
Clutch Cover		15-20

ℂ - Supersedes previous 27-33 ft lbs

EXHAUST MANIFOLD INSTALLATION

Place manifold on sleeve gaskets, tap manifold lightly to insure alignment with gaskets, then firmly seat manifold with a soft hammer Install manifold clamps and french locks Torque attaching nuts to 23-27 ft. lbs , then bend tab on locks.

CRANKCASE STUD DIMENSIONS

ENGINE MOUNTS

Front Mount Removal - Remove clutch lever control cable cross shaft ball stud at front mount bracket, or Powerglide control cable Support engine and remove insulator-to-bracket nuts Remove shift rod coupling from transmission shift rod Lower engine about 2" so front engine bracket clears mount stud Disconnect parking brake cable from mounting bracket. Remove front mount and insulator *CAUTION - Shims between transmission and mounting bracket control rear wheel toe-in and must be replaced in original positions.*

Rear Mount Removal - Support engine and remove rear center shield Remove bracket-to-skid plate nuts, lower engine and remove engine-to-bracket mount assembly

CRANKCASE COVER, BLOWER & BLOWER BEARING REMOVAL

1) Disconnect battery ground strap, accelerator and fuel lines, then remove oil level gauge and carburetor air cleaners and supports Remove spare tire Remove carburetor vacuum balance tube and retaining strap at engine upper shroud assembly and front shield

2) Remove pulley belt and distributor wire harness, then remove carburetor cross shaft and choke cable assembly from carburetors Disconnect generator brace and swivel it away from upper shroud Remove engine upper shroud

3) Remove four retaining bolts from blower pulley and remove pulley and blower from bearing hub assembly Remove crankcase cover and blower bearing assembly as a unit Remove crankcase-to-crankcase vent gasket and crankcase vent

Blower Bearing Replacement - Use hypoid lubricant on bearing shaft and press bearing on crankcase cover so distance from crankcase cover gasket rail to top surface of large diameter of hub assembly is 4 15/32-4 31/64"

OIL COOLER REMOVAL

Remove all screws retaining cooler to engine shrouds, shields and cylinder head, then remove oil cooler access hole cover and remove long oil cooler mounting bolt.

OIL PAN REMOVAL

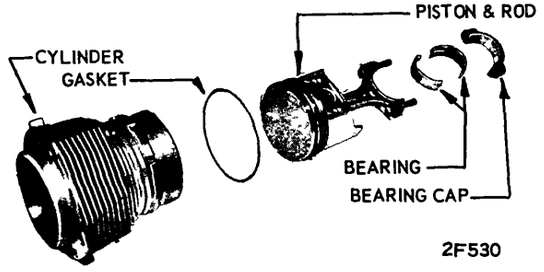
Drain crankcase and remove oil pan retaining bolts Remove pan

CYLINDER HEAD

Removal - *When removing right hand cylinder head, disconnect coil, oil pressure and cylinder head temperature sending unit wires in addition to following procedure*

1) Drain crankcase and disconnect battery cables from battery and generator. Disconnect radio ground strap. Remove air cleaner, accelerator return spring and air cleaner support. Disconnect accelerator rod from carburetor and remove cross shaft retainer at shaft support. Disconnect cross shaft support from carburetor. Disconnect fuel line and choke cable from carburetor. Remove carburetor and long (outboard) carburetor mounting stud from manifold. Disconnect vacuum balance tube from intake manifold.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes



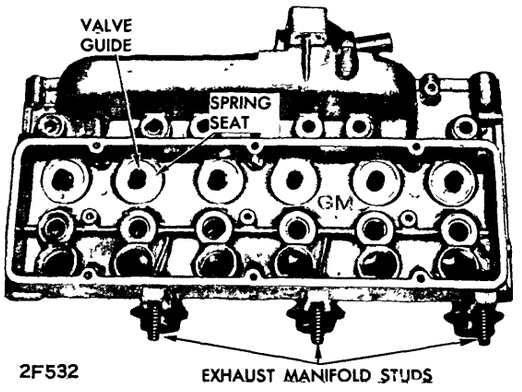
2) Disconnect generator mounting bracket and swivel bracket up and away from engine upper shroud. Remove spark plugs. Remove engine side shield. Remove oil cooler.

3) Raise car on a hoist and attach Tool J-7894 (adapter) to underside of engine. Remove both engine side seal retainers and rear seal retainers. Remove engine rear center shield and seal assembly. Remove lower engine shroud and exhaust duct, then remove exhaust pipe-to-manifold nuts and remove exhaust manifold. Remove engine rear mounting nut and washer from below body rear mounting bracket.

4) Remove valve rocker cover (catch oil draining from cylinder head), then remove rocker arms, pushrods, rocker arm studs and pushrod guides. Remove "O" rings from cylinder head and from bottom of pushrod drain tubes, then remove drain tubes.

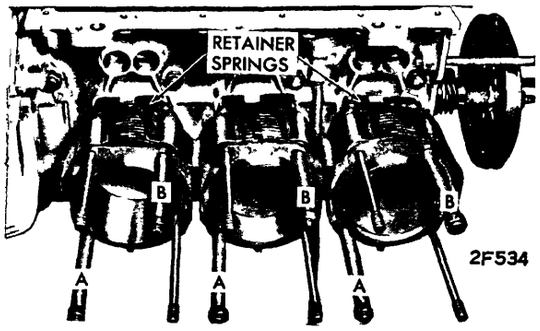
5) Remove cylinder head nuts and flat washers, then carefully lower engine assembly approximately 3" to clear cylinder head carburetor flange. Remove cylinder head from crankcase studs.

► *CAUTION - Do not rotate crankshaft with cylinder head removed unless holding fixtures are installed on studs to hold cylinder in place. ½" O.D. steel tubes 4¼" long should be installed on one long stud and ½" O.D. steel tubes 3½" long should be installed on one diagonally opposite short stud of each cylinder. See illustration.*



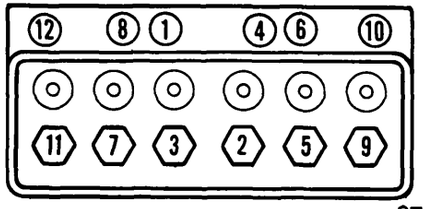
PISTON & CYLINDER ASSEMBLY (EXPLODED)

CYLINDER REMOVAL



NOTE - The cylinders can be removed with the engine in the car. Remove the cylinder heads and install holding fixtures (see above). Remove crankcase cover and blower assembly (see above). Remove cylinder air baffles (secured by retainer spring clips at base of cylinder). Turn crankshaft and remove connecting rod caps. Remove cylinder holding fixture and remove cylinder, piston and rod as an assembly. *NOTE - If desired, cylinder can be removed without removing piston and connecting rod. In this case, use Tool J-8356 to compress piston rings when installing cylinder.*

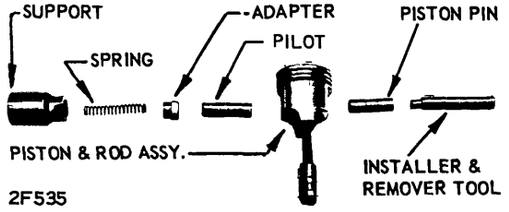
Installation - Install new copper gasket over cylinder pilot and install cylinder into crankcase. Reverse removal procedure.



CORVAIR CYLINDER HEAD

Installation - To install head, reverse removal procedure and note the following: Use anti-seize compound such as Permatex No. 404 or its equivalent on the threads of all bolts, studs and capscrews entering aluminum parts. Tighten cylinder head retaining nuts and rocker arm stud nuts (rocker arm studs have internal threads at lower end that thread over cylinder head studs and act as cylinder head nuts) to 27-33 ft. lbs. in the sequence shown in diagram.

CYLINDER HOLDING FIXTURES



CYLINDER HEAD TIGHTENING SEQUENCE

PISTONS, PINS, RINGS

Engine	PISTONS Clearance	PINS Piston Fit	PINS Rod Fit	RINGS Ring	RINGS End Gap	RINGS Side Clearance
All	① .0011-.0015"	.00015-.00025"	②	Comp. 1 Comp. 2 Oil	.010-.020" .010-.020" .010-.020"	.0012-.0032" .0012-.0032" .002-.0035"

① - Measured 2.20" from top of cylinder bore. ② - Press Fit. *See "Replacing Pins".*

PISTON PIN INSTALLATION

REPLACING PISTON PINS

Use Tool Set J-6994 & Pilot J-8355-4 to remove and install piston pin in piston and connecting rod (see illustration). When installing, press pin in until pilot of tool bottoms on adapter and support.

INSTALLING PISTONS

Install piston with notch on top of piston toward front (flywheel end) of engine on both banks.

INSTALLING PISTON RINGS

Install rings with identification marks and inside bevel away from top of piston.

CRANKCASE & BEARINGS

FLYWHEEL HOUSING

Crankshaft Front Oil Seal Replacement - Tap out old seal, clean surface in housing and check for nicks. Coat beaded outer surface of seal with lubriplate and install with Tool J-2221-A or suitable installer. *CAUTION - Sealing lips of seal must be packed with a good grade of cup grease with a minimum melting point of 350°F.*

ENGINE REAR HOUSING REPLACEMENT

Observe the following points:

1) Grooved pin holding oil pump pressure regulator valve must be installed with a suitable drift.

2) Oil pump gallery plug must be flush with counterbore (use sealing compound).

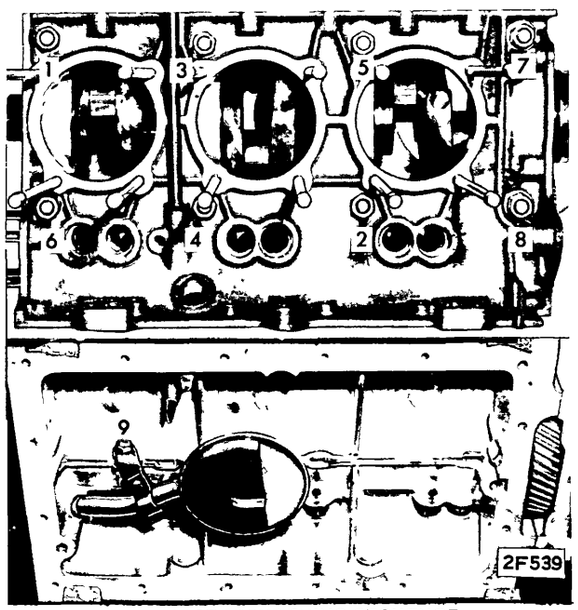
3) Distributor holding stud should project 1 1/8" from distributor mounting pad on housing.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

CONNECTING ROD BEARING REPLACEMENT

Bearings can be replaced without removing engine from car. Remove crankcase cover and blower assembly (see above). Remove spark plugs. Remove connecting rod bearing caps (turn crankshaft to position rods for access to cap bolts).

CRANKSHAFT PULLEY REMOVAL



Following procedure supersedes previous recommendations. Rework Crankshaft Pulley Remover J-6978-1 by drilling two 7/16" holes through puller. Place holes 180° apart on a 2¼" circle which is concentric with screw hole in center of tool. Proceed as follows:

1) Raise and support rear of car. Loosen blower belt, remove oil filter assembly, and remove engine grille. Remove engine rear sealing strip retainer and sealing strip, then remove engine rear center shield.

2) Support rear of engine, disconnect and remove rear engine mount and remove mount bracket from engine. *NOTE - On trucks, lower rear of engine to obtain sufficient clearance.* Remove pulley attaching bolt, then remove pulley using reworked Puller J-6978-1 (see above).

CRANKSHAFT REAR OIL SEAL REPLACEMENT

Tap out old seal from rear housing, clean surface in housing and check for nicks. Coat beaded outer surface of seal with lubriplate and install with Tool J-270-6 or suitable installer. *CAUTION - Sealing lips of seal must be packed with a good grade of cup grease with a minimum melting point of 350°F.*

CRANKCASE TIGHTENING SEQUENCE

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

	MAIN BEARINGS				CONNECTING RODS		
Engine	Journal Diameter	Clearance	Thrust Bearing	Endplay	Journal Diam.	Clearance	Sid play
All	1 & 2 2.0978-2.0988" 3 & 4 2.0983-2.0993"	.0012-.0027" .0007-.0022"	Rear	.002-.006"	1.799-1.800"	.0007-.0027"	.005-.010"

CAMSHAFT

Hi Perf. & Spyder	1.1995-1.2005"	1.4395-1.4405"	ℂ.0015-.0035"	.002-.007"	.252"	.252"

ℂ - New. .002-.004" Used. ② - Monza P.G. with Air Cond. is .252".

SEPARATING CRANKCASE

After cylinders, rear housing, and flywheel housing are removed, loosen crankcase holding bolts. Tilt crankcase on right side at about 15° angle to prevent camshaft and crankshaft falling out. Remove holding bolts and remove crankcase left half.

ASSEMBLING CRANKCASE

See *"Main Bearing Servicing"*. Make sure split line surfaces are free of nicks and scratches. Install main bearing inserts in right half and install crankshaft. Install camshaft, guiding thrust washer into groove in crankcase and index timing marks on camshaft and crankshaft gears. Install main bearing inserts in left half and carefully install left half of crankcase to right half. Torque holding nuts to proper specifications in sequence shown in diagram. *CAUTION - Hold bolt head and tighten nuts. Do not tighten at bolt head.*

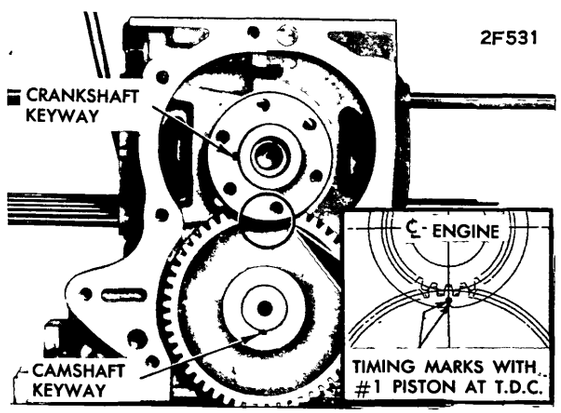
MAIN BEARING SERVICING

1) When testing bearing clearance, crankcase must be assembled without camshaft exactly as indicated under "Assembling Crankcase".

2) No. 1 (rear - thrust bearing) replacement bearings have only one flanged bearing half. Install this flanged half in **left half** of crankcase only.

3) No. 4 bearing halves are tapered (upper end .0015" thicker, and lower end .0015" thinner than corresponding halves of other bearings) to lower centerline of No. 4 bearing. No. 4 bearing halves have brown dye on edges for identification. Do not install a No. 4 bearing in No. 2 or 3 positions, nor a No. 2 or 3 bearing in No. 4 position.

CRANKSHAFT DRIVE FLANGE



Drive flange and crankshaft timing gear are a one-piece unit with a tight press fit on crankshaft. A hydraulic press is necessary to remove and install gear and flange. To remove, use Support Plate J-358-1, Adapter Rings J-7028, and a hydraulic press. To install, support crankshaft between front crankshaft throw and front journal (support must clear thrust face of No. 6 crankpin). Install woodruff key and install crankshaft gear. Press gear on shaft with Tool J-6175 and hydraulic press.

FLYWHEEL INSTALLATION

Flywheel or flex plate-to-crankshaft gear bolts must have sealing compound applied before installation to prevent oil leakage.

CAMSHAFT SETTING

Notch in crankshaft gear flange and notch in camshaft gear can be aligned only when crankcase reassembled.

VALVE TIMING MARKS

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

CAMSHAFT GEAR REPLACEMENT

Remove gear by supporting gear with Tool J-971 and pressing out shaft with an arbor press. To install, support camshaft at back of front journal, install thrust washer and woodruff key and press gear on shaft with an arbor press (support gear with Tool J-971) until gear bottoms on thrust washer.

CAMSHAFT END THRUST

Controlled by thrust washer located between camshaft gear and front bearing. Not adjustable.

CAMSHAFT BEARING SERVICE

If clearance excessive (see table), replace either crankcase or camshaft.

TIMING GEAR REPLACEMENT

Timing gears must be replaced in matched sets only.

VALVE GUIDE SERVICING

Guides are pressed into cylinder head. If valve stem-to-guide clearance excessive (see Valve Table), valves with oversize stems may be used if guides are not cracked or worn to the extent that largest oversize valve stem cannot be installed. If guides cracked or worn excessively, guides may be replaced and valves with standard diameter stems used. *NOTE - Valve guides NOT replaceable on Turbocharged engines.* Proceed as follows:

Oversiz Valv Installation - Valves are furnished with Std., .003", and .010" oversize stems. Use Reamer Set J-5830 to ream guides. Use smallest reamer possible which will properly finish guide bore.

Valve Guid Replacement - *NOTE - Valve guides NOT replaceable on Turbocharged engines.* Replacement guides furnished .002" (replacement standard), .010", & .020" oversize (Outside Diameter). Inside diameter bored for use with valves with standard size stems. Use Remover J-21280 to drive old guide out of cylinder head from spring seat side (guide will come out combustion chamber side). If valve guide bore in head is smooth and without scoring, use .002" oversize guide. If bore damaged, ream with .010" oversize Reamer J-21282. Finished bore diameter should be .524-.525", then use .010" oversize guide. If further refinishing of guide bore necessary, use .020" oversize Reamer J-21283 and .020" oversize guide. Finished bore diameter should be .534-.535". Drive new guide in with Installer J-21281 (tapered end of guide first), from combustion chamber side, until guide is approximately 1" below top surface of valve seat insert (align groove on installer flush with top surface of valve seat insert). Finish ream guide inside diameter with Reamer J-21318. Install valve with standard diameter stem.

VALVE STEM SEALS

None used.

VALVE SPRING INSTALLATION

Spring must be installed with a hardened shim (minimum .020" - furnished .030") under it to protect aluminum cylinder head.

VALVES

Engine		Head Diam.	Face Angle	Seat Angle	Seat Width	Stem Diam.	Stem Clearance	Valv Lift
Standard & Monza P.G.	Intake	1.335-1.345"	44°	45°	1/16-3.32"	.3415-.3422"	① .0010-.0027"	③ .344"
	Exhaust	1.235-1.245"	44°	45°	1/16"	.3410-.3417"	② .0015-.0032"	③ .344"
Hi Perf. & Spyder	Intake	1.335-1.345"	45°	45°	3/32"	.3415-.3422"	① .0010-.0027"	.378"
	Exhaust	1.235-1.245"	45°	45°	1/16"	.3410-.3417"	② 0015-.0032"	.378"

① - Wear limit .001-.004". ② - Wear limit .002-.005" ③ - .378" on Monza Powerglide with Air Conditioning.

VALVE SPRINGS & LIFTERS

Engine	SPRINGS			LIFTERS	
	Free Length	Pressure (Lbs.) Valve Closed	Valve Open	Diameter	Clearanc
Standard	1.74"	58-64 at 1.508"	141-149 at 1.148"	.....	.....
Monza P.G.	2.08"	76-79 at 1.696"	159-169 at 1.306"	.....	.....
Hi Perf. & & Spyder	2.08"	76-79 at 1.696"	159-169 at 1.306"	.....	.....

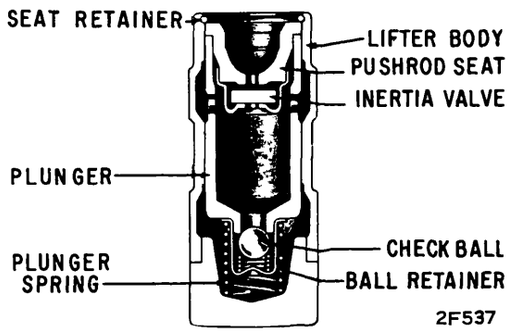
VALVE SPRING INSTALLED HEIGHT

Check installed height of valve spring after grinding valves by measuring distance from spring seat on cylinder head to top of valve spring. If this dimension exceeds "Preferred Height" listed in table below, install additional 1/32" shim (different shims for various engines) under valve spring to bring height within limits. *Do not add shims to bring height to less than "Minimum Height" below.*

Valve Spring Height Specifications

Engine		Preferred Height	Min. Height
Std. (80 H.P.)	Intake	1 15/32"	1 7/16"
	Exhaust	1 1/2"	1 15/32"
All Others	Intake	1 11/16"	1 21/32"
	Exhaust	1 11/16"	1 21/32"

HYDRAULIC LIFTER SERVICE



Lifters are removed from lifter bores after pushrods and drain tubes removed by means of a magnet or wire hook, and should be reinstalled in same bore from which removed. Replace entire lifter if any part damaged. Fill lifter with SAE 10 engine oil at reassembly and before installing in engine.

HYDRAULIC LIFTER ADJUSTMENT (AT ENGINE OVERHAUL)

NOTE - Make this adjustment whenever any part of valve train is disturbed (such as cylinder head or rocker arm removal). Set distributor at No. 1 firing position and crankshaft pulley notch at 0° on timing tab. Adjust No. 1, 3, 6 Intake and No. 1, 4, 5 Exhaust valves as follows: Turn rocker arm adjusting nut down until no axial movement of pushrod is felt, then turn adjusting nut 1 more turn additional. With distributor at No. 2 firing position (pulley notch at 0°), adjust No. 2,4,5 Intake and No. 2,3,6 Exhaust valves in same manner.

PUSHROD, PUSHROD GUIDE, & DRAIN TUBE INSTALLATION

Place "O" rings on each end of drain tubes and install with long end of tube toward cylinder head. Insert pushrods into drain tubes with .050" side oil hole at rocker arm end (pushrod marked with blue paint). Install pushrod guides and rocker arm studs. Install rocker arms and make valve lifter adjustment.

HYDRAULIC VALVE LIFTER (SECTIONAL)

VALVE TIMING

Engine	INTAKE Open BTDC	INTAKE Close ALDC	EXHAUST Open BLDC	EXHAUST Cl s ATDC
Standard & Monza P.G. ①	43°	93°	87°	69°
Hi Perf. & Spyder	54°	118°	95°	78°

① - Monza P.G. with Air. Cond. same as Hi Perf. & Spyder.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

Oil Pressur - 40 lbs. at 2000 RPM.
Pressure Regulator Valve - In engine rear housing. Not adjustable.

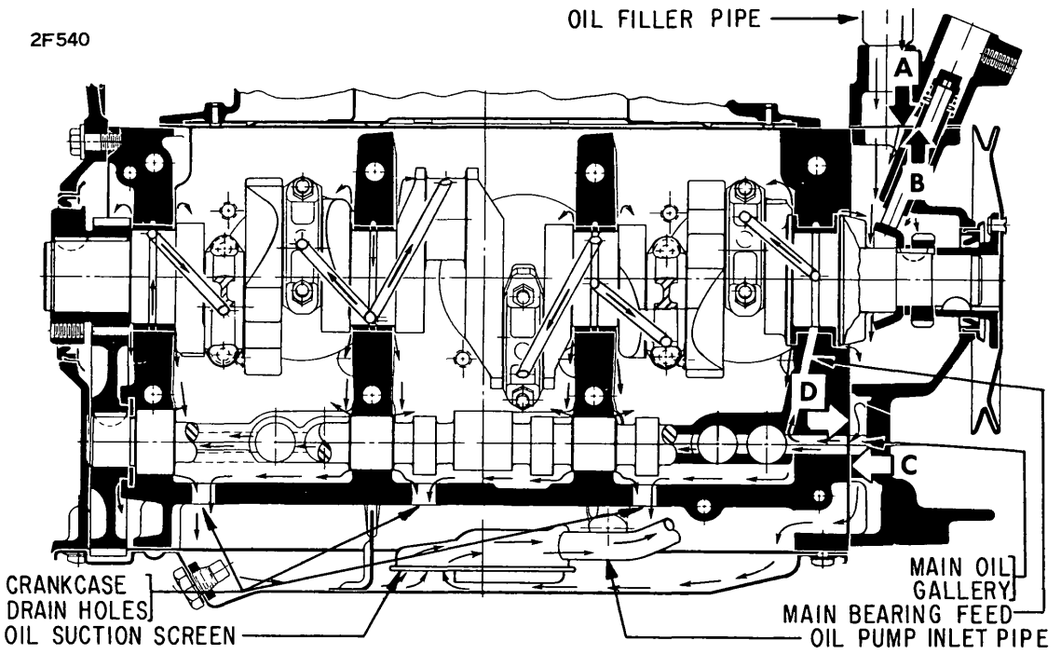
LUBRICATION SYSTEM

Force feed type with oil under full pressure supplied to all crankshaft, camshaft, and connecting rod bearings, and to hydraulic valve lifters. Oil metered by lifters lubricates pushrods and rocker arms. All other parts are lubricated by oil spray. Oil pump located in engine rear housing and driven by distributor shaft which is driven by crankshaft. Pump draws oil through fixed oil screen and intake pipe in crankcase and delivers oil to full-flow type filter mounted on Filter & Generator Adapter on engine rear housing (10 lb. type bypass valve in adapter permits oil circulation through engine if filter element is clogged - see illustration). Oil is then directed through oil cooler mounted on side of engine rear housing. A 10 lb. bypass valve in adapter permits oil circulation through engine if cooler is clogged. From oil cooler oil is directed to the two main oil galleries (one on either side of camshaft) which extend entire length of crankcase. Oil is distributed through the main galleries as detailed below. *NOTE - See Engine Rear Housing and Filter & Generator Adapter illustrations for location of channels and passages in these parts and for location of bypass valves for oil filter and oil cooler.*

Crankshaft & Camshaft Bearings - Lubricated through passages in crankcase webs from main oil galleries. Individual bearings are lubricated from right or left main oil galleries as follows: **Crankshaft Bearings** - Nos. 1 & 3 (right gallery), Nos. 2 & 4 (left gallery). **Camshaft Bearings** - Nos. 1,3,4 (right gallery), No. 2 (left gallery).

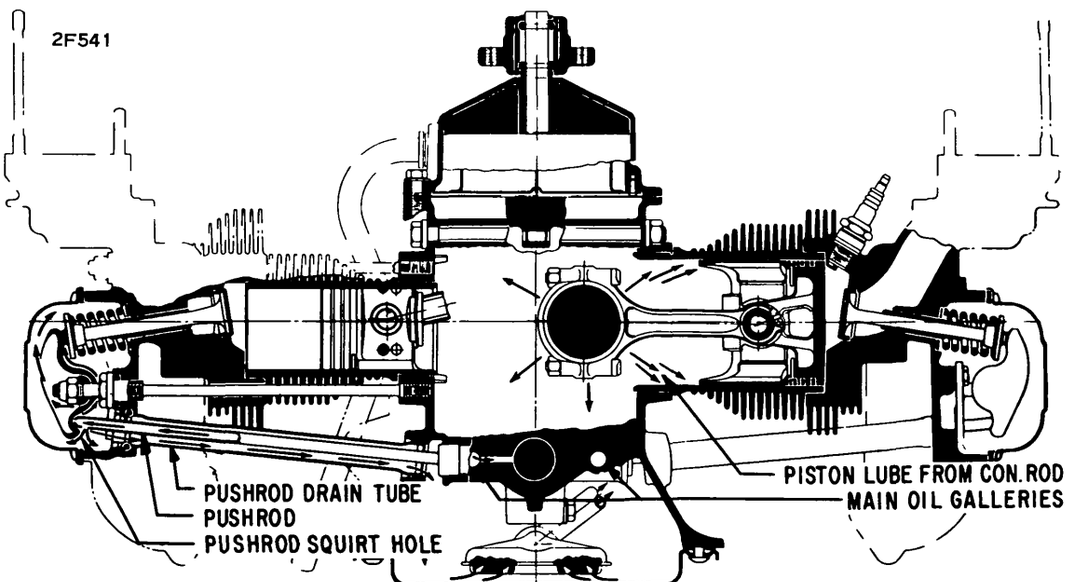
Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated through passage from adjacent main bearing.

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from ends of connecting rod bearings.



Timing Gears - Lubricated by oil spray from forward end of crankshaft and camshaft No. 1 bearings.

Fuel Pump Eccentric & Distributor Drive Gear - Lubricated through drilled orifice and pressed in nozzle in engine rear housing which directs oil on these parts (early cars), lubricated by overspray from No . 1 (rear) main bearing (later cars - orifice and nozzle omitted from rear housing).

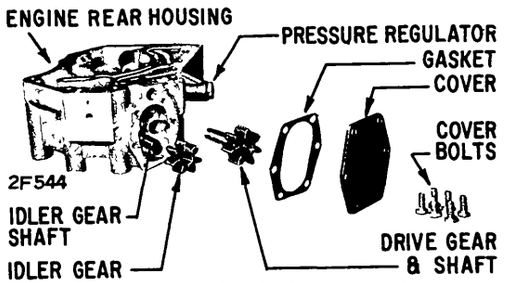


Hydraulic Valve Lifters - Main oil galleries intersect lifter bores and lifters are supplied with oil directly from these galleries.

Rocker Arms, Pushrods, & Valves - Pushrods are hollow and are supplied with oil from hydraulic lifter (inertia valve in upper end of lifter permits oil to flow through hole in end of pushrod). Upper end of pushrod has a side hole which sprays the valve chamber (lifter and pushrod rotate in operation and this oil spray is directed around valve chamber) and a through hole in the end which lubricates pushrod socket and rocker arm ball (pushrod hole registers with hole in rocker arm once during each revolution directing oil upward to the rocker arm ball). Oil in rocker arm chamber is returned to crankcase through the tubular pushrod drain tubes.

ENGINE OILING

ENGINE OILING SYSTEM (SIDE VIEW - SEE VIEWS A,B,C,D)



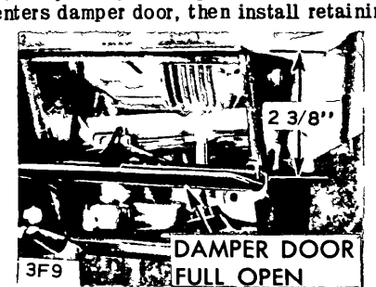
ENGINE OILING SYSTEM (CROSS SECTION)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

OIL PUMP OVERHAUL

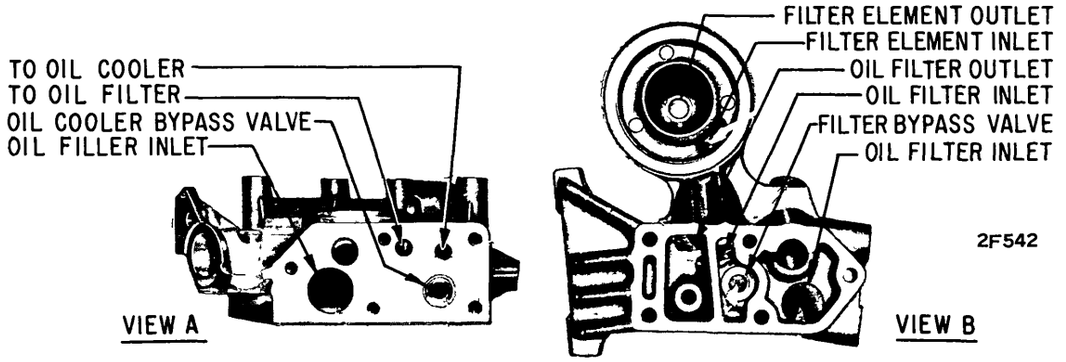
Disassembly - Drain crankcase, remove rear grille, center shield and engine rear mount (support engine). Remove oil pump cover. Remove oil pump drive gear and shaft and idler gear from rear housing. Remove pressure regulator valve plug, gasket, spring, and valve.

Reassembly & Checking - Lubricate gears with engine oil. Install idler gear on idler shaft and make sure shaft is 010-.020" below housing gasket surface. Insert drive gear and shaft in housing. Clearance between gears and housing should be .002-.005". Gear backlash should be .002-.008". *NOTE - Oil pump gears should extend .0025-.0045" above housing gasket surface for oil pump prime. Gears of .001" oversize thickness are available.* Install oil pump gasket and cover, and pressure regulator valve assembly.



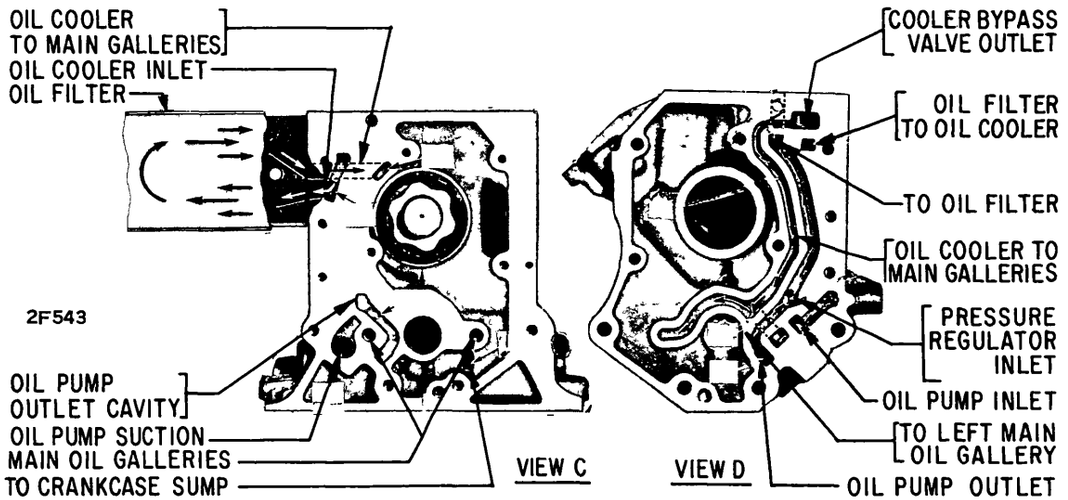
CORVAIR OIL PUMP (EXPLODED)

ENGINE COOLING



Air cooled by blower mounted on top of engine. Engine temperature regulated by a bellows type thermostat filled with butyl alcohol in each lower shroud exhaust duct. Each thermostat operates a damper door at rear of each lower exhaust duct. Exhaust damper doors restrict blower air exhaust until engine reaches operating temperature *NOTE - If thermostat fails, damper doors will remain open.*

Thermostat - Alcohol filled bellows type in each lower shroud exhaust duct. Thermostats start to open damper doors at 200-210°F (fully open 225-230°F).



Exhaust Damper Door Adjustment - *Make this adjustment whenever a new thermostat is installed.* With exhaust damper door fully open, pull thermostat actuating rod out to maximum travel (thermostat against bellows stop). There should be 2 3/8" opening from top of damper door to top of opening (exhaust duct top edge). Adjust by turning swivel on actuating rod until it enters damper door, then install retaining clip.

EXHAUST DAMPER DOOR ADJUSTMENT

OIL FILTER-GENERATOR ADAPTER (SEE OILING SYSTEM SIDE VIEW)

ENGINE REAR HOUSING (SEE OILING SYSTEM SIDE VIEW)

ENGINE WARNING SYSTEM

►*OIL PRESSURE & TEMPERATURE SWITCHES INSTALLATION CAUTION:* Switches are grounded through threads of body. **Do not** coat threads with sealer or anti-seize compound. Torque oil pressure switch to 45-65 **inch-lbs.**, and temperature switch to 10-15 ft. lbs.

ALL MODELS (EXCEPT TURBOCHARGED SPYDER)

Oil Pressure-Temperature Indicator - Light on instrument panel comes on when ignition switch turned on but goes off during normal engine operation. If oil pressure is low, or if cylinder head temperature reaches 450°F, light will come on. Light controlled by an oil pressure switch and a disc type temperature switch on underside of right cylinder head near No. 3 cylinder.

TURBOCHARGED SPYDER

Oil Pressure-Temperature Indicator - **1)** Same system as for standard cars (see above).

2) In addition to indicator light system, a temperature gauge is installed in instrument cluster and controlled by a sending unit in **left** cylinder head. A warning buzzer to indicate excessive engine temperature is located under instrument panel. A silicon rectifier in wiring harness near warning buzzer allows light current to flow to ground through closed engine temperature switch (right head), but prevents oil pressure switch from completing buzzer circuit. *See "Monza Spyder Engine Warning System" supplementary wiring diagram for circuits.*

Manifold Pressure Gauge - A pressure gauge, calibrated in inches of mercury, located in instrument cluster and connected to intake manifold by a tube, indicates manifold pressure.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

MODEL IDENTIFICATION

Series	Body Style	Series Prefix
500 Std.	2-Door Coupe	527
700 Deluxe	2-Door Coupe	727
700 Deluxe	4-Door Sedan	769
900 Monza ①	2-Door Coupe	927
900 Monza	4-Door Sedan	969
900 Monza ①	Convertible	967
Corvair "95"	Greenbrier	R-1206
Corvair "95"	Pickup (Rampside)	R-1254
Corvair "95"	Panel (Corvan)	R-1205

① - When equipped with Turbocharged Engine, called "Monza Spyder"

SERIAL NUMBER

Stamped on plate attached to left front door lock pillar. Number carries identification data as follows:

① ② ③ ④
3 0927 T 100001

① - Year. 3 1963.

② - Body Style (Series Prefix) preceded by "O" on all models except Corvair "95". *See table above.*

③ - Assembly Plant. *See listing below.*

④ - Beginning vehicle number at each assembly plant (separate sequence for Corvair & Corvair "95").

Assembly Plant Designation

A - Atlanta	K - Kansas City	S - St. Louis
B - Baltimore	L - Los Angeles	T - Tarrytown
F - Flint	N - Norwood	W - Willow Run
G - Framingham	O - Oakland	
J - Janesville	R - Arlington	

ENGINE NUMBER

Stamped on top of cylinder block just forward of generator-oil filter adapter. Number carries identification data as follows:

① ② ③ ④
T 12 10 YC

① - Engine Assembly Plant. F Flint. T Tonawanda.
② - Month of Manufacture. 12 December.
③ - Day of Manufacture. 10 Tenth.
④ - Engine Type. *See listing below.*

Engine Code Suffix Letters

Engine Type	① Suffix Letters
Std., 80 H.P., 8.0-1	YC, YL, Z, ZD, V, W
Monza Powerglide, 84 H.P., 9.0-1	ZH
Hi Perf., 102 H.P., 9.0-1	YN, YM, ZF, ZG
Spyder Supercharged, 150 H.P., 8.0-1	YR

① - Different combinations for various transmission and accessory options.

FILTERS & CLEANERS

Filter or Cleaner	Service Interval (Miles)
Oil Filter	Replace 6,000
Air Cleaner	Clean 6,000
Engine Oil Cooler	Clean 12,000
Fuel Filter (Exc. Spyder)	Replace if Carb. Floods
(Spyder)	Replace 12,000

SERVICING AIR CLEANER

Clean element in kerosene, squeeze dry, then dip in engine oil and squeeze to remove excess oil. Wrap element in a clean, dry cloth and squeeze out remaining oil. *Do not shake or wring element.*

REPLACING OIL FILTER

Air Conditioned Cars - To prevent oil spilling into engine compartment when changing filter, remove both filter and adapter as a unit and separate filter from adapter at the bench.

CAPACITIES

Crankcase (Qts.) ①	4
Synchro-mesh 3-Speed (Pts.)	3
4-Speed (Pts.)	3¾
Powerglide (Pts.)	Refill 6
	② Dry 13
Rear Axle (Pts.)	4½

① - Add ½ quart with filter change.
② - Transmission and torque converter.
NOTE - Synchro-mesh transmission and differential carrier connected by internal passages.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

TUNE-UP SPECIFICATIONS

COMPRESSION PRESSURE

With throttle and choke wide open and all spark plugs removed, the lowest reading cylinder should not be less than 80 percent of the highest reading cylinder. No cylinder reading should be less than 100 lbs.

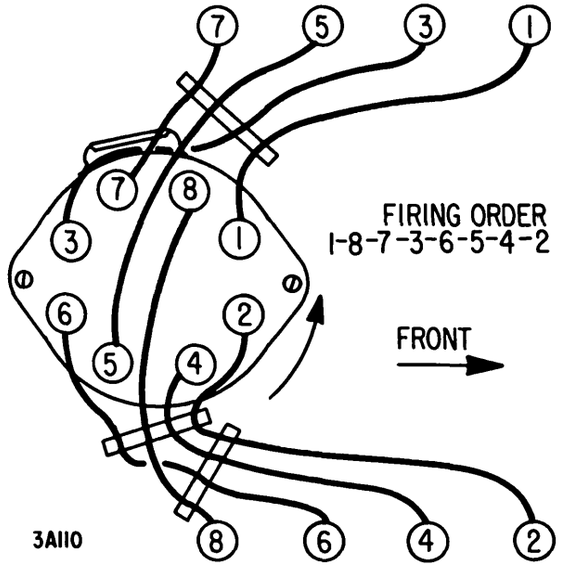
Cam Angle (All)	28-32° (Adjust to 30°)
Breaker Arm Spring Tension (All)	19-23 ozs
Condenser Capacity	.18-.23 mfd.

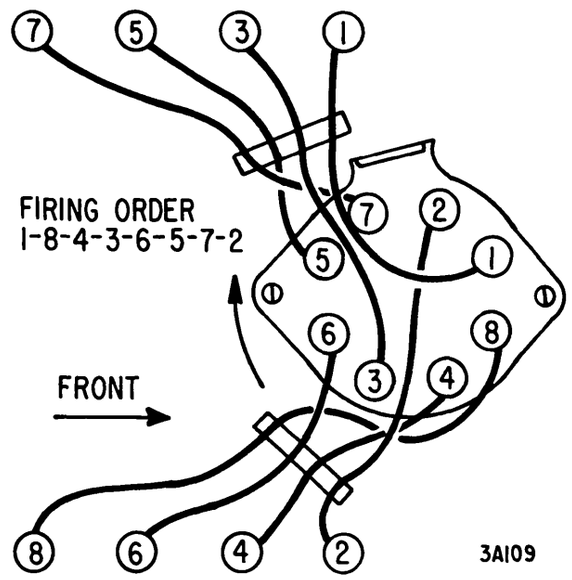
IGNITION TIMING

At 850 RPM with vacuum line disconnected.



Al. 215" (2-Bbl. Carb. & Synchro-mesh)	5° BTDC
(2-Bbl. Carb. & Auto. Trans.)	7½° BTDC
(Jetfire)	10° BTDC
(4-Bbl. Carb., All Trans.)	7½° BTDC
394" (Synchro-mesh)	2½° BTDC
(Auto. Trans.)	5° BTDC

►*DETONATION NOTE:* If engine detonates at proper ignition timing (may be caused by low octane fuel or excessive carbon build-up in combustion chamber), timing should be retarded 2½° If extra high octane fuel used, timing may be advanced beyond specified setting if no detonation occurs



3A108

IGNITION TIMING MARKS

394" ENGINE FIRING ORDER

ALUMINUM 215" ENGINE FIRING ORDER

HOT (SLOW) IDLE RPM

With Synchro-mesh Trans. in Neutral; Auto. Trans. in Drive.

Al. 215" Engine

	Synchro-mesh	Auto. Trans.
With Air Conditioning	①550	①550
Less Air Conditioning	500	500
Jetfire	①600	①600

394" Engine

	Synchro-mesh	Auto. Trans.
With Air Conditioning	①550	①500
Less Air Conditioning	550	500

① - With factory installed Air Cond. OFF and Idle Compensator or Carb-Airator held closed. Dealer installed Air Cond. must be ON.

FAST IDLE RPM

Engine & Carburetion

Al. 215" with 4-Bbl.	① 1800
with Supercharger (Synchro-mesh)	① 2400
with Supercharger (Auto. Trans.)	② 1500
394" with 2-Bbl.	① 1900
with 4-Bbl.	① 1600

① - Fast idle screw on high step of cam.
② - Fast idle screw on second step of cam.

AUTOMATIC CHOKE SETTING

Rochester Carb. No.	Setting
2GC 7023052,53	1 Lean
7023056,58	Centered
4GC 7023050,51	Centered
7023054,55	2 Rich

FUEL PUMP PRESSURE

Al. 215" Engine	6-8 psi at 1800 RPM
394" Engine	5-6 psi at 1800 RPM

MANIFOLD HEAT CONTROL VALVE

Aluminum 215" Engine - None used Intake manifold heated by engine coolant

394" Engine - Automatic thermostatic type located on left exhaust manifold. Free-up if necessary DO NOT LUBRICATE valve shaft bearing surfaces If bushings are worn, replace entire assembly

CRANKCASE VENTILATION VALVE

Check operation periodically Remove assembly every 12,000 miles and clean To clean, blow compressed air through hoses Wash valve in kerosene, then blow air through small tubing of valve. Clean bleed hole in connector (at carburetor) with 1/16" wire or drill.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ALUMINUM 215" ENG. AUTO. TRANS. THROTTLE LINKAGE

THROTTLE LINKAGE ADJUSTMENT

Aluminum 215" Engine (Exc pt J tfir) Aut matic Transmission - 1) Raise car and disconnect throttle valve lever on transmission, position Gauge BT-33-2 on transmission with index dowel on gauge in bolt hole on case (in boss at lower left front corner of case). Hole in lever must be centered within hole in gauge with lever held in rearward position. Bend lever as necessary with Tool BT-33-7.

2) Connect rod to transmission throttle lever, then disconnect upper end of rod from bellcrank. Disconnect rear end of upper throttle valve rod from bellcrank and hold bellcrank down at rear. Press downward on throttle valve rod (lower) and adjust clevis at upper end of rod so that clevis pin is free fit in rod and bellcrank. Connect rod.

3) Remove air cleaner, block or move throttle return check out of way, block choke valve open (2-Bbl.); block intermediate choke lever open (4-Bbl.). With fast idle cam released, back off throttle lever stopscrew so that throttle valves are completely closed.

4) On 2-Bbl. carbs., place Tool BT-6117 on machined surface of manifold and bend auxiliary bellcrank link so top of accelerator rod just touches tool.

5) On 4-Bbl. carbs., bend auxiliary bellcrank link as necessary so clearance between auxiliary bellcrank and gauging surface of carburetor throttle body is .020-.040".

6) On all carbs., adjust swivel on rear end of upper throttle valve rod so that rod is slightly short. *CAUTION - Swivel must turn fre ly on r d thr ads.* Connect rod to bellcrank.

7) Hold bellcrank against stop and turn swivel to lengthen rod until swivel turns freely and feels sloppy. Continue to lengthen rod until all play has been taken up and slight resistance is felt when turning swivel (resistance should be slight and adjustment should be

(Continued)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

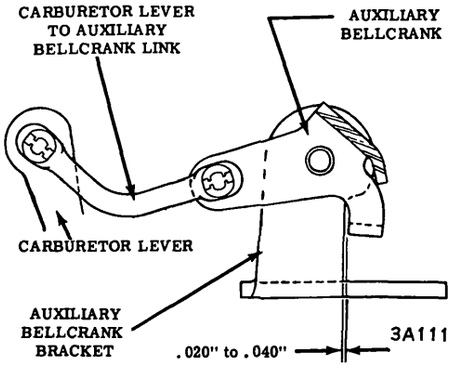
repeated to point where play is taken up can be determined). Hold swivel from turning and tighten locknut

8) Loosen throttle downshift stopscrew locknut and back off stopscrew approximately 6 turns. Use accelerator lever to move throttle valves to wide open position and overtravel linkage to point of maximum transmission throttle valve lever travel. *CAUTION - Do not bend or str tch linkage.* Hold accelerator lever in this position and turn downshift stopscrew in until it just touches downshift lever tang. Turn stopscrew in an additional 1½ turns (2-Bbl.), 1½-2 turns (4-Bbl.). Tighten locknut.

9) Free choke valve. With engine at normal operating temperature, adjust slow and fast idle RPM. Adjust pedal height, then adjust throttle return check. *See below.*

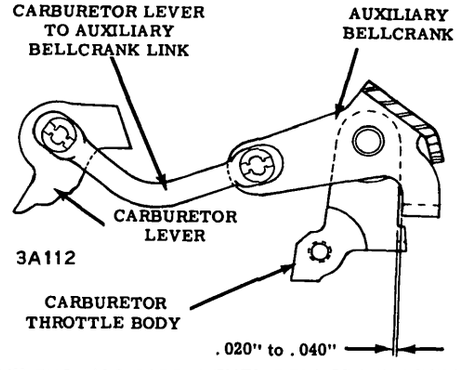
Aluminum 215" (Jetfir) Engine Automatic Transmissi n - 1) Raise car and disconnect lower throttle valve rod from throttle valve lever on transmission. Position Gauge BT-33-2 on transmission with index dowel on gauge in bolt hole on case (in boss at lower left front corner of case). Hole in lever must be centered within hole in gauge with lever held in rearward position. Bend lever as necessary with Tool BT-33-7.

2) Connect rod to throttle valve lever, then disconnect upper end of rod from bellcrank. Hold rod in downward position and bellcrank down at rear. Adjust clevis on upper end of rod as necessary so clevis pin is free fit in bellcrank and rod clevis. Connect rod .



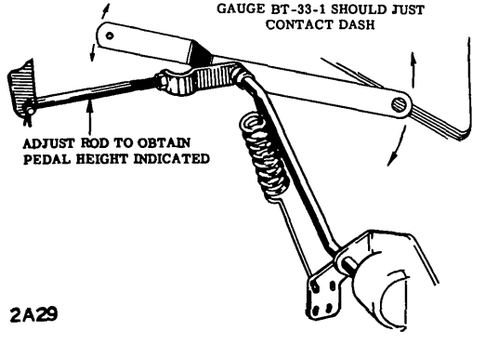
3) Remove air cleaner, disconnect upper end of carburetor rod from carburetor throttle lever, install Throttle Return Check Tool J-6342-01 on return check plunger to hold plunger out of way. Back out slow idle stopscrew and make sure fast idle screw does not contact fast idle cam (If necessary, block choke valve open with screwdriver inserted in carburetor bore).

4) Back out auxiliary bellcrank stopscrew until bellcrank contacts stop. Loosen locknut at lower end of carburetor rod adjusting sleeve, turn sleeve to shorten rod and connect upper end to front carburetor throttle lever. While holding throttle valve in closed position (press on rear carburetor throttle lever) turn adjusting sleeve to lengthen carburetor rod until rod links close and a slight load is felt on sleeve threads.



5) Shorten rod 1 turn of adjusting screw, then tighten locknut. Loosen locknut at adjusting sleeve on rear end of upper throttle valve rod (at bellcrank). Shorten rod slightly, then while holding bellcrank against its stop, lengthen rod until slight resistance is felt on adjusting sleeve threads. Tighten locknut.

6) Adjust slow and fast idle RPM. Adjust accelerator pedal height and throttle return check. *See below.*



7) Loosen throttle downshift stopscrew locknut (on auxiliary bellcrank) and back off stopscrew approximately 6 turns. Use accelerator lever to move throttle valve to wide open position and overtravel the linkage to point of maximum transmission throttle lever travel. *CAUTION - D n t b nd or stretch linkage.* Hold accelerator lever in this position and turn downshift stopscrew in until it just touches downshift lever tang. Turn stopscrew in an additional 1½ turns. Tighten locknut.

394" ENG. 2GC CARB. LEVER-BELLCRANK LINKAGE

394" ENG. 4GC CARB. LEVER-BELLCRANK LINKAGE

394" ENGINE PEDAL HEIGHT

394" Engine Automatic Transmission - 1) Raise car and remove lower throttle valve relay rod from side of transmission. Place short end of Gauge BT-33-1 into manual lever shaft. Hold throttle valve lever to end of its rearward travel and adjust (by bending as required) so hole in throttle valve lever is visible within hole in gauge (not necessarily centered).

2) Lower car and make next 3 adjustments with carburetor throttle valves in closed position. To completely close throttle valves, start engine, remove air cleaner, and block intermediate choke lever (at climatic control housing) to release fast idle cam. Use Tool J-6342-01 to hold throttle return check plunger away from throttle lever. Stop engine, back out slow idle adjusting screw until carburetor throttle valves are completely closed. There should be clearance at end of fast idle screw, slow idle screw, and throttle return check plunger.

3) Adjust carburetor leve-to-auxiliary bellcrank link as necessary to obtain .020-.040" clearance as shown in illustration.

4) Upper throttle valve rod swivel must turn freely on the threads. Adjust rod slightly short and snap onto ball stud. While holding throttle valve bellcrank against its stop, lengthen rod until swivel turns freely, then feels sloppy. Continue to lengthen rod until a slight resistance is felt. Tighten locknut.

5) Make idle speed adjustment. With choke completely off, fast idle off, and carburetor throttle valves in slow idle position, make Accelerator Pedal Height & Alignment Adjustment. *See below.*

6) To adjust throttle downshift stopscrew, loosen jam nut and back out stopscrew (located in auxiliary bellcrank adjacent to carburetor throttle lever) several turns. Hold throttle lever so throttle valves are in wide open position then rotate throttle valve bellcrank counterclockwise to point of maximum transmission lever travel. *NOTE - Do not bend or str tch linkage.* Hold linkage in this position and adjust stopscrew to just touch tang on downshift lever. Allow throttle valves to close, then turn screw in 1½-2 turns and tighten jam nut.

ACCELERATOR PEDAL HEIGHT ADJUSTMENT

Aluminum 215" Engine (All) Automatic Transmissi n - 1) With choke valve wide open and fast idle screw not contacting fast idle cam, position Tool BT-33-2 on rear end of accelerator rod (engage center hole of tool with clevis pin) with dowel pin end of tool extending forward.

2) Loosen locknut and turn adjusting clevis on accelerator rod until end of gauge just touches cowl. Tighten locknut.

394" Engine Automatic Transmission - Bend left ball stud (located behind lower end of accelerator pedal) up or down as required to correct pedal alignment. Adjust accelerator rod to position rod-to-bellcrank bushing so Gauge BT-33-1 just touches dash (see illustration). Lubricate linkage pivot points.

THROTTLE RETURN CHECK ADJUSTMENT

All Engines - After making fast idle adjustment, rotate fast idle cam so fast idle screw rests on top of highest step of fast idle cam. Measure between contact screw and throttle lever contact for clearance of .020" (394" Eng. with 4-Bbl.) .040" (Al. 215" Engine with 4-Bbl.); .050" (All Engs. with 2-Bbl. & Jetfire). If necessary, adjust plunger screw, using two wrenches.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ELECTRICAL

BATTERY

12 Volt

Capacity - 44 Amp. Hr. (F-85), 70 Amp. Hr. (Others) at 20 Hour rate.
Battery Ground - Negative.
Engine Ground - Rear of right cylinder head to firewall.

Point Gap - .014" with lower contacts just touching.
Setting - 13.5-14.4 volts at 125°F ambient temperature (upper contacts); .1-.3 volt lower operating on lower contacts.

Indicator Light Relay

Air Gap - .011".
Point Gap - .015".
Closing Voltage - 3.8-5.2 volts.

FUSES & CIRCUIT BREAKERS

FUSE BLOCK

See illustration. Located to left of steering column under instrument panel.

IN-LINE FUSES

Guide-Matic headlight control in line connector near headlight switch. Cigar lighter fuse on back of lighter.

CIRCUIT BREAKERS

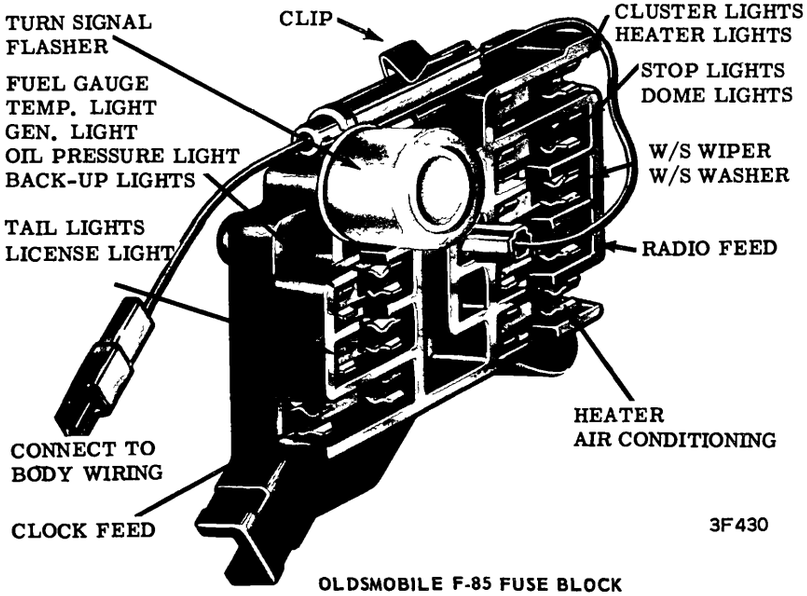
Headlights - Located on headlight switch.
Power Seats, Windows, Top (Exc. F-85) - All located on left hand side of cowl in engine compartment.
Power Seats, Windows, Top (F-85) - All located on fuse block.

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH

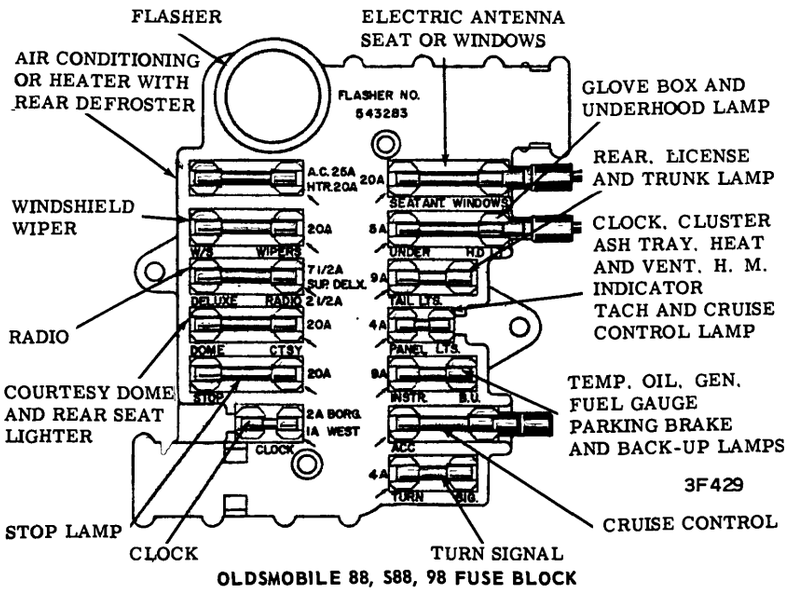
Located on steering column mast jacket (exc. floor-mounted gearshift), inside console (floor-mounted gearshift). To adjust, loosen switch attaching screws. With selector lever in Neutral, position switch so a .090" gauge pin can be inserted through hole in switch face. Tighten attaching screws and remove pin. Check for starter operation in only Park and Neutral positions.

LIGHTING SWITCH REMOVAL



Disconnect battery positive cable. Disconnect wiring from light switch. Pull knob out to ON position, then depress spring loaded button on switch body and pull knob out of switch assembly. Remove escutcheon, then remove headlight switch from under rear of instrument panel. To install, reverse removal procedure.

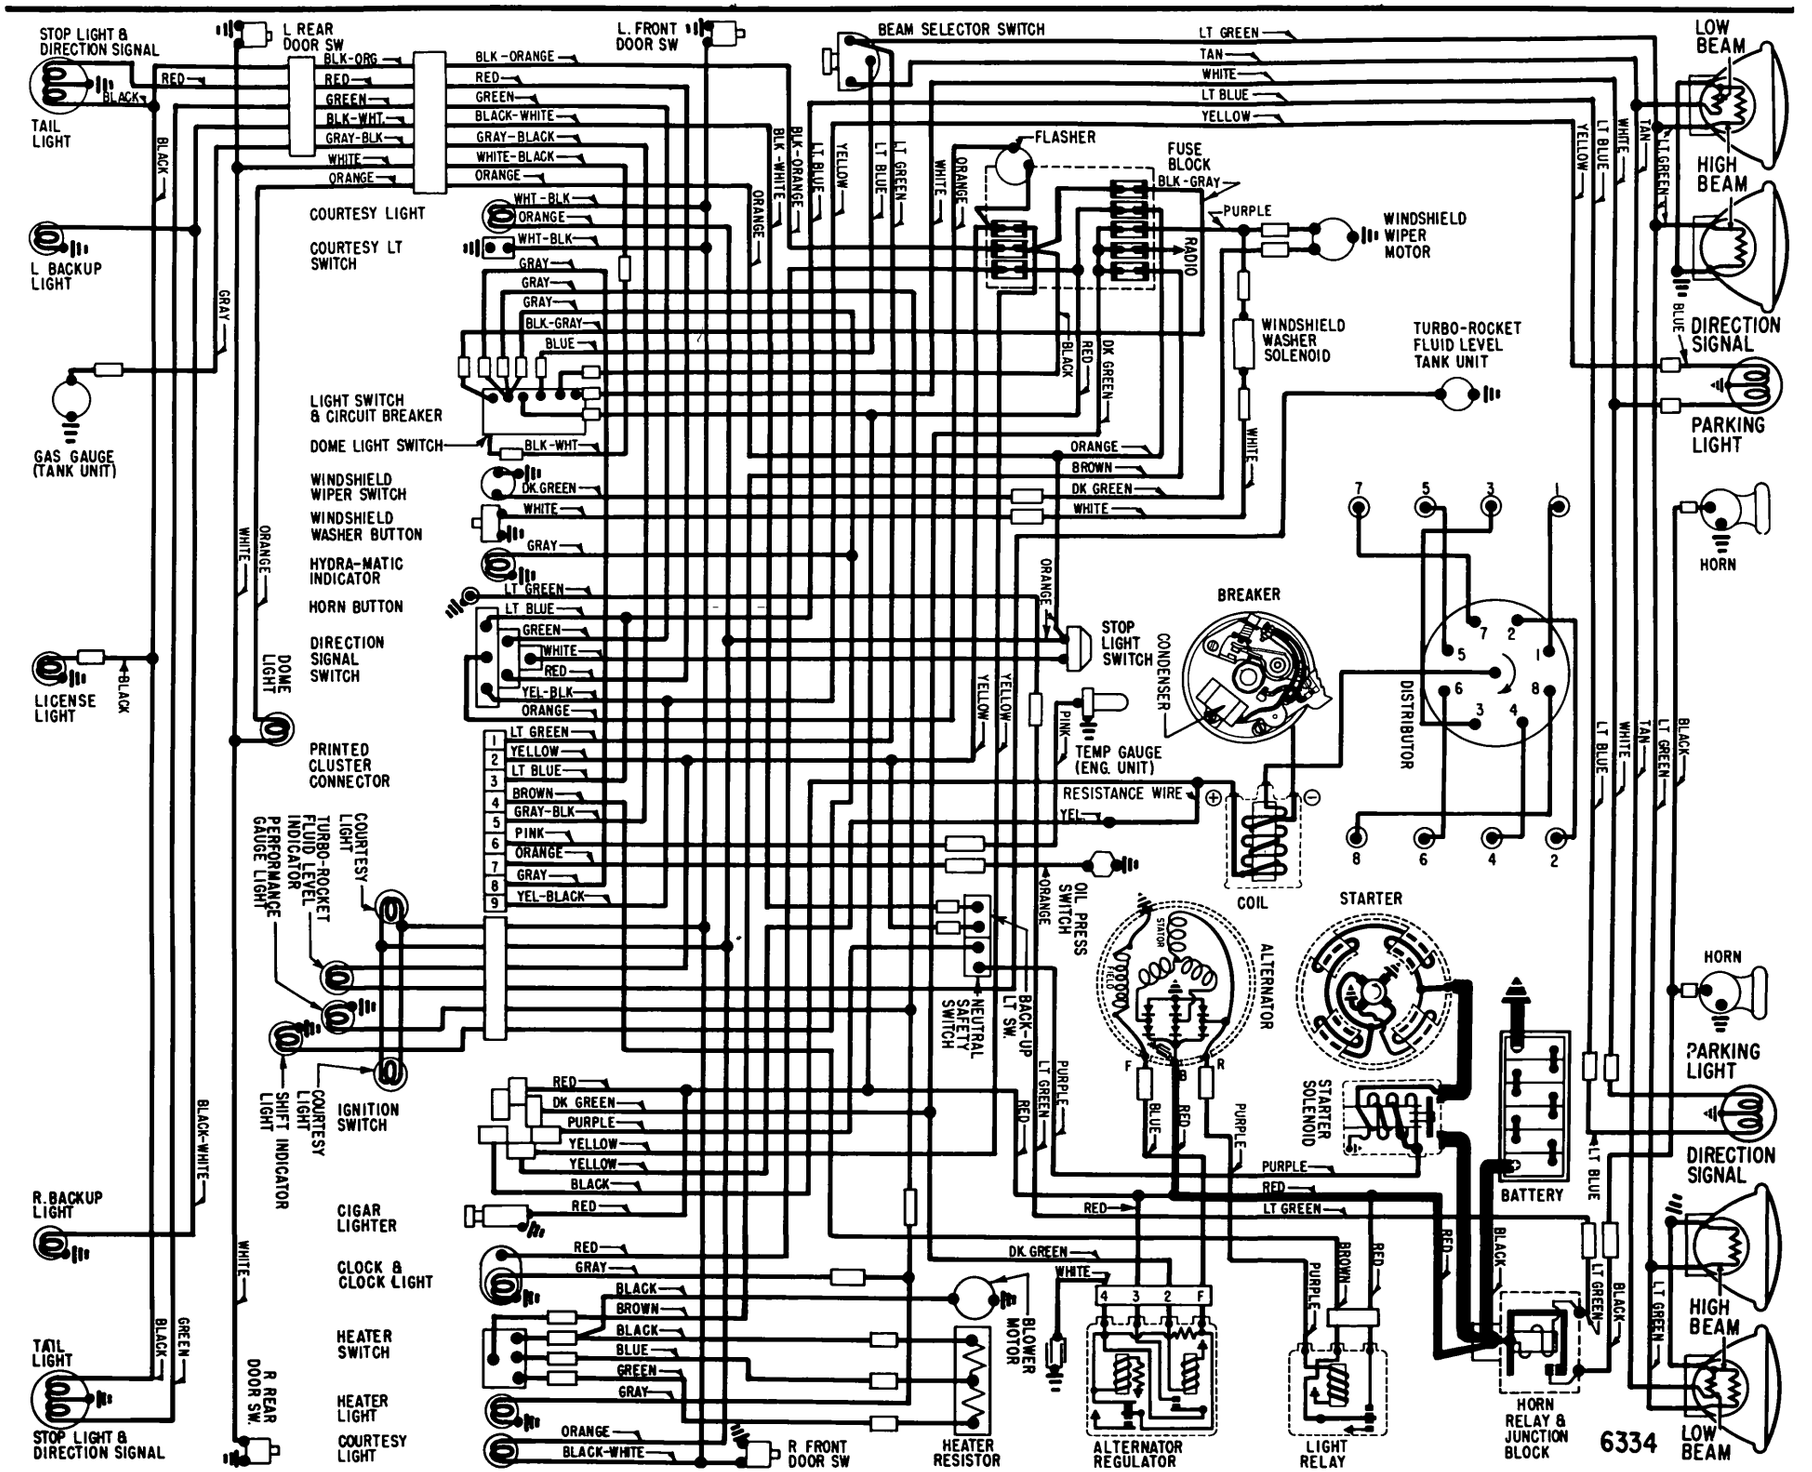
TURN SIGNAL FLASHER



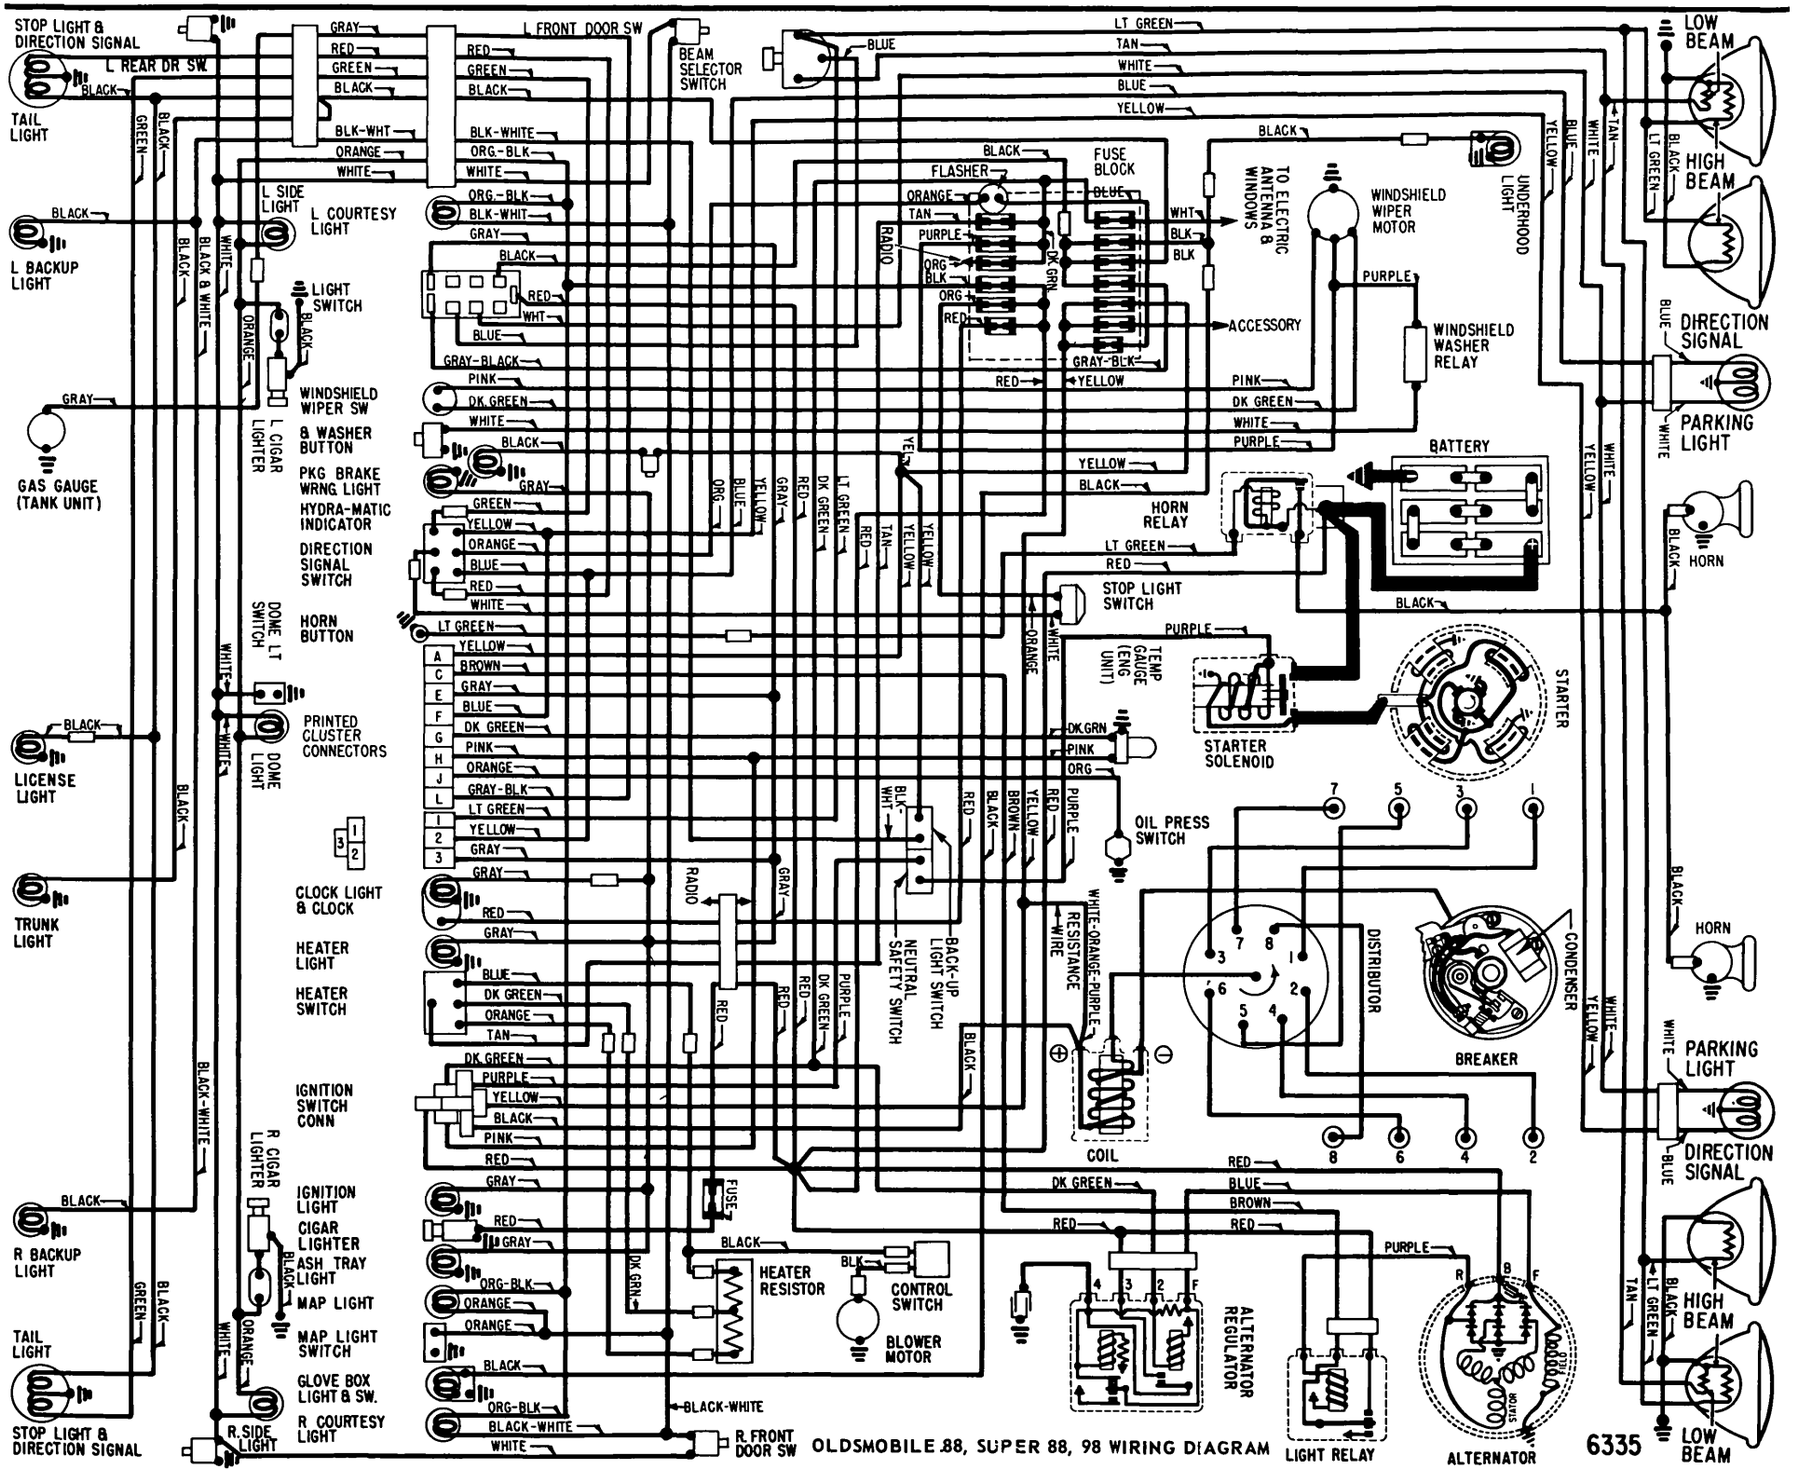
Located on Fuse Block under instrument panel on left side of car.

STOP LIGHT SWITCH ADJUSTMENT

Oldsmobile (except F-85) - Located on brake pedal bracket. To adjust, release brake pedal fully then turn adjusting screw until lights just go off. Back up adjusting screw three turns.
F-85 - Located on brake pedal bracket below dash. To adjust, loosen locking nuts and move switch in the bracket until lights operate properly.



OLDSMOBILE F-85 FUSE BLOCK



OLDSMOBILE 88, S88, 98 FUSE BLOCK

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

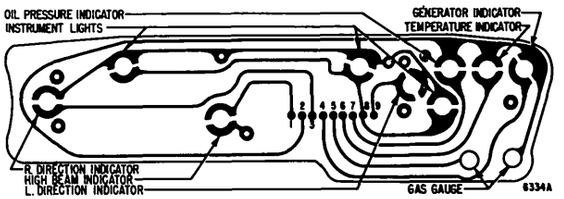
OLDSMOBILE F-85 WIRING DIAGRAM

OLDSMOBILE 88, SUPER 88, 98 WIRING DIAGRAM

SPEEDOMETER REMOVAL

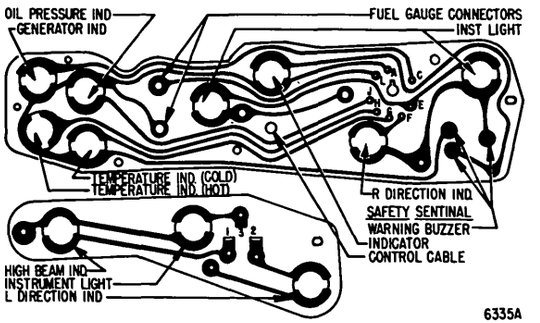
Remove instrument cluster (see below) then remove all necessary attaching screws.

PRINTED CIRCUIT REMOVAL



Remove instrument cluster (see below) then remove all necessary attaching screws. If equipped with safety sentinel, remove control cable from printed circuit.

BELT ADJUSTMENT



Place Tension Tool BT-33-70 on belt. Adjust belt until index groove on tool plunger aligns with notches just above pointer (will provide belt tension of 90 lbs.).

INSTRUMENT CLUSTER REMOVAL

Disconnect wiring harness or connectors, then disconnect speedometer cable. Remove instrument panel attaching nuts and screws. Remove instrument cluster from top of instrument panel (F-85), by rotating top of cluster downward (Oldsmobile except F-85).

OLDSMOBILE F-85 PRINTED CIRCUIT

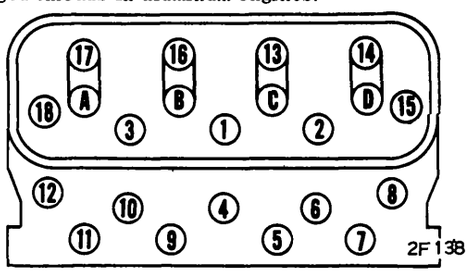
OLDSMOBILE 88, 588, 98 PRINTED CIRCUIT

ENGINE

ALUMINUM ENGINE CAUTIONS

Observe extreme caution when working with aluminum engines to prevent damage by scratching, nicking, or scoring. Note the following:

1) Do not slide or drop machined surfaces.
2) Do not use gasket cement except as indicated under Cylinder Head Installation.
3) Lubricate all bolts or screws entering any aluminum parts. Use engine oil or special thread lubricant.
4) Tighten bolts and nuts to specified torque. DO NOT OVERTIGHTEN. Torque values are for clean, lubricated threads.



ALUMINUM ENGINE THREAD REPAIR

Use "Heli-Coil" tools and inserts when repairing damaged threads in aluminum engines.

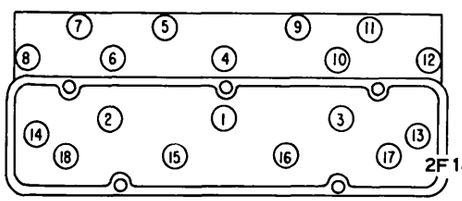
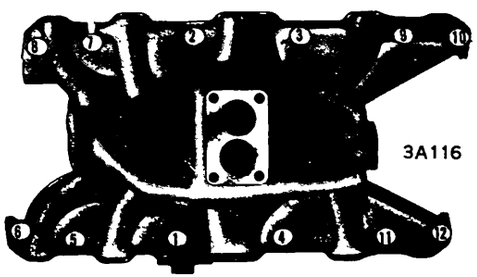
394" CYLINDER HEAD TIGHTENING SEQUENCE

394" INTAKE MANIFOLD TIGHTENING SEQUENCE



OIL PAN REMOVAL

Aluminum 215" Engine - Remove dipstick, hoist car and drain oil. Disconnect idler arm from relay rod and remove cover on front of lower flywheel housing and remove pan bolts. *NOTE* - Position crankshaft so so counterweights do not interfere with pan removal.



394" Engine - Position No. 1 piston at bottom of stroke (moves No. 1 and No. 2 crankshaft counterweights out of way). Disconnect battery cable. On cars with single exhaust system, remove exhaust crossover pipe. Disconnect idler arm support from frame. Remove attaching bolts and move starter out of way. Remove 2 engine front mount attaching nuts and raise engine with Tool J-8568. Drain oil, then remove pan. *NOTE* - Holes provided in frame crossmember for access to front oil pan bolts.

CYLINDER HEAD REMOVAL (ALUMINUM ENGINE)

Right Cylinder Head - Remove all head bolts except rear rocker arm shaft bracket bolt. Then LOOSEN rear rocker arm shaft bracket bolt and raise shaft assembly from head and remove all pushrods except No. 16. Raise No. 16 to within 1" of blower case and tape to rocker shaft. Lift head, rocker shaft assembly, and exhaust manifold off dowel pins and remove as a unit by angling it forward to clear blower case.

ALUMINUM 215" CYLINDER HEAD TIGHTENING SEQUENCE

ALUMINUM 215" INTAKE MANIFOLD TIGHTENING SEQUENCE

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

L ft Cylinder Head - Remove power steering bolt (if equipped), then remove power steering pump bracket-to-cylinder head bolts. Remove rocker arm shaft assembly and pushrods. Remove cylinder head bolts and remove cylinder head with exhaust manifold attached.

CYLINDER HEAD INSTALLATION

394" Engine - Apply Gasket Sealer to both sides of gasket and install. Apply C.P. Sealer to head bolts, then install center and lower row of bolts finger tight. Install pushrods and rocker arm shaft assemblies. Tighten rocker arm shaft bracket and cylinder head bolts in sequence shown in diagram to specifications. Torque lettered bolts to 14-22 ft. lbs.

Aluminum 215" Engine - Head gaskets should be coated on both sides with P.O.B. No. 4 Sealer or equivalent. Likewise, coat cylinder head bolts and torque to specifications in sequence shown in diagram.

INTAKE MANIFOLD INSTALLATION

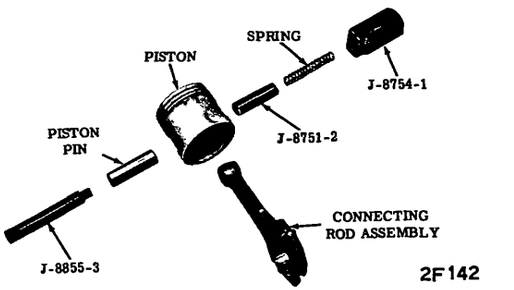
394" Engine - Apply Permatex No. 3 Sealer or equivalent to both sides of graphite coated metal gaskets. Dip manifold bolts in C.P. No. 9 Sealer, install bolts and nuts and torque to specifications in sequence shown diagram.

Aluminum 215" Engine - Coat both sides of gasket with P.O.B. No. 3 Sealer and install. Install end seals and clamps, then lubricate clamp bolts with engine oil and install. Torque to specifications. *NOTE - When tightening clamp bolts, intake gasket must be positioned so manifold-to-head bolt holes will be open.* After positioning intake manifold on engine and connecting thermostatic bypass hose to water pump, coat intake manifold bolts with engine oil and install. Torque bolts to specifications in sequence shown in diagram.

PISTONS, PINS, RINGS

Engine	PISTON	PINS		RINGS		
	① Clearance	Piston Fit	Rod Fit	Ring	End Gap	Side Clearanc
Al. 215"	.0005-.0011"	② .0003-.0005"	③ .0007-.0013"	Compr. Oil	.010-.020" .015-.055"	.003-.005" .0005-.0055"
394"	.0075-.00125"	② .0003-.0005"	② .0003-.0005"	Compr. Oil	.013-.023" .015-.055"	.001-.004" .0005-.007"

① - Measured at thrust surface. ② - Loose fit. ③ - Press fit. *See Piston Pin Installation.*

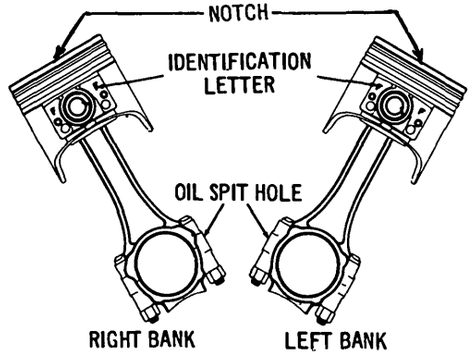


FITTING PISTON

Use a .0015" x ½" x 12" ribbon feeler gauge between inverted piston (pin and rings removed) and cylinder wall at right angle to piston pin position. Pull to withdraw feeler should be 3-8 lbs. (Aluminum 215" Eng.), 3-12 lbs. (394" Eng.).

PISTON PIN INSTALLATION

Aluminum 215" Engine - Using tools J-8751,54,55, place spring and guide stop in main body of support. Place piston on this tool with letter "F" up. Place connecting rod in piston (see illustration). Coat pin with engine oil and press into piston and rod until it contacts guide stop (automatically centers pin in piston).



394" Engine - Pin is light hand press fit and is retained by lock ring at each end. Hone piston pin hole for correct fit of standard or oversize (.001" & .003") pins. With high limit .0005" clearance, clean unoiled pin should slide through pin hole of own weight. With low limit .0003" clearance, pin should hold own weight.

ALUMINUM 215" ENGINE PISTON PIN ASSEMBLY

PISTON & ROD INSTALLATION

All Engines - Install piston on same numbered connecting rod with "F" and notch in head towards front of engine. Install connecting rod with oil spit hole towards center of engine. Install rod caps with bearing index notches in rod and cap on same side. *See illustration.*

Rocker Arm Bracket	45-55	Engine Rear Mount to Transmission	30-40
Rocker Arm Cover	3-5	Engine Rear Mount to Cross Support	20-34

Se Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

CRANKSHAFT ASSEMBLY REPLACEMENT (ALUMINUM ENGINE)

Crankshaft, balancer, and flywheel are balanced individually in production and complete assembly is then balanced by installation of unstaked pins in holes provided around rim of flywheel and balancer. *NOTE* - Flywheel is balanced individually in production by installation of staked pins in above holes. When replacing balancer or flywheel, maintain crankshaft assembly balance by transferring balance pins (unstaked) to new unit as follows:

Balancer - If no pins used on old balancer, install new balancer as is. If balance pins found on old balancer, transfer these pins (unstaked) to corresponding position on new balancer.

Flywh l - If no balance pins (unstaked) found on old flywheel, install new flywheel as is. If balance pins (unstaked) found on old flywheel, transfer pins to corresponding position on new flywheel. *NOTE* - If the presence of a staked pin on new flywheel prevents transfer of balance pin, place pin in nearest corresponding hole.

CRANKSHAFT REAR OIL SEAL

394" Engin - Asbestos covered wiper seal installed in rear groove in bearing cap and block (oil slinger operates in front groove). Whenever crankshaft removed, install a new seal coated with graphite grease in engine block.

Oil Seal Installation - Crankshaft must be removed to replace upper half of seal. Place seal in groove in cap or block by hand, then drive tightly into groove by tapping Tool 23-18 with hammer. Seal is bottomed in cap or block when tool is seated; the undercut area of tool will pass over seal, when tool moved across cap or block. Hold tool tightly against seated seal and cut seal flush with parting line between upper and lower bearing. *NOTE - Ends of seal must be cut clean and seal must fill groove entirely.* After bearing cap installed, wipe cement No. 557621 in grooves in block on both sides of bearing cap and press two cork seals into place in grooves.

Aluminum 215" Engine - Crankshaft must be removed to replace seal in block. Install seal into bearing cap, packing by hand Hammer seal into place with Tool J-8807. To check if seal is fully seated, slide tool away from seal, then slide tool against seal. If undercut area of tool slides over seal, seal is fully seated. Rotate tool before cutting off excess seal packing. Cut seal 1/16" from bearing surface. Taper end of seal to a point (pack fibers toward center, away from edges). Rotate tool to cut seal between notch and handle. Install two side bearing cap seals, leaving seals extended on each side. Coat back of insert with light film of oil and install in bearing cap. To install cap bolts, apply lubricant Part No. 980131 to bolts then torque to specifications. Do not trim ends of side seals.

CRANKSHAFT, MAIN BEARINGS, CONNECTING ROD

Engine	MAIN BEARINGS				CONNECTING ROD BEARINGS		
	Journal Diam.	Clearance	Thrust Brg.	Endplay	Journal Diam.	Clearance	③ Sideplay
Al. 215"	① 2.298-2.299"	② .0008-.0024"	No. 3	.004-.008"	① 1.999-2.000"	① .0002-.0022"	.006-.014"
394"	① 2.9990-3.000"	②⑤	No. 5	.004-.008"	①④	① .0005-.0026"	.002-.011"

① - Out-of-round limits .0015". ② - .0035" wear limit. ③ - Total both rods.

④ - 2.4988-2.4998" (Std. size); 2.4893-2.4988" (Engs. with "X" on left front face of block).

⑤ - .0005" (Nos. 1,2); .0008-.0024" (Nos. 3,4); .0020-.0034" (No. 5). Wear limit .0035" (Nos. 1,2,3,4); .0045" (No. 5). *NOTE* - Replace both bearing halves as a set.

ENGINE FRONT COVER REMOVAL & INSTALLATION

394" Engine - Removal - Drain cooling system and disconnect lower radiator hose and heater hose from front cover. Disconnect generator link at generator and remove front engine mount-to-crossmember nuts. Raise engine to clear bolts of crossmember, then insert wood block between each exhaust manifold and upper control arm and allow engine to rest on blocks. Remove oil pan, radiator, fan blades and pulley, then remove crankshaft pulley. Remove distributor cap and rotate engine until rotor points to front of engine. Remove fuel pump assembly. Remove front cover attaching screws and front cover assembly.

Installation - Reverse removal procedures and tighten belts to gauge line on Tool 33-70. *NOTE* - Use a new front oil seal and coat fuel pump rocker arm pad with lubricant No. 567196. Front cover bolts should be dipped in No. 557622 Sealer and torqued to specifications. One side of fuel and vacuum pump gasket should be coated with Sealer No. 557622.

Aluminum 215" Engine - Removal - Drain cooling system and remove all hoses. Disconnect oil pressure switch wire. Remove crankshaft balancer, fan, pulleys, distributor cap, vacuum hose, generator and mounting bracket. Remove fuel pump. Remove oil pan. Remove cover bolts and cover.

Installation - Reverse removal procedures and note the following:

1) Remove oil pump cover and pack petrolatum around pump gears (insures oil pump prime).
2) Install new front cover gasket using P.O.B. No. 2 Sealer on gasket.
3) Apply engine oil to cover bolts and torque to specifications.

FRONT COVER OIL SEAL REPLACEMENT

394" Engine - Front cover oil seal can be replaced without removing radiator or crankshaft pulley key as follows:

Removal - Remove crankshaft pulley and thread Pilot Bolt J-7583-3 into crankshaft. Thread Tool J-7583-1 into oil seal and then tighten Forcing Screw J-7583-2 until seal is free from front cover.

Installation - Coat outer diameter of seal with No. 557622 Sealer and lips of seal with Special Lubricant No. 567196. Position seal in front cover. Place Installer J-7584-1 over seal and thread Forcing Screw J-7584-3 into crankshaft until installer contacts front front cover.

Aluminum 215" Engine - Removal - Remove front cover. Lay cover flat on bench and remove seal retainer with a drift.

Installation - Assemble seal in retainer. Support front cover on wood block, then apply P.O.B. Sealer No. 4 to outside of seal retainer. Place seal and retainer in cover with seal joint towards top of cover and install with Tool J-8753 until seated. Stake retainer securely. Place Tool J-8753-2 in seal and push tool, a little at a time, from both sides until tool goes through seal.

VALVES

Engine & Valve	Head Diameter	Seat Angle	Seat Width	Stem Diameter	Stem Clearance	Valv Lift
Al. 215" Int.	1.517-1.527"	45°	.037-.075"	.3427-.3432"	.0010-.0025"	.384"

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

VALVE GUIDES

Aluminum 215" Engine - Pressed in head. To replace, drive old guide out from combustion chamber side with Tool BT-68-5A. Place valve guide into cylinder head with outside beveled end up. Place Installer Tool BT-68-5B over new guide and drive in until tool contacts cylinder head. *NOTE - Inside bore of guides is grooved. Exhaust guide has grooves full length of bore and Intake guide has grooves to within ½" of bottom. Intake guides must be installed with grooves up.*

394" Engine - Pressed in head. To replace, drive out out guide from combustion chamber side with Tool J-3062. To install, lay Gauge Washer J-5158-3 on valve spring seat and install guide into cylinder head (grooved end of guide up) by driving on Tool J-5158-2 until tool seats against washer. Guide should now extend 25/32" above face of valve spring seat.

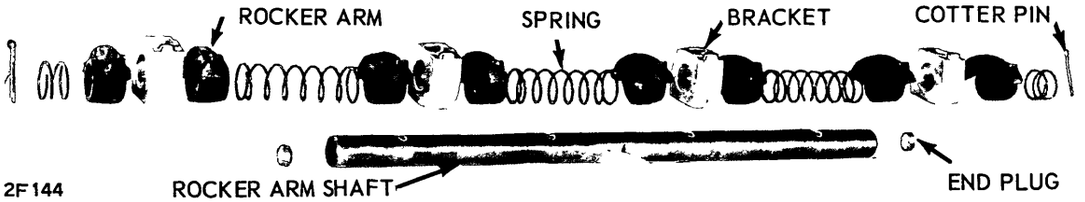
VALVE STEM SEALS

Cup type used on all valves. Install with cupped side down toward cylinder head.

ROCKER ARM

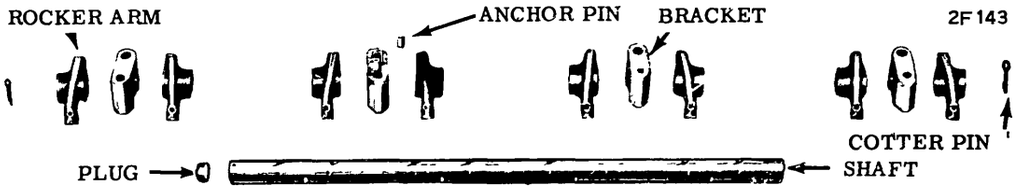
Aluminum 215" Engine - *See illustration.*
394" Engine - *See illustration and note the following:* One bracket is attached to shaft by anchor pin. When necessary to remove this bracket, insert drift through oil passage and drive out pin. To replace, drive pin in flush with bracket. Rocker arm shaft oil ports must face down. If rocker shaft plug has been removed, drive in new plug until outer shoulder is 9/32" into end of shaft.

HYDRAULIC LIFTERS



Inspection - Check all parts for nicks, burrs, or scoring. *NOTE - Ball, ball check retainer, springs, pushrod seat and snap ring are interchangeable or can be replaced individually.* Body and plunger are selective fits and are not interchangeable. *CAUTION - Do not replace lifter when a slight gap appears or lifter shows leakage where foot is welded to body unless leak-down not within specifications.* Place straightedge across lifter foot. If light appears under straightedge, lifter should be replaced and camshaft lobe checked for wear. Wear at camshaft cam center is normal, but wear across entire width of cam base circle requires camshaft replacement.

Leak-down Test - Lifter must be assembled while submerged in test fluid. Proceed as follows:



1) Install Adapter 105-2 in reservoir of Tester BT-60, then fill reservoir with Hydraulic Lifter Test Fluid BT-59 to ½" of top of reservoir.

2) Assemble ball check, spring and retainer into plunger with flange pressed tight against bottom of recess in plunger.

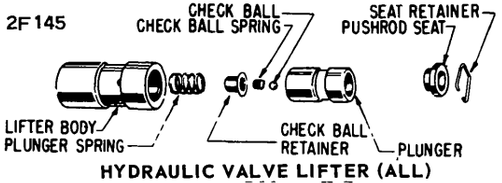
3) Install spring over ball check retainer. Hold plunger with spring up and insert into lifter body (to prevent cocking spring). Place assembly in tester cup, then position pushrod seat into plunger. Position ¼" steel test ball on pushrod seat and lower tester ram until it contacts steel ball. *NOTE - Allow ram to move downward by its own weight until air bubbles disappear.* Repeat several times until all air is expelled from lifter. *CAUTION - DO NOT attempt to expel air from lifter by pumping arm.*

ALUMINUM 215" ENGINE ROCKER ARM ASSEMBLY

394" ENGINE ROCKER ARM ASSEMBLY

4) After air removed, allow ram to bleed down lifter to expose ring groove and install retaining ring.

5) Adjust ram screw so it contacts steel ball in pushrod seat when pointer is at start line. Raise ram and start test by resting arm on steel ball.



6) Rotate reservoir one revolution every two seconds, and time indicator from start to stop line. Allowable leak-down time is shown in table below. *NOTE* - If lifter within specifications, place in service without removing test fluid.

Lifter Leak-d wn Rate

Engine	Used Lifters	New Lift rs
394"	12-90 seconds	20-90 seconds
Aluminum 215"	8-40 seconds	12-40 seconds

Lifter Identification

394" Engine - Standard size, .001" and .010" Oversize lifters are used. Note size when replacing. Lifters identified as follows: "1" (.001" o/s), "10" (.010" o/s), or no marks (Standard size) marked on lifter body and on rail under rocker arm cover.

HYDRAULIC VALVE LIFTER (ALL)

VALVE SPRINGS & LIFTERS

Engine	SPRINGS			LIFTERS	
	Pressure (Lbs.)		Free Length	Diamet r	Cl arance
	Valve Closed	Valve Open			
Al. 215"	70-80 at 1.750"	160-175 at 1.350"	2.150"	.8422-.8427"	.0008-.0023"
394"	85-95 at 1.837"	175-189 at 1.437"	2.25"	.9210-.9215"	.0005-.0020"

VALVE SPRING INSTALLED HEIGHT

Measure from spring seat on head to underside of spring retainer. *See "Valve Closed" spring length in specification table.*

VALVE SPRING INSTALLATION

Install oil deflector over valve stem (cupped side down), then position spring over stem with large diameter against head. Install spring retainers and valve stem keys. Key should seat properly in groove on stem.

See Pages 2 to 13 for complete Car Model General Ind xes and Equipment Indexes

CAMSHAFT

Engin	JOURNAL DIAMETERS 1	2	3	4	5	BEARING Clearance
Al. 215"	1.785-1.786"	1.755-1.756"	1.725-1.726"	1.695-1.696"	1.665-1.666"	①
394"	1.9977-1.9985"	1.9977-1.9985"	1.9977-1.9985"	1.9977-1.9985"	1.9977-1.9985"	.0010-.0033"

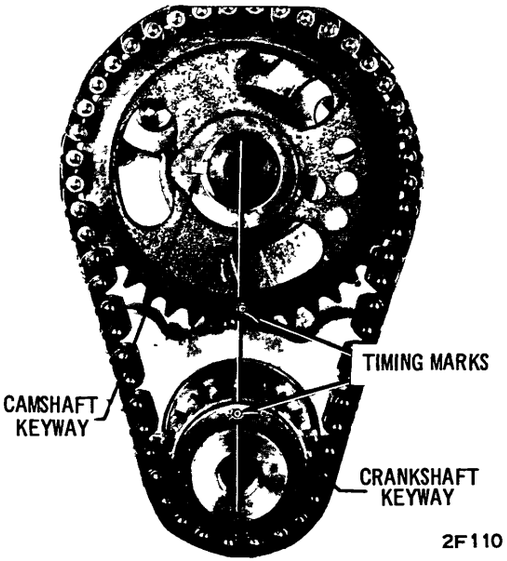
① - .0005-.0025" (No. 1); .0005-.0035" (Nos. 2,3,4,5).

CAMSHAFT REMOVAL

Remove grille and radiator. Remove valve lifters, distributor, engine front cover, rocker arm assembly, fuel pump eccentric, camshaft sprocket and timing chain. Slide camshaft carefully out front of engine.

CAMSHAFT BEARING REPLACEMENT

394" Engin - Use Tool Set J-4476 and note the following: DO NOT replace bearings individually (replace as a set). DO NOT remove or disturb camshaft plug at rear of block.



Aluminum 215" Engin - Bearings must be replaced in complete sets. Remove bearings in numerical order, drive them rearward out of their bores (except No. 5). To remove No. 5 bearing, drill a 3/16" hole in block (do not drill through the bearing) and with a small drift, dent the bearing enough to allow removal out of front of bore. Install No. 5 bearing first, then install all others opposite of removal sequence (align all oil passages). Position bearings in block as follows: No. 5 bearing - 18 7/32", No. 4 - 13 13/32", No. 3 - 9 11/64", No. 2 - 4 15/16", No. 1 - 1/8" from front face of block.

4-Bbl. ②	21°	77°	60°	20°

① - Except Starfire & Custom 98.

② - Starfire & Custom 98 only.

VALVE TIMING MARKS (TYPICAL)

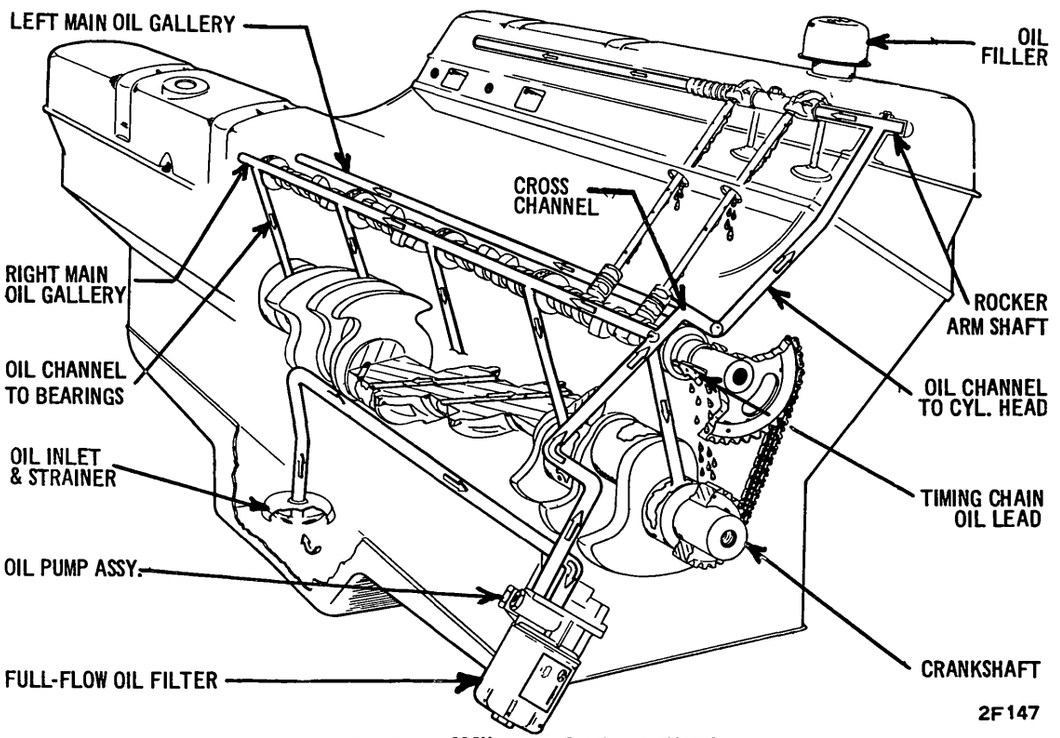
ENGINE OILING

Oil Pr ssur (394" Eng.) - 35-45 psi at 50 MPH.
Oil Pr ssur (Al. 215" Eng.) - 30 psi at 2400 RPM.
Pr ssur R gulat r Valv - Located in oil pump cover. Not adjustable.

ENGINE OILING SYSTEM

215" Aluminum Engin

S e illustration. Oil pump and filter located in engine front cover. Oil from filter flows through passages in front cover to right and left main oil galleries extending full length of crankcase. Pressure regulator valve is located in pump cover and there is also a bypass valve which opens when pressure differential across filter reaches 4½-5 lbs. Oil distribution is conventional except as follows:



Crankshaft & Camshaft - Both crankshaft and camshaft are supplied oil through drilled passages in crankcase, from right main oil gallery.

Timing Chain & Spr ck ts - Drilled holes in camshaft connect front camshaft bearing to key slot in front of camshaft. Oil flows from camshaft journal into keyslot over woodruff key in space between key and camshaft sprocket and fuel pump eccentric. A relief in forward end of fuel pump eccentric allows oil to escape between eccentric and camshaft distributor gear. Oil strikes distributor gear once each camshaft revolution, supplying lubrication to timing chain and sprockets.

Hydraulic Lifters - Full pressure lubrication is supplied hydraulic lifters from cutouts in lifter bores in main oil galleries.

R ck r Arms, Valv s and Pushr ds - These items receive oil from main oil galleries through drilled

(C ntinued)

ALUMINUM 215" ENGINE OILING SYSTEM

See Pages 2 t 13 for complete Car Model General Indexes and Equipment Indexes

holes in front of cylinder block and head, leading up from forward end of corresponding main oil gallery. Hole in head ends beneath front rocker arm shaft bracket. A notch cast in base of bracket allows oil to flow up inside bracket (between bracket and bolt) to hollow rocker arm shaft (plugged at both ends). Each rocker arm receives oil through hole in underside of shaft. Grooves in arm provide lubrication to bearing surfaces. Oil is metered to pushrod seat and valve stem through holes drilled in rocker arm. Excess oil returns to oil pan through passages in cylinder head and block.

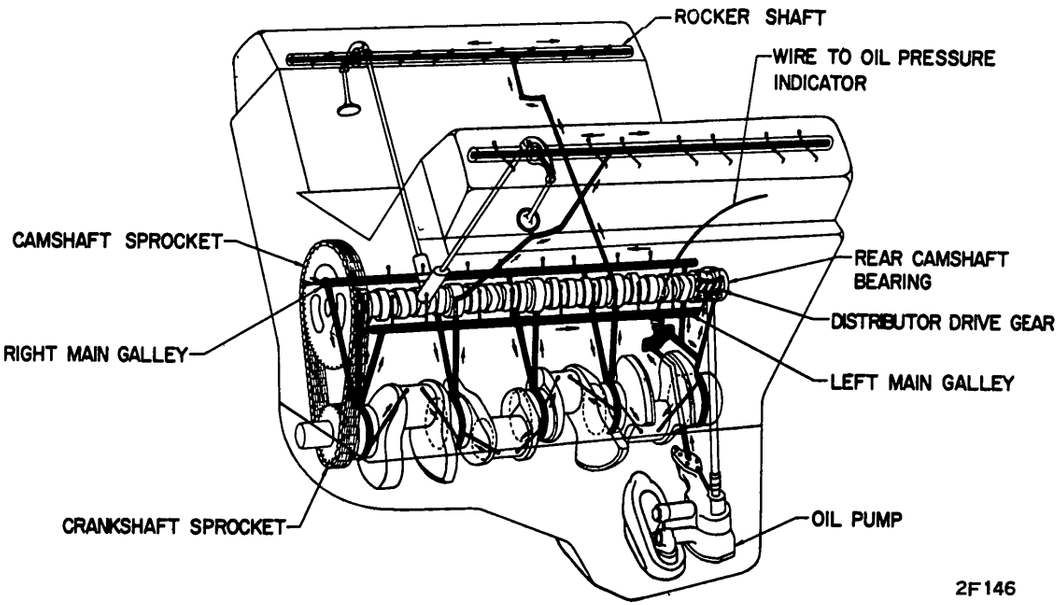
394" Engine

See illustration. Oil pump mounted on rear main bearing cap in crankcase with full flow filter on right side of crankcase. *NOTE* - If filter not used, a cover with a channeled oil passage is installed on filter pad to provide oil circulation. Oil from filter flows through passages at rear of block to rear end of right main oil gallery and through "V" passage at front of engine to left main oil gallery. Oil distribution is conventional except as follows:

Crankshaft & Camshaft Bearings - Rear crankshaft and camshaft bearings are lubricated by a vertical passage intersecting the horizontal cross passage from the oil filter (see above). **Other** crankshaft and camshaft bearings are lubricated by a "V" shaped oil passage in each crankcase web leading down from the right main oil gallery to the crankshaft bearing and then up to the camshaft bearing (additional passage at front crankshaft bearing supplies oil to left main oil gallery).

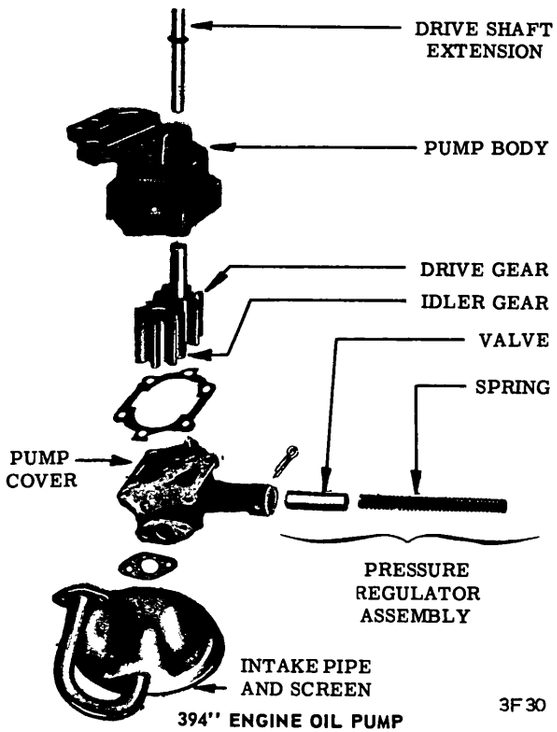
Valve Lifters - Each lifter supplied with oil through short passage leading upward from main gallery at point directly below lifter.

Rocker Arms, Pushrods & Valves - Hollow rocker arm shafts are supplied with oil through passage in block leading from No. 2 camshaft bearing (left bank), No. 4 camshaft bearing (right bank), and connecting passage in head which registers with drilled oil passage in rocker shaft bracket (see Note below). Rocker arm is drilled to provide lubrication for pushrod socket and valve tip. Oil return holes are provided on lower side of heads.



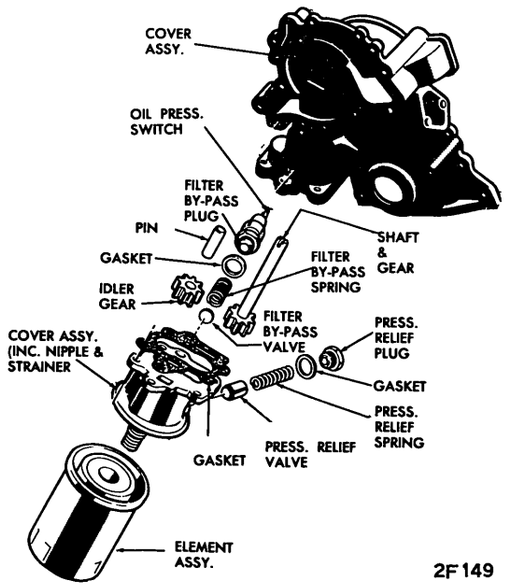
ROCKER SHAFT BRACKET NOTE - Rocker shaft bracket with drilled oil lead has anchor pin which locates shaft properly so that oil hole in bracket and shaft line up (pin is driven in flush with top of bracket). This bracket is No. 2 (left bank), No. 3 (right bank).

Distributor Drive Gear - Lubricated from drilled hole in plug at rear end of left main oil gallery.



Timing Chain & Sprockets, Fuel Pump Lever & Eccentric - Lubricated from drilled hole in hexagonal headed plug which closes front end of right main oil gallery.

OIL PUMP SERVICING



394" Engine - *NOTE* - Do not remove washers from drive shaft extension. Drive shaft extension and washers must be serviced as a unit.

394" ENGINE OILING SYSTEM

394" ENGINE OIL PUMP

ALUMINUM 215" ENGINE OIL PUMP

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

Installation - Reverse disassembly procedure and tighten cover screw to specifications. Tighten pressure regulator nut. Install intake pipe and screen assembly with screen facing away from pump mounting pad then tighten screws. Assemble drive shaft extension so end nearest washers is inserted into oil pump drive shaft. Other end of shaft should mate with distributor drive gear in block. Position pump on bearing cap and tighten bolts to specifications.

Aluminum 215" Engin - *See illustration and note the following:* When installing pump, fill gear pocket with petrolatum and force it into every cavity and between gear teeth. Pump will not prime itself with air in cavity.

ENGINE COOLING

Thermostat - 170°, located in water outlet on intake manifold.

Pressure Valve - 15 psi radiator filler cap.

WATER PUMP

Pumps are serviced as an assembly. Install pumps as follows:

Aluminum 215" Engine - Apply thin coat of gasket cement to pump housing, position gasket on housing, then install pump assembly in front cover. Lubricate 1/4" bolts with engine oil, apply sealer to 5/16" bolts. Torque to specifications.

394" Engine - Install water pump assembly on front cover with a new gasket. Dip 1/4" bolts in lubricant, No. 980131, before installing; use sealer on 3/8" bolts (these bolts enter cylinder block), torque all bolts to specifications.

FLUID FAN DRIVE

Used on F-85 Jetfire and all Air Conditioned cars. Thermostatically controlled clutch limits maximum fan speed to 1500 RPM when air temperature below 135°F. and allows increased fan speed of 2000 RPM maximum at temperatures above 160°F. Serviced as an assembly.

All V8 Engines ..... 5 1/4-6 3/4 psi at 1000 RPM

MANIFOLD HEAT CONTROL VALVE

Located in outlet of exhaust manifold (4 Cyl), mounted in right bank manifold (all V8) Check every 6000 miles for free operation Lubricate with graphite in alcohol if sticky.

CRANKCASE VENTILATION VALVE

Replace valve assembly every 12,000 miles. Assembly should be replaced if pinching off hose from valve causes an engine idle speed reduction of less than 35 RPM (4 Cyl), less than 15 RPM (all V8)

TUNE-UP NOTES

► *TRANSISTORIZED IGNITION CAUTIONS:* To prevent damage to output transistor in control unit, be sure never to disconnect the following while cranking engine: Not more than 4 secondary leads (at spark plugs or distributor cap). Coil secondary cable (between coil and distributor cap). *NOTE* - When performing a compression test or any test where the engine is to be cranked without starting engine, ALWAYS DISCONNECT COIL PRIMARY LEAD

► *TEMPEST V8 WITH AUTO. TRANS. (EARLY) LOADING EXCESSIVELY ON RESTART CORRECTION:* Remove choke coil cover and choke baffle, then rotate fast idle cam so screw is on high step of cam. Rotate choke piston lever counterclockwise as far as possible (choke should be fully closed). If choke piston is not extending out of cylinder .060-.080", bend choke intermediate rod as necessary to obtain desired measurement.

► *PONTIAC ENGINE LOADING AT IDLE AFTER COLD START (CARTER 3300SA & 3326SA CARBURETORS):* Correct by installing new type Choke Piston Carburetors identified by letter "A" in lower left corner of identification tag have this new piston installed *See "Carter AFB 4-Barrel Carburetor" In Carburetion Section.*

► *PONTIAC & TEMPEST POOR THROTTLE RETURN CORRECTION (CARTER AFB CARBURETORS):* May be caused by misaligned or burred throttle valves or binding throttle valve shaft. *See "Carter AFB 4-Barrel Carburetor" in Carburetion Section.*

MANIFOLD FUEL DISTRIBUTION

Tempest 4 Cyl. Eng. (4-Bbl.) - Left barrels feed cylinders 1-4; right barrels feed cylinders 2-3.
All V8 Engines - Le ft barrels feed cylinders 1-4-6-7; right barrels feed cylinders 2-3-5-8.

THROTTLE LINKAGE ADJUSTMENT

ROCHESTER TRIPLE 2-BARREL CARB. THROTTLE LINKAGE ADJUSTMENTS: See "Rochester Triple 2-Bbl. Carburetor" in Carburetion Section.

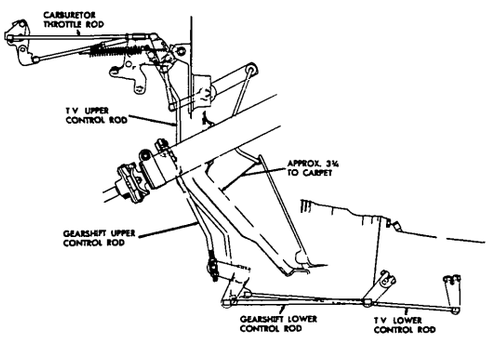
Pontiac (Exc. Tempest) Auto. Trans. - 1) Remove air cleaner and loosen both nuts at transmission throttle control rod trunnion.

2) Adjust engine idle speed (see TUNE-UP), then shut off engine and install linkage adjustment pin J-7687 through holes in throttle control lever and bracket. *NOTE* - On carburetors with throttle return check, before installing pin, remove throttle return check or install Tool J-6342-01 over return check so there will be no interference with adjustment.

3) With throttle valves fully closed, loosen locknut and adjust length of transmission throttle control rod so gauge pin in hole is free. Leave pin installed and tighten locknut.

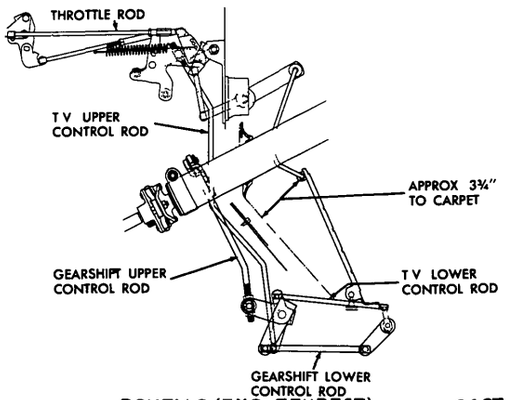
See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

4) Push throttle control rod to transmission (TV upper rod) downward slightly until outer throttle lever is felt to touch end of travel *CAUTION - Lever must not touch trunnion now.* Tighten trunnion locknuts finger tight, then shorten TV upper rod by backing off lower trunnion nut 3½ turns (Roto Hydra-Matic), 4½ turns (Super Hydra-Matic) Tighten upper nut



5) Loosen locknut on carburetor throttle rod, then adjust to obtain 3¾" clearance from under side of attaching boss on pedal to body toe pan (carpet installed)

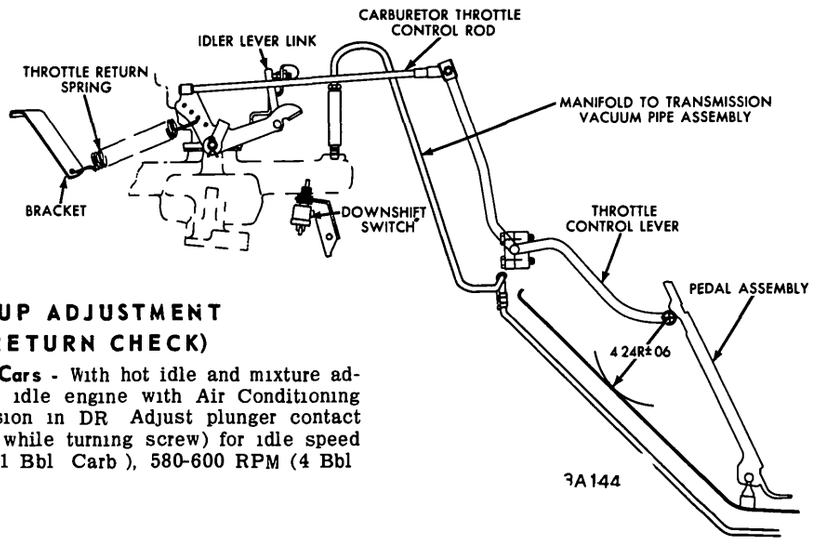
6) Tighten locknut on carburetor throttle rod securely.



7) Road test car and tailor adjustment as required by shortening or lengthening TV upper rod ½ turn at a time to obtain best shift feel

THROTTLE RETURN CHECK ADJUSTMENT

With hot idle and mixture adjustments correct, place transmission in Neutral. With engine running, disconnect vacuum hose from throttle return check and plug hose. To adjust, hold sleeve next to diaphragm from turning, adjust contact screw for speed of 1175 RPM (4 Cyl with BC carburetor), 1050 RPM (other engines)



PONTIAC (EXC. TEMPEST) 2A36
ROTO HYDRA-MATIC THROTTLE LINKAGE

PONTIAC (EXC. TEMPEST) 2A37
SUPER HYDRA-MATIC THROTTLE LINKAGE

IDLE SPEED UP ADJUSTMENT (THROTTLE RETURN CHECK)

4 Cyl. Air Cond. Cars - With hot idle and mixture adjustments correct, idle engine with Air Conditioning ON and transmission in DR Adjust plunger contact screw (hold stem while turning screw) for idle speed of 620-640 RPM (1 Bbl Carb), 580-600 RPM (4 Bbl Carb)

TEMPEST AUTO. TRANS. THROTTLE LINKAGE

PEDAL HEIGHT ADJUSTMENT

Tempest - Adjust carburetor throttle control rod for clearance of 4 24" ± 06" as shown in illustration.

Pontiac (Exc. Tempest) - *See THROTTLE LINKAGE ADJUSTMENT*

DOWNSHIFT SWITCH ADJUSTMENT

Tempest - Check and adjust pedal height *See above.* With throttle in wide open position, use adjusting nuts to position downshift switch to obtain a clearance of 030- 100" between lever extension and threaded body of switch

ALTERNATOR

► *1100648 ALTERNATOR CAUTION:* This alternator has lower field resistance and MUST be used with Transistor Regulator No 1116365 *If us d with r gular Doubl Contact Regulator, higher field curr nt will caus burnt r gulator contacts.*

Se Pages 2 to 13 for complete Car Model General Indexes and Equipment Ind xes

ELECTRICAL (Continued)

Delco-Remy Alternator Specifications

Delco-Remy No.	Amps.	Volts	Alt. RPM
1100632, 37	25	14.0	2000
	35	14.0	5000
1100634, 36, 51	25	14.0	2000
	40	14.0	5000
1100621, 48 ①	32	14.0	2000
	50	14.0	5000
1117765 ②	18 ③	14.0	1100
	62 ③	14.0	6500

① - Use with Transistor Regulator 1116365.
② - Use with Transistorized Regulator 9000567.
③ - 5-10% higher if tested without regulator.

Field Current - 2.8-3.2 amps. (1100648), 3.7-4.4 amps (1117765), 1.9-2.3 amps. (All Others), at 12 volts and 80°F

ALTERNATOR REGULATOR

►*RADIO EQUIPPED CARS (EARLY) REGULATOR NOTE:* Remove capacitor from voltage regulator on cars built before Nov. 2, 1962. Capacitors have been eliminated in production after this date.

►*1117365 REGULATOR CAUTION:* This Transistor type regulator MUST be used with Alternator No. 1100648 (Double Contact Regulators will not handle larger field current of this alternator without burning).

Delco-Remy 1119511 (Double Contact)

Air Gap - .067" with lower contacts just touching.
Point Gap - .015" with lower contacts just touching.
Setting - 13.5-14.4 volts (upper contacts) .1-.3 volts lower (lower contacts) at 125°F ambient temperature.

Delco-Remy 1116365 (Transistor)

Setting - 13.4-14.1 volts at 125°F ambient temperature (at "O" position of adjusting screw).

Delco-Remy 9000567 (Transistorized)

Voltage Regulator and Field Relay units.

Voltage Regulator

Air Gap - .075" with contacts just touching.
Setting - 13.2-14.2 volts at ambient temperature of 125°F.

Field Relay

Air Gap - .014" with contacts just touching.
Contact Gap - .027".
Closing Voltage - 5.0-9.5 volts.

FUSES & CIRCUIT BREAKERS

FUSE BLOCK

Located on passenger side of dash, left side of car.

CIRCUIT BREAKER

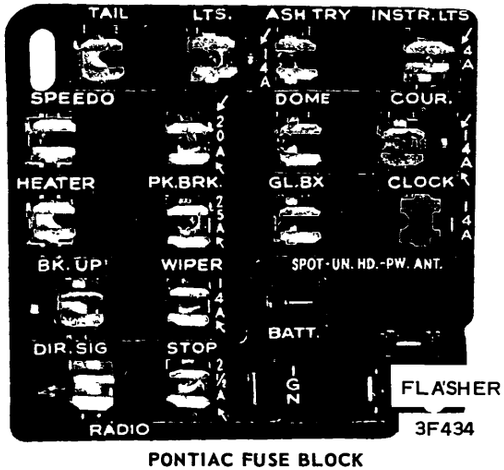
Integral with headlight switch, protects lighting circuit.

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH

Tempest - Located on rear of gearshift control and indicator light assembly. Engine should crank with selector lever in Neutral. To adjust, loosen 2 switch mounting screws and reposition switch as necessary.
Pontiac (Exc. Tempest & Console Models) - Located on steering column. Engine should crank with selector lever in Park or Neutral. No adjustment provided.
Pontiac (Console Models) - Located under console. Engine should crank in Park or Neutral. To adjust, loosen 2 switch attaching screws and reposition switch as necessary.

LIGHT SWITCH REMOVAL



Disconnect battery cable. Pull switch knob to ON position, then push latch button on bottom of switch assembly and pull switch knob assembly out. Unscrew ferrule and remove switch assembly.

STOP LIGHT SWITCH ADJUSTMENT

Located on bracket adjacent to brake pedal arm. To adjust, position switch and bracket so light operates only when pedal depressed.

SPEEDOMETER REMOVAL

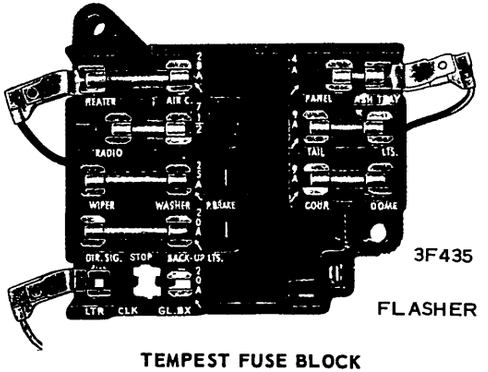
Pontiac (except Tempest) - Disconnect Safeguard control cable and remove cluster (see below). Remove face plate and lens by unsnapping from housing. Remove screws on back of cluster at speedometer cable fitting. Remove speedometer and instruments carefully. *NOTE - If equipped with Safeguard speedometer, disconnect ground wire at clip terminal and wire retaining clip. Note routing of wires before removing ground wire.* Remove two numeral plate screws, then remove speedometer head assembly.

PONTIAC FUSE BLOCK

Tempest - Remove instrument cluster (see below). Remove speedometer head retaining screws, then remove screws retaining speedometer to head assembly.

INSTRUMENT CLUSTER REMOVAL

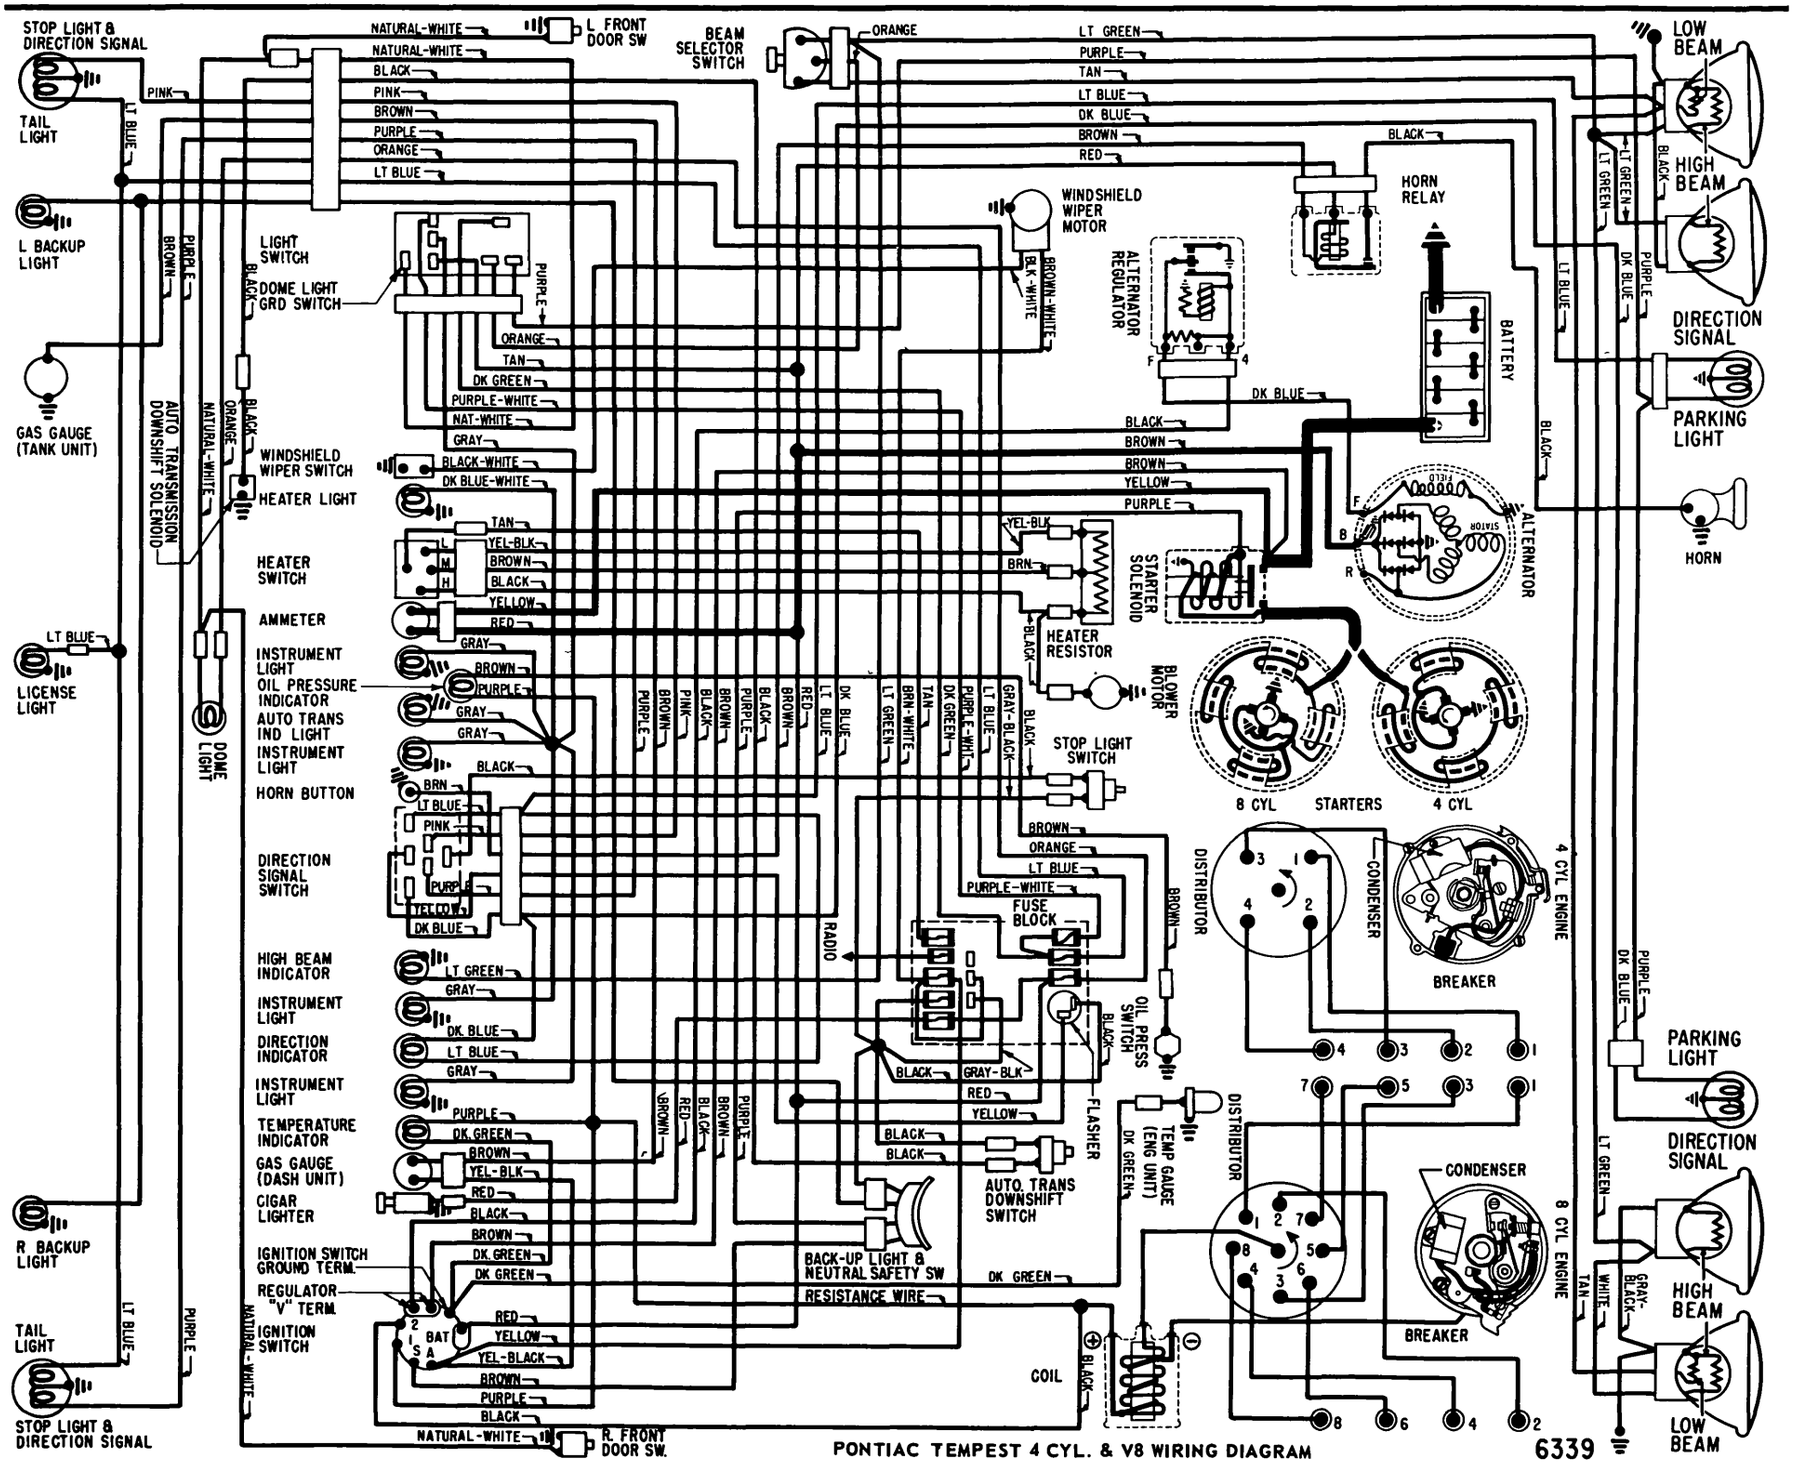
Pontiac (except Tempest) - Disconnect battery and remove center duct assembly (cars with Circ-L-Aire). Disconnect cluster wire at chassis wiring harness connection. Remove nuts and lockwashers. Disconnect speedometer cable. Remove wire connector from ammeter terminals and other wire connections from back side of cluster. Push cluster toward front of car and remove assembly.
Tempest - Disconnect battery and remove left duct (Air Cond. cars). Remove retaining nuts and speedometer cable. Pull cluster and housing out from instrument panel opening and remove bulbs and wiring.



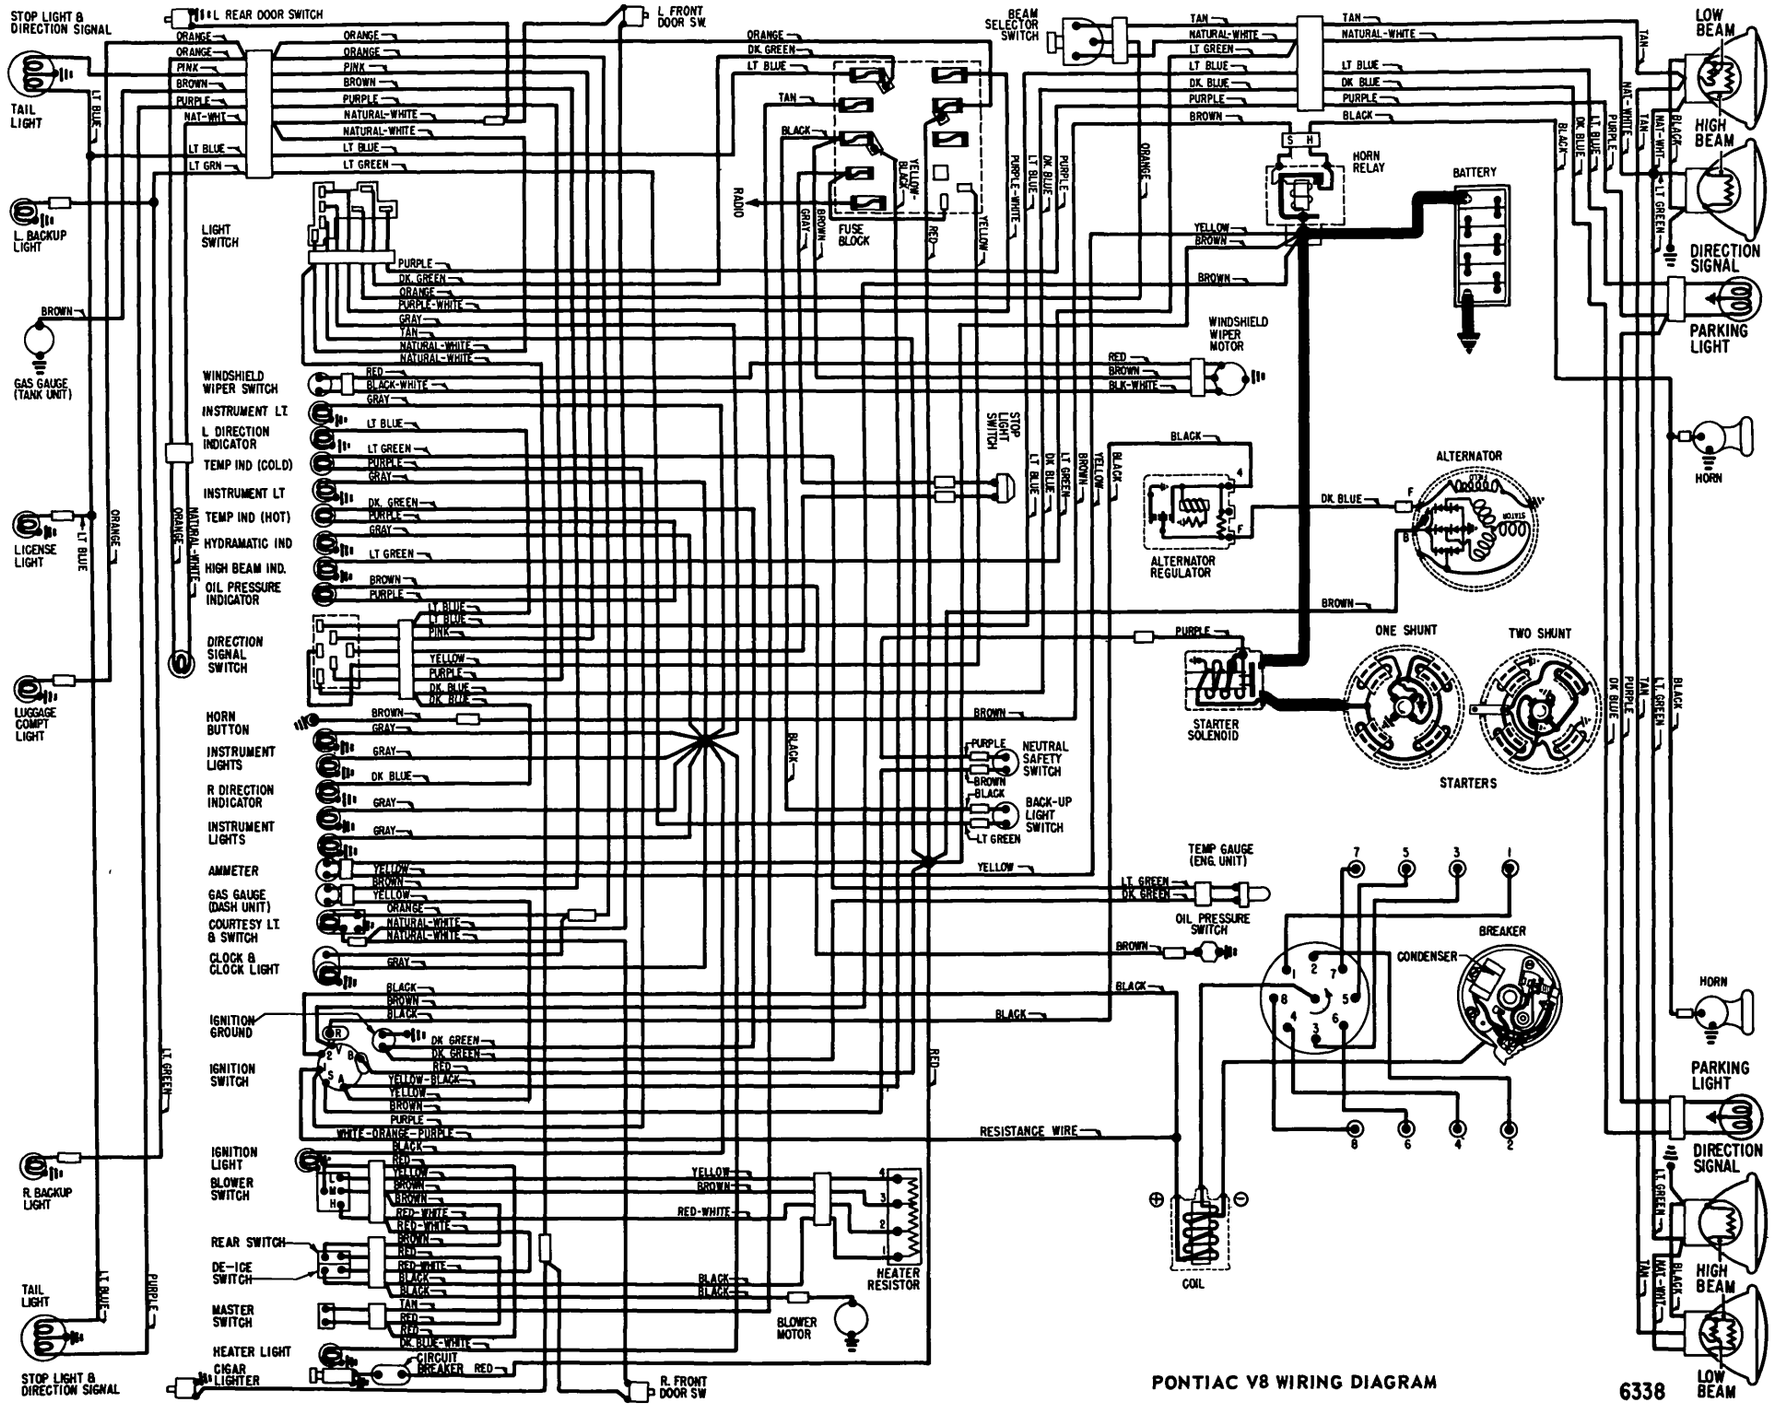
TURN SIGNAL FLASHER

Located on fuse block under instrument panel on left side of car

BELT ADJUSTMENT



Belt	Burroughs Gauge
Alternator & Water Pump	70-75
Power Steering (Tempest)	70-75
(Pontiac)	100-105
Air Cond. (Tempest 4 Cyl.)	70-75
(Tempest V8 & Pontiac) ①	100-105
(Tempest V8 & Pontiac) ②	110-115



① - First type Rayon cord belt.
② - Later type premium cord belt. Adjust NEW belt to 150-155 lbs. Burroughs Gauge reading. Readjust if reading less than 110 lbs. *NOTE* - This belt has embossed part number (9772059 or 9772317).

ENGINE

ENGINE IDENTIFICATION

Special Engine Code Letter - Engine code (79Y 89Z etc) is stamped directly below engine number on machined pad on front of right hand cylinder bank These codes are used in the engine specifications to designate special engine specifications

Engine Compression Ratio - Different compression ratios obtained by special cylinder heads with same pistons Compression ratio can be identified by cast number on head near center exhaust port between exhaust manifold attaching flange and lower center head bolt as listed below *This identification number is NOT a part number*

Cylinder Head Identification No.

Pontiac Engines		Tempest Engines	
Engine & Ratio	Number	Engine & Ratio	Number
389" 8 6-1	543796	4 Cyl 8 6-1	543796
389" 10 25-1	543797	4 Cyl 10 25-1	543797
401" 10 75-1	9770716	V8 8 6-1	543796
401" 11 0-1	9771980	V8 10 25-1	548232

ENGINE REMOVAL

Pontiac (except Tempest) - Engine can be removed with or without transmission Following includes engine removal with transmission

1) Drain systems and remove hood Disconnect all wires, pipes, linkages, hoses, cooler lines Remove carburetor crankcase vent pipe, radiator, fan, battery, and cables

2) On Pwr Strg cars, remove pump belt and pump from mounting bracket and secure out of way

3) Disconnect exhaust pipe from crossover pipe, and disconnect gearshift linkages

① - 120 at 3800 RPM (Synchro-mesh), 140 at 4400 RPM (Auto Trans)
② - Synchro-mesh Trans ③ - Auto Trans ④ - Catalina
⑤ - Starchief ⑥ - 110 HP (Export)

4) On synchro-mesh cars, disconnect clutch fork linkage and remove clutch countershaft bracket from flywheel housing

5) Remove propeller shaft assembly Raise engine slightly

6) Remove front and rear insulator mounting screws Disconnect cooler lines at timing cover

7) On automatic transmission cars place jack under transmission and remove frame crossmember *CAUTION - Without jack for support, transmission will swing down when crossmember removed*

8) Hoist engine and transmission out of chassis

Tempest - 1) Remove hood, drain and remove radiator

2) Disconnect hoses and all accessible wires

3) Disconnect fuel line at pump, then disconnect vacuum modulator line (auto trans cars)

4) Disconnect battery remove front fender cross brace, fan and pulley Disconnect all linkages

5) Disconnect exhaust pipe at manifold Place wooden block at rear of engine to prevent damage to distributor if engine should rock to rear

6) Disconnect propeller shaft and torque tube from rear of engine

7) Disconnect engine support at crossmember, raise engine and move it forward to clear firewall and heater

OIL PAN REMOVAL

Tempest - 1) Drain crankcase Remove exhaust crossover pipe

2) Support engine and remove front crossmember assembly

3) Remove flywheel housing front shield and lower cover

4) Remove oil pan bolts and remove pan

Pontiac (Exc Tempest) - 1) Drain radiator and crank case Remove hood and air cleaner Disconnect battery negative lead Disconnect radiator hoses

2) Remove upper radiator support and fan guard Remove coil retaining bolts and move coil out of way

3) Remove crossover and exhaust pipe-to-exhaust manifold retaining bolts Remove 2 idler arm-to-frame retaining bolts and lower idler arm and tie rod

4) Remove engine front mount bolts Remove 2 starter-to-clutch housing retaining bolts and lower starter

5) Remove oil pan-to-block retaining bolts and oil pan to-timing chain cover retaining bolts Remove lower cover from clutch housing

6) Hook chain fall under front of intake manifold and lift front of engine as high as possible

7) Remove flywheel cover from clutch housing Remove oil pan from block and let drop

8) Move crankshaft to No 1 position Hold crossover pipe and tie rod down then remove oil pan

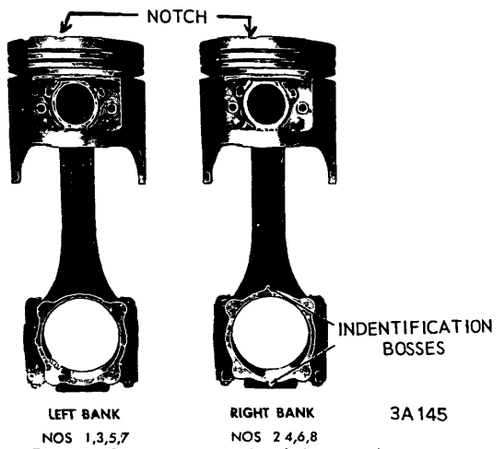
CYLINDER HEAD INSTALLATION

3 sizes of cylinder head bolts used When installed properly, all will project equally from their bosses Tighten bolts evenly to specifications

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

PISTON & ROD INSTALLATION

V8 Engines - Notch on piston head (arrow on 421" Engines) should point toward front of engine (all cylinders). Identification bosses on side of connecting rod (see illustration) should point toward front of engine (Right Bank), toward rear of engine (Left Bank).



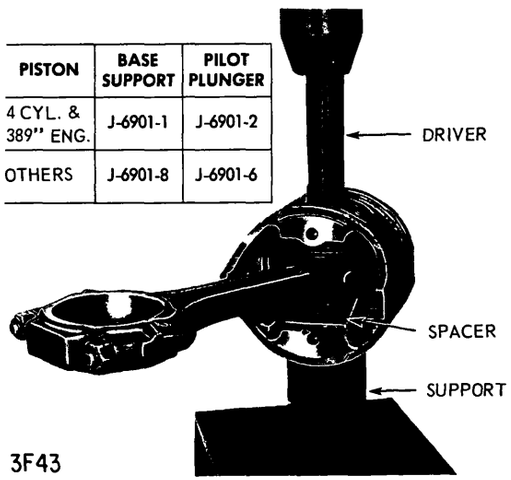
4 Cylinder Engine - Identification bosses on rod to rear of engine. Notched side of piston head must face to front of engine.

FITTING PISTON

Measure diameter of bore at its smallest diameter. Measure piston skirt perpendicular to piston pin boss (pin removed) and at center of skirt (Exc. 421" Eng.), top of skirt (421" Eng.).

PISTON PIN INSTALLATION

See illustrations and note the following:
Use Tool J-6901 for removal and installation of piston pins. To install, place plunger and spring in tool support (use correct support and pilot plunger for piston type). Place plunger in piston pin bore. Position on press. Coat pin and rod lightly with graphite lubricant and insert pin. Press pin in until it bottoms against plunger. Piston must turn freely on pin. *Pin must not move under 1500 lb. minimum load after assembly.*



PISTON & ROD ASSEMBLY (TYPICAL)

PISTONS, PINS, RINGS

Engine	PISTONS	PISTON PINS		PISTON RINGS		
	① Clearance	Piston Fit	Rod Fit	Ring	End Gap	Side Clearance

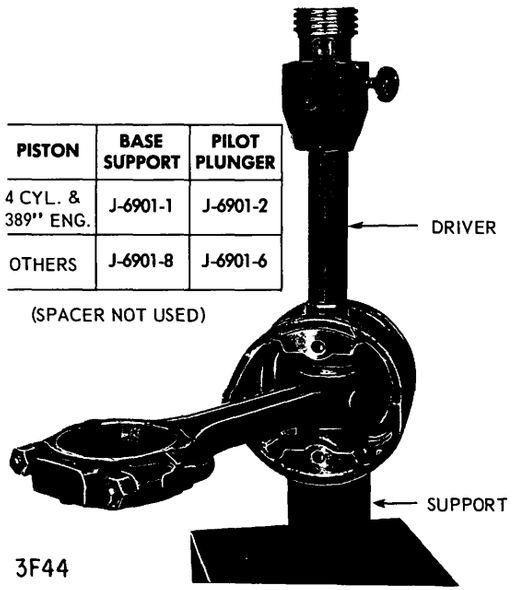
OTHERS	J-6901-8	J-6901-6



PISTON PIN REMOVAL

Oversize Pin Installation - .001" and .003" Oversize pins can be installed. Connecting rod can be honed to fit **but must be .0008-.0016" smaller than pin.**

PISTON	BASE SUPPORT	PILOT PLUNGER
4 CYL. & 389" ENG.	J-6901-1	J-6901-2
OTHERS	J-6901-8	J-6901-6

(SPACER NOT USED)

PISTON PIN INSTALLATION

REAR MAIN BEARING OIL SEAL REMOVAL

Pontiac (except Tempest) - Drain oil, remove pan, oil pump and oil pump drive shaft. Remove oil baffle and cylinder block-to-oil baffle tube. Remove rear main bearing cap and rear center main bearing cap. Loosen remaining bearing caps enough to allow crankshaft to be moved away from block about ½". Remove upper half of rear main bearing oil seal. Remove oil seal and bearing shell from bearing cap.

Tempest - Drain oil. Disconnect propeller shaft and torque tube from rear of engine. Support engine and remove front crossmember assembly. Remove oil pan, oil baffle, and cylinder block-to-oil baffle tube. Remove rear center main bearing cap and upper half of rear center main bearing shell. Remove rear main bearing cap and loosen remaining bearing caps enough to allow crankshaft to be lowered about ½" at rear. Remove upper half of rear main bearing oil seal. Remove oil seal and bearing shell from rear main bearing cap.

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

Engine	MAIN BEARINGS				CONNECTING ROD BEARINGS		
	Journal Diam.	Clearance	Thrust Brg.	Endplay	Journal Diam.	Clearance	Sideplay
All	① 3.000"	.0005-.002"	Rear Center	.0035-.0085"	2.2492-2.2502"	.0005-.0025"	②

① - 3.250" on 421" Engine. ② - .0035-.0085" (Tempest Std. Eng.); .006-.011" total both rods (All except Tempest Std. Eng.).

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

REAR MAIN BEARING OIL SEAL INSTALLATION

Install seal in cap, compress with suitable tool and trim one end flush with cap. Rotate seal in cap and recompress slightly to eliminate bumps caused by seal retention slots in cap. Remove seal from cap and insert into block (insert end which was flush with cap first) by slipping it up over crankshaft into seal cavity in block. Install rear center main bearing cap (pull crankshaft into place against seal) and bearing shell and torque to specifications. Trim both ends of seal flush with block. Install new seal in cap (as above) and trim flush with cap. Install cap with shell and torque to specifications. Remove rear main bearing cap again and inspect split line to be certain none of seal material is compressed between cap and block. Apply a bead of sealer about 1/16" in diameter to mating surface of cap extending from packing seal groove outward to groove for oil pan cork rear gasket. Install rear main bearing cap and torque to specifications.

ENGINE FRONT COVER

►*FRONT COVER PRODUCTION CHANGE & REPLACEMENT CAUTION:* Beginning Engine No. 390797 (Tempest), 451447 (Pontiac), a new aluminum Front Cover and Water Pump were used. These parts can be identified by larger water pump assembly and larger pump mounting hole in cover. An inserted Internal Housing and Divider must be used in the cover behind the pump.

Removal - Drain radiator and cylinder block, loosen alternator adjusting bolts (remove alternator brackets on Tempest), remove fan and pulley, disconnect radiator hoses, remove fuel pump, remove harmonic balancer. Remove bolts attaching oil pan to cover. Remove cover bolts from block and intake manifold (manifold bolt is a draw bolt on Tempest), remove the cover.

Installation - Thoroughly clean gasket surfaces on block and cover, inspect oil pan gasket and replace if damaged. Use new "O" ring seal in water passage in intake manifold (Pontiac only). Install and tighten cover to block and intake manifold bolts first, then install oil pan screws. Tighten to correct torque specifications.

FRONT COVER OIL SEAL

To replace seal, remove fan and accessory drive belts. Remove harmonic balancer. Remove seal by prying out of bore with pry bar. Install new seal with seal lip facing rear of engine (use Seal Installer Tool J-21147).

VALVE STEM OIL SEALS

"O" ring type used on all valves. Install in second groove (from end) of valve stem.

VALVE GUIDES

Integral with cylinder head. Ream to next oversize when installing valves with oversize stems.

VALVES

① - *Refer to CAMSHAFT USAGE CHART.* ② - Standard size. ③ - 4 Cylinder Engine.
④ - Tempest V8. ⑤ - Pontiac (Except Tempest) V8 Engine.

VALVE STEM LENGTH CHECK

Position rocker arm on stud and hold in place using Tool J-8927. Slip valve into place and hold against valve seat. Insert Gauge Tool J-8928 through pushrod hole and seat snugly in pushrod seat of rocker arm. With all parts seated, step end of gauge should be flush with gasket face of head (see NOTE below), but should not project past step on gauge. If gauge projects too far (stem too long) grind tip of stem as necessary. *CAUTION* - When grinding stem tip, be careful not to overheat it (could soften hardened stem and cause rapid wear).

NOTE - Undercut cylinder head requires a straightedge at this point. Clamp straightedge on lower inboard side of head (flush with bottom of head). Use this point for reference.

VALVE SPRING INSTALLED HEIGHT

Measure from spring seat on head to underside of spring retainer. *See "Valve Closed" spring length in specification table.*

ROCKER ARM STUD REPLACEMENT

Use .003" Oversize stud only when original stud is found to be loose in head. Use Standard sizes for replacement when original stud threads are damaged.

Stud Removal - Remove cylinder head. With rocker arm removed, file two slots, 3/32-1/8" deep, on opposite sides of rocker arm stud. Top of slots should be

(Continued)

VALVE SPRINGS & LIFTERS

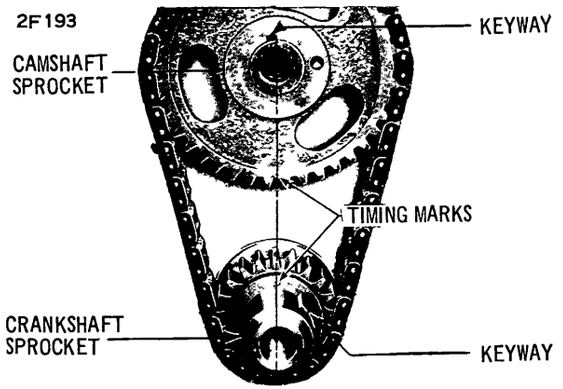
CAMSHAFT REMOVAL (ENGINE IN CAR)

Tempest - Remove radiator grille lower panel, grille, and hood latch as an assembly Remove front bumper assembly, drain and remove radiator Engine now accessible for camshaft removal

Pontiac (except Tempest) - Remove radiator and hood latch bracket When pulling camshaft out from front of block, it may be necessary to raise engine slightly for camshaft clearance between grille and hood catch support plate



TIMING CHAIN TENSIONER REMOVAL (4 CYLINDER TEMPEST)

Right bumper must be removed first DO NOT remove spring by twisting or stretching spring *See illustration*

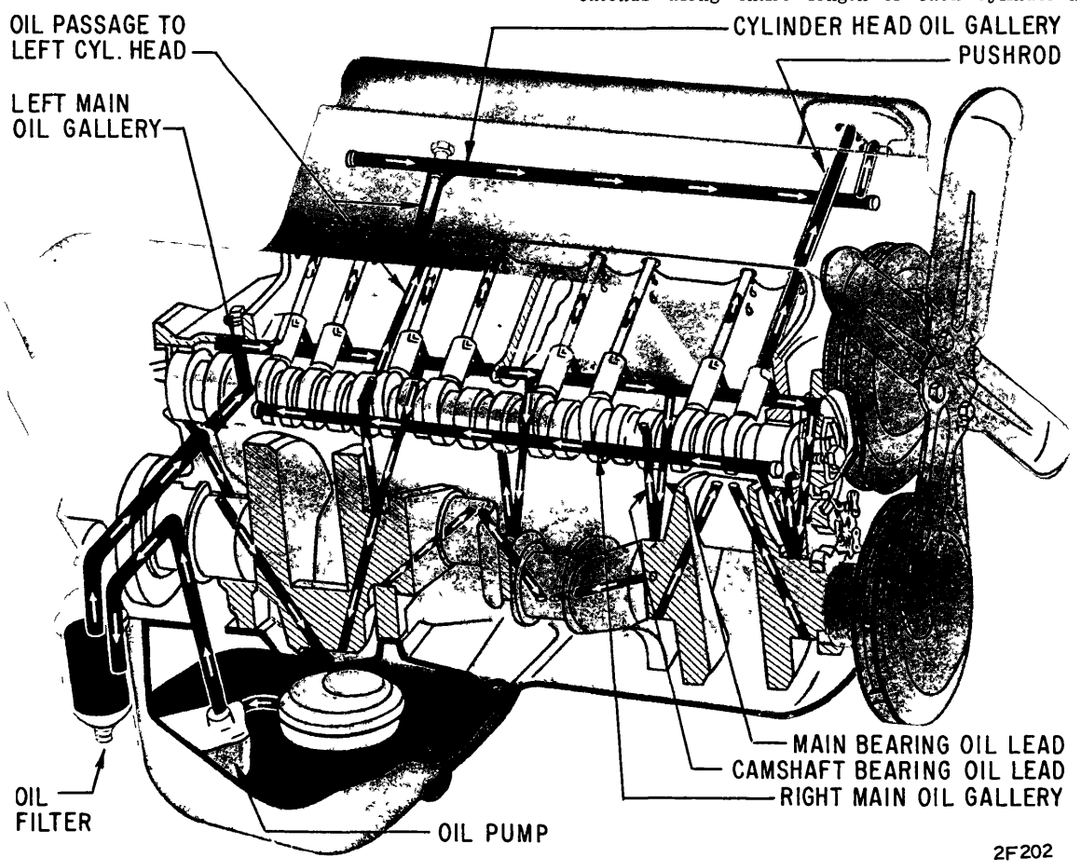
4 CYL TIMING CHAIN TENSIONER

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

VALVE TIMING MARKS

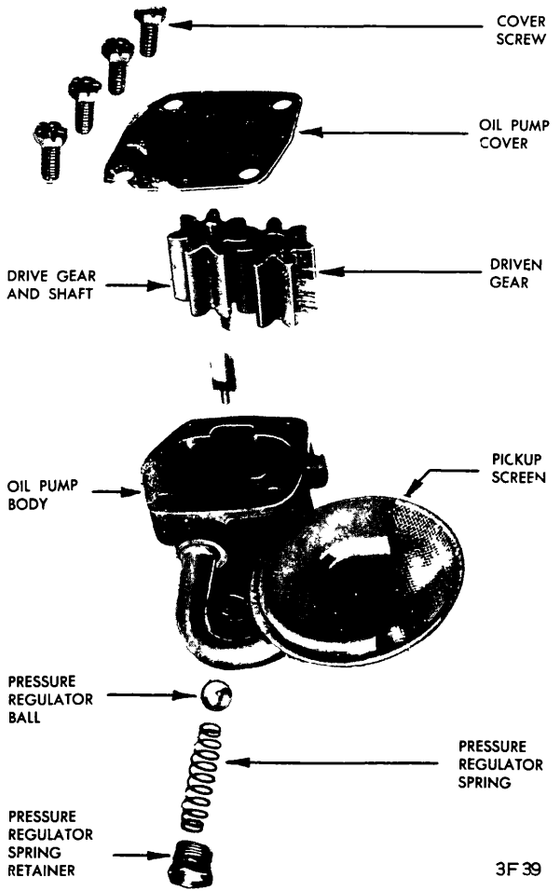
ENGINE OILING

Oil Pressure - 30-40 psi at 2600 RPM
Pressure Regulator Valve - In oil pump body. Not adjustable



ENGINE OILING SYSTEM

4 Cylinder Engine - Engine design and oiling system similar to V8 except for absence of left bank.
V8 Engines - Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, and to hydraulic valve lifters. Metered oil is supplied to pushrod seats, rocker arms, timing chain and sprockets, and distributor drive gear. All other parts are lubricated by oil spray.
NOTE - Pushrods are filled with oil directly through small hole in top of lifter for lubrication of upper and lower pushrod seats. Vertical passages in block at No. 2 camshaft bearing (for right bank), and No 4 camshaft bearing (for left bank) extend up through engine block and matching passages in head (passage in head is around one cylinder head bolt with grooved channel in lower face of head to connect with hole in block) to connect with cylinder head oil gallery which extends along entire length of each cylinder head



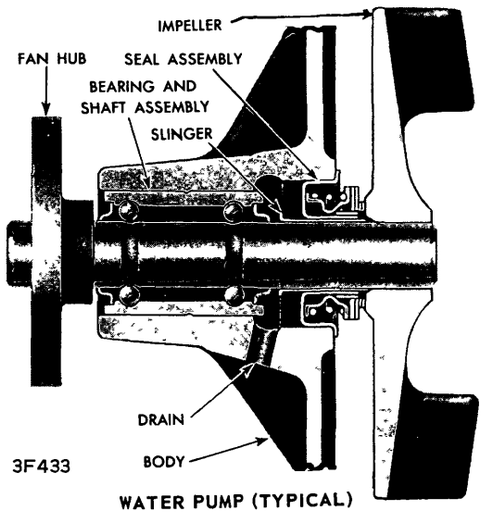
This oil is metered by camshaft bearing and is fed intermittently by oil holes lining up. Rocker arm studs (pressed in head) extend down into this cylinder head oil gallery and have drilled oil passage with side hole at rocker arm ball seat through which oil flows to lubricate ball seat and up through grooves in ball to fill channel section of arm.

OIL PUMP ASSEMBLY

Install drive and driven gears. Install cover and torque bolts to specifications Turn drive shaft by hand to insure it turns freely. Install pressure regulator ball, spring, and retainer (use new gasket on retainer). *CAUTION - DO NOT try to change oil pressure by varying length of pressure regulator spring.* To install pump, position drive shaft into distributor and oil pump drive gears. Place oil pump on block indexing drive shaft with pump drive gear shaft. Install attaching screws and lockwashers. *NOTE* - Removal and installation of pump does not disturb distributor timing.

V8 ENGINE OILING SYSTEM (4 CYL. ENGINE SIMILAR)

ENGINE OIL PUMP
(SCREEN & TUBE ASSEMBLY STAKED IN PLACE)



See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE COOLING

Thermostat - Pellet type located in water outlet passage of intake manifold. Opens 180°F.
Pressure Valve - Radiator filler cap. 14-17 psi (Pontiac Exc. Tempest); 15 psi (Tempest).

WATER PUMP

Two types used. *See "Engine Front Cover" for production change.* Pump is serviced as an assembly.

WATER PUMP (TYPICAL)

MODEL IDENTIFICATION

Car Model	Series
Tempest	2100
Le Mans	2200
Catalina	2300

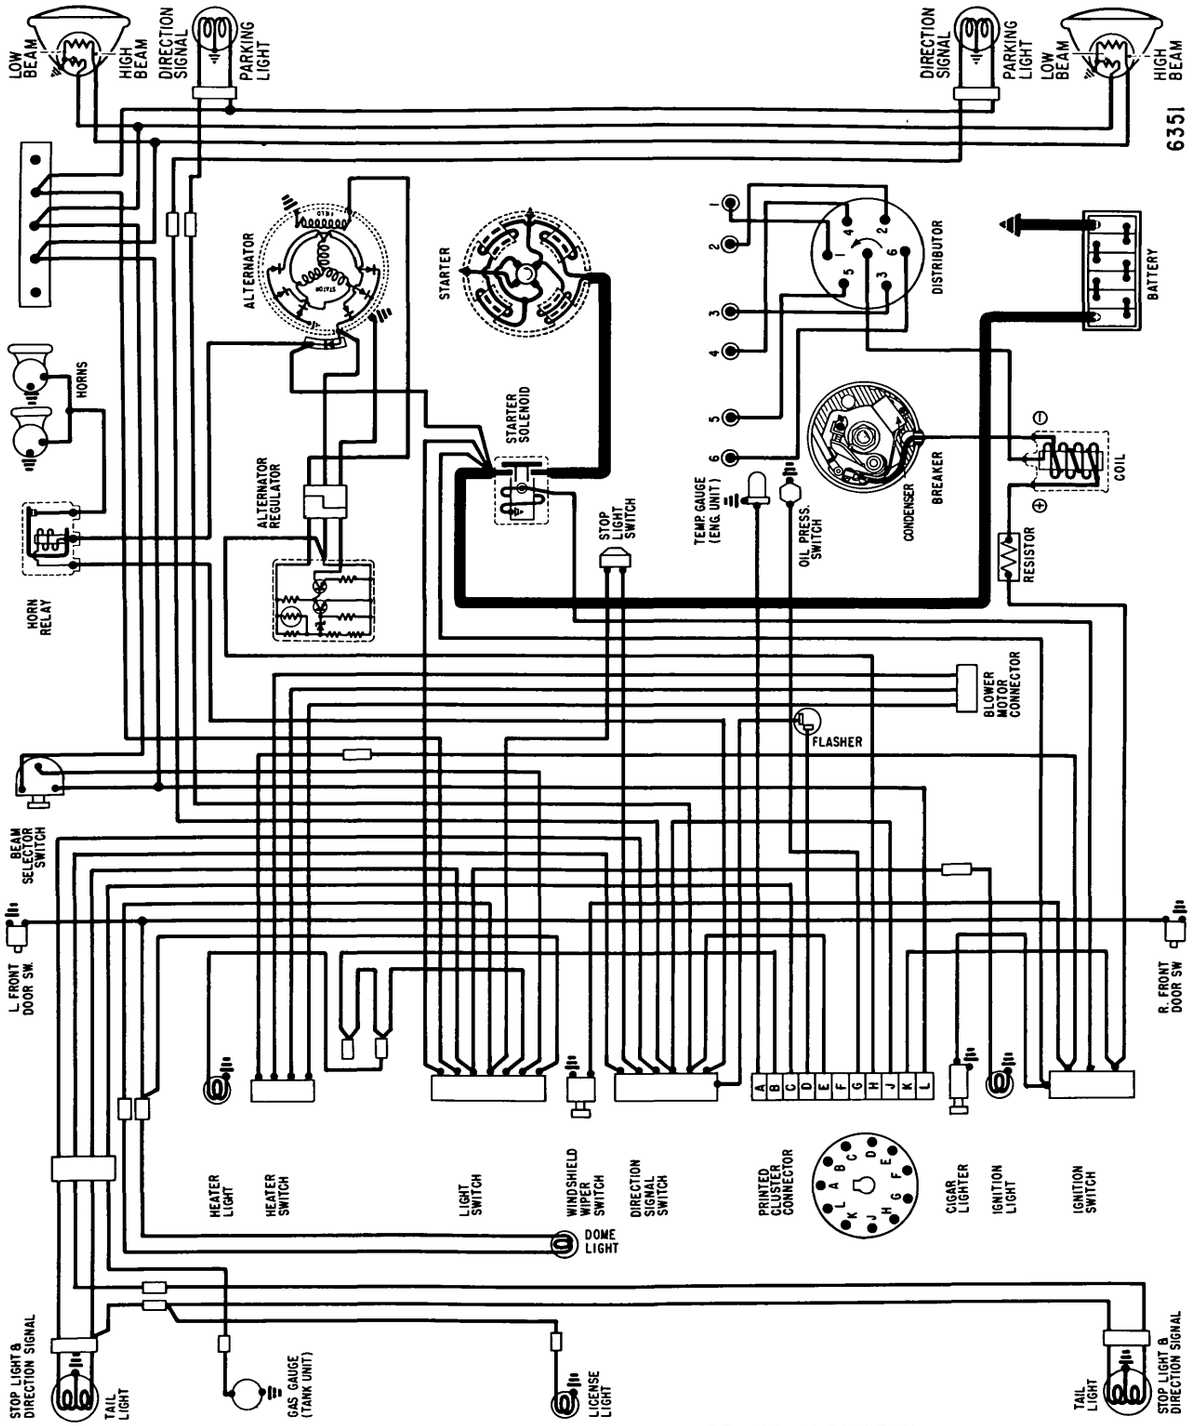
FUSES & CIRCUIT BREAKERS

Circuit Br ak r - On main lighting switch. Protects all circuits except those listed under "Fuses".

Fuses - In-line fuses for each of the following units: Direction Signal, Heater, Radio, Overdrive, Back-up Light, Clock, Parking Brake Warning, 4-Wheel Drive Indicator.

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH



Switch located on shift lever (Fleetvan), on steering column (Gladiator & Wagoneer). To adjust, loosen switch attaching screws and place selector lever in "N" (Neutral). Move switch as necessary so starter will operate with selector lever in "N" only, then tighten attaching screws.

STOP LIGHT SWITCH

Located on brake master cylinder. No adjustment.

HEADLIGHT SWITCH REMOVAL

Loosen setscrew on side of control knob and remove knob. Remove retaining nut and remove switch from instrument panel.

JEEP SERIES J GLADIATOR & WAGONEER WIRING DIAGRAM

ELECTRICAL (C ntinu d)

SPEEDOMETER & INSTRUMENT CLUSTER

FC-150 & FC-170 - To remove speedometer and instrument cluster, remove instrument panel as follows: Remove screws holding steering column to instrument panel skirt (2 at hinge pillar, 4 at instrument panel front flange, 1 at right end of skirt). Remove screws from top front edge of instrument panel, then remove the screw holding right front flange of panel lower right extension. Loosen right nut on steering column clamp. Remove radio control knobs and remove both mounting screws from top of instrument panel. Lift instrument panel for clearance for cluster removal. Disconnect speedometer cable and gauge wires, snap out lamp bulb sockets, then remove 4 stud nuts holding instrument cluster to panel. Remove cluster. To install, reverse removal procedure.

TRANSFER CASE INDICATOR LIGHT SWITCH (GLADIATOR & WAGONEER)

Switch located on transfer case and actuated by raised lands on transfer case shift rod. To check and adjust, proceed as follows: Loosen switch in its mounting and attach a test light to switch terminals. Move shift rod in transfer case until poppet ball is fully seated in detent position corresponding to indicator light being checked. Turn switch in or out until test light lights, then move shift rod until poppet ball is free of detent position. If test light does not go out, adjust switch in or out until light does go out. Test light should go on and off as poppet ball is moved in and out of detent position. Tighten switch locknut.

BELT ADJUSTMENT

Belt	©D flecti n
Alternator, Generator, Fan, Water Pump	1/2"
Power Steering	3/16"

© - Under strong thumb pressure midway between pulleys.

ENGINE

ENGINE NUMBER SUFFIX LETTERS

Suffix letters after engine serial number indicate undersize main and connecting rod bearings and/or oversize bore and pistons as follows:

All 4 Cyl. & OHC-6 - A .010" undersize main and rod bearings. **B** .010" oversize bore and pistons. **AB** combinations of both **A** and **B**.

L6-226 - A .010" undersize main and rod bearings. **N** .020" oversize bore and pistons. **AN** combination of both **A** and **N**.

ENGINE NOTES

► *OHC-6 ENGINE FRONT ENGINE PLATE OIL LEAK CORRECTION:* May be caused by interference between cylinder block and riveted end of chain tensioner lower pin, thus preventing engine plate from being tightened flush against block-to-plate gasket. To correct, grind or drill a dimple on block to accommodate pin. *DO NOT grind pin.*

► *OHC-6 ENGINE CYLINDER HEAD & INTAKE MANIFOLD GASKET INSTALLATION CAUTIONS:* Gaskets for cylinder head and intake manifold will overlap manifold port and block water passage openings. These overlappings are specially designed for maximum engine efficiency and cooling. *DO NOT alter gaskets in any way or engine operation and parts life will be seriously affected.*

► *OHC-6 ENGINE COOLANT LEAK CORRECTION:* If coolant leaks at lower intake manifold attaching stud, remove stud, coat threads with sealer, and reinstall stud.

► *FUEL PUMP LINKAGE LUBRICATION CAUTION:* Be sure to coat all linkage parts (camshaft eccentric, pushrod, fuel pump arm) whenever linkage parts are being serviced.

GENERAL SPECIFICATIONS

© - 7.3-1 optional.

ENGINE REMOVAL

FC-150 - *NOTE - Engine, transmission, and transfer case are removed as a unit as follows:* Disconnect battery, drain oil and water, and remove engine housing. Remove carburetor and air cleaner, surge tank, oil filter and bracket, and upper accelerator control bellcrank. Disconnect all lines, hoses, and wires from engine. Disconnect exhaust pipe at manifold. Raise and support truck. Remove exhaust pipe and extension, and clutch control cross shaft. Disconnect hand brake control parts from lever, and transmission and transfer case shift rods. Remove front and rear propeller shafts. Remove fan belt, raise generator bracket out of way, disconnect spark plug cables and remove cables and bracket, remove rocker arm cover, then disconnect engine front mounts from engine. Attach a suitable lifting fixture and sling to engine and attach to a crane or A-frame inside of cab. Disconnect engine rear support (frame crossmember) from frame side rails, then lower engine to floor. Pull or raise truck away from engine.

FC-170 - *NOTE - Engine, transmission, and transfer case are removed as a unit as follows:* Loosen spring clips on front axle and slide axle as far forward as hydraulic brake hose will permit. Drain oil and water, remove seats, engine cover, radiator access cover, carburetor and air cleaner (and air cleaner bracket), distributor, oil filler tube, oil filter and bracket. Disconnect all hoses, lines, wires, and linkage from engine. Remove generator housing, generator and bracket, idler pulley and bracket, fan, and belt. Disconnect and swing radiator brace out of way. Remove fuel line between fuel pump and carburetor. Disconnect exhaust pipe at manifold, and transfer case and transmission shift rods. Disconnect clutch linkage and remove cross shaft and bracket. Disconnect hand brake control parts and remove lever bracket from crossmember. Disconnect propeller shafts at transfer case and tie to frame side rail. Attach a suitable lifting fixture and sling to engine and attach to a crane or A-frame inside of cab. Disconnect engine front mounts, engine rear support (frame crossmember) from frame side rails, then lower engine to floor, guiding it to left and rear. Pull or raise truck away from engine.

Utility Models - Drain cooling system. Remove hood, fan, radiator, and shroud. Disconnect battery and disconnect all wires, hoses, lines, and linkage from engine. Remove air cleaner. Disconnect clutch linkage and exhaust pipe at manifold. Attach a suitable lifting fixture to head bolts, then disconnect clutch housing from engine. Remove engine by raising and moving forward.

Fleetvan - *NOTE - Engine, torque converter, and transmission are removed as a unit as follows:* Drain cooling system, crankcase, torque converter, and transmission. Remove air cleaner, and radiator and heater hoses. Remove transmission cover panel, transmission side cover panel, dash lower center panel, and brake pedal cover plate. Remove exhaust pipe from muffler and manifold. Disconnect all lines, wires, hoses, and linkage from engine and transmission. Remove shift linkage cable support from transmission. With parking brake "off", remove brake cable support bracket from crossmember. Disconnect propeller shaft and tie out of way. Install cable and lifting crane around torque converter mounting flange, and place a floor jack (with suitable wood block) under engine. Disconnect rear crossmember from frame, and disconnect engine front mounts from frame. Move truck forward (or engine rearward) about 4" and remove front mounts from engine. Lower engine and transmission to floor, then raise truck away from engine.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

OIL PAN GASKET REPLACEMENT (ALL 6 CYL.)

NOTE - Following procedure is recommended to replace oil pan gasket with engine installed in truck and without removing engine front filler block Cut 1¼" from front end of two new oil pan gaskets and fabricate suitable dowels as shown in illustration Pull ends of both front and rear filler block seals out of filler blocks as shown, then install dowels in front oil pan attaching bolt holes Install new gasket on top of old gasket and cut through both gaskets 3/32" from edge of filler block (5/16" from edge of nearest gasket hole) *NOTE - Cut must be made so end of filler block rubber seal will cover the splice* Repeat procedure for both sides of oil pan, then remove and discard old gasket Install new gaskets with non-hardening sealer, making sure new gasket butts against ends of old gasket at front filler block Install oil pan, being careful not to dislodge gaskets and tighten attaching screws finger tight Torque all screws to correct torque, starting from center screws and working toward filler blocks and alternating from side to side

CYLINDER HEAD REPLACEMENT

All Except OHC-6 Engine - Use no gasket sealer On 4 Cyl , do not overlook bolt under carburetor On L6-226, distributor adapter may have to be removed to

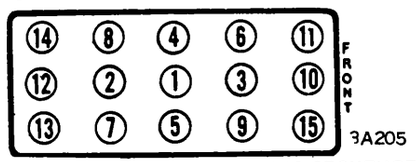
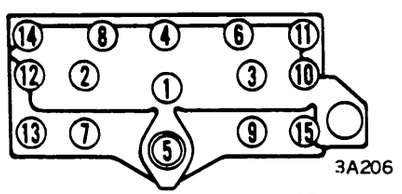
ENGINE (C ntinu d)



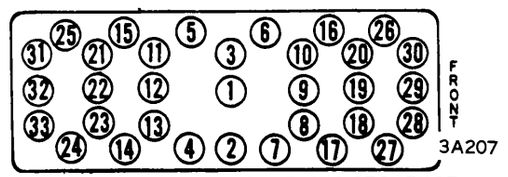
6 CYLINDER (ALL) OIL PAN GASKET INSTALLATION



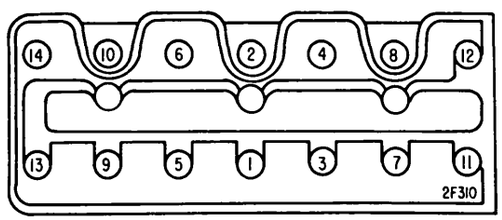
torque bolt near it Tighten all bolts in sequence shown in diagrams to correct torque Retighten after engine at normal operating temperature

OHC-6 Engine - Removal - *NOTE - Procedure is for head removal without removing timing chain or engine front cover.* Remove hood and windshield wiper motor Remove rocker arm cover, install Camshaft Sprocket Replacer Tool W-268 on rocker arm cover studs Install hood of tool in camshaft sprocket, tighten nut to relieve tension on camshaft Remove capscrew, lockwasher, flat washer, and fuel pump eccentric from camshaft sprocket, pull forward on sprocket to free from pilot on camshaft Release tension on removal tool by backing off tool nut and allow chain and sprocket to rest on bosses on timing chain cover *CAUTION - Do not slack off on chain (which would allow it to disengage from crankshaft sprocket), do not attempt to remove sprocket from chain (valve timing will be changed), and do not try to crank engine with sprocket and chain resting on timing chain cover (will cause severe damage)* Remove lubrication tube from cylinder head and block, then remove cylinder head bolts Remove cylinder head **by lifting straight up with an overhead chain fall.** *CAUTION - Do not remove head without the use of an overhead chain fall.*

Installation - *NOTE - Following procedures supersede all previous recommendations* Make sure head bolt holes in block are drilled 1 25" deep and tapped to 1 09" Coat both sides of new gasket with Perfect Seal Sealing Compound, No 935611, and install gasket on cylinder block Using an overhead chain fall, lower cylinder head assembly until it is **suspended** ¼" above gasket and install suitable guide pins through cylinder head and into block at No 12 & 14 bolt hole locations *CAUTION - Cylinder head must be SUSPENDED above block It must not rest on any spacers placed between head and gasket Do not install guide pins until head assembly is suspended ¼" above block, and do not use guide pins in any other bolt holes than No 12 & 14* Carefully lower cylinder head on top of gasket and install head bolts (except at guide pin locations) and tighten snugly according to sequence shown in diagram Replace guide pins with head bolts and tighten all bolts in proper sequence to correct torque Retighten to same torque after engine at normal operating temperature, and again after 500 and 1000 miles of operation



L4-134 CYLINDER HEAD TIGHTENING SEQUENCE



F4-134 CYLINDER HEAD TIGHTENING SEQUENCE

MANIFOLD INSTALLATION (OHC-6)

To insure proper sealing and prevent cracking or breaking of manifold flanges, there must be no bind between manifold studs and stud holes, and stud nuts must be tightened uniformly as follows Tighten all nuts snugly, then work from center outward, and alternately from side to side, and tighten nuts to correct torque

L6-226 CYLINDER HEAD TIGHTENING SEQUENCE

OHC-6 CYLINDER HEAD TIGHTENING SEQUENCE

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

FITTING PISTONS & CHECKING CLEARANCE

With 003" (All 4 Cyl), 004" (All 6 Cyl used pistons), 0015" (All 6 Cyl new pistons) ribbon feeler inserted between inverted piston and cylinder wall on thrust side, pull required to withdraw feeler should be 5 to 10 lbs

PISTON & ROD INSTALLATION

All 4 Cyl. - "T" slot of piston should be to valve (left) side of engine, and short side of connecting rod bearing toward nearest main bearing or to front of engine on Nos 1 & 3, to rear of engine on Nos 2 & 4 Oil spray hole in lower end of rod must be toward right of engine (away from camshaft) on all rods

L6-226 - Slot in piston skirt must be to left side of engine (away from camshaft) Rod bearings are offset with narrow side of rod toward nearest main bearing (Nos 1,3,5 forward, Nos 2,4,6 rearward) Oil spray hole in lower end of rod must be toward camshaft

OHC-6 - "F" mark on piston must be to front of engine Oil spurt hole in connecting rod must face exhaust side of cylinder block

MAIN BEARING REPLACEMENT (4 CYL.)

Engine must be removed from vehicle for bearing replacement as bearings are "doweled" in crankcase and crankshaft must be removed to replace bearings Make sure oil holes in bearings line up with oil holes in crankcase, and that bearings fit snugly on dowel pins in crankcase and bearing caps Install bearing cap evenly to avoid bending dowels Bent dowels will cause misalignment of bearing cap and rapid bearing wear Replace any bent dowels

BEARING CAP IDENTIFICATION - Cylinder block center crankshaft bearing web and bearing caps marked with daub of paint to indicate that caps are to be used with that block only *Do not use caps with any other color than shown on web*

REAR BEARING OIL SEAL REPLACEMENT (4 CYL.)

Upper & Lower Seal - *NOTE - Upper and lower halves of seal can be replaced without removing crankshaft* Neoprene seal with steel back Upper half of seal can be removed by using a suitable piece of strap steel (hack saw blade) Rotate upper half of seal around shaft with strap until opposite end protrudes far enough to grasp and remove To install, coat both parts of seal with grease and install upper half by rotating it around crankshaft until it is in position with ends even at the cylinder block Coat both ends of lower seal with Permatex before installing to insure good seal with upper half

Cap Seal - Bearing cap sealed by cylindrical rubber packing strips inserted in holes between cap and case When installing bearing cap, coat upper face lightly with sealing compound, and insert new packing strips after cap is in place Packing strips should protrude ¼" to provide proper compression when oil pan is installed and should not be cut off

CRANKSHAFT END THRUST (4CYL.)

Taken by thrust washer between crankshaft gear and front bearing Endplay controlled by shims between thrust washer and shoulder on crankshaft Thrust washer must be installed with inner beveled edge toward front bearing

CRANKSHAFT FILLER BLOCK SERVICING (6 CYL,)

L6-226 Engine - Front - Remove by taking out mounting screws and timing gear cover screws which enter the filler block When installing filler block, first install oil pan side gaskets, then install filler block (use Permatex), and install new end gasket on block

Rear (Lower) - Remove by taking out mounting screws Remove and discard old seal Install new seal in same manner as detailed below for Rear Upper Guard Install lower filler block **after** upper filler block guard has been installed

Rear (Upper Guard) - Guard is seated in groove in crankcase and can be rotated out without disturbing crankshaft after lower filler block removed Remove and discard old gasket or seal, clean out seal groove, and install new seal by flattening seal slightly and using a rod to seat seal in groove by rolling from ends toward center Seal ends must extend slightly above flat surface of guard Do not use shellac or sealing compound in groove *CAUTION - Oil seal in both upper guard and lower filler block must be centered with crankshaft If necessary, seal can be built up using 1/32" thick gasket material, 3/16" wide, as shims shellacked to groove in block or guard behind seal*

OHC-6 Engine - Lower (Front & Rear) - Remove 2 socket head machine screws attaching rear filler block to cylinder block Remove oil pan seal, filler block, gasket inserts, and lower rear seal Remove front filler block-to-cylinder block attaching bolts and remove filler block Discard seals and oil pan gaskets Replace front and rear bearing oil seals Cement filler blocks for a distance of 2" from each end (also coat oil pan seals for a distance of 2" from each end), then install oil pan seals Ends of pan seals should be 1/16" below top of filler block Allow cement to dry before installing filler block

Upper (Rear) - Guard is seated in groove in crankcase and can be rotated out without disturbing crankshaft after lower filler block removed Remove and discard old seal, clean out seal groove, then install new seal Do not use sealing compound in groove

ENGINE FRONT COVER REMOVAL

OHC-6 Engine - Remove hose from front cover water port Remove front cover-to-engine front cover plate attaching bolts, nuts and washers Remove cover, lifting eye, and gasket Slide oil slinger and oil pump drive gear from crankshaft

ENGINE FRONT COVER OIL SEAL

4 Cyl. Engines - Cover has double metal baffle and spring-loaded leather seal which contacts polished surface of crankshaft pulley hub When installing seal, make certain that seal lip is inward (to rear of engine)

L6-226 Engine - Drive out old seal using Driver KF-44 Place cover with opening flange on flat surface Coat outer edge of new seal with sealing compound, place seal in opening with seal lip to rear and drive seal into place

OHC-6 Engine - With timing chain cover installed, apply thin coating of sealing compound on outer edge of seal and position seal in opening so that seal lip faces toward inside of cover Drive seal into place using Oil Seal Installing Tool W-269

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

VALVE TAPPET ADJUSTMENT (L6-226)

Adjust valves as indicated in table below. With valves in fully raised position (camshaft rotated as necessary), other valves will be on low side of cam in position for tappet adjustment.

Valves Fully Raised	Valves To Be Adjusted
Nos. 1 & 3	Nos. 10 & 12
Nos. 8 & 9	Nos 4 & 5
Nos. 2 & 6	Nos. 7 & 11
Nos 10 & 12	Nos. 1 & 3
Nos 4 & 5	Nos. 8 & 9
Nos 7 & 11.	Nos. 2 & 6

ROCKER ARM COVER & GUIDE INSTALLATION (OHC-6 ENGINE)

Rocker Arm Guide - When installing rocker arm guide, make sure that all rocker arms are aligned correctly and that all tabs of guide fit into rocker arm cavities. This will prevent misalignment of rocker arm and forcing of guide through rocker arm cover.

Rocker Arm Cover - 1) Oil seal washers must have minimum thickness of .222". Replace if necessary. Make sure rocker arm cover distortion at bottom edge does not exceed .020" at any point.

2) Install gasket into cover **without sealer,** install oil seal washers on cover studs, then place cover in position. Install a flat washer on rear stud, and spark plug cable brackets on front three studs (flat washers unnecessary). Install crown nuts and torque to 6-8 ft. lbs. *NOTE - Correct torque of crown nuts is important to prevent distortion and oil leaks.*

ROCKER ARM REPLACEMENT (F4-134)

Removal - Lock rocker arms, shaft, brackets, and springs together as a unit by removing cover studs in front and rear rocker arm shaft brackets and installing 5/16"-24 setscrews in front and rear brackets in same manner setscrews are installed in center brackets Remove nuts on bracket studs and lift entire assembly off studs as a unit.

Installation - Check pushrods, straighten or replace any that are bent. Place pushrods in holes in head and block, being sure that they are properly seated in intake valve tappets. Place rocker arm assembly on its studs, seat intake valve adjusting screws in tops of pushrods before installing nuts on bracket studs Torque nuts to specifications. Remove extra setscrews from front and rear rocker arm shaft brackets, install cover studs in front and rear brackets with short end of stud down.

ROCKER ARM STUD REPLACEMENT (OHC-6)

Position cam bearing support deck on an arbor press and position the support of Rocker Arm Stud Remover & Installer W-266 under defective stud. Position tool guide on top of stud with chamfered end up. Place driver in guide so end rests on top of stud. Press on end of driver to dislodge stud Remove stud. Invert cam bearing support deck on arbor press and install support of tool under deck and aligned with hole for stud. Place new stud in hole in bearing deck (thread end first). Position tool guide on knurled end of stud with chamfered end down Press stud into place until it seats firmly.

VALVE GUIDE SERVICING

F4-134 - Use Tool W-238 to remove and install guides. Drive exhaust guide down into valve compartment to remove. Drive new exhaust guide to 1" below surface of cylinder block, and new intake guide flush with bottom of valve guide bore in cylinder head.

L4-134 - Use Tool W-238 to remove and install guides. Drive guides into valve compartment to remove. Drive new exhaust guide to 1" below surface of cylinder block, and new intake guide to 1 5/16" below surface of cylinder block.

L6-226 - Use Tool KF-27 to remove and install guides. Place guide with tapered end of guide toward top in position in guide bore and drive to correct position of 1 7/32" below top face of cylinder block. Ream new guides to inside diameter of 3422-.3432".

OHC-6 - Use Tool W-265 to press old guide out bottom of head and to press new guide in from top of head. Use a spacing stop to limit distance guide can be installed. Properly positioned, top of valve guide will be .45" above machined surface of cylinder head. After installation, ream guide to .342-.343".

OHC-6 VALVE TIMING MARKS

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

CAMSHAFT REMOVAL

4 Cyl. Engines - Drain radiator and cylinder block, remove radiator and grille, cylinder head, manifold, valves, and valve springs Remove oil pump oil pan, crankshaft pulley (use puller), fan drive belts and fan assembly Remove timing gear cover, camshaft gear and thrust plate and spacer Block up all valve lifters (can be tied up with string to manifold studs) Remove camshaft through front of engine

L6-226 Engine - Drain cooling system and remove radiator, vibration damper, engine front cover, timing chain and gears Remove fuel pump, cylinder head, oil pan and oil pump Remove valve chamber cover, valves and springs Hold valve lifters in fully up position Remove camshaft thrust plate and carefully withdraw camshaft from engine

OHC-6 Engine - With cylinder head removed, lift rocker arm guide off mounting studs on camshaft support deck, turn rocker arms parallel to camshaft (rotate camshaft to release tension on rocker arms, turn arms off cams as tension is relieved) Remove nuts and lockwashers attaching retainer to front of support deck, remove retainer, pull camshaft forward and out of support deck bearing bores *INSTALLATION CAUTION* - If 030" thick shim installed between cam bearing deck casting and camshaft thrust plate, shim must be reinstalled after camshaft servicing To determine if the engine has this shim, measure between centerline of base holes to thrust plate surface If measurement is 810", no shim required If measurement is 780" a thrust plate shim, No 932076, is required

CAMSHAFT SUPPORT DECK REMOVAL (OHC-6)

After camshaft removed, remove three nuts, lockwashers, and Plain washers attaching deck to cylinder head, then lift support deck off head

CAMSHAFT BEARINGS

4 Cyl. Engines Front Bearing - Bearing is staked in place to prevent rotation with oil hole in bushing aligned with oil hole in crankcase

OHC-6 Engine - Camshaft operates directly in bearing bores in camshaft support deck Check support deck and bearing bores for cracks, visible wear, or scoring Check bearing bore and camshaft journal diameters with micrometer Replace support deck or camshaft if bearing clearance more than 004" (see table below)

Bearing	Support Deck Bore	Camshaft Journal
No 1	1 9995-2,0005"	1 9965-1 9975"
No 2	1 8745-1 8755"	1 8715-1,8725"
No 3	1 7495-1 7505"	1 7465-1 7475"
No 4	1 3745-1 3755"	1 3715-1 3725"

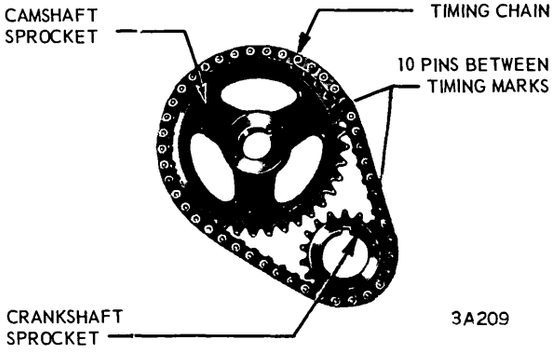
CAMSHAFT END THRUST

All 4 Cyl. - Taken by thrust plate behind camshaft gear Endplay controlled by spacer between camshaft gear and shoulder on shaft Endplay can be increased by installing shim between spacer and shaft, or decreased by dressing off spacer Inner beveled edge of spacer must be toward crankcase

L6-226 - Taken by thrust plate on front of engine (between front bearing journal and hub of sprocket) Not adjustable If endplay excessive replace thrust plate

OHC-6 - Taken by thrust plate between camshaft sprocket and cam bearing deck Not adjustable

CAMSHAFT



Engine	Journal Diameter No. 1	Journal Diameter No. 2	Journal Diameter No. 3	Journal Diameter No. 4	Bearing Clearance	Camshaft Endplay

TIMING CHAIN REMOVAL (OHC-6)

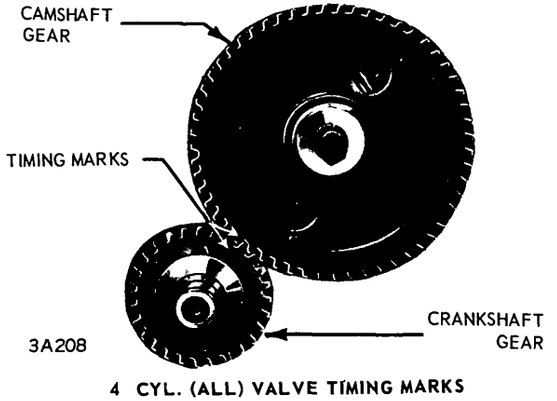
Remove timing chain cover Install Sprocket Replacer W-268 on rocker arm cover studs of cam bearing support deck Install the hook of this tool in sprocket and tighten nut to relieve tension on camshaft Remove capscrew, lockwasher and flat washer and fuel pump eccentric from sprocket Pull forward on camshaft to remove from pilot Release tool hook, then slide timing chain sprocket to remove from crankshaft Remove chain tensioner pin Remove blade assembly and tensioner spring from lower tensioner mounting stud Remove chain guide bracket-to-front engine plate attaching capscrews, washers and nuts Remove chain guide bracket To install, reverse removal procedure and check valve timing

TIMING CHAIN TENSIONER (OHC-6)

Tensioning device compensates for normal wear and stretch If rubber facing of tensioner contact face is worn, replace tensioner Timing chain should be replaced if distance between chain sides at narrowest point is less than 3 38" with tensioner in place

L6-226 VALVE TIMING MARKS

VALVE TIMING



Engine	INTAKE Open BTDC	INTAKE Close ALDC	EXHAUST Open BLDC	EXHAUST Clos ATDC
All 4 Cyl	9°	50°	47°	12°
L6-226	2°	42°	42°	8°
OHC-6	15°	55°	55°	15°

CHECKING VALVE TIMING

All 4 Cyl. - Set tappet clearance of No 1 intake valve at 026" Turn crankshaft until No 1 piston is approaching top dead center on exhaust stroke, stop with piston 9° BTDC (estimate this point by noting distance between "TC" and 5° marks on timing pointer) Rocker arm should be just tight against No 1 intake valve stem Reset tappet clearance to correct running specification

L6-226 - Set tappet clearance of No 1 intake and exhaust valves at 0175" Turn crankshaft until No 1 piston is approaching top dead center and all clearance is taken up between lifter and No 1 intake valve stem Timing indicator should indicate 2° BTDC plus or minus 2° Turn crankshaft slightly past top dead center to check exhaust valve closing point Timing indicator should indicate 8° ATDC plus or minus 2° with valve just seated Reset tappet clearance to correct running specification

OHC-6 - *See Valve Timing Marks Illustration*

4 CYL. (ALL) VALVE TIMING MARKS

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

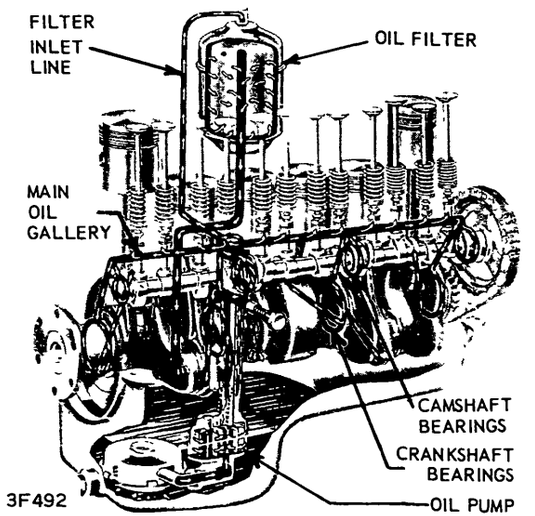
Normal Oil Pressure - As follows:

Engine	Pressure	Engine RPM
All 4 Cyl.	35 lbs.	2000
L6-226	35 lbs.	1700
OHC-6	50 lbs.	2000

Pressure Regulator Valve - In oil pump body (All 4 Cyl. & OHC-6), right side of cylinder block below valve chamber cover (L6-226). Not adjustable.

ENGINE OILING SYSTEM

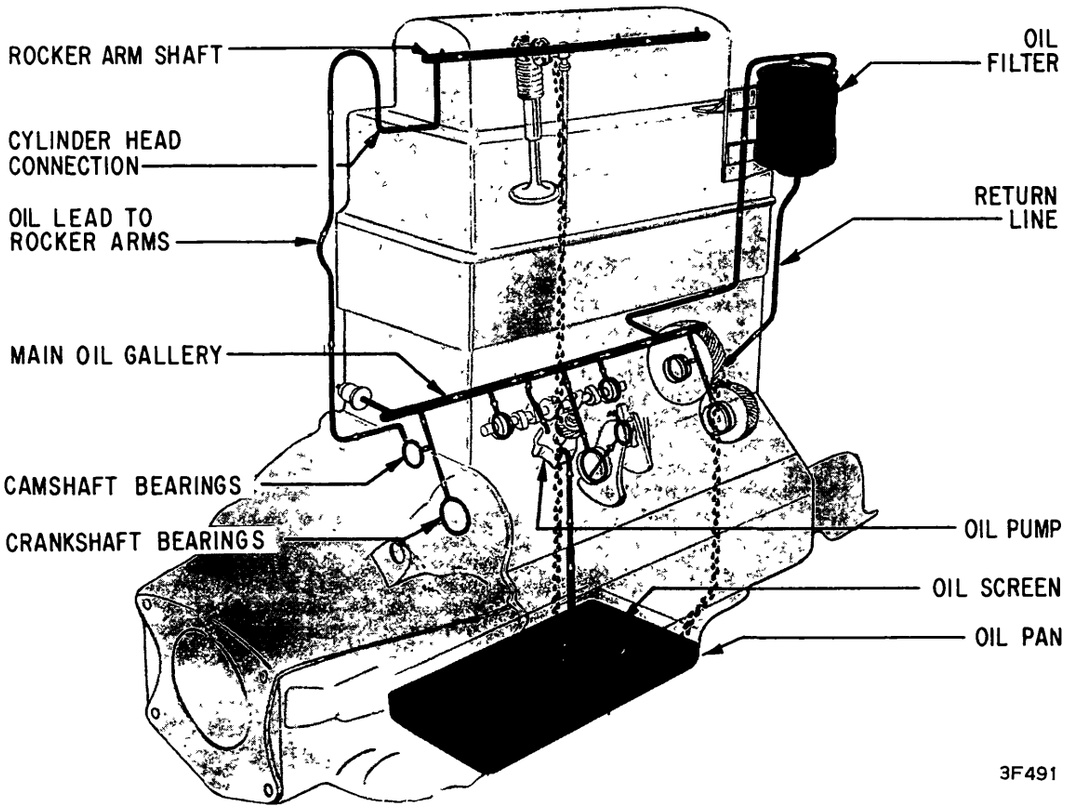
4 Cyl. Engines - "L" head and "F" head engines have similar oiling systems with the exception of cylinder head valve mechanism oiling (pushrods, rocker arms, valve tips) used on "F" head engines only. *See illustration and note the following:*



Valve Lifters - Lubricated from oil reservoir trough cast in crankcase which is filled by oil spray from connecting rod bearings. Lifter guides are drilled to permit oil flow from trough to lifter bore (lifters have oil groove at center for uniform lubrication of lifter bore).

Oil Filter - Partial flow type mounted on bracket on engine. Filter inlet is from main oil gallery.

L6-226 Engine - *See illustration and note the following:*



Crankshaft Bearings - No. 3 crankshaft bearing is lubricated directly from pump outlet cross passage.

Valve Lifters - Lubricated directly from main oil gallery through cross passage drilled through each lifter boss. Oil holes extend completely through lifter bosses and first two groups (Cyls. 1, 2, 3, 4) are shielded by sheet metal oil shields held in place by spring clips on underside of shield. No shield is used on rear group (Cyls. 5 & 6).

L6-226 ENGINE OILING SYSTEM

ENGINE OILING

4 CYL. "F" HEAD ENGINE OILING SYSTEM ("L" HEAD SIMILAR)

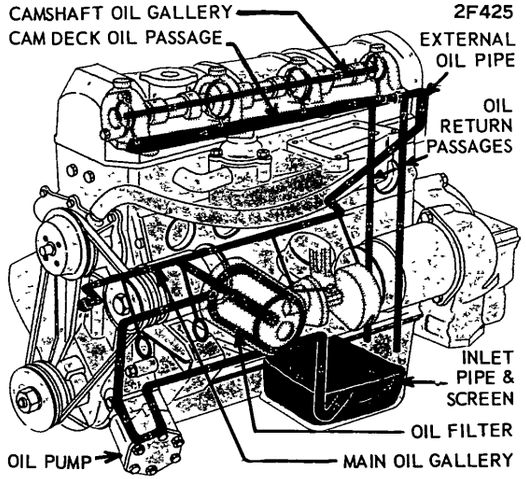
Oil Filter - Partial flow type mounted on bracket on left side of engine. Filter inlet is from main oil gallery.

OHC-6 Engine - *Refer to illustration.* Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings. All other parts are lubricated by oil spray. Double rotor type oil pump, driven by helical gear on crankshaft, draws oil through fixed intake screen, and delivers oil to full flow filter through passages in block. Oil flow from filter is through passage in block to main oil gallery which extends along left side of block. Oil is distributed from main oil gallery as follows:

Crankshaft Bearings - Each main bearing supplied with oil from main oil gallery through angle passage in crankcase web extending down from main oil gallery to main bearing bore.

Camshaft Bearings - Drilled passages in support deck provide lubrication to camshaft bearings. Oil passage to rear camshaft bearing also provides oil under pressure to fill oil passages in camshaft to keep cams lubricated.

Camshaft Bearing Support Deck - A ¼" steel tube is inserted in this passage to conduct oil to front of support deck and to prevent oil drain-back when engine is idle. Oil enters this tube by way of external tube at rear of block which connects oil passage in block to oil passage in cylinder head.



Connecting Rod Bearings - Oil passages in crankshaft mate with oil grooves in main bearings and these passages conduct oil to the connecting rod bearings.

Pistons & Pins - Lubricated by oil spray thrown on cylinder wall from spurt hole in connecting rod when this hole lines up with oil hole in crankpin.

Timing Gears - A passage in block conducts oil to a fitting at front of block which provides a stream of oil to timing chain, sprockets, and oil pump drive gear at front end of crankshaft.

Oil Filter - Full flow type mounted externally on left side of cylinder block. All oil supplied by oil pump passes through filter, then through passage to main oil gallery in block. Relief valve located in pump body.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

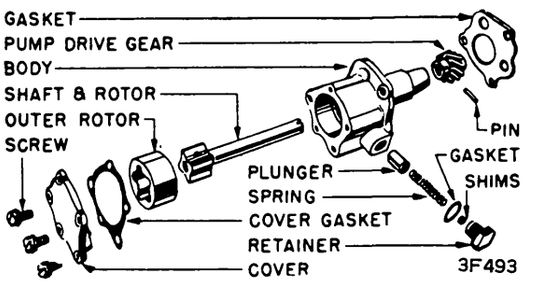
OHC-6 ENGINE OILING SYSTEM

OIL PUMP

4 Cyl. Engines - Removal - Rotate engine until distributor rotor points to No. 1 firing position and timing mark on flywheel or vibration damper is directly under pointer. *CAUTION - Do not rotate crankshaft with oil pump removed.* Remove pump mounting bolts and pull pump out as far as possible. Place a short jack between front suspension support and front lower edge of block and push engine to right until pump is free (loosen engine support bolts for more movement if necessary).

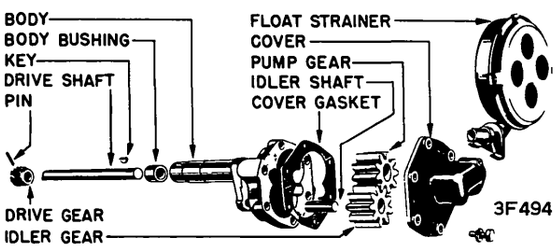
Overhaul - *Refer to illustration for arrangement of parts.* Before disassembling pump, check pump shaft for wear at pump drive gear. If sideplay exceeds .010", replace entire pump. Outer rotor-to-body clearance should not exceed .012". Cover must be flat within .001". Rotors must be of equal thickness within .001". Clearance between rotors should be .010". Install pump drive gear on shaft so clearance between gear and pump body is .003-.010"

Installation - Check to see that timing marks on flywheel or vibration damper are directly under pointer and distributor rotor is pointed toward No. 1 firing position. Insert pump in block with pump gear positioned so that it will engage camshaft gear and the distributor shaft drive key without moving distributor rotor. Installation can be made only in one position without moving distributor rotor as slot in drive gear and key on distributor shaft is machined off-center.



L6-226 Engine - *See illustration for arrangement of parts.* Observe the following specifications: If there is more than .005" clearance between pump body and ends of lower drive gear teeth, replace pump body bushing and ream to .500-.501". *CAUTION - Pump bushing in block must be tight and installed flush with bottom of cylinder block. Loose or improperly installed bushing may restrict main oil gallery.* Pump shaft diameter should be .4990-.4985". End of lower drive gear should be .001-.004" beyond gasket seat on pump body. There should be .002-.004" clearance between underside of upper drive gear and upper end of pump body (controlled by pressing lower drive gear on shaft until this clearance obtained).

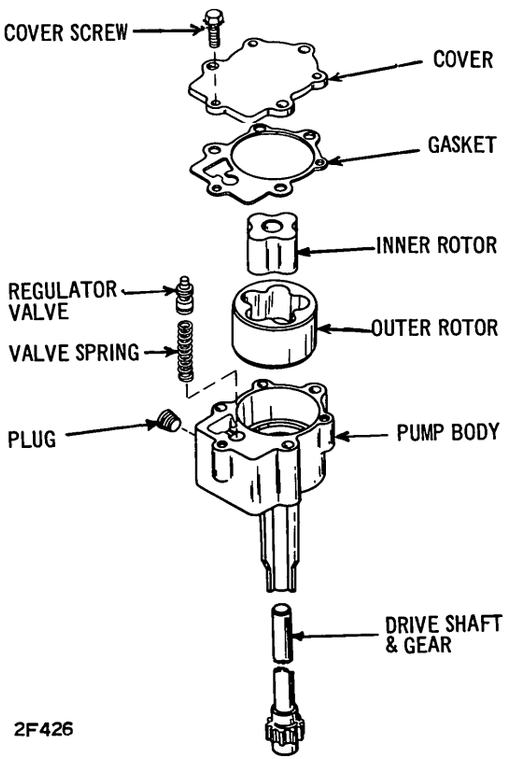
ENGINE OILING (C ntinued)



Installation - Set No. 1 piston at TDC. Insert distributor main drive shaft from top of block. Install pump with pump drive shaft tongue engaging slot in lower end of distributor main drive shaft and in such a position that when installed, slot in upper end of distributor main drive shaft will be approximately parallel to side of block (slot pointing fore-and-aft). Install lockwasher, tighten mounting nut, and remove distributor shaft for cylinder head installation.

OHC-6 Engine - Removal - Remove three nuts and lockwashers. Pull straight out to remove pump.

Inspection - Clean and check pump for cracks or leaks. Check drive gear for worn teeth, cracks, etc. Replace gear if damaged. Mount dial indicator on oil pump to check for endplay. Move pump shaft to its extremes and check for total endplay. If this exceeds .005", replace pump. *CAUTION - Drive gear is press fit on oil pump shaft and must be removed and replaced with an arbor press.* Correct axial positioning of the gear on shaft as follows: Outside end of gear hub must be 7 1/32" from mounting face of pump. Centerline of face of gear teeth should coincide with bottom of distributor shaft slot in end of oil pump shaft.



4 CYL. (ALL) ENGINE OIL PUMP

L6-226 ENGINE OIL PUMP

Installation - Oil pump is driven from crankshaft by means of a helical gear. Distributor is driven by the oil pump by means of a tongue on end of distributor shaft engaging slot on end of oil pump shaft. Tongue and slot are machined off-center so they can be meshed in only one position. To install, rotate crankshaft until pointer on timing chain cover is aligned with "O" timing mark on vibration damper. Install oil pump mounting gasket and position oil pump on studs on timing chain cover. Do not engage distributor drive gear worm. Insert long bladed screwdriver in distributor shaft opening on opposite side of block and engage slot in oil pump shaft. Turn shaft so that slot is positioned at roughly the 4 and 10 o'clock position with narrow side of shaft up. Remove screwdriver and, looking down distributor shaft hole with a flashlight, recheck position of oil pump shaft slot. Replace screwdriver and, while turning screwdriver counterclockwise to guide oil pump shaft gear into engagement with camshaft gear, press against oil pump to force it into position. Remove screwdriver and recheck position of slot. If correctly installed, slot will be in roughly the 3 and 9 o'clock position with narrow side of shaft still on top. If slot out of position, remove pump assembly and repeat operation. Secure pump with three nuts and lockwashers.

OHC-6 OIL PUMP (EXPLODED)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE COOLING

Pressure Valve - 7 lb., 9 lb., or 13 lb. radiator filler cap.

Thermostat - Standard - starts to open at 165°F. High Temperature - starts to open at 180°F.

WATER PUMP

4 Cyl. Engin s - Disassembly - Use Puller W-116 and pull impeller off shaft, lift out bakelite seal washer. Remove gearing lock ring from slot in bearing hub on pump housing, support pump housing in arbor press, press shaft and bearing assembly out of pump housing toward forward end. To remove fan pulley from shaft, use any suitable puller. Do not attempt to remove bearing from shaft (shaft and bearing serviced as an assembly only).

Servicing - If rear face of pump housing is not smooth and flat, resurface with special Tool C-551 or install new pump body.

Reassembly - Install shaft and bearing assembly in pump housing (long end of shaft to rear) so that outer end of bearing is flush with front end of housing. Install seal assembly in impeller (dip seal parts in brake fluid before installing), press impeller on shaft until end of shaft is flush with face of impeller hub. Press fan pulley on forward end of shaft until end of shaft is flush with face of pulley. Check location of locking ring groove in bearing with respect to slot in housing, align groove and slot, install bearing locking wire.

L6-226 Engin - Disassembly - Remove fan and pulley from pulley hub. Remove pump cover and gasket. With Puller KF-29 and adapter, KF-113, remove impeller from shaft. Remove bearing retainer ring from slot in housing and press shaft assembly out front of housing. Press or drive seal assembly from pump body.

R assembly - Press seal assembly carefully into pump housing. Apply oil or graphite to face of carbon seal washer. Press pump shaft and bearing assembly into oump housing just far enough to insert retaining ring. Insert ring. Press impeller on until flush with shaft end. Check impeller position to be sure it clears cover.

Pull y Hub Installati n - Press hub on shaft so fan mounting face is 5 7/32" from rear face of rear cover plate. Install cover gasket and cover.

OHC-6 Engin - *Pump is serviced as an assembly only. No overhaul is recommended.*

MODEL IDENTIFICATION

All 3½-5 lbs at 30 MPH

MANIFOLD HEAT CONTROL VALVE

Thermostatic type in exhaust manifold Valve must be free (use Metalclene to free sticking shaft)

CLOSED CRANKCASE VENTILATION SYSTEM

Clean system every 10 000 miles or sooner if needed especially under cold weather driving conditions

TUNE-UP NOTES

►*HARD COLD STARTING & POOR ACCELERATION PERFORMANCE CORRECTION (Cars before Engine No S-273119 with Carter RBS 3538S Carb)* Check the following points

1) Loose or Missing Diaphragm Chamber Cover - Install Repair Kit No 1560178 following instructions in kit

2) Rough Accelerating Pump B re - Remove air cleaner and note pump discharge when throttle opened half way Discharge should be a steady stream If spurts or dribbles noted, replace carburetor

3) Automatic Choke Setting - Set choke setting 1 Notch Rich (change from Centered setting)

Carburetors on later engines (date cod d L2 or later or with blue dot on bowl cover) have these changes See Production Change Note under Carburetor

IGNITION

►*DISTRIBUTOR REMOVAL CAUTION* Turn crankshaft to No 1 Cyl TDC position before removing distributor (necessary to provide clearance and prevent damage to Nos 3 & 4 piston skirts)

DISTRIBUTOR ADVANCE SPECIFICATIONS

Prestolite IAT-4403B

Mechanical Advance		Vacuum Advance	
Distr Degrees	Distr RPM	Distr Degrees	Vacuum " of Hg
Start	300	Start	7
2	400	4¼	11
4	500	8	13
8	700		
12	900		

For engine degrees & RPM, multiply by 2

IGNITION COIL

Ignition Current 4.0 amps idling

Carter "RBS" 3537S,3538S	15/32"		ℂ
3563S	15/32"		Centered

ℂ - **Centered** (Carbs date coded before L2), **1 Notch Rich** (Carbs date coded L2 and later, and earlier carburetors to correct Hard Cold Starting & Poor Acceleration complaints)

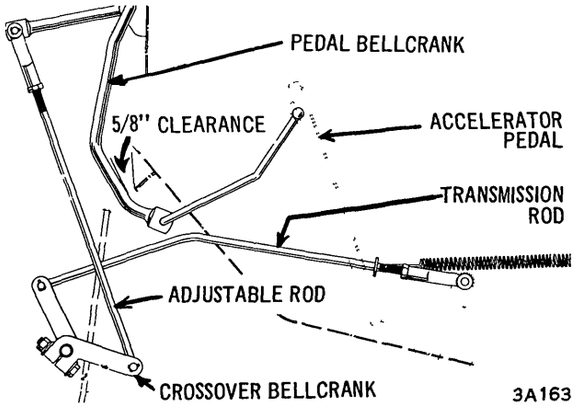
►*1963 CARTER RBS 3538S PRODUCTION CHANGE (Carbs date coded L2 and later used beginning Engine No S-273119)* Carburetors have improved method of retaining diaphragm chamber cover burnished pump cylinder, and 1 Notch Rich choke setting *See "Hard Cold Starting & Poor Acceleration Correction" above*

ACCELERATING PUMP

Cart r "AS" & "RBS" - No seasonal adjustment

THROTTLE LINKAGE ADJUSTMENT

►*1963 AUTO TRANS THROTTLE LINKAGE BIND (STICKING IN KICKDOWN POSITION) CORRECTION* To correct this condition replace outer throttle control lever (Part No 1559139), and place the wave washer on top of throttle control lever on transmission to prevent rod interference with transmission case



Auto. Trans Cars - With engine at normal operating temperature and running, and off fast idle, proceed as follows

1) On right side of engine disconnect adjustable crossover bellcrank-to-carburetor rod from carburetor and adjust engine idle speed to 550 RPM in "P" or "N" position Attach bellcrank-to-carburetor rod to carburetor throttle lever and place a .010" feeler gauge between crossover bellcrank stop lever and the stop Lengthen bellcrank-to-carburetor rod until feeler gauge can just be removed freely, then lock adjustable end locknut on rod

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

2) On left side of engine adjust length of rod between accelerator pedal bellcrank and crossover bellcrank so there is 5/8" clearance between rib on floor pan and accelerator pedal bellcrank arm *CAUTION - This adjustment must be accurate to prevent engine race on hard brake application or improper kickdown operation.*

3) Install pressure gauge on transmission (takeoff is near bottom flange of case at rear), and adjust length of rod from crossover bellcrank to transmission throttle lever for 85-95 lbs. pressure at 1000 RPM in "D" with brakes applied and wheels locked.

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

ELECTRICAL

BATTERY

12 Volt, 50 Ampere Hour.

ELECTRICAL (C ntinued)

FUSES & CIRCUIT BREAKERS

CIRCUIT BREAKERS

Headlights - In lighting switch
Windshield Wiper - In wiper switch
Tailgate Window - On left front fender apron

FUSE BLOCK

Located on back of instrument panel on lower left side

IN-LINE FUSES

Clock & Radio fuses in lines back of instrument panel
NOTE - Heater fuse mounted on Heater Switch, Over drive fuse on Kickdown Switch

SWITCHES, GAUGES, & SPEEDOMETER

NEUTRAL SAFETY SWITCH

Switch located on steering column Place selector lever in "N", then loosen switch mounting bracket attaching screws Align pin hole in switch lever with hole in switch body Hold switch in position or use a pin to maintain alignment and tighten mounting screws Check operation Starter should operate with selector lever in 'N" or "P ' only

HEADLIGHT, HEATER, WINDSHIELD WIPER SWITCH REMOVAL

1) Remove fresh air control bracket and fuse block retainer screws Loosen heater control cable bracket
2) Remove access hole cover from lower part of instrument panel (two cross-head screws)
3) Loosen switch lower retainer screw (work through access hole) remove switch upper retainer screw from behind instrument panel
4) Slide switch up and out, disconnect switch wires

STOP LIGHT SWITCH LOCATION

Hydraulic In front brake line fitting on inner side of left frame side member just forward of steering gear (Without Power Brakes) on brake master cylinder on firewall (Power Brakes)

TURN SIGNAL FLASHER

On fuse block on back of instrument panel on lower left side

SPEEDOMETER REMOVAL

Disconnect drive cable at speedometer head remove four light bulb and socket assemblies (press-in type), remove retainer nuts and brackets withdraw speedometer from panel

INSTRUMENT REMOVAL

Instrument case (Fuel Gauge, Temperature Gauge, Oil Pressure Gauge, Ammeter) is removed as an assembly as follows
1) Disconnect oil pressure gauge pipe at gauge
2) Remove fresh air control bracket and fuse block retainer screws Remove two instrument case retainer nuts and brackets
3) Withdraw instrument case from panel, remove two press-in type light bulb and socket assemblies disconnect wires
4) For access to individual gauges, pry up retainer tabs to free bezel, remove bezel glass glass retainer, and dial face assembly

BELT ADJUSTMENT

Use a spring scale on belt midway between pulleys Adjust belt tension so specified lbs pull on scale will lift belt proper distance (see table below)

Belt Adjustment Specifications

Belt	Lbs. Pull	D flection
Alternator	10	1/4"
Power Steering	4	3/16-1/4"
Air Conditioning	20	1/2"

ENGINE

ENGINE REMOVAL

1) Remove hood, radiator battery and air cleaner Drain crankcase
2) Disconnect all lines, wires, cables and hoses from engine
3) Disconnect accelerator pedal bellcrank to cross over bellcrank rod
4) Disconnect exhaust pipe at manifold, disconnect U-clamp at clutch or converter housing lower the exhaust pipe for clearance
5) Remove lower stud nuts from engine front mount insulators and disconnect ground strap at right front mount bracket
6) Remove starter
7) Disconnect right tie rod, remove shaft from steering bellcrank and move bellcrank out of the way for pan clearance
8) Remove left front and left rear cylinder head bolts (Nos 15 & 20) install lifting eyebolts in these locations, attach hoist, raise engine slightly to remove weight from front mounts
9) On Auto Trans Cars, disconnect accelerator bellcrank to transmission rod, remove converter housing lower plate, disconnect torque converter from converter drive plate
10) On all models, remove clutch or converter housing to engine bolts, drive out two clutch housing dowel pins
11) Raise engine slightly and move it forward until clutch clears drive shaft splines lift engine out

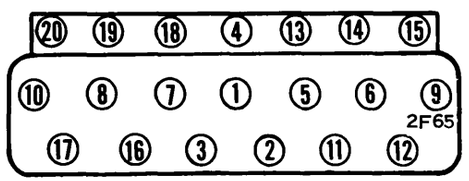
OIL PAN

Removal - Remove dipstick and drain crankcase. Disconnect tie rods and reach rod from steering bellcrank, remove retaining pinch bolt and remove bellcrank from shaft. Remove oil pan screws and remove pan.



Installation - Front filler block must be removed for installation of oil pan side gaskets. Install oil pan as follows:

1) Take out filler block screws and carefully separate filler block from front cover gasket. *NOTE* - If gasket damaged, cut away exposed portion of gasket and install similar part of new cover gasket.
2) Apply Permatex sealer to pan mounting flanges and install pan side gaskets.
3) Place filler block in position and install one upper filler block screw. Press filler block upward to compress pan gaskets and install opposite upper screw. Install remaining screws and tighten all screws finger tight. AFTER oil pan screws are tightened, torque all filler block screws to correct specifications.
4) Install pan end gaskets. Install pan and torque pan capscrews to specifications.

CYLINDER HEAD

Removal - Remove rocker arm assembly (center row of head bolts retain rocker arm brackets), and remove manifolds, then remove head.

Installation - Use dowel studs in head bolt holes Nos. 1, 15, 17 to position gasket and head. Coat both sides of head gasket lightly with Perfect Seal or equivalent, install gasket and head. Dip head bolts in engine oil, tighten two outer rows of bolts finger tight. Install rocker arm assembly and tighten head bolts fingertight, then tighten bracket bolts alternately to pull rocker arm assembly down evenly. Partially tighten all head bolts in sequence shown, then torque all bolts in same sequence to specifications, finally torque rocker arm bracket bolts to specifications.

CYLINDER HEAD TIGHTENING SEQUENCE

MANIFOLD ASSEMBLY

Manifolds serviced separately but should be installed as an assembly (if manifolds separated, install four bolts finger tight with nuts on top of intake manifold, tighten bolts securely **after** manifold installed on head). Install manifold assembly with clamps positioned so that two points engage intake manifold flange (triangular clamps), use plain washer under nut, torque all nuts evenly from center outward to torque specifications.

PISTONS, PINS, RINGS

Engine	PISTONS	PINS		RINGS		
	Clearance	Piston Fit	Rod Fit	Ring	End Gap	Side Clearance
All	①	.0001-.0003"	②	Comp. Oil	.007-.017" .007-.017"	.002-.005" .0015-.004"

① - Selective feeler fit. *See "Fitting Pistons".* ② - Locked in rod by tapered pin and locknut.

PISTON PIN

Removal - Tool J-1293C can be used to mount piston assembly in vise (tool mandrel extends through pin with retaining nut on outer end). Remove locknut and star washer from clampscrew, install nut on opposite end of screw and tighten nut to withdraw tapered clampscrew.

Installation - Assemble piston and rod (solid side of piston on numbered side of rod), install clampscrew with flat surface engaging flat on piston pin, install star washer and locknut on clampscrew and tighten snugly, use brass drift and hammer to seat clampscrew in rod, tighten locknut to correct torque specification. *CAUTION - Thus procedure important since half-thread on clampscrew will not permit nut to seat clampscrew properly*

INSTALLING PISTON RINGS

Top compression ring has step at the inside which must be installed upward. Second compression ring has step at outside which must be installed downward. Inner and outer oil ring end gaps must not meet at the same point.

PISTON & ROD INSTALLATION

Assemble piston on pin so "T" slot of piston is on side opposite oil hole in lower end of rod. Insert tapered end of clamp screw toward heavy boss on rod. With "T" slot of piston away from camshaft side, oil squirt hole and number will be to right on odd numbered rods, to left on even numbered rods. Odd numbered rods and even numbered rods cannot be interchanged.

FITTING PISTONS

Use a .002" x 1" x 12" feeler gauge inserted on camshaft side of cylinder. Insert inverted piston in cylinder bore with slotted side away from camshaft and bottom edge of piston 1" below top edge of bore. Pull required to withdraw feeler should be 7-12 lbs.

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

Engine	MAIN BEARINGS				CONNECTING RODS		
	Journal Diameter	Clearance	Thrust Bearing	Endplay	Journal Diameter	Clearance	Sideplay
All	3.0623-3.0628"	.0005-.0021"	No. 1	.003-.006"	1.81175-1.81275"	.0005-.002"	.005-.009"

CRANKSHAFT END THRUST

Crankshaft end thrust taken by thrust washer between front main bearing and crankshaft gear, and controlled by shims between thrust washer and main bearing journal. These shims furnished .003", .005", .007" thick.

CRANKSHAFT REAR OIL SEAL

Brummer (molded rubber) seals used in block and bearing cap. Bearing cap seal has integral cross seals and cork filler blocks are used between sides of cap and block. When installing seal, thoroughly clean seal channel in block and cap by swabbing with alcohol or solvent and drying with air.

Upper Seal - Loosen Nos. 2 & 3 intermediate bearing cap bolts approximately 2 turns for clearance, use screwdriver or similar tool to blunt sharp edge of flange at rear of block to prevent scuffing inside edge of seal, apply Lubriplate to sealing lip of seal, insert seal with inner lip toward front of engine, roll seal in place between crankshaft and block to point ¼" past face of block, then rotate seal back flush with block (this will relieve internal stresses).

Lower Seal - Install seal on bearing cap flange (inner lip toward front of engine), fully seat cross seals in cap grooves, trim outer ends of cross seals flush with cap edges. Apply Lubriplate or engine oil to sealing lip, install bearing cap and tighten all caps to correct torque specification. Install new cork filler block seal between bearing cap and block on each side.

ENGINE FRONT COVER

Removal - Remove radiator, fan, vibration dampener, and crankshaft pulley (Puller J-8111 and crankshaft thread protector HM-925-12). Remove cover.

Installation - Leave cover screws loose until after crankshaft pulley installed (hub will center cover), then torque cover screws to correct specification.

FRONT COVER OIL SEAL

Use crankshaft pulley hub to seat new felt oil seal in cover. Lubricate seal with engine oil.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

VALVE GUIDE SERVICING

Use Tool No. J-9265 to drive guide out of cylinder head from combustion chamber side. Coat outside of new guide with white lead, then start chamfered end into head from combustion chamber side *(CAUTION - Different guides used - intake guides are longer).* Install driver through correct hole of installing plate (plate marked "Intake" and "Exhaust" and should be placed across head with correct mark up). Drive guide in until driver bottoms on installing plate.

VALVE LIFTER REPLACEMENT

Lifters should slide into place of own weight. If .001" oversize lifter does not correct excessive clearance, ream lifter bore using Reamer 1352-5TB (L.O.Beard Tool Company) which will provide correct clearance for .005" oversize lifter.

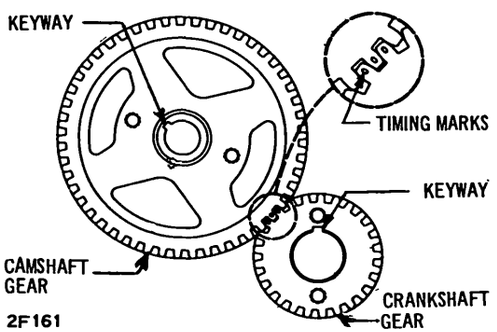
VALVE STEM SEALS

Used on all valves. Install seal over guide with cupped side of seal toward top of valve guide.

VALVE SPRING INSTALLED HEIGHT

Measured from spring seat on cylinder head to underside of spring retainer. *See "Valve Closed" spring length in specification table.*

VALVE SPRING INSTALLATION



Install cup type damper on closed coil end of spring and install spring with damper end down toward cylinder head.

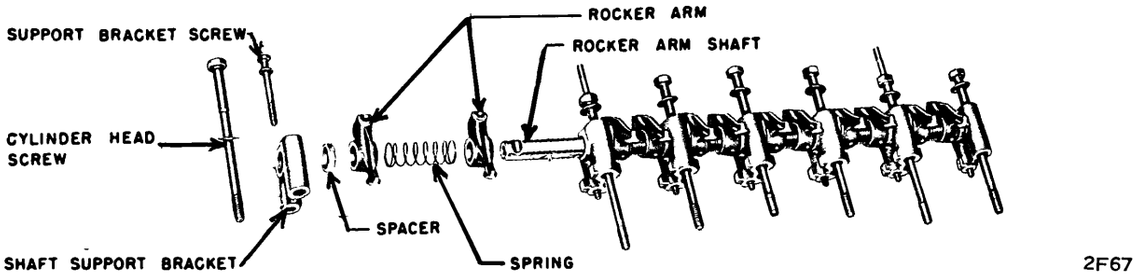
ROCKER ARM ASSEMBLY

See illustration for assembly of parts. End support brackets are special type and flat on end of shaft must be toward front of engine. Cylinder head bolts are installed through brackets. *See CYLINDER HEAD for installation of rocker arm assembly.*

TAPPET CLEARANCE ADJUSTING SCREW

Self-locking type screws must have minimum turning torque of 30 In. Lbs. with screw fully engaged in rocker arm. Replace screws if torque below minimum.

VALVE TIMING MARKS



VALVES

Engine		Head Diam.	Face Angle	S at Angle	Seat Width	Stem Diam.	Stem Clearance	Valv Lift
All	Intake	1.593"	45°	45°	1/16-3/32"	.3415"	.0015-.0035"	.359"
	Exhaust	1.406"	45°	45°	1/16-3/32"	.3415"	.0015-.0035"	.359"

VALVE SPRINGS & LIFTERS

Engine	SPRINGS			LIFTERS	
	Free Length	Pressure (Lbs.)			
		Valve Closed	Valve Open	Diameter	Clearance
All	.....	45-55 at 2.031"	105-115 at 1.671"	.....	℄

℄ - Lifter should just slide into place by its own weight.

6 CYL. ENGINE ROCKER ARM ASSEMBLY

CAMSHAFT

Engine	Journal Diameter				Bearing Clearance	Camshaft Endplay
	No. 1	No. 2	No. 3	No. 4		
All	1.7475-1.7480"	1.7162-1.7170"	1.6857-1.6865"	1.6232-1.6240"	℄	.003-.006"

℄ - **No. 1** - .0007-.0022". **Nos. 2,3,4** - .0010-.0027"

VALVE TIMING

Engine	INTAKE		EXHAUST	
	Open BTDC	Close ALDC	Open BLDC	Close ATDC
All	15°	50°36'	55°36'	10°

CHECKING VALVE TIMING

Adjust No. 1 intake valve to .030". Rotate engine until No. 6 piston is on the compression stroke and the IN-OP 1-6 marking on vibration damper is several inches from pointer. Then, while moving pushrod up and down, continue to rotate crankshaft until no up and down movement can be felt. When there is no clearance, No. 1 intake valve begins to open, and IN-OP 1-6 mark on damper should be directly below pointer.

TIMING GEAR REPLACEMENT

Backlash should be .001-.003". Replace both gears if backlash excessive. Use pullers (J-8111) to remove gears, pusher set (J-4704-A with camshaft adapter HM-861-P or crankshaft adapter HM-861-S) to install new gears. *See Valve Timing Marks illustration.*

CAMSHAFT REMOVAL

Camshaft can be removed in usual manner with engine in car (except Convertible) after grille, radiator, and fan removed. Remove camshaft gear to provide clearance for camshaft removal. See OIL PUMP for removal of pump driveshaft and gear. *NOTE* - If camshaft bearings being replaced, remove engine from car.

CAMSHAFT END THRUST

Camshaft end thrust taken by thrust plate on front face of engine block behind camshaft gear, and controlled by spacer on camshaft between gear hub and front bearing journal. Adjust endplay by replacing thrust plate or spacer. When installing thrust plate, tighten capscrews evenly and alternately to avoid distorting plate.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

N rmal Oil Pr ssur - 30-50 lbs. at 40 MPH (30 lbs. minimum at 2000 RPM).

Pressur Regulat r Valve - Under plug on lower right front corner of engine (remove engine front cover bolt for access). *NOTE* - Timing gears are lubricated by oil discharge from valve (small bleed hole in plunger provides gear lubrication when valve closed). Remove and clean valve yearly or more often.

►*HIGH OIL PRESSURE GAUGE READING CORRECTION (GAUGE FITTING LOCATION CHANGE):* On cars before Serial No. 63S-21015, if oil pressure gauge reads high, relocate pressure take-off point from right to left side of engine for more accurate reading as detailed below. *Cars after above serial number have this relocated pressure pipe.*

1) Remove **upp r** oil line plug located in front of distributor in engine block.
2) Disconnect oil pressure gauge line at right side of engine, remove special fitting from block, install pipe plug in this hole.
3) Install special fitting in hole on left side of block from which pipe plug removed. Fitting outlet must point upward.
4) Reroute oil pressure line to left side of car (under brake master cylinder and along left fender apron), connect flexible oil line to the special fitting.
5) Make certain oil line enters grommet in firewall squarely (not at an angle), use suitable clip to attach line to horizontal surface of fender apron (line must not be in direct contact with apron), reposition oil line ground strap. Flexible oil line must have a slight loop to allow for engine movement.

ENGINE OILING SYSTEM

Force feed type with full-flow filter. See illustration and note the following:

R cker Arms, Pushrods & Valves - Vertical oil gallery at center of block connects valve lifter oil gallery to passage in cylinder head. Oil flows through cylinder head passage, around relieved cylinder head bolt in center rocker arm shaft bracket, and through hole drilled in bracket to hollow rocker arm shaft. Rocker arms are drilled for pushrod lubrication.

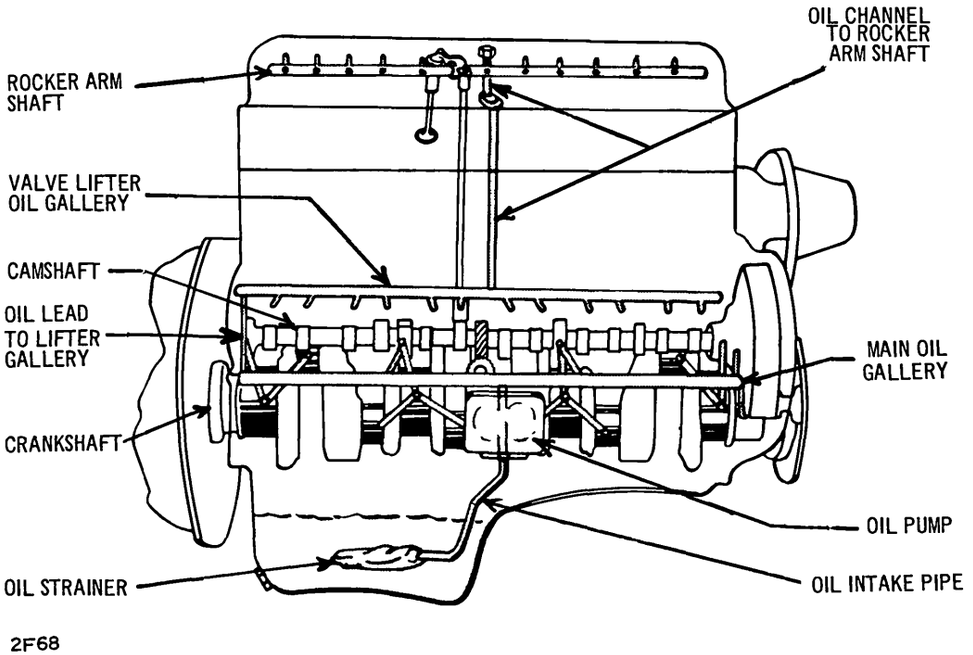
Timing Gears - Lubricated by oil return from pressure regulator valve (channel formed by groove in front face of block behind engine front plate directs oil to gears). Small bleed hole in valve plunger provides lubrication for gears at low speeds when pressure regulator valve closed.

Oil Filt r - Full-flow type. Intake and outlet passages and bypass valve (to allow oil flow to engine if filter clogged) are located in filter base (no external oil lines).

OIL PUMP

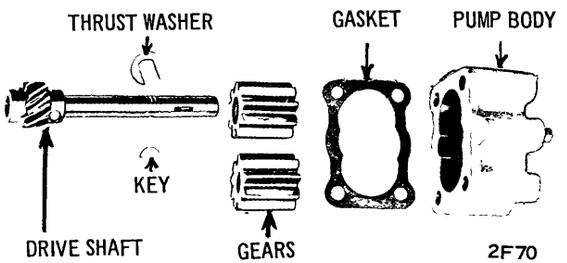
NOTE - Pump must be disassembled for removal. If driveshaft and gear being removed (for replacement or camshaft removal), turn crankshaft to No. 1 Cyl. TDC position *(CAUTION - This is necessary to provide clearance and prevent damage to Nos. 3 & 4 pistons),* remove distributor, remove oil pan, then proceed as follows:

Removal - Take out mounting screws, remove pump body, idler gear, and mounting gasket. Remove drive gear and Woodruff key, take out "C" washer in shaft groove. Push shaft inward and remove shaft and gear from inside engine. Shaft and gear can be separated by pressing out pin and pressing shaft out of gear.



Overhaul - Check all parts for wear and replace gears and body if clearances excessive.

Pump Gear Endplay - With gears installed in pump body, gears should be from .001" longer to .006" shorter than mounting face of body (to provide correct .0014-.009" end clearance with .004-.005" thick gasket). Replace gears if more than .006" shorter than body.



Gear Clearance in Body - Install gear on idler shaft in pump body, place .006" feeler between gear and side of body. Gear should be locked tight (indicating total clearance of .011"). If gear rotates, replace pump body.

Installation - With crankshaft at No. 1 Cyl. TDC position, insert driveshaft and gear from inside engine, turn shaft so that keyway is down toward oil pan, mesh gears fully, keyway should then point toward rear of engine (when distributor installed rotor should be at No. 1 terminal in cap). Dip all parts in engine oil and reassemble pump. Torque pump mounting bolts to specifications, check the pump for binding by rocking pump shaft, then turn crankshaft one full revolution and repeat bind check. If pump binds, reposition housing by tapping with mallet. With pump turning freely, remove pipe plug and prime pump by filling housing with engine oil.

ENGINE OILING

6 CYLINDER ENGINE OILING SYSTEM -FULL FLOW SYSTEM

6 CYLINDER ENGINE OIL PUMP

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE COOLING

Pressure Valve - 13 lb. radiator filler cap.
Thermostat - 170° type. Starts to open at 167-172°F.

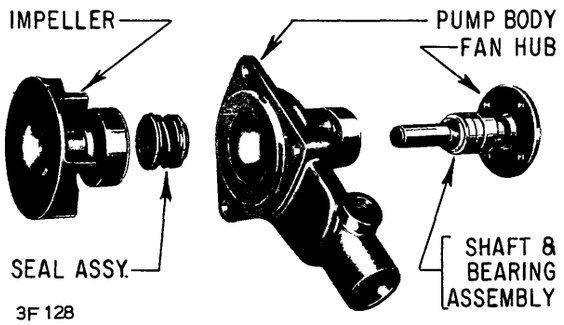
WATER PUMP

Use suitable support plates and press tools when disassembling and reassembling pump. Install parts to following specifications:
Shaft & Bearing Assembly - 2.719-2.7324" from hub end of bearing to machined mounting face of pump housing.
Fan Hub - 4 13/32" from outer face of hub to machined mounting face of pump housing.
Impeller - .015-.031" clearance between impeller and pump housing.

VISCOUS FAN DRIVE

Limits maximum fan speed to approximately 2550 RPM. Replace as an assembly (sealed unit). Special 5-blade fan assembly serviced separately.

FILTERS & CLEANERS



Filter or Cleaner	Service Interval (Miles)
Oil Filter	Replace 4,000
Air Cleaner (Paper Type)	Clean 4,000; Replace 20,000
Oil Filler Cap Filter	Clean 1,000
Heater Air Filter	Clean 5,000
Fuel Pump Filter	Replace 10,000

SERVICING AIR CLEANER

Paper Element Type - Shake element clean. Do not use compressed air or solvents.

REPLACING OIL FILTER

Disposable Type - Screw element onto base by hand until gasket is seated, then tighten an additional ½-turn. *Do not overtighten. Tighten by hand only.*

AVANTI V8 FIRING ORDER

TUNE-UP NOTES

►*HARD STARTING & POOR WARM-UP IN COLD WEATHER (AVANTI & JET-THRUST ENGINE CARS):* Check for installation of production change modifications and use special settings as follows:

1) Starting Bypass Circuit & New Type Points - Wire must be installed between starter solenoid "IGN" terminal and coil "+" terminal (to bypass resistor for starting) New type Breaker Points, Studebaker No 1560473, must be used and set to specifications listed below (points may be identified by length of 1" between centerlines of pivot post and contacts - superseding 1¼" type)

2) Spark Plug Gaps - Set to 030"

3) Carburetor Choke Valve Drilling - Valve should have 4 1/8" holes on upper side *See Carter AFB Carburetor in Carburetion Section*

4) Fast Idle Setting - Change throttle valve fast idle clearance to 040" (from 022")

5) Automatic Choke Setting - Change choke setting to 1 Notch Lean (from Centered) *If car lopes or overchoking noted after starting, set choke 2 Notches Lean*

6) Engine Idle Speed - Set at 650-700 RPM

►*SPECIAL EQUIPMENT 304 5" ENGINE IGNITION NOTE:* Ignition system is Prestolite Transigniter Model 201 *See "Prestolite Transistorized Ignition" in Electrical Section*

►*FLAT SPOT OR ROUGHNESS ON ACCELERATION ABOVE 1500 RPM (SUPERCHARGED AVANTI & JET-THRUST ENGINES)* Caused by sudden opening of secondary auxiliary throttle valves Correct by modifying carburetor *See "Carter AFB 4-Barrel Carburetor" in Carburetion Section*

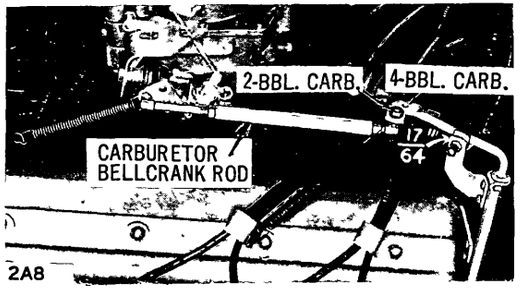
THROTTLE LINKAGE ADJUSTMENT

Auto. Trans. Cars - With engine at normal operating temperature, choke valve wide open and throttle return check operating correctly, proceed as follows

(Continued)

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes



CARBURETOR (C ntinu d)

1) Adjust engine to correct idle speed with transmission in "N". Set stop on bellcrank (at rear of engine) to provide a 17/64" gap between bellcrank pads (use a 17/64" drill as a gauge). After stop is adjusted, hold in this position.

2) Make sure that carburetor-to-bellcrank rod ball joint is in inner hole of bellcrank pad on cars with 2-barrel carburetor, and in outer hole on cars with 4-barrel carburetor. In both cases, ball joint must be on underneath side of bellcrank lever.

3) Adjust carburetor-to-bellcrank rod until idle speed screw on carburetor throttle lever just begins to leave its stop.

4) Stop engine and remove 1/8" pipe plug near throttle lever on side of transmission and install a pressure gauge. Place selector lever in "D" position and run engine at 1000 RPM (1400 RPM on Avanti) with rear wheels held stationary. Adjust length of main bellcrank-to-transmission throttle valve outer lever rod to obtain 80-85 lbs. pressure on gauge (95-100 lbs. on Taxi). Stop engine, remove gauge, and install plug.

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

THROTTLE RETURN CHECK

Stromberg Carb. - Loosen throttle return check assembly screw locknut and adjust return check in bracket until plunger just breaks contact with tab on outer lever. Mark position of check assembly relative to bracket, then turn check assembly 1¾-2 turns toward lever. Tighten locknut.

Carter Carb. - With fast idle screw on second step of fast idle cam, adjust throttle return check plunger screw until it just contacts pad on primary throttle shaft. Tighten locknut.

ELECTRICAL

BATTERY

12 Volt.

Capacity

Model	Amps. Hrs. (20 Hr.)
All except Avanti (Std.)	50
Avanti	60
With 304.5" Engine	60

Battery Ground - Negative.
Engine Ground - Front engine support bracket to frame.

STARTER

►*STARTER PRODUCTION CHANGE:* Prestolite "MDU" (3 coil) starters used on first cars, "MDY" (4 coil) type used on later cars. These "MDY" starters provide better cranking performance in cold weather

Prestolite MDU-7025,7026

Torque	RPM	Volts	Amperes
0 ft. lbs.	5200	10.0	55
11 ft. lbs.	Lock	6.0	425

Brush Spring Tension - 31-47 ozs.

Prestolite "MDY"

Torque	RPM	Volts	Amperes
0 ft. lbs.	4200	10 0	60
9 ft lbs.	Lock	4.0	405

Brush Spring Tension - 31-47 ozs. (MDU), 32-40 ozs. (MDY)

ALTERNATOR

Prestolite Alternator	Amps.	Volts	Temp.	Alt. RPM
ALK-5001	35	14.2	70°F	℄4200
ALE-5003	38-42	14.0-14.4	70°F	℄4200

℄ - 1700-1750 Engine RPM.

ALTERNATOR REGULATOR

Prestolite VBT-6201A, VBV-6221A

VBT-6201A - Single unit type with double contact voltage regulator. Regulator not adjustable. Service by replacement only

VBV-6221A - Contains a circuit breaker relay and a relay and a voltage regulator. Regulator not adjustable. Service by replacement only

BELT ADJUSTMENT

Use a spring scale on belt midway between pulleys. Adjust belt tension so specified lbs. pull on scale will lift belt proper distance (see table below).

Belt Adjustment Specifications

Belt	Lbs. Pull	Deflection
Alternator	10	1/4"
Power Steering	4	3/16-1/4"
Air Conditioning	20	1/2"

FUSES & CIRCUIT BREAKERS

LARK, CRUISER, HAWK

CIRCUIT BREAKERS

Lighting - In Light Switch (at switch on Hawk).
Windshield Wiper - In wiper switch
Tailgate Window (Power) - On left front fender apron.
Cigar Lighter - On back of lighter socket.

FUSE BLOCK

On back of instrument panel on lower left side. Two fuses: 1) Direction Signal & Back-up Lights, 2) Dome & Stop Lights

OTHER FUSES

Clock & Radio - In-line fuses back of instrument panel. Heater - On heater switch. Overdrive - On kick-down switch.

AVANTI

Fuse block on left inner cowl panel above kick pad. See *illustration.*

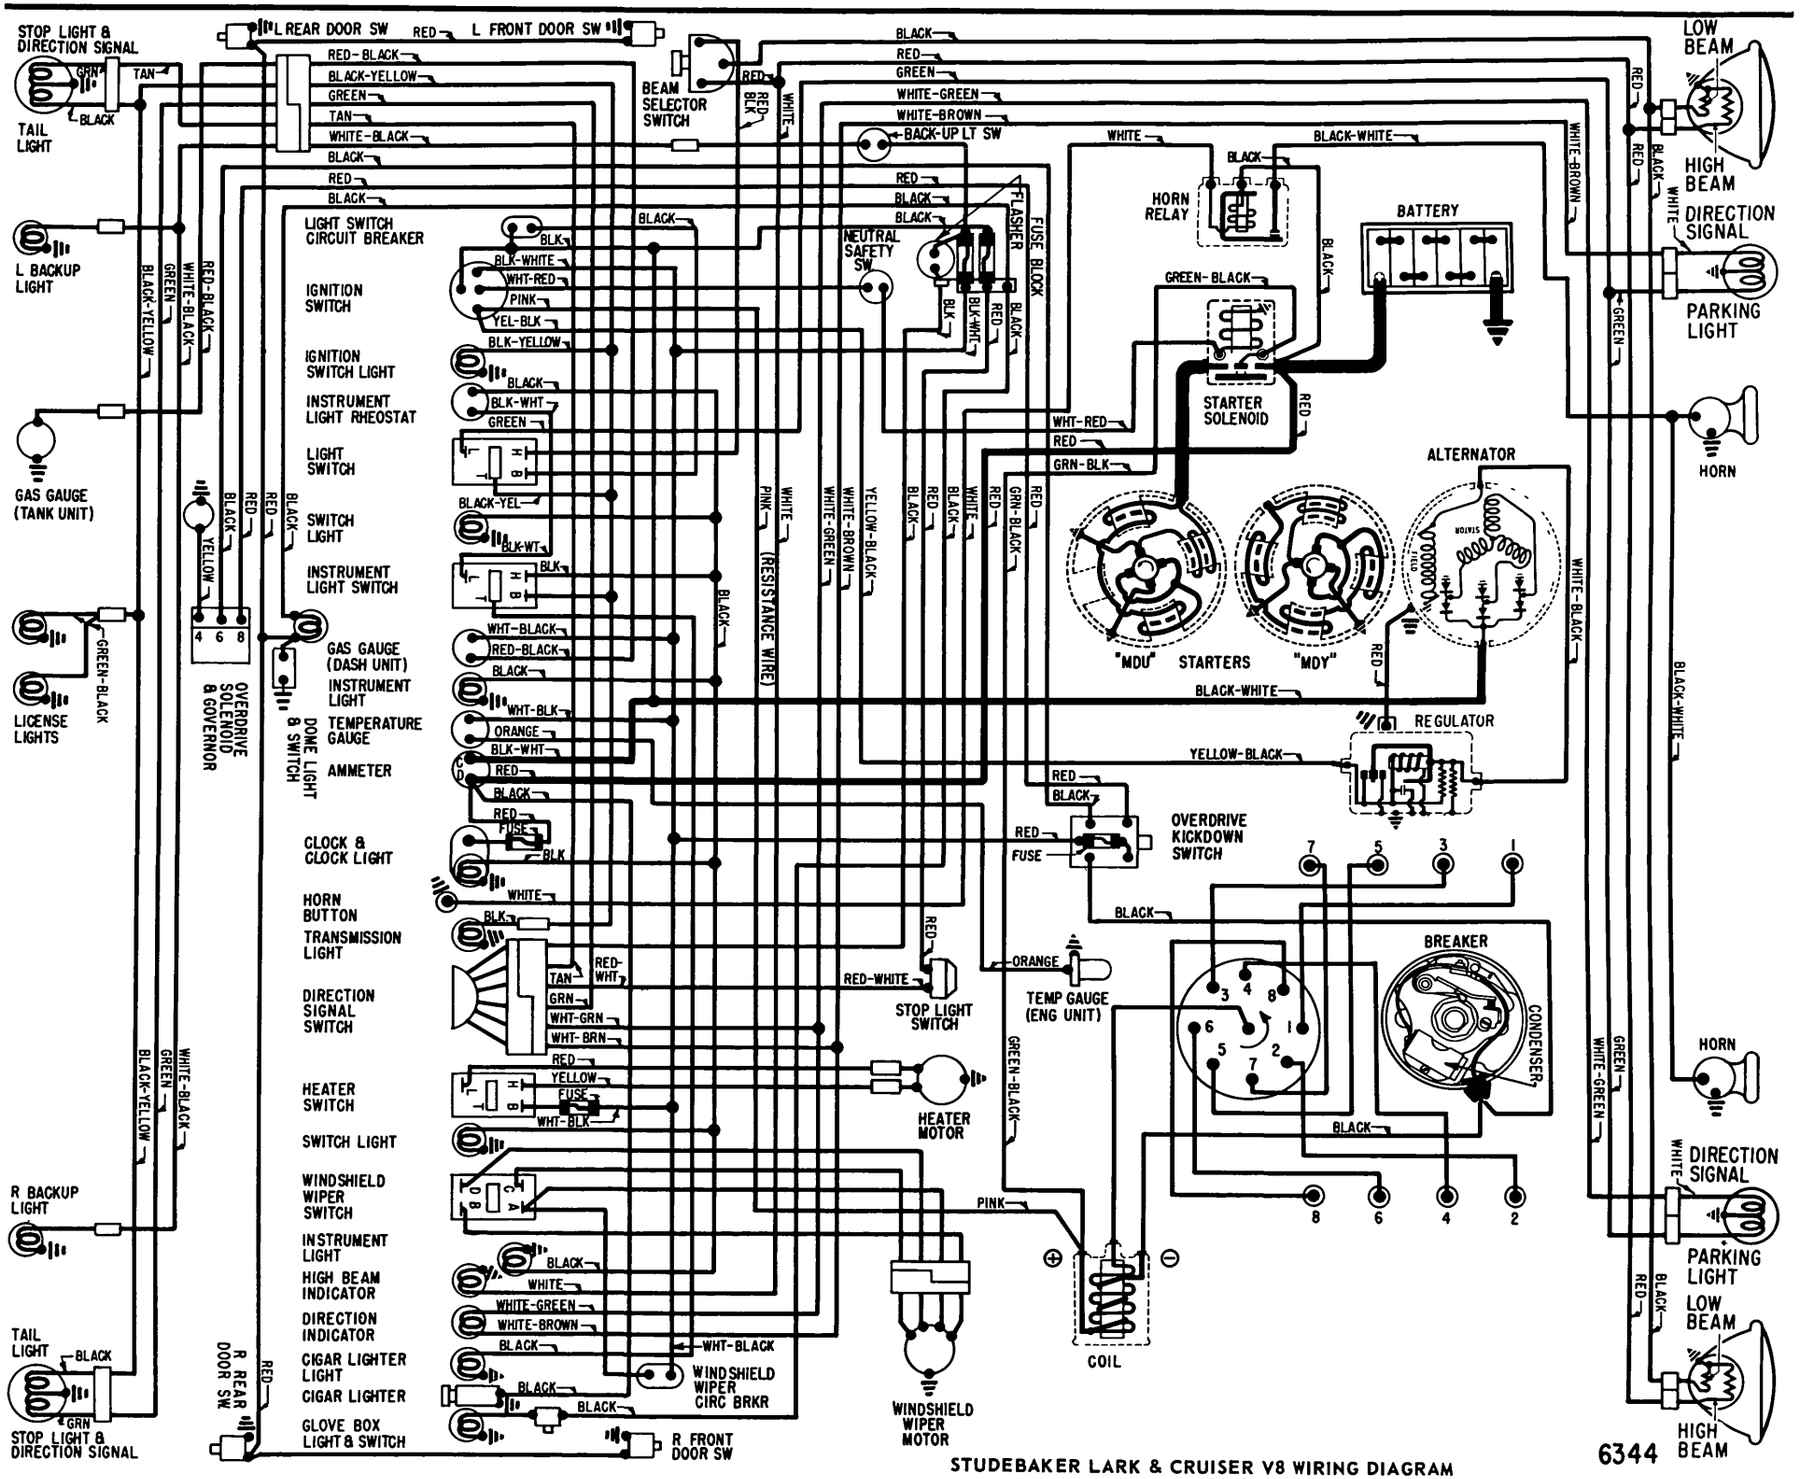
8 - Trans Indicator & Console Light.

AVANTI FUSE BLOCK

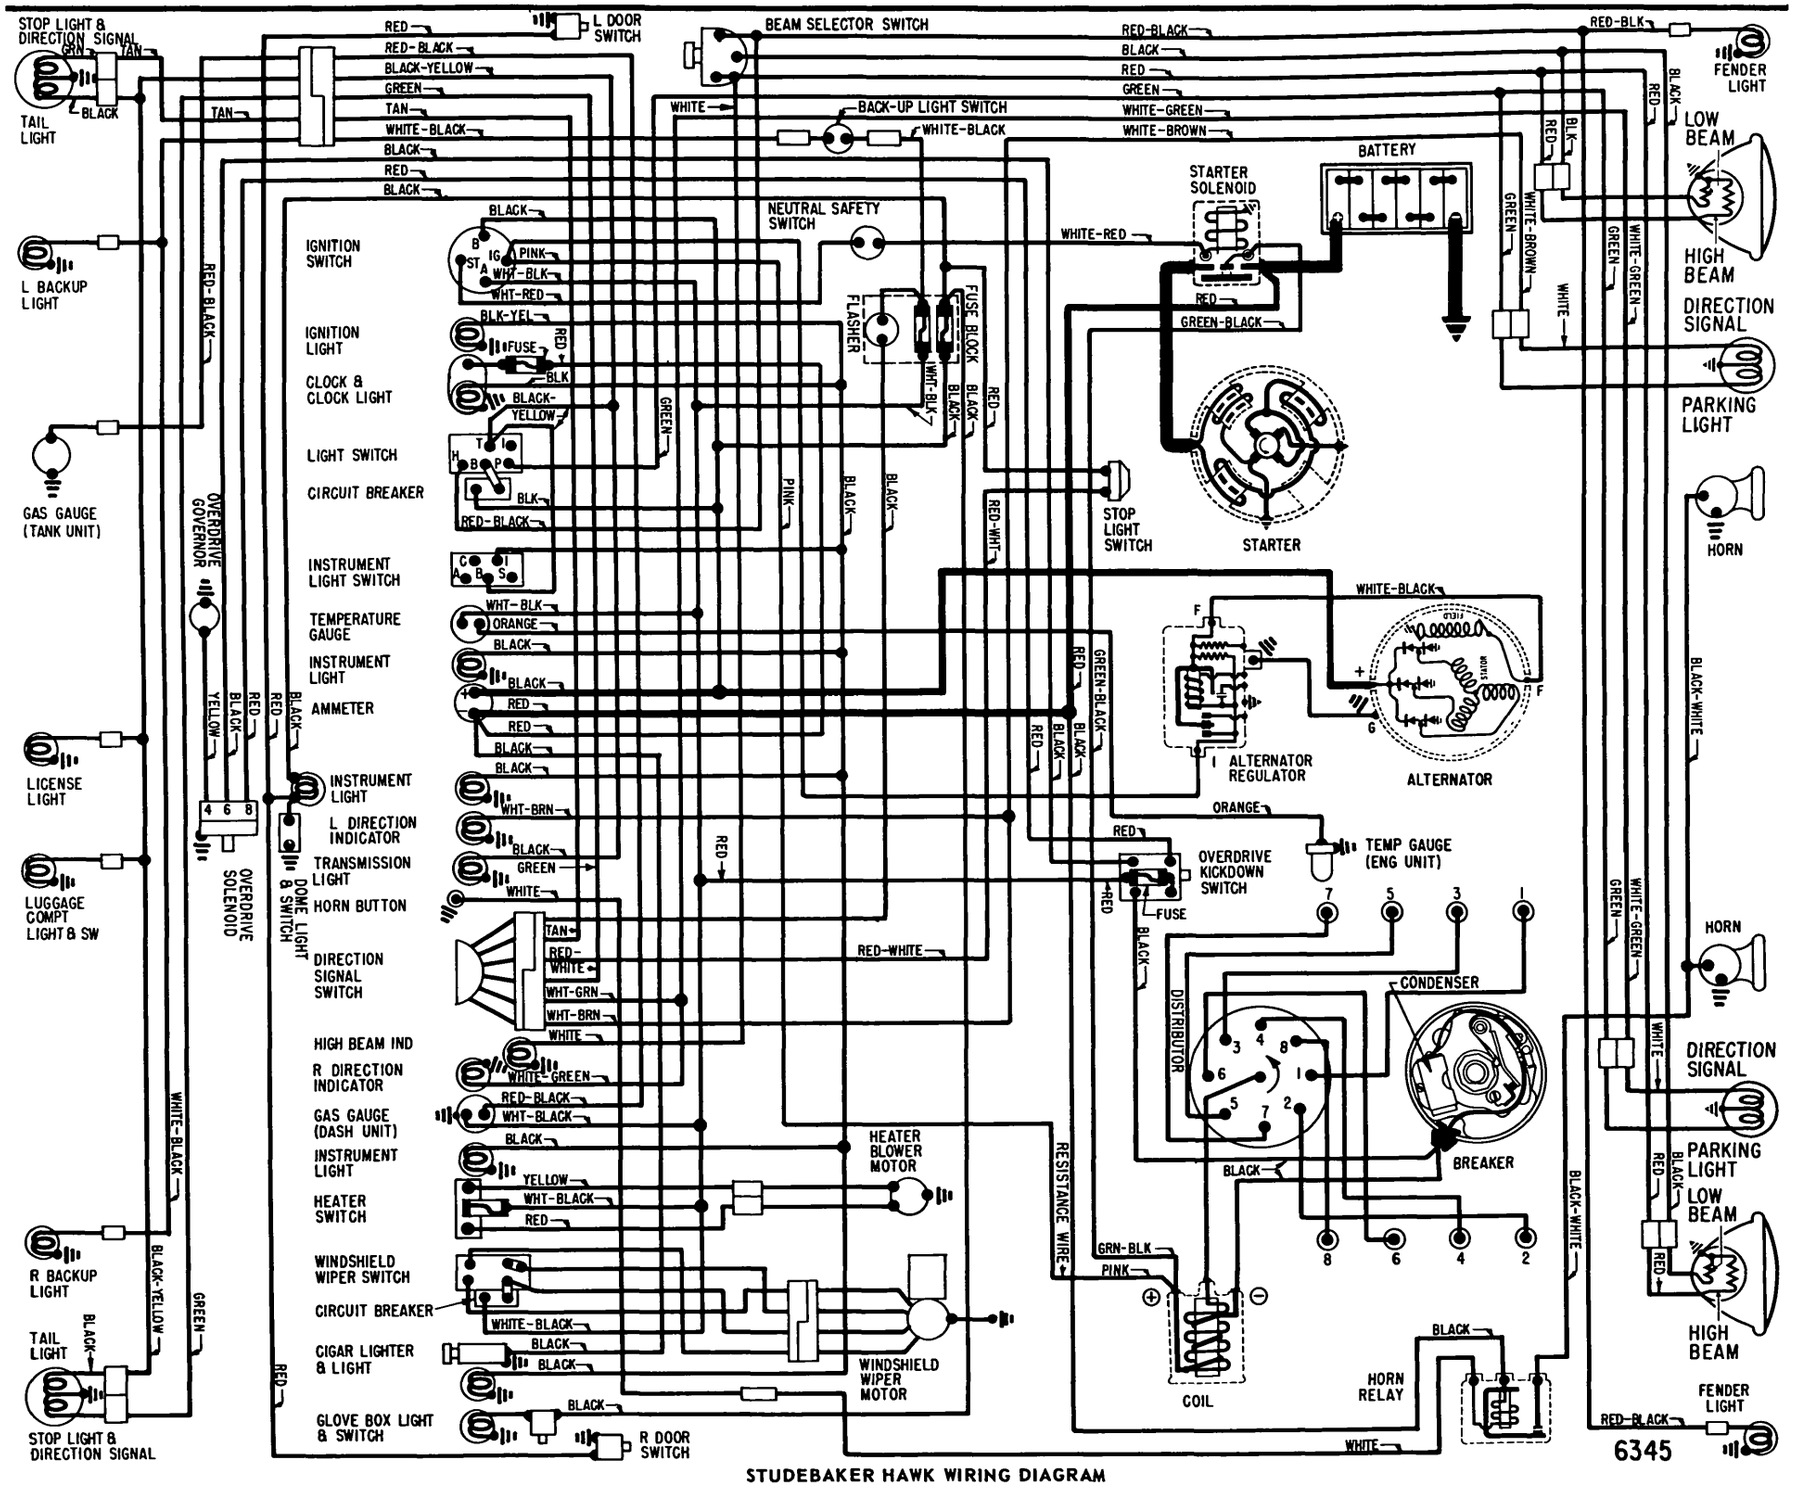


SWITCHES, GAUGES, & SPEEDOMETER

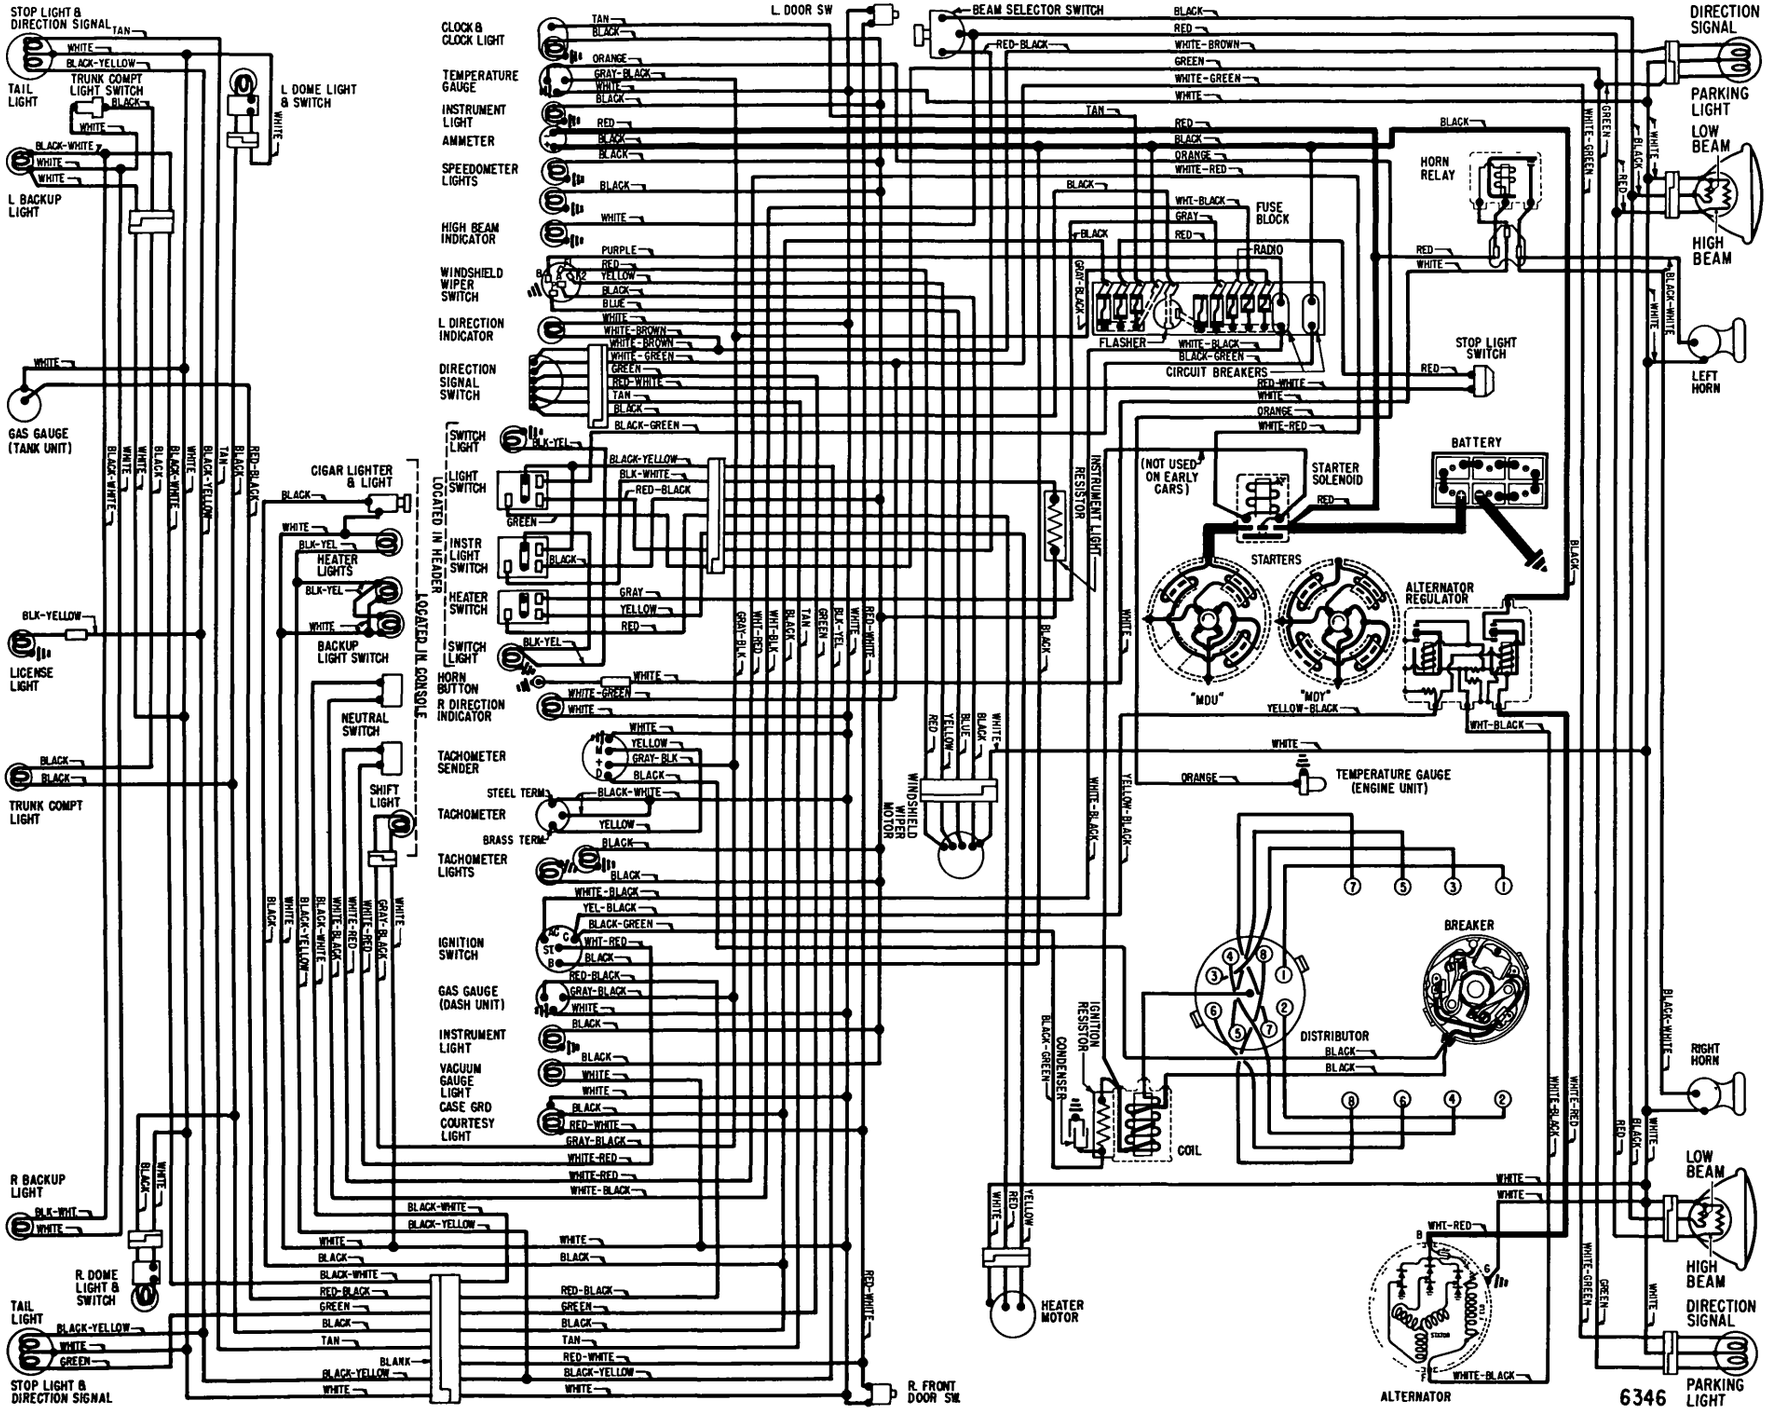
LARK & CRUISER

NEUTRAL SAFETY SWITCH

Switch located on steering column (column mounted gearshift lever), on bracket attached to retainer plate at side of transmission (floor mounted gearshift lever). Place selector lever in "N", then loosen switch mounting bracket attaching screws. Align pin hole in switch lever with hole in switch body on gearshift mounted type. On floor mounted type, align pin hole in switch lever with hole in mounting bracket. Now hold switch in position or use a pin to maintain alignment and tighten mounting screws. Check operation. Starter should operate with selector lever in "N" or "P" only.



See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes



STUDEBAKER LARK & CRUISER V8 WIRING DIAGRAM

6344

Studebaker V8 & Avanti 1963

STUDEBAKER HAWK WIRING DIAGRAM

STUDEBAKER AVANTI WIRING DIAGRAM

ELECTRICAL (C ntinu d)

HEADLIGHT, HEATER, WINDSHIELD WIPER SWITCH REMOVAL

1) Remove fresh air control bracket and fuse block retainer screws. Loosen heater control cable bracket.
2) Remove access hole cover from lower part of instrument panel (two cross-head screws).
3) Loosen switch lower retainer screw (work through access hole), remove switch upper retainer screw from behind instrument panel.
4) Slide switch up and out, disconnect switch wires.

STOP LIGHT SWITCH LOCATION

Hydraulic. In front brake line fitting on inner side of of left frame side member just forward of steering gear (Without Power Brakes), on brake master cylinder on firewall (Power Brakes).

TURN SIGNAL FLASHER

On fuse block on back of instrument panel on lower left side.

SPEEDOMETER REMOVAL

Disconnect drive cable at speedometer head, remove four light bulb and socket assemblies (press-in type), remove retainer nuts and brackets, withdraw speedometer from panel.

INSTRUMENT REMOVAL

Instrument case (Fuel Gauge, Temperature Gauge, Oil Pressure Gauge, Ammeter) is removed as an assembly as follows:

1) Disconnect oil pressure gauge pipe at gauge.
2) Remove fresh air control bracket and fuse block retainer screws. Remove two instrument case retainer nuts and brackets.
3) Withdraw instrument case from panel, remove two press-in type light bulb and socket assemblies, disconnect wires.
4) For access to individual gauges, pry up retainer tabs to free bezel, remove bezel, glass, glass retainer, and dial face assembly.

HAWK

NEUTRAL SAFETY SWITCH

See Lark & Cruiser (above).

HEADLIGHT, INSTRUMENT, WINDSHIELD WIPER, HEATER SWITCH REMOVAL

Remove nut on switch stem, push switch back through instrument panel, disconnect wiring.

STOP LIGHT SWITCH LOCATION

Hydraulic. In front brake line fitting on inner side of left frame side member just forward of steering gear.

TURN SIGNAL FLASHER

On fuse block on back of instrument panel on lower left side.

SPEEDOMETER REMOVAL

Disconnect drive cable at speedometer head, remove light bulb and socket assemblies, remove retaining nuts and bracket, withdraw speedometer from panel.

GAUGE REMOVAL

Gauges can be removed individually through face of instrument panel after wires or pipes disconnected, and stud nuts removed.

AVANTI

NEUTRAL SAFETY SWITCH

See Lark & Cruiser (above).

SWITCH PANEL & SWITCH REMOVAL

Take out two screws and remove nameplate and gasket from header switch panel. Remove two screws retaining switch panel on header, pull panel down and away from header. Remove individual switches by disconnecting wires and taking out two screws attaching switch to panel.

STOP LIGHT SWITCH LOCATION

Hydraulic type. On master cylinder on firewall.

TURN SIGNAL FLASHER

On fuse block on left inner cowl panel above kick pad.

SPEEDOMETER & TACHOMETER REMOVAL

Disconnect speedometer cable or tachometer wires. Disconnect ground wire from mounting stud (speedometer), remove light bulb anf socket assemblies. Remove retaining clamp stud nuts and retainer, pull unit out of panel toward steering wheel.

GAUGE REMOVAL

Gauges can be removed individually through face of instrument panel after wires or pipes disconnected, bulb and socket assemblies removed, and mounting stud nuts and insulating grommets removed.

ENGINE

►*ENGINE IDENTIFICATION: See MODEL IDENTIFICATION for Engine Number Prefixes.*

GENERAL SPECIFICATIONS

Engine ①	HP at RPM	Compr. Ratio	Bore	Stroke	Displacement
Thunderbolt I 2-Bbl.	180 at 4500	① 8.25-1	3 9/16"	3 1/4"	259.2 cu. ins.
4-Bbl.	195 at 4500	① 8.25-1	3 9/16"	3 1/4"	259.2 cu. ins.
Thunderbolt II 2-Bbl.	210 at 4500	① 8.25-1	3 9/16"	3 5/8"	289 cu. ins.
4-Bbl.	225 at 4500	① 8.25-1	3 9/16"	3 5/8"	289 cu. ins.
Jet Thrust 4-Bbl. ②③	.....	10.25-1	3 9/16"	3 5/8"	289 cu. ins.
Super Jet Thrust 4-Bbl. ②④	.....	9.0-1	3 9/16"	3 5/8"	289 cu. ins.
Avanti ③	.....	10.25-1	3 9/16"	3 5/8"	289 cu. ins.
Avanti ④	.....	9.0-1	3 9/16"	3 5/8"	289 cu. ins.
Special Equipment ④	⑤305 at 5200	9.75-1	3 21/32"	3 5/8"	304.5 cu. ins.

① - 8.5-1 Optional.
② - Optional except Avanti.
③ - Non-supercharged Engine.
④ - Supercharged Engine.
⑤ - With 6 lbs. manifold pressure.

OIL PAN

Removal - Remove oil level dipstick and adapter tube by removing head bolt retaining tube bracket. On engines with crankcase vent hose connection at oil pan, remove hoses from adapter, take out exhaust manifold bolt retaining adapter, and adapter-to-oil pan screws, remove adapter assembly. Remove starter. On Hawk, swing front wheels to right to move steering bellcrank out of the way. On other models, disconnect tie rods and reach rod from steering bellcrank, remove retaining pinch bolt and remove bellcrank from shaft. Remove oil pan screws and remove pan.

Installation - Front filler block must be removed for installation of oil pan side gaskets. Install pan as follows:

1) Take out filler block screws and carefully separate filler block from front cover gasket.

NOTE - If gasket damaged, cut away exposed portion of gasket and install similar part of new cover gasket.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE (C ntinu d)

2) Apply Perfect Seal or equivalent sealer to pan mounting flanges and install pan side gaskets
3) Apply sealer to filler block screw threads, place filler block in position and install one upper filler block screw Press filler block upward to compress pan gaskets and install opposite upper screw Install remaining screws and tighten all screws finger tight AFTER oil pan screws are tightened, torque all filler block screws to correct specifications
4) Install pan end gaskets, install pan and torque pan capscrews to specifications Install other parts

ENGINE REMOVAL

Lark, Cruiser, Hawk - If old cylinder block to be reinstalled, engine can be removed without disturbing clutch housing and transmission If new block being installed, remove transmission and then remove engine and clutch housing as an assembly (clutch housing must be aligned to new block)
1) On Air Conditioned cars, remove compressor mounting bracket and compressor as an assembly **without disconnecting refrigerant lines,** position compressor in **upright** position on right fender (to prevent oil leaking into compressor chamber above pistons)
2) On Power Steering cars, disconnect power steering pump from engine and place on one side out of the way
3) Remove hood, battery, upper air deflector, and fan shroud On Lark and Cruiser, remove radiator and water manifold On Hawk, remove fan blade assembly (not necessary to remove radiator or water manifold)
4) Disconnect all lines, wires, cables, and hoses from engine Remove starter
5) On cars with single exhaust pipe, remove Crossover pipe and exhaust connection section On other cars, disconnect exhaust pipes at manifolds
6) On Lark and Cruiser, disconnect tie rods, remove steering bellcrank and shaft assembly and move it out of the way for pan clearance On Hawk, turn front wheels to right for bellcrank clearance
7) Remove air cleaner (on supercharged engines, remove supercharger-to-carburetor air hose and air horn adapter) Disconnect all ignition wiring and remove distributor Disconnect accelerator rod at bellcrank
8) On Auto Trans Cars, disconnect transmission rod at bellcrank Remove converter housing lower plate and disconnect torque converter from converter drive plate (if converter housing not being removed)
9) Remove upper stud nuts from engine front mount insulators, disconnect ground strap at right front support bracket
10) Install lifting sling under intake manifold, attach hoist, raise engine slightly to remove weight from engine mounts
11) If clutch housing being removed with engine, disconnect propeller shaft and remove transmission, disconnect and move clutch operating shaft out of the way On Auto Trans cars, take out capscrews to free rear engine mounts from converter housing
12) If clutch housing not being removed, remove clutch or converter housing-to-engine bolts
13) Push engine forward to disengage clutch housing dowel pins and until clutch clears drive shaft splines, then lift engine out

Avanti - Remove transmission, then remove engine and clutch or converter housing as an assembly following same procedure as for Lark and Cruiser (above) with the following exceptions 1) Remove carburetor and all ignition shielding 2) Not necessary to remove water manifold 3) Not necessary to remove steering bellcrank (turn front wheels to right to move bellcrank out of the way)

CYLINDER HEAD

Removal - Heads are removed in usual manner after the following steps have been performed On Air Conditioned cars, remove compressor and mounting bracket as an assembly **without disconnecting refrigerant lines** and position compressor **upright** on right fender (to prevent oil leaking into compressor chamber above pistons) On Avanti, remove shielding from around distributor and spark plugs (for access to cables) Loosen all water manifold bolts and remove bolts from head being removed Remove rocker arm assembly (center head bolts retain rocker arm brackets), remove pushrods

Installation - Use Perfect Seal or equivalent on head gasket, make certain that oil leads are open (oil feed hole at one end of head, hollow dowel hole at opposite end), install gasket and head, with new water manifold gasket cemented to head Oil cylinder head bolts and install bolts fingertight (short bolts in outer rows, medium length bolts in center row) Install rocker arm assembly and tighten head bolts in brackets fingertight, then tighten bracket bolts alternately to pull rocker arm assembly down evenly Torque all head bolts in sequence shown to correct specifications, then torque rocker arm bracket bolts to specifications Tighten all water manifold bolts

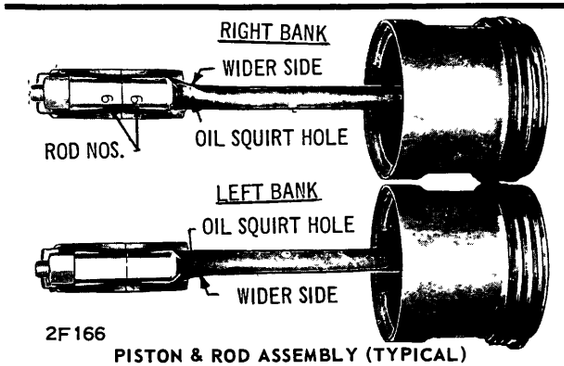
③ - Locked in rod by tapered pin and locknut or press fit in rod



CYLINDER HEAD TIGHTENING SEQUENCE

FITTING PISTONS

Except 304.5" (9.75-1) Engine - Use a 002" x 1" x 12" feeler gauge inserted on camshaft side of cylinder Insert inverted piston in cylinder bore with slotted side away from camshaft and bottom edge of piston 1' below top edge of bore Pull required to withdraw feeler should be 7-12 lbs

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

PISTON & ROD ASSEMBLY (TYPICAL)

INSTALLING PISTON RINGS

Install compression rings with chamfered side of ring upward.

PISTON PIN

R moval - Tool J-1293C can be used to mount piston assembly in vise (tool mandrel extends through pin with retaining nut on outer end). Remove locknut and star washer from clampscrew, install nut on opposite end of screw and tighten nut to withdraw the tapered clampscrew.

Installati n - Assemble pistcn and rod (see Piston & Rod Installation), insert clampscrew from oil squirt hole side of rod and install star washer and locknut on tapered end of screw (nuts will face left side of engine on all rods when installed in engine). Torque locknuts to correct specification.

PISTON & ROD INSTALLATION

Install piston on rod so solid side of piston is on same side as oil hole in bearing bore. Install pistons and rods into cylinder block with notch in piston head to front of engine and numbers on rods and bearing caps together and installed in same numbered cylinder with numbers downward and oil squirt hole toward right side of engine on all rods. Wider side of rod will be toward rear (Right Bank), toward front (Left Bank).

VIBRATION DAMPER & PULLEY ASSEMBLY

Remove radiator and fan shroud. Then proceed as follows:

259", 289" (8.25-1 Engines) - Pulleys and damper are bolted on pulley hub pressed on crankshaft. Disassemble parts after removing nuts on pulley hub bolts. One bolt hole is offset to insure correct assembly (offset bolt hole in line with timing marks on damper and marked by reference line on pulley spacers). Use suitable puller and pusher to remove and install hub (Puller Set J-8111 and Pusher Set J-4704-A). Install damper with identification mark "6H" toward radiator, torque bolt nuts and crankshaft bolt to specifications. *NOTE* - Cars with Air Conditioning or Power Steering have extra pulley and spacer and use longer hub bolts.

289" (10.25 & 9.0-1 Engines) - Pulleys are bolted to damper which is pressed on crankshaft. Use suitable puller and pusher to remove and install damper after pulleys are removed (Puller J-8305 and Pusher Set J-4704-A). Torque pulley capscrews and crankshaft bolt to specifications.

CRANKSHAFT MAIN & CONNECTING ROD BEARINGS

	MAIN BEARINGS				CONNECTING RODS		
Engine	Journal Diameter	Clearance	Thrust Bearing	Endplay	Journal Diameter	Clearance	Sideplay
259". 289" (8.25-1)	2.4995-2.5000"	ℂ.0005-.0025"	No. 1	.003-.006"	1.99925-2.00025"	.00025-.00275"	.008-.013"
289" (10.25 & 9.0-1)	2.4995-2.5000"	.0008-.0033"	No. 1	.003-.006"	1.99925-2.00025"	.00025-.00275"	.008-.013"
304.5"	2.4995-2.5000"	.0018-.0043"	No. 1	.003-.006"	1.99825-1.99925"	.00125-.00375"	.008-.013"

ℂ - Taxicab & Police: Nos. 1 & 5 - .0006-.0027", Nos. 2,3,4 - .0003-.0028".

CRANKSHAFT REAR OIL SEAL

Brummer (molded rubber) seals used in block and bearing cap. Bearing cap seal has integral cross seals and cork filler blocks are used between sides of cap and block. When installing seals, thoroughly clean seal channel in block and cap by swabbing with alcohol or solvent and drying with air.

Upper Seal - Loosen all intermediate bearing cap bolts approximately 2 turns for clearance, use screwdriver or similar tool to blunt sharp edge of flange at rear of block to prevent scuffing inside edge of seal, apply Lubriplate to sealing lip of seal, insert seal with inner lip toward front of engine, roll seal in place between crankshaft and block to point ¼" past face of block, then rotate seal back flush with block (this will relieve internal stresses).

Lower Seal - Install seal on bearing cap flange (inner lip toward front of engine), fully seat cross seals in cap grooves, trim outer ends of cross seals flush with cap edges. Apply Lubriplate or engine oil to sealing lip, install bearing cap and tighten all caps to correct torque specification. Install new cork filler block seal between bearing cap and block on each side.

CRANKSHAFT END THRUST

Crankshaft end thrust taken by thrust washer between front main bearing and crankshaft gear, and controlled by shims between thrust washer and main bearing journal. These shims furnished .003", .005", .007" thick.

ENGINE FRONT COVER

Removal - Remove radiator, fan shroud, fan, water manifold, and fuel pump. Remove vibration damper and pulleys (see above). Remove cover.

Installation - Leave cover screws loose until after pulley hub or vibration damper installed (will center cover), then torque cover screws to specifications.

FRONT COVER OIL SEAL

DO NOT remove four self-tapping screws retaining seal retaining plate. Use pointed tool to remove old felt seal, clean seal recess, install new felt seal in recess and use damper or pulley hub to seat and center seal. Lubricate seal with engine oil.

VALVES

Engine	Head Diameter	Face Angle	Seat Angle	Seat Width	Stem Diameter	Stem Clearance	Valve Lift
259",289" Int.	1 21/32"	45°	45°	1/16-3/32"	.3437"	.0015-.0035"	ℂ.3594"
(All) Exh.	1 17/32"	45°	45°	1/16-3/32"	.3437"	.0015-.0035"	ℂ.3594"
304.5" Int.	1 7/8"	45°	45°	1/16-3/32"	.3437"	.0015-.0035"	.406"
Exh.	1 5/8"	45°	45°	1/16-3/32"	.3437"	.0015-.0035"	.406"

ℂ - .400" on 289" (10.25 & 9.0-1 Ratio) Engines.

VALVE GUIDE SERVICING

Use Tool J-4673 to drive old guides out from combustion chamber side. Coat outside of new guide lightly with white lead, insert chamfered end of guide into head from combustion chamber side *(CAUTION - Different guides used - intake guide is longer)*, install driver through correct hole of installing plate (plate marked "Intake" and "Exhaust" and should be placed across head with correct mark up), drive guide in until driver bottoms on installing plate.

VALVE STEM SEALS

Used on all valves. "Umbrella" type. Install seals with cupped side down toward top of valve guide.

VALVE LIFTER REPLACEMENT

Lifters should slide into place of own weight. If .001" oversize lifter does not correct excessive clearance, ream lifter bore using Reamer 1352-STB (L.O. Beard Tool Company) which will provide correct clearance for .005" oversize lifter.

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

VALVE SPRING INSTALLATION

Install cup type damper on closed coil end of spring (damper fingers must contact spring coils), install spring with damper end down toward cylinder head

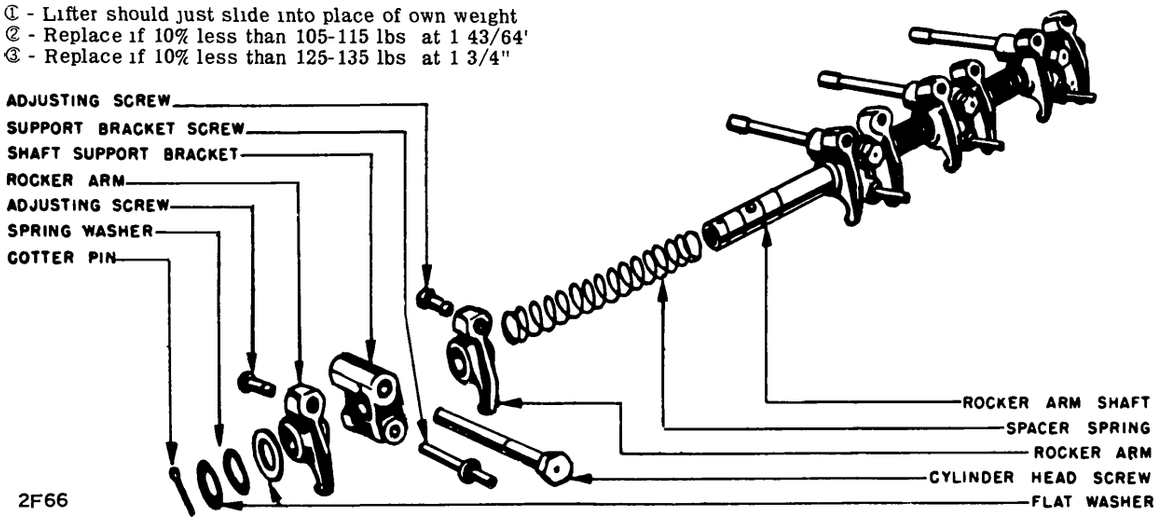
VALVE SPRING INSTALLED HEIGHT

Measure from spring seat on head to underside of spring retainer *See "Valve Closed" spring length in specification table*

ROCKER ARM ASSEMBLY

See illustration for assembly of parts Flat on end of shaft should be at rear of engine (Right Bank), front of engine (Left Bank) When installing assembly tighten head bolts finger tight, then tighten bracket bolts evenly to draw rocker arm assembly down on head, tighten two inner head bolts first, and end bolts last, to correct torque, then torque bracket bolts to correct specifications

Rocker Arm Clearance 0005- 0025"
Spacer Spring Tension 9½-10½ lbs min.at 2 1/32"



TAPPET CLEARANCE ADJUSTING SCREW

Self-locking type screws must have minimum turning torque of 30 In Lbs with screw fully engaged in rocker arm Replace screws if torque below minimum

VALVE SPRINGS & LIFTERS

Engine	SPRINGS Free Length	SPRINGS Pressure (Lbs) Valve Closed	SPRINGS Pressure (Lbs) Valve Open	LIFTERS Diam t r	LIFTERS Cl arance
8 25-1 Ratio		45-55 at 2 031'	② 105-115 at 1 671		①
9 0-1 & 10 25-1 Ratios		67-75 at 2 031'	③ 148-160 at 1 631"		①
9 75-1 Ratio		67-83 at 2 031"	150 172 at 1 63 1"		①

① - Lifter should just slide into place of own weight
② - Replace if 10% less than 105-115 lbs at 1 43/64'
③ - Replace if 10% less than 125-135 lbs at 1 3/4"

ROCKER ARM ASSEMBLY

CAMSHAFT

Engine	Bearing Diameter No. 1	No. 2	No. 3	No. 4	No. 5
All	1 86975-1 87075"	1 85375-1 85475"	1 83875-1 83975"	1 82275-1 82375"	1 24475-1 24575"

Bearing Clearance	Camshaft Endplay
No 1 00075- 00225"	003- 006"
Others 001- 00275"	

CAMSHAFT REMOVAL

Engine must be removed from car Camshaft can then be removed in usual manner

CAMSHAFT BEARING REPLACEMENT

Suitable arbors must be used to install bearings Align all oil holes and install front bearing with oil groove toward front of block

CAMSHAFT END THRUST

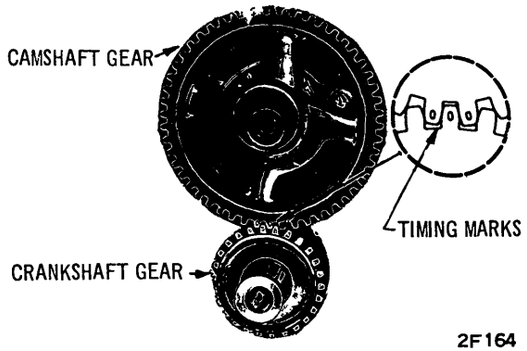
Camshaft end thrust taken by thrust plate on front face of engine block behind camshaft gear, and controlled by spacer on camshaft between gear hub and front bearing journal Adjust endplay by replacing thrust plate or spacer When installing thrust plate, tighten capscrews evenly and alternately to avoid distorting plate

CAMSHAFT TOOL NOTE Aluminum camshaft gear used on 289" (10 25 & 9 0-1 Ratio) and special tools required as follows

Gear Puller Set
259", 289" (8 25-1 Ratio) J-8111
289" (10 25 & 9 0-1 Ratio) J-8305

Gear Installer Pusher S t
All J-4704-A (Camshaft), J-4704 (Crankshaft)

TIMING GEAR REPLACEMENT



Backlash should be 001- 003" Use suitable pullers and pushers to remove and install gears (see Tool Note below) Thrust plate oil grooves must face camshaft gear and one tang of lockplate must engage camshaft gear keyway with opposite tang engaging fuel fuel pump cam *See Valve Timing Marks illustration*

VALVE TIMING

Engine	INTAKE Open BTDC	INTAKE Cl s ALDC	EXHAUST Open BLDC	EXHAUST Close ATDC
8 25-1 Ratio	11°	54°36'	51°36'	14°
9 0-1& 10 25-1 Ratios	17°	63°	56°	24°
9 75-1Ratio ①	28°	80°	80°	28°

① - Additional camshaft timings optional

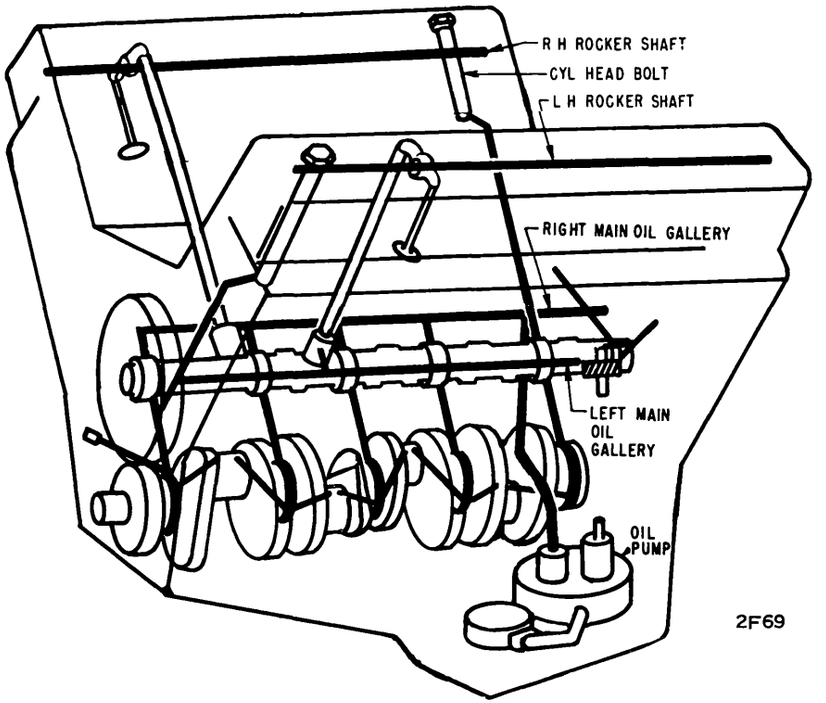
See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

VALVE TIMING MARKS

CHECKING VALVE TIMING

Set tappet clearance of No. 1 intake valve at .030". Turn crankshaft until No. 6 piston is on compression stroke and the IN-OP 1-6, or index mark, on vibration damper is several inches from pointer. Then, while moving pushrod up and down, continue to rotate crankshaft until no up and down movement can be felt. When there is no clearance, No. 1 intake valve begins to open and IN-OP 1 mark on the damper should be directly below the pointer (259", 289" 8.25-1 Ratio), index mark on damper should be between 14° and 20° marks on pointer (289" 10.25 & 9.0-1 Ratio engines).

ENGINE OILING



Normal Oil Pressure - 30-50 lbs. (30 lbs. min.) at 2000 RPM.

Pressure Regulator Valve - Under plug at right front of engine slightly above crankcase flange. *NOTE* - Timing gears lubricated by oil discharge from valve (small bleed hole in plunger provides lubrication when valve closed). Remove and clean valve yearly or more often

ENGINE OILING SYSTEM

Force feed type with full-flow filter. See illustration and note the following:

Rocker Arms, Pushrods & Valves - Vertical oil passages in block from rear of right main oil gallery (for right bank), front of left main oil gallery (for left bank) extend up to matching passages in heads Oil flows through cylinder head passages, around relieved cylinder head bolt in rear rocker shaft bracket (right bank head), front rocker shaft bracket (left bank head) and through holes drilled in bracket into hollow rocker arm shaft. Rocker arms and adjusting screws are drilled for pushrod seat lubrication. Surplus oil from rocker arm chamber is returned to crankcase through return passage (hollow dowel) at rear of block.

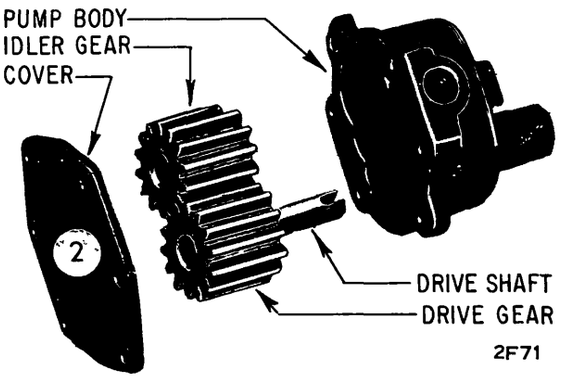
ENGINE OILING SYSTEM

Distributor Gear - Rear camshaft bearing is lubricated through separate passage from right main oil gallery and passage at rear of this bearing supplies oil to distributor drive gear.

Valve Lifters - Lubricated by cross-passages from main oil galleries. Surplus oil in lifter chamber returns to crankcase through drain hole.

Timing Gears - Camshaft gear thrust face is lubricated by oil from front camshaft bearing (Bearing and thrust plate are grooved to distribute oil on thrust face). Gears are lubricated by oil return from pressure regulator valve through passage in front of block (small bleed hole in valve plunger provides lubrication at low speeds when valve closed).

Oil Filter - Full-flow type. Intake and outlet passages and bypass valve (To allow oil flow if filter clogged) are located in filter base.



OIL PUMP

Removal - Pump mounted on rear main bearing cap. Accessible after oil pan removed.

Overhaul - Check all parts for wear and replace gears and pump body if clearances excessive. When assembling pump, tighten oil pipe and strainer assembly to 30 ft. lbs. with bottom of strainer parallel with pump cover.

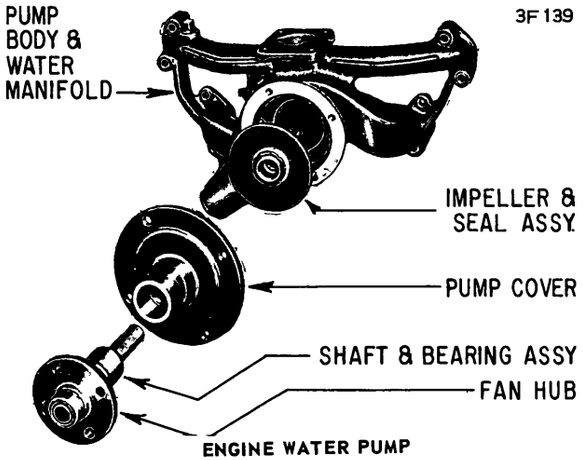
Pump Gear Endplay - .007" maximum. Install gears, place straightedge across face of pump body, use feeler to check clearance between straightedge and face of gears.

Gear Clearance in Body - .010" (total). Check by placing .005" feeler between gear teeth and body at each side of pump. Gears should be locked. If gears rotate, replace body.

ENGINE OIL PUMP

See Pages 2 to 13 for complete Car Model General Indexes and Equipment Indexes

ENGINE COOLING



Pr ssur Valv - 12-15 lbs. Radiator filler cap.
Thermostat - 170° type Std (starts to open 167-172°F), 160° (starts to open 157-162°F) and 180° (starts to open 177-182°F) Optl.

WATER PUMP

Use suitable support plates and press tools when disassembling snd reassembling pump. Install parts to following specifications:
Shaft & Bearing Assembly - 1.625-1 640" from hub end of bearing to machined mounting face of pump housing
Fan Hub - 2 33/64" from front face of hub to machined mounting face of pump housing.
Impeller - .934- 938" (15/16") from machined edge of impeller blade to machined mounting face of pump housing.

VISCOUS FAN DRIVE

Limits fan speed to approximately 2550 RPM Replace as an assembly (sealed unit). Fan blade assembly serviced separately

ENGINE WATER PUMP

MODEL IDENTIFICATION

SERIAL NUMBER

Lark, Cruiser, Hawk - Stamped on a plate attached to left front door hinge pillar post.
Avanti - Stamped on a plate attached to top of right frame side member ahead of front body hold-down bracket.

Starting Serial Numbers

Model	South Bend	Canada
Lark, Cruiser, Hawk	63V-1001	63VC-1001
Avanti	63R-1001	

ENGINE NUMBER

Stamped on machined pad at upper left front of cylinder block

Starting Engine Numbers

Engine or Model ①	Starting Number
Thunderbolt I	V-1001
Thunderbolt II	P-1001
Jet Thrust	JT-1001
Super Jet Thrust (Supercharged)	JTS-1001
Avanti (Not Supercharged)	R-1001
Avanti (Supercharged)	RS-1001

① - *See "Engine Identification" under TUNE-UP, or "General Specifications" under ENGINE for further identification.*

FILTERS & CLEANERS

Filter or Cleaner	Servic Interval (Miles)
Oil Filter	Replace 4,000
Air Cleaner	Clean 4,000; Replace 20,000
Oil Filler Cap	Clean 1,000
Heater Air Filter	Clean 5,000
Fuel Filters	Replace 10,000

SERVICING AIR CLEANER

Paper Element Type - Shake element clean Do not use compressed air or solvents.

REPLACING OIL FILTER

Screw filter element onto base by hand until gasket is seated, then tighten an additional ½-turn *Do not over-tighten. Tighten by hand only.*

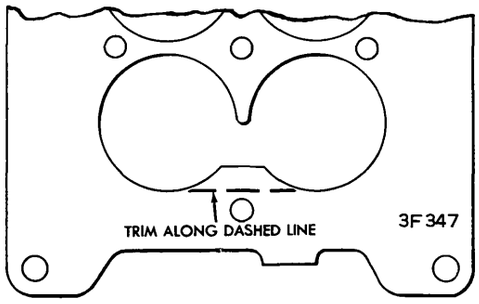
① - See procedure below.
② - Air conditioner ON.
③ - Headlights ON.
④ - Auto. Trans. in "D" (Drive).
⑤ - 540-560 RPM with air conditioner OFF.
⑥ - Air conditioner OFF.
⑦ - 450 RPM with Auto. Trans. in "D" (Drive).
⑧ - 525 RPM with air conditioner OFF.
⑨ - 500 RPM with air conditioner ON.
(10) - Fast idle screw on second step of fast idle cam (against shoulder of highest step).
(11) - Fast idle screw on low step of cam.
(12) - Special procedure required. See below.
(13) - Idle Air Bypass System (use idle air screw for speed adjustment).
(14) - Initial setting. Turns open from a lightly seated position.
(15) - Connector rod in center hole of pump lever.
(16) - Connector rod in upper hole of pump lever
(17) - Index (Exc. Corvette); 1 Lean (Corvette).
(18) - Resilient needle valve seat.
(19) - Solid needle valve seat. If resilient type seat is used, adjust float level to 5/16".
(20) - Solid needle valve seat. If resilient type seat is used, adjust float level to 3/16"
(21) - Solid needle valve seat. If resilient type seat is used, adjust float level to 21/64".
(22) - Solid needle valve seat. If resilient type seat is used, adjust float level to 5/32".
(23) - Auto. Trans. in "N" (Neutral).
(24) - 640-660 RPM with Air Conditioner OFF.
(25) - 690-710 with Air Conditioner OFF .

CARTER AFB 4-BARREL CARBURETORS (C nt.)



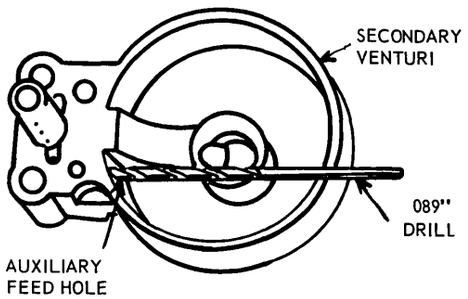
►*1963 CHRYSLER, DODGE, PLYMOUTH HARD COLD WEATHER STARTING CORRECTION.* This condition may be caused by choke vacuum piston sticking To correct, remove air cleaner and squirt a suitable carburetor cleaner through piston link opening while operating choke valve to flush out gum formation

►*1963 CHRYSLER, DODGE, PLYMOUTH HARD COLD STARTING CORRECTION:* If this condition is caused by insufficient choke application or by over choking it may be due to a binding condition To check, unsnap choke rod connector clip when engine is at normal operating temperature If any binding or resistance is encountered when removing choke rod from hole in arm on choke shaft, improper alignment is indicated To correct, remove choke assembly from engine and allow to cool, then disassemble (being careful to note shape and position of all parts for reassembly in original position) Correct bend at lower end of rod to exactly 90.° (use a square) Reassemble choke, making sure that all parts move freely (do not lubricate), and are located in original position When installing unit, make sure choke coil housing does not contact sides of well in manifold Check operation during engine warm-up

►*1963 LINCOLN ENGINE STALLING OR STUMBLE (ON COLD DRIVE-AWAY) CORRECTION·* On early cars (before Oct 22, 1962), install carburetor spacer, Part No C3VY-9A589-B and spacer gaskets, Part No C3VY-9447-B to correct the condition *NOTE - If the new gaskets are used with an early design carburetor spacer, modify the gasket as shown in illustration.*

►*1963 PONTIAC 3300SA & 3326SA CARBURETOR CHOKE PISTON PRODUCTION CHANGE TO PREVENT LOADING AT IDLE AFTER COLD START* Carburetors with the later type choke piston are identified by letter "A" in lower left corner of carburetor identification tag To correct a similar condition on earlier carburetors (without letter "A" on tag), install choke piston, Carter Part No 160-234

►*1963 PONTIAC & PONTIAC TEMPEST POOR THROTTLE RETURN CORRECTION:* This condition may be misaligned primary throttle valves, burr on edge of throttle valve, or by a binding primary throttle valve shaft To free a binding shaft, open and close throttle valves several times and gently tap ends of throttle shaft with valves closed



LINCOLN CARBURETOR GASKET MODIFICATION

►*1963 STUDEBAKER AVANTI, JET THRUST & SUPER JET THRUST ENGINE HARD STARTING & POOR WARM-UP IN COLD WEATHER:* Check for installation of production change modifications and use special settings (see "Studebaker V8" Car Model pages) Check carburetor choke valve for four 1/8" holes drilled (in evenly spaced formation) in short upper side of valve midway between choke valve shaft and upper edge of valve If choke valve is not drilled, remove carburetor from engine and drill the holes as described above Use care to prevent metal chips from entering carburetor assembly Adjust fast idle throttle valve clearance, automatic choke setting and engine idle speed to proper specifications (see below)

►*1963 STUDEBAKER & AVANTI SUPERCHARGED ENGINE LEAN CONDITION OR FLAT SPOT CORRECTION.* This condition which occurs when throttle is fully opened at engine speeds above 1500 RPM may be caused by the sudden opening of secondary auxiliary throttle valves, causing a lean condition To correct, remove carburetor from engine, then remove step-up rods and check the number on rods If they are Carter No 16-220, replace them with Carter No 16-263 Remove thermostatic valve assembly and the secondary venturi clusters Increase size of auxiliary feed hole (initial discharge port) located in the bore of each cluster, to 089" (see illustration for location of feed hole) Remove auxiliary throttle shaft and weight assembly and replace it with a new assembly, Carter Part No 3-1228S Check and adjust carburetor as indicated (see "Adjustment" below)

►*1963 STUDEBAKER & AVANTI (WITH JET THRUST ENGINE) LOPING OR OVER-CHOKING DURING WARM-UP CORRECTION:* Set the choke one or two notches lean as required, from the index mark

STUDEBAKER AUXILIARY FEED HOLE ENLARGEMENT

DESCRIPTION

Four barrel downdraft type similar to design of carburetors used on corresponding previous models

ADJUSTMENT

CADILLAC IDLE SPEED ADJUSTING NOTE. Parking brake cannot be applied with transmission selector lever in "D" (Drive) position unless vacuum release is disconnected Disconnect parking brake vacuum hose at diaphragm and connect vacuum gauge to this hose Loosen transmission throttle valve rod locknuts at carburetor throttle lever trunnion

CHRYSLER, DODGE & PLYMOUTH IDLE SPEED ADJUSTING NOTE Turn headlights ON On models with automatic transmission (Exc 413" Eng with Ram Manifold), loosen carburetor throttle rod locknut in sliding link so stop in transmission will not interfere with carburetor throttle lever After adjusting idle speed, move throttle rod to rear against stop and tighten locknut

Idle Speed & Mixture

One Carburetor Engine - *NOTE - On carburetors with Idle Compensator, compensator valve must b held closed while adjusting idle speed. On carburetors with Idle Air Bypass system, turning the idle air bypass screw (to adjust engine idle speed) will change idle mixture setting. Readjust idle mixture setting after engine idle speed adjustment has been completed.* If an initial adjustment is required for engine warm-up, turn both idle mixture screws in until lightly seated, then back screws out the number of turns indicated in specification table On carburetors with conventional idle speed screw, turn screw in sufficiently to slightly open throttle valves On carburetors with Idle Air Bypass system, turn idle screw outward 1½-3½ turns from a lightly seated position With engine at normal operating temperature, choke valve wide open and fast idle inoperative, proceed as follows Connect vacuum gauge and tachometer, then adjust idle speed to correct engine RPM (see specifications) with throttle stopscrew (or Idle Air Bypass screw) Adjust each idle mixture screw for smooth idle at highest vacuum reading and engine RPM Recheck, and if necessary, reset the idle speed, then readjust idle mixture *NOTE - On carburetors with Idle Air Bypass system always readjust idle mixture after changing setting of idle air screw.* On automatic transmission cars, check and adjust throttle linkage (see car model pages)

Two Carburetor Engine (Ram Manifold) - Disconnect carburetor interconnecting linkage at each carburetor *NOTE - If an initial adjustment is required for engine warm-up, set idle mixture screws on both carburetors 1-2 turns open from a lightly seated position and set idle air bypass screws (one on each carburetor) 2 turns open from a lightly seated position.* With engine at normal operating temperature, connect a tachometer to engine and adjust idle speed to correct engine RPM (see specifications) by turning idle air bypass screw equally on each carburetor Adjust idle mixture screws on each carburetor for maximum engine RPM, then repeat idle mixture screw adjustment *NOTE - If idle speed exceeds specifications by 50 RPM during adjustment, readjust idle air bypass screws to obtain original engine RPM.* Before attaching rod at each carburetor, check and adjust throttle valve linkage on automatic transmission cars (see car model pages) Recheck and readjust carburetor synchronization after a five mile or more road test

Two Carburetor Engine (Runner Manifold - Dodge & Plymouth) - Disconnect interconnecting linkage at rear carburetor throttle lever then start engine and run at idle speed (off fast idle) *NOTE - If an initial adjustment is required to start engine, turn idle mixture screws 1 2 turns open and idle bypass screws 1 turn open from a lightly seated position* Adjust engine idle

(Continued)

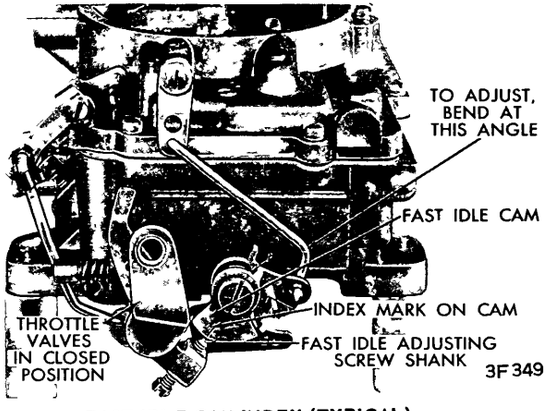
CARTER AFB 4-BARREL CARBURETORS (C nt.)

speed to 700-800 RPM by turning idle bypass screw equally on each carburetor. Adjust idle mixture screws on front carburetor for maximum engine RPM, then repeat on rear carburetor. Readjust front carburetor if necessary. Readjust idle air bypass screws as necessary to maintain correct engine RPM. *NOTE - Before attaching interconnecting rod at rear carburetor (on Automatic Transmission cars), check and adjust throttle linkage so that idle position is not disturbed.*

Tw Carbur t r Engin (Chevrolet 409" Engine) - *NOTE - If an initial adjustment is required for engine warm-up, set idl mixture screws on rear carburetor ¾ turn open from a lightly seated position, then back idl speed screw off so it is just touching throttle lever. Turn the idle speed screw in 1½-2 turns.* With engine at normal operating temperature, air cleaner assembly removed, connect tachometer and vacuum gauge to engine. Adjust both idle speed screws equally to obtain correct engine idle speed (see specifications). Adjust idle mixture screws separately on each carburetor to obtain highest vacuum and engine RPM. *NOTE - Readjust idle speed screws equally to maintain correct idle sp ed while adjusting idle mixture screws.* Repeat the above adjustment. See car model pages for throttle linkage adjustment.

Fast Idle (On Engine)

On Carbur t r Engine - With engine at normal operating temperature and hot idle speed properly adjusted, rotate fast idle cam so that fast idle adjusting screw is in alignment with index mark on fast idle cam (except Buick, Lincoln & Cadillac); on low step of cam (Buick); on low step of cam and with transmission in "Drive" (Lincoln); on second step of cam (Cadillac). On all models, operate engine and adjust fast idle screw to obtain correct engine RPM (see specifications).



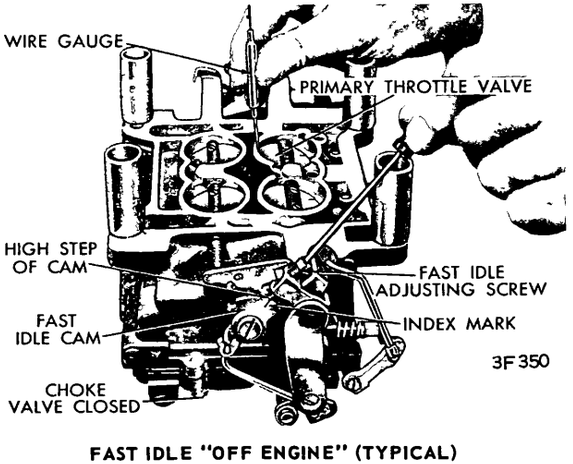
Tw Carbur tor Engine (Ram Manifold) - With engine at normal operating temperature and at normal (hot) idle speed (Air conditioner compressor OFF, if so equipped), remove air cleaners and disconnect each throttle rod at bellcrank on intake manifold. Open throttle valves of left carburetor and rotate fast idle cam to align fast idle screw with index mark on cam. *NOTE - Right carburetor should remain at normal (hot) idle position.* Adjust fast idle screw on left carburetor to obtain correct engine RPM (see specifications). Open throttle valves slightly and allow engine to return to normal (hot) idle speed. Repeat above procedure on right hand carburetor (left hand carburetor at normal idle speed). *NOTE - Each carburetor must have identical fast idle speeds. There is no specification for engine RPM with both carburetors set simultaneously at fast idle position.*

Two Carburetor Engine (Chevrolet 409" Engine) - Fast idle speed adjustment is made on rear carburetor only. Use same procedure as for "One Carburetor Engine" above. See specifications for fast idle speed.

Fast Idle Cam Index

All Mod ls (Exc. Cadillac, Linc ln, P ntiac) - With choke valve closed, fast idle screw should align with index mark on fast idle cam. To adjust, bend fast idle connector rod. *NOTE - If necessary, b nd stop lug on fast idl cam.*

Cadillac - With choke valve tightly closed and lug on valve outer choke shaft lever contacting stop on inner choke shaft lever, align center of fast idle screw with index mark on cam by bending fast idle connector rod.



FAST IDLE CAM INDEX (TYPICAL)

Lincoln - With slight clearance between lug on fast idle cam and stop on flange casting, and inner countershaft lever contacting lug on outer countershaft lever, align index mark on cam with adjusting screw. To adjust, bend fast idle connector rod. *NOTE - It may be necessary to bend stop lug on fast idle cam.*

Pontiac & Tempest - With choke valve tightly closed, and trip lever and cam arm in alignment, align center of fast idle screw with index mark on cam by bending fast idle connector rod.

Fast Idle (Off Engine)

With choke valve closed and fast idle screw aligned with index mark on fast idle cam, adjust fast idle screw to obtain specified clearance between lower edge of throttle valve and wall of carburetor (see specifications).

FAST IDLE "OFF ENGINE" (TYPICAL)

Anti-Stall Dashpot

See CARBURETOR on car model pages for adjustment procedure.

Idle Speed-Up Control

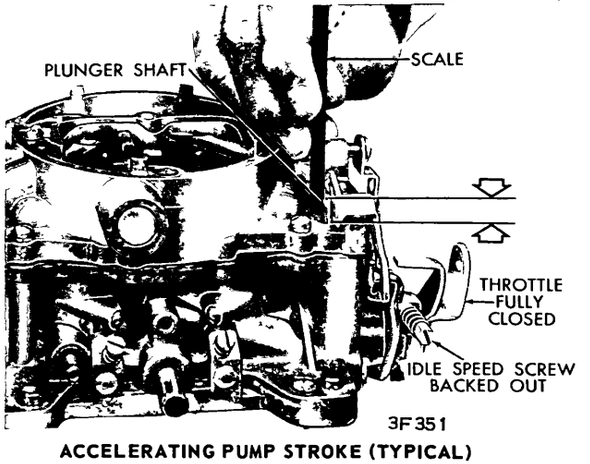
See CARBURETOR on car model pages for adjustment procedure.

Float Level

NOTE - Before making float adjustment, make sure floats are parallel to outer edge of air horn casting. Remove as much clearance as possible between arms of float lever and support lugs on air horn. Arms should be parallel to inner surfaces of supports and float arm should operate freely without excess clearance on hinge pin.

FLOAT SETTING CAUTION (CARBURETORS WITH RESILIENT INLET VALVE SEAT) - When bending float lever to adjust height, do not allow lever to contact inlet needle valve as seat can be compressed enough to cause a false setting. Check float level with weight of float only resting on needle.

Adjust both primary and secondary floats to same height. With air horn inverted, bowl cover gasket in place and needle valve seated, measure distance from top of float at outer end to air horn gasket with proper gauge (see specifications). Adjust by bending float arm. *NOTE - On all Pontiac models, float level measurement must be made in line with center of float indentation at outer end of float.*



Float Drop

With bowl cover held in upright position so that floats hang down at lower end of travel, measure distance from outer (free) end of float to bowl cover gasket. Distance should be as indicated in specifications. To adjust, bend float stop tabs on float bracket.

Accelerating Pump

NOTE - This is a pump stroke (travel) adjustment and not a seasonal setting. On all models with provision for seasonal setting, make certain that pump connector rod is engaged in correct hole of pump arm (see specifications).

(Continued)

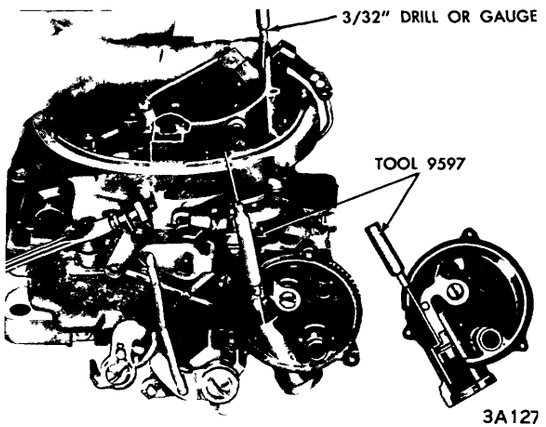
ACCELERATING PUMP STROKE (TYPICAL)

CARTER AFB 4-BARREL CARBURETORS (C nt.)

Back out throttle stopscrew (if so equipped) so that throttle valves are fully seated, then use a scale to measure distance from top surface of bowl cover to top of pump plunger stem (see specifications). If distance is not correct, adjust by bending connector rod at lower angle.

Automatic Choke

Integral Type - *NOTE - Adjust choke after Choke Piston Linkage has been adjusted.* Adjust automatic choke thermostatic spring housing by loosening cover screws and rotating cover as required (see specifications).



Well Type - See specifications above. *CAUTION - This unit is serviced as a complete assembly. Do not attempt to repair unit or change the adjustment.*

Choke Piston Linkage

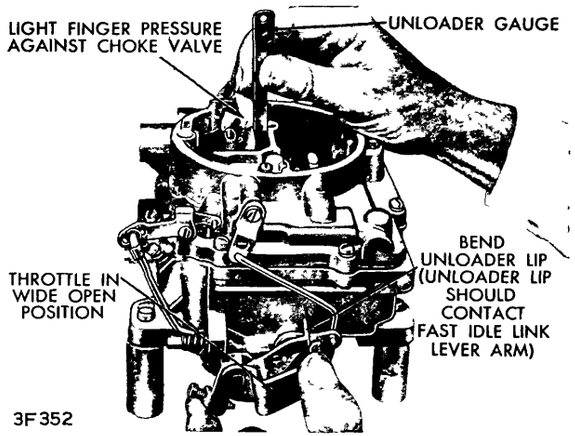
NOTE - This adjustment is made on carburetors with "Integral Type" choke assemblies. Remove cover and coil assembly, then proceed as follows:

Buick, Chevrolet & Lincoln - Bend .026" wire gauge (T109-189) at a 90° angle approximately 1/8" from end, then open choke valve and insert wire gauge so that bent portion is between top of slot in choke piston cylinder and bottom of slot in piston (see illustration). Hold wire gauge in position and close choke valve by pressing on piston lever in choke housing until resistance is felt. Clearance between top of choke valve and wall of air horn should be as indicated in table below. To adjust, bend choke connector rod (exc. Chevrolet 409" Eng.); loosen choke control shaft clamp lever screw and rotate lever on shaft, then tighten screw (Chevrolet 409" Eng.).

Cadillac & Pontiac - With choke valve closed, choke piston should be flush to 1/16" below top surface of piston housing. To adjust, bend choke connector rod. *NOTE - Choke valve should be held closed by applying pressure to piston lever in piston housing.*

CHOKE PISTON LINKAGE (TYPICAL)

Choke Piston Linkage Setting



Carburetor	Piston Clearance
3362S	.090"
3460S, 3461S	.070"
3480S, 3481S	.120"
3499S	.190"
3503S, SA	3/32"
3521S, 3522S	3/32"
3578S, 3579S	3/32"
3506S, 3507S	.062"
3540S, 3588S, 3589S, SA	.045"

Unloader

After fast idle cam index adjustment is completed, rotate primary throttle valves to wide open position and check choke valve opening between upper edge of choke valve and wall of air horn. Clearance should be as indicated in specifications. To adjust, bend unloader lip on primary throttle lever.

Auxiliary Throttle Valves

Velocity type valves. No adjustment required. *NOTE - Auxiliary throttle valves not used on all models.*

UNLOADER (TYPICAL)

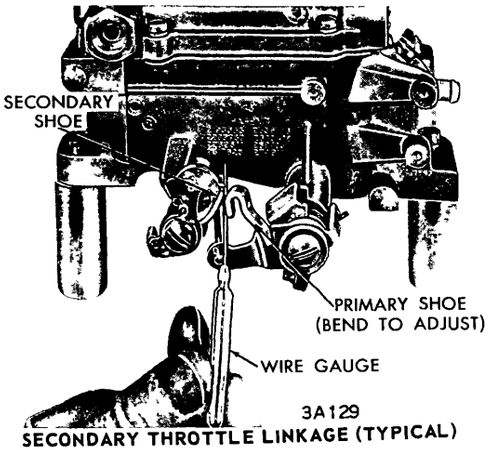
Secondary Throttle Lockout

All Models (Exc. Chrysler with Ram Manifold) - Open throttle valves slightly to clear fast idle cam, then open and close choke valve manually. Lockout tang on secondary throttle lever should freely engage notch in lockout dog. To adjust, bend tang on secondary throttle lever. *NOTE - Make additional adjustment on cars indicated below.*

Cadillac - Hold lockout dog tight against stop on flange. With secondary throttle valves slightly open, clearance between secondary throttle lever and lockout arm should be .026". To adjust, bend arm at slot on lockout dog.

Secondary Throttle Lever

NOTE - This adjustment is required to insure correct action of primary and secondary throttle valves.



Block choke valve wide open, then open throttle valves until clearance between lower edge of primary throttle valves and bore on side opposite idle ports is as specified in table below. Secondary throttle valves should just start to open at this point. To adjust, bend throttle operating rod. *NOTE - Secondary throttle valves will be a few degrees from wide open when primary valves are wide open (Cadillac, Buick & Chevrolet); are past wide open (Chrysler 3505S & Pontiac). On all other models, primary and secondary throttle valves will be vertical at wide open throttle. On all models, if necessary, bend stop lug on secondary throttle lever to prevent secondary throttle valves from going past wide open.* With primary and secondary throttle valves tightly closed, there should be .010-.030" clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

Secondary Throttle Lever Setting

Car Model	Primary Throttle Opening
Buick	23/64"
Cadillac	23/64"
Chevrolet	15/32"
Chrysler (Ram Manifold)	29/64"
Chrysler (exc. Ram Manifold)	3/8"
Dodge & Plymouth	3/8"
Lincoln	29/64"
Pontiac	7/16"
Pontiac Tempest	7/16"
Studebaker (All Models)	7/16"

OVERHAUL

See 1958 Final Data, Page 240, or later Manual edition for overhaul procedure.

Pass Cars & Corvette (Synchro-mesh)	3501S

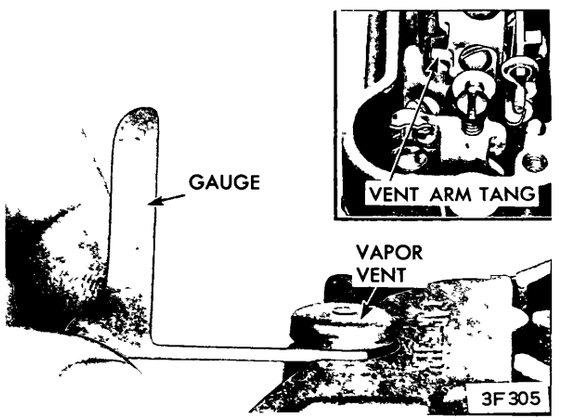
DESCRIPTION

4-barrel downdraft type of same design as used on previous models Velocity type auxiliary throttle valves are controlled by counterweight on shaft and are not operated by linkage. These auxiliary throttle valves are locked out when choke is operating.

ADJUSTMENTS

Idle Speed & Mixture

With engine at normal operating temperature, connect a vacuum gauge and a tachometer to engine and adjust idle speed to correct engine RPM (see "Specification Table"). Adjust each idle mixture screw for highest engine RPM and vacuum reading, then readjust engine idle speed to correct RPM.



Accelerating Pump

NOTE - This is a linkage adjustment and not a seasonal change specification.

Remove dust cover and place pump connector link in correct hole of pump shaft lever (see "Specification Table"), then back out idle speed adjustment screw With a straightedge across top of dust cover boss at pump arm, flat on top of pump arm should be parallel to straightedge. To adjust, bend connector rod at lower angle.

Metering Rod

Back out throttle lever stopscrew so throttle valves are fully seated in bores, then loosen metering rod arm clampscrew. With metering rods in place, press down on vacumeter link until metering rods bottom in carburetor body casting. Hold rods in downward position (throttle valves fully seated), then rotate metering rod arm until finger on arm contacts lip of vacumeter link. Hold in position and tighten clampscrew.

BOWL VAPOR VENT ADJUSTMENT

CARBURETOR ADJUSTMENT SPECIFICATIONS

Carter Carb. No.	Idle Speed (Eng.RPM)	Initial Idle Mixture ②	Fast Idle (Off Eng.) ③	Float Level		Bowl Vent	Unloader	Choke Piston	Accel. Pump	Auto. Choke
				Primary	Secondary					
3500S	450 ①	½-2¼	020"	3/16" ④	1/4" ⑤	3/32"	3/16"	.060"	Outer	Centered
3501S	475	½-2¼	020"	3/16" ④	1/4" ⑤	3/32"	3/16"	035"	Outer	Centered

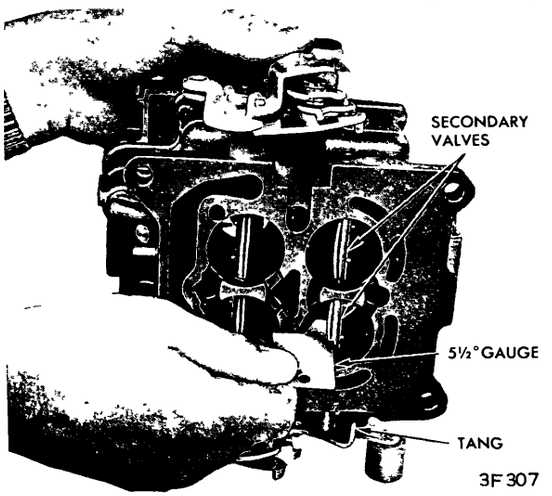
① - Transmission in "D" (Drive).
② - Turns open from a lightly seated position.
③ - "On Engine" fast idle adjustment not required.
④ - With resilient needle seat. Set to 7/32" with solid needle seat.
⑤ - With resilient needle seat. Set to 9/32" with solid needle seat.

Bowl Vapor Vent

NOTE - This adjustment should be made after completing pump and metering rod adjustments. With dust cover and gasket installed, back out throttle lever stopscrew so that throttle valves are seated in bores, then measure distance between lower edge of vent and well in dust cover. This measurement should be as indicated in "Specification Table". To adjust, bend vapor vent arm as required.

Unloader

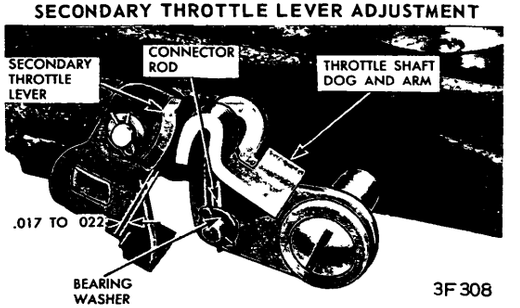
With throttle valves held in wide open position, the distance between upper edge of choke valve and inner wall of air horn should be as indicated in "Specification Table" To adjust, bend unloader lip on throttle shaft lever



Secondary Throttle Lever

Block choke valve wide open and back throttle stopscrew out so primary throttle valves are seated in bores. With primary valves open 7/32", secondary valves should just start to open. To adjust, bend throttle operating rod. *NOTE - Secondary valves will be a few degrees from wide open when primary valves are wide open.* With primary and secondary valves tightly closed, there should be .017-.022" clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary throttle lever

Auxiliary Throttle Lockout

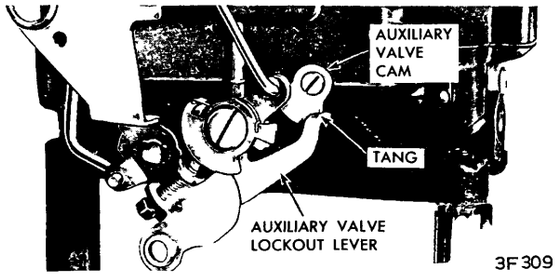


Crack throttle valves and manually open and close choke valve. Tang on lockout arm should freely engage in notch of auxiliary throttle shaft dog To adjust, bend tang on lockout arm.

(Continued)

UNLOADER ADJUSTMENT

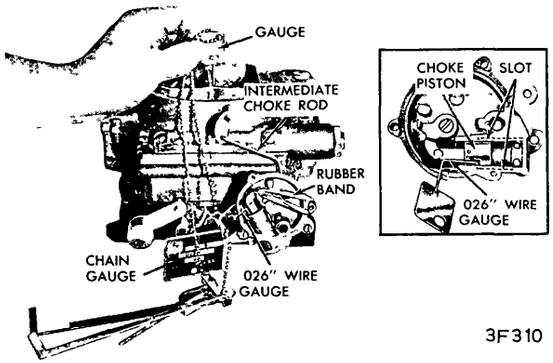
SECONDARY THROTTLE LEVER ADJUSTMENT



SECONDARY THROTTLE LEVER CLEARANCE

CARTER WCFB 4-BARREL CARBURETORS (C nt.)

Automatic Choke



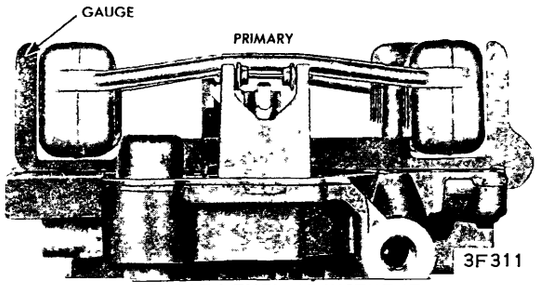
Loosen choke cover retaining screws and rotate cover assembly so index mark on cover aligns with correct mark on housing. See "Specification Table".

AUXILIARY THROTTLE LOCKOUT ADJUSTMENT

Choke Piston Lever

Bend a .026" wire gauge at a 90° angle approximately 1/8" from its end, then remove choke cover assembly, gasket, and baffle. Block throttle valve about half open so fast idle cam does not touch its adjusting screw, then open choke valve and insert the wire gauge so that bent part is between top of slot in choke piston cylinder and bottom of slot in piston. Hold wire in position and close choke valve by pressing on piston lever in choke housing until resistance is felt. Clearance between top of choke valve and wall of air horn should be as indicated in "Specification Table". To adjust, bend choke connector rod.

CHOKE PISTON LEVER ADJUSTMENT



Float Level

NOTE - Primary and secondary floats must be checked and adjusted separately and both float level and float drop must be checked for each assembly.

FLOAT LEVEL SETTING NOTE - When bending float lever to adjust height on carburetors with resilient type inlet valve seats, do not allow float lever to contact inlet needle as seat can be compressed enough to cause a false setting. Check float level with weight of float only resting on needle. Float level setting specifications are different for carburetors with resilient type inlet valve seats (see "Specification Table").

Lateral Adjustment- With bowl cover assembly inverted, gasket removed and float resting on seated needle, place float gauge (see "Specification Table") directly under center of floats with notched portion of gauge fitted over edge of casting. Sides of floats should just clear vertical uprights of gauge. Bend float arms to adjust.

Vertical Adjustment - With bowl gasket removed, install proper gauge (see "Specification Table") on bowl cover under center of floats. Both floats should just clear horizontal section of gauge. To adjust, bend float arms.

FLOAT LEVEL ADJUSTMENT

Float Drop

With bowl cover held in upright position, bowl cover gasket removed, measure distance between free end of floats and bowl cover. Distance should be as indicated in "Specification Table". To adjust, bend stop tabs on float brackets.

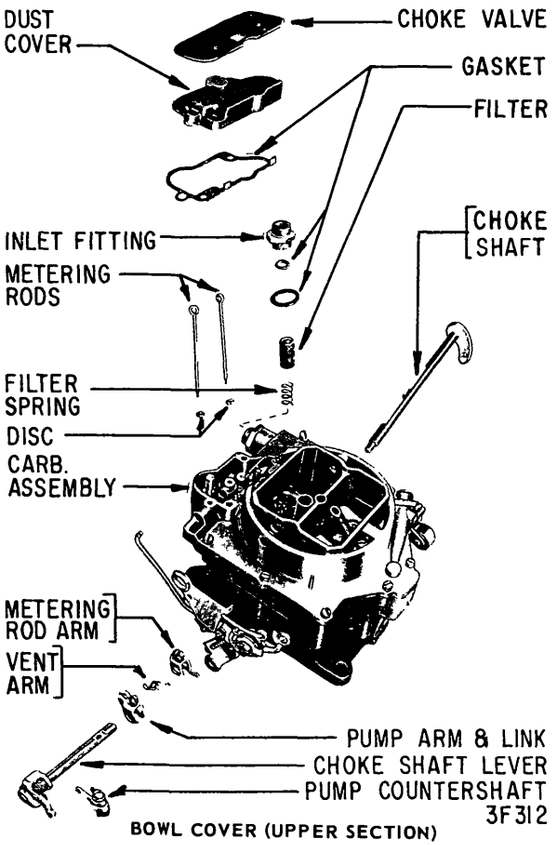
Fast Idle (Off Engine)

Loosen choke lever clamp screw on choke shaft and insert a wire gauge of correct thickness (see "Specification Table") between lip of fast idle cam and boss of throttle body casting. Hold choke valve tightly closed and pull choke shaft lever upward to eliminate all slack, then tighten clamp screw

Fast Idle (On Engine)

No adjustment required. Fast idle speed will be correct when normal idle speed is properly adjusted.

OVERHAUL



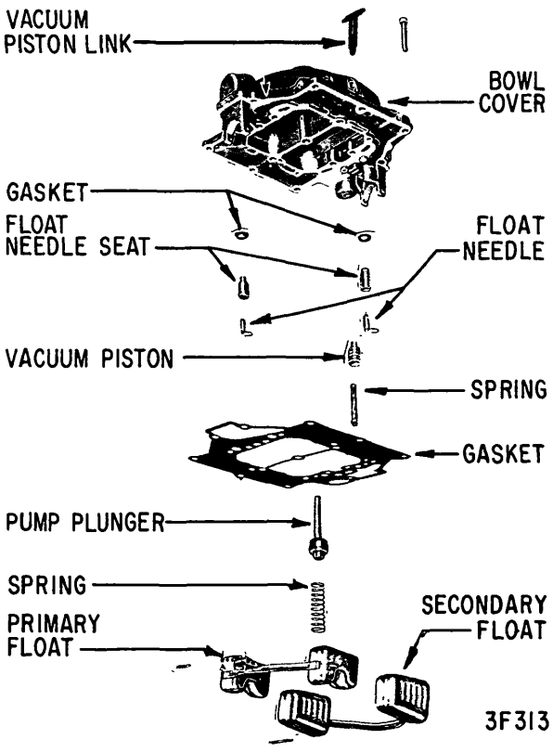
Disassembly

Bowl Cover (Upper Section) - Remove inlet nut and gasket, then remove filter inlet well in primary side of carburetor (do not remove fuel from bowl). Disconnect choke connector rod and intermediate choke rod at choke valve shaft levers, then disconnect throttle rod from lever on pump countershaft. Remove metering rod dust cover, then remove vapor vent arm. Loosen, but do not remove screws securing pump operating arm and metering rod arm to countershaft and pull countershaft out of bowl cover. Remove metering rod arm from well. Push connecting link out of pump shaft and remove arm and link. Rotate each metering rod one-half turn and remove from hanger (do not lose rod discs). If further disassembly is required, remove choke valve screws, choke valve, and choke shaft.

Bowl Cover (Lower Section) - Remove bowl cover, then remove primary and secondary float assemblies. *NOTE - Mark both floats for installation in same location.* Remove primary and secondary float needles, seats and gaskets (keeping each group of parts separated to prevent intermixing parts). Remove pump plunger assembly from bowl cover and return spring from main body and place plunger in gasoline or kerosene. Rotate vacuum piston 90° to disconnect from vacuum piston link and remove link, then remove bowl cover gasket.

Main Body (Fuel Bowl) - Remove the vacuum piston spring. Drain the fuel bowl. Remove the pump jet cluster and gasket, then invert the carburetor and remove small brass pump discharge needle. Remove pump inlet ball retainer and check ball from bottom of pump cylinder well by prying the retainer sideways with a 5/16" six point socket. Remove both primary metering

(Continued)



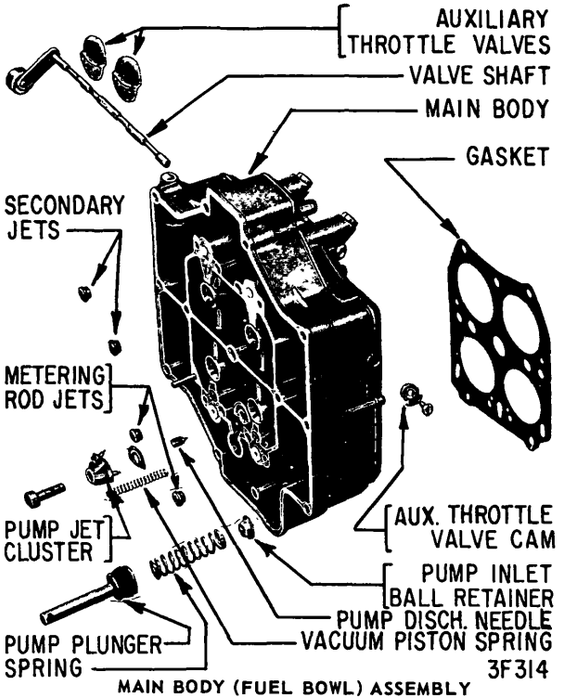
BOWL COVER (UPPER SECTION)

CARTER WCFB 4-BARREL CARBURETORS (C nt.)

rod jets (on pump side of carburetor), then remove both secondary main jets. DO NOT mix metering rod jets and secondary main jets (openings are different size). *NOTE - Low speed jets are installed at slight angle (do not remove). Anti-percolator plugs and bushings, and main discharge nozzles are pressed in and should not be removed.* Separate throttle flange from main body and remove gasket. If necessary to remove auxiliary throttle valves, file off staked ends of screws, then remove screws and valves and pull out shaft.

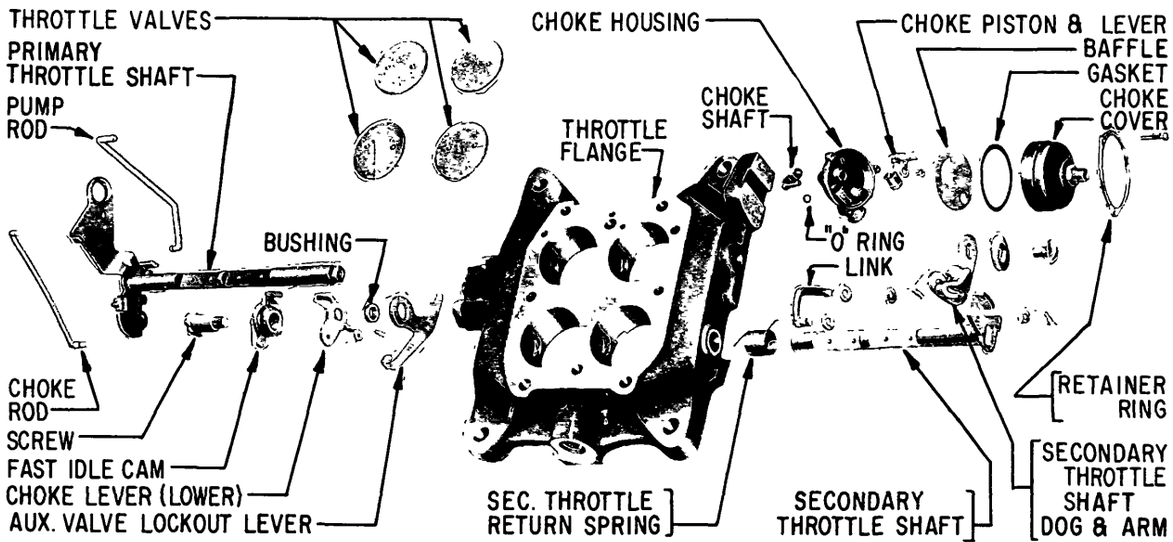
Throttle Body - Remove idle mixture screws, throttle lever stop screw, washer and spring. *NOTE* - Further disassembly not required except to replace parts. If necessary, proceed as follows: Remove fast idle cam retaining screw, fast idle cam assembly and lockout arm. Remove primary to secondary connector rod pin, springs and washers, then remove rod. Remove primary throttle levers, then unhook secondary throttle return spring. File off staked ends of throttle valve retaining screws and remove throttle valves and throttle shafts. Remove choke cover, gasket and baffle plate. Remove choke housing mounting screws and housing. Remove "O" ring seal from vacuum opening of housing mounting boss. Remove choke piston lever screw and disassemble piston and levers.

BOWL COVER (LOWER SECTION)



Cleaning & Inspection

Wash all parts in carburetor cleaning solvent except pump plunger assembly, thermostatic coil and cover assembly, and choke housing gasket (clean these parts in gasoline). Clean and blow out all passages with compressed air, then remove all gum and carbon deposits. Make certain all calibrated restrictions are clean but DO NOT use drills to clean these passages. Inspect floats for dents and leaks. Check choke and throttle shafts for excessive wear, inspect pump plunger leather and replace plunger if cracked or creased. See that choke piston operates freely in cylinder. If there is carbon or dirt in slots of piston and cylinder, remove welch plug in housing and clean, then install a new welch plug, making sure that it is tight.



Reassembly

Use all new gaskets. Install all parts by reversing disassembly procedure and note the following:

Throttle Valves - Use new screws when installing valves. Install throttle valves as follows. Before tightening screws, shift valves to provide closest possible fit in barrel in closed position (short end of auxiliary valves should have a good bearing on stop bosses), then tighten screws securely and stake ends lightly. *CAUTION - Support shaft on steel block while staking screws.* Install retaining washer on end of primary shaft with prongs outward, then press washer in on shaft just far enough to obtain a snug fit without endplay in shaft.

MAIN BODY (FUEL BOWL) ASSEMBLY

THROTTLE BODY (FLANGE) ASSEMBLY

CARTER WCD 2-BARREL CARBURETORS

RAMBLER	Carter No.
Classic 6 Cyl. (E-Stick)	3434S
Classic 6 Cyl (Exc E-Stick)	3535S

DESCRIPTION

Dual downdraft carburetors of same design as used on previous models. Carburetors used with "E-Stick" clutch are equipped with a dashpot to control closing of throttle valves

ADJUSTMENT

Idle Speed & Mixture

With engine at normal operating temperature, choke valve wide open and fast idle inoperative, adjust throttle stopscrew for correct engine speed (see "Specification Table"). Adjust both idle mixture screws equally for smooth idle speed at highest engine RPM. Turn screws out for richer mixture.

Accelerating Pump

With pump connector link installed in outer hole (long stroke) of pump arm (under dust cover on bowl cover), back off throttle stopscrew so that throttle valves are fully closed. Place a straightedge across dust cover boss directly above pump arm. Flat on pump arm should be parallel to straightedge. To adjust, bend throttle connector rod at upper angle .

Metering Rods

NOTE - Check and adjust metering rods after Accelerating Pump adjustment is completed. With throttle stopscrew backed off and throttle valves fully closed, loosen metering rod arm clampscrew (on countershaft under dust cover on bowl cover). Press down on vacumeter link until both metering rods just bottom in carburetor casting, then rotate metering rod arm until finger on arm contacts lip on vacumeter link and tighten clampscrew. *CAUTION - Do not disturb arm position*

Float Level

FLOAT LEVEL SETTING CAUTION - When bending float level to adjust height on carburetors with resilient inlet valve seat, do not allow float lever to contact needle as seat can be compressed enough to cause a false setting. Float level specifications are different for carburetors with resilient inlet valve seats. See "Specification Table".

With bowl cover and float assembly removed from carburetor, invert assembly, remove cover gasket and install correct gauge (see "Specification Table") on cover directly below floats. Top of each float should just clear horizontal portion of gauge. To adjust, bend float arms so that both floats are uniform height. *LATERAL ADJUSTMENT NOTE - Sides of floats should barely touch vertical uprights of float gauge so as not to hang up in fuel bowl when floats are installed. Bend float arms as necessary.*

Float Drop

With bowl cover held in upright position, distance between top of float at center and bowl cover should be as indicated in "Specification Table" To adjust, bend stop tab on float bracket.

Fast Idle (Off Engine)

NOTE - Two adjustments are required as follows:

Fast Idle Cam Clearance - Loosen choke lever clampscrew on choke valve shaft, then insert a gauge of proper thickness (see "Specification Table") between lip on fast idle cam and boss on flange casting. Hold choke valve tightly closed and remove all slack from linkage by pressing choke lever toward closed position, then tighten choke lever clampscrew.

Fast Idle (Initial Setting) - With choke valve tightly closed, tighten fast idle adjusting screw against high step of fast idle cam until throttle valve opening (clearance between edge of valve and carburetor bore on side opposite idle ports) is as indicated in "Specification Table".

Fast Idle (On Car)

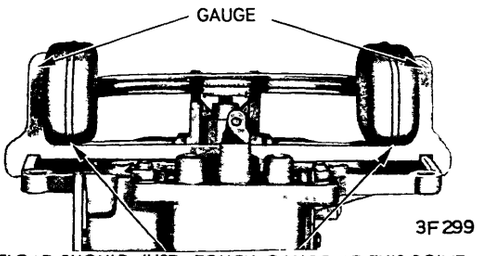
With engine at normal operating temperature and fast idle screw on high step of fast idle cam, adjust fast idle screw to obtain the correct engine speed (see "Specification Table").

Unloader

Hold throttle valves wide open and check clearance between edge of choke valve and air horn wall. Clearance should be as indicated in "Specification Table". To adjust, bend unloader lip on throttle valve lever.

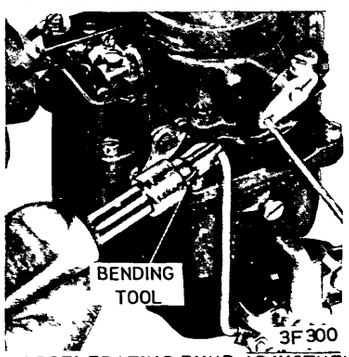
Automatic Choke

Loosen choke cover attaching screws and rotate cover to align index mark on cover with proper graduation on choke housing See "Specification Table"



OVERHAUL

See "Carter WCD Carburetor" in "Carburetion Section" of Manual.



CARBURETOR ADJUSTMENT SPECIFICATIONS

Carter Carb. No.	Hot Idle Speed (Eng. RPM)	Initial Idle Mix. Screw ①	Fast Idle Speed ② (Eng. RPM)	Fast Idle Initial Setting	Fast Idle Cam Clearance	Float Level ③	Float Drop	Unloader Setting	Auto. Choke

383" Eng. (All Trans.) 3476S

DODGE POLARA & PLYMOUTH V8
318" Eng. (Synchro-mesh) 3472S
318" Eng. (Auto. Trans.) 3473S
361" & 383" Eng. (All Trans.) 3475S

① - Carburetor number stamped on tag attached to air horn cover screw.

►CHANGES, CAUTIONS, CORRECTIONS

►*HARD COLD ENGINE STARTING CORRECTION:* Hard starting may be caused by choke piston sticking. To correct, remove air cleaner and squirt carburetor cleaner, lacquer thinner, or alcohol through piston link opening while operating choke to clean out gum formation.

►*1963 383" ENG. RICHNESS DURING WARM-UP CORRECTION:* This condition which may occur on cars driven at continuous high speeds in warm climates is caused by distortion of choke thermostatic coil. To correct, install a new thermostatic coil, Part No. 2463159.

DESCRIPTION

Two barrel downdraft type with separate "Well Type" automatic choke. Carburetor design is similar to previous models.

►*CARBURETOR RECONDITIONING NOTE: After reconditioning, the following adjustments must be made in the order indicated before proceeding with other adjustments.*

318" Engine Carburetors - "Accelerating Pump & Bowl Vent"; "Fast Idle Cam Index"; "Unloader".

361" & 383" Engine Carburetors - "Accelerating Pump"; "Fast Idle Cam Index"; "Unloader"; "Bowl Vent".

ADJUSTMENT

Idle Speed & Mixture

On automatic transmission cars, loosen nut in sliding link of carburetor-to-bellcrank so stop in transmission will not interfere with movement of carburetor throttle lever. Adjust idle speed to correct engine RPM (see specifications) with choke valve wide open and fast idle screw not contacting fast idle cam. Adjust idle mixture screw to obtain highest engine RPM, then turn idle mixture screw inward (leaner) until speed starts to drop. Turn screw in opposite direction (richer) just far enough to recover the lost engine speed. *NOTE - This procedure assures idle mixture being set to leanest possible mixture for smooth idle.* Move sliding link to rear against stop and tighten locknut.

Fast Idle Speed

With engine at normal operating temperature and running, align fast idle screw with index mark on fast idle cam, then turn fast idle screw as necessary to obtain correct engine speed (see specifications).

CARBURETOR ADJUSTMENT SPECIFICATIONS

Carter Carb. No.	Idle Speed (Eng. RPM) Hot ①	Idle Speed (Eng. RPM) Fast ②	Initial Idle Mixture ③	Float Level ②	Bowl Vent ②	Unloader Setting ②	Choke Setting ②	Accel. Pump Travel ②
3472S	500	1400	1	1/4"	1/16"	1/4"	Index	.....

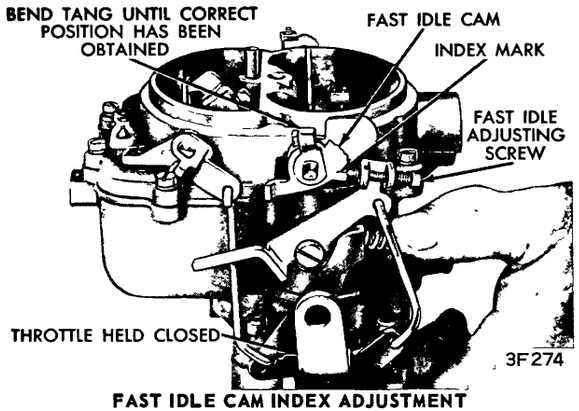
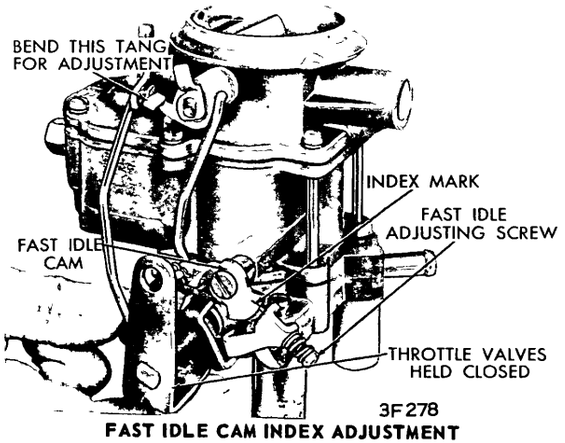
3476S	500	1400	3/4	1/4"	1/16"	1/4"	2 Rich	1"±1/64"



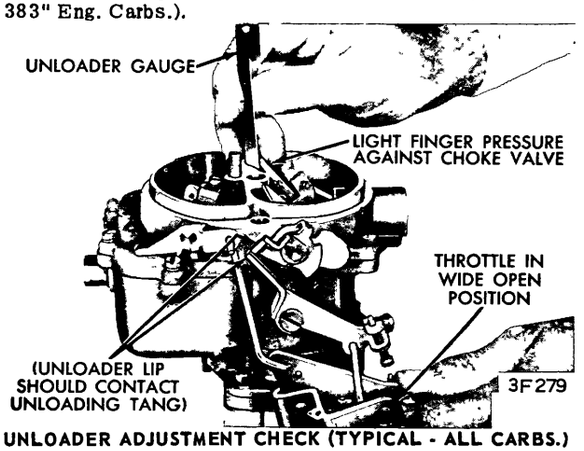
① - All models, with headlights turned ON. Air Conditioning ON (if so equipped).
② - See procedure below. ③ - Turns open from a lightly seated position.

Fast Idle Cam Index



Open throttle valve and hold choke in fully closed position, then close throttle valve. Index mark on cam (see illustrations) should be aligned with center of fast idle adjusting screw. To adjust, bend tang on choke shaft lever.

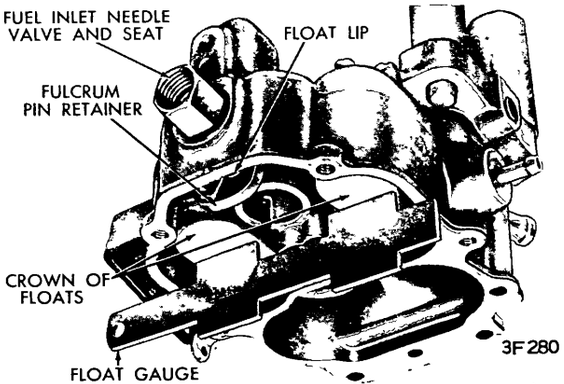
Unloader



Hold throttle valves in wide open position and insert a drill of proper size (see specifications) between upper edge of choke valve and wall of air horn (see illustrations). If no drag is felt, or if too much drag is apparent, adjust as follows: Bend tang on throttle lever (318" Eng. Carbs.); on fast idle lever (361" & 383" Eng. Carbs.).

FAST IDLE CAM INDEX ADJUSTMENT (361" & 383" ENG. CARBS.)

FAST IDLE CAM INDEX ADJUSTMENT (318" ENG. CARBS.)



UNLOADER ADJUSTMENT CHECK (TYPICAL - ALL CARBS.)

Float Level

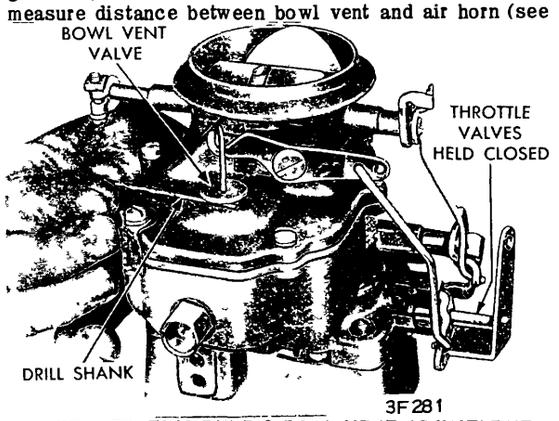
With carburetor off engine, remove fuel bowl cover and invert carburetor main body so that weight of float only is holding needle valve against seat (hold fingers against fulcrum pin retainer to fully seat pin). Use the correct gauge or a scale (see specifications) and measure distance between surface of fuel bowl and

(Continued)

FLOAT LEVEL ADJUSTMENT (TYPICAL - ALL CARBS.)

CARTER BBD 2-BARREL CARBURETORS (Cont.)

crown of each float at center. To adjust, bend lip of float lever. *CAUTION - When bending float lip, do not allow lip to push against needle valve which is rubber tipped.*

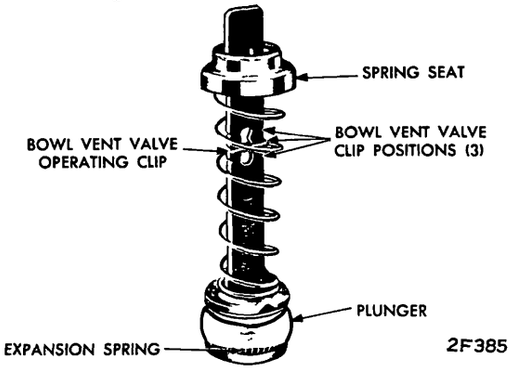


Automatic Choke

See specifications (above). *CAUTION - This unit is serviced as a complete assembly. Do not attempt to r pair unit or change the adjustment.*

Accelerating Pump & Bowl Vent

318" Eng. Carb. - *NOTE - Three holes are provided in throttl lev r and three grooves in pump plunger shaft for seasonal pump s tting as indicated below.* With throttle stopscrew backed off and throttle valves fully closed, place connector rod in center hole of throttle lever and bowl vent clip on pump plunger in center groove (see illustration). Close throttle valve and measure distance between bowl vent and air horn (see specifications). To adjust, bend operating rod at lower angle.



Pump Seasonal S tting - Standard setting is with pump connector rod engaged in center hole of throttle lever. *NOTE - Outer hole of throttle lever provides greater discharge; inner hole provides less. Whenever connector rod is moved, a corresponding change must be made in vent clip on pump plunger as follows: Center hole (center groove of plunger); inner hole (upper groove of plunger); outer hole (lower groove of plunger).*

ACCELERATING PUMP & BOWL VENT ADJUSTME NT (318" ENG. CARBS.)

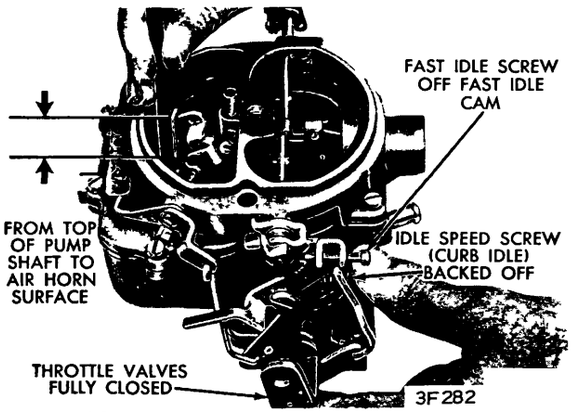
Accelerating Pump

361" & 383" Eng. Carbs. - *NOTE - Three holes are provided in throttle lever for pump connector rod engagement to provide seasonal pump setting as indicated below.* Back off idle speed adjusting screw and open choke valve so throttle valves can be completely closed. With pump connector rod installed in center hole of throttle lever and throttle valve tightly closed distance between air horn and end of plunger shaft should be as indicated in specifications (see illustration). To adjust pump travel, bend pump connector rod at lower angle.

ACCELERATING PUMP PLUNGER ASSEMBLY (318" ENG. CARBS.)

Pump Seasonal S tting - Standard setting is with pump connector rod engaged in center hole of throttle lever. *NOTE - Out r hole of throttl l v r provid s greater discharge; inner hole provides less. Whenev r connector rod is moved, bowl vapor vent must be r - adjusted.*

Bowl Vent



361" & 383" Eng. Carbs. - With throttle valves held closed, clearance between bowl vent valve and air horn should be as indicated in specifications. To adjust, bend short tang on vent valve operating lever.

OVERHAUL

See 1959 Final Data, Page 269, or later Manual edition.

►CHANGES, CAUTIONS, CORRECTIONS

►*HARD COLD ENGINE STARTING CORRECTION:* Hard starting may be caused by choke piston sticking To correct, remove air cleaner and squirt carburetor cleaner, lacquer thinner, or alcohol through piston link opening while operating choke to clean out gum formation

DESCRIPTION

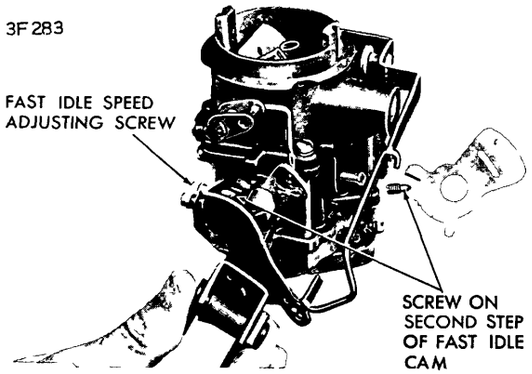
Single barrel downdraft type with separate "Well Type" automatic choke. Carburetor design is similar to previous models. Choke lever assemblies used on 170" Eng. carburetors have a "spring staged" feature which reduces choke valve closing torque when engine is cranked at temperatures below zero, resulting in better starting mixtures at both low and moderate temperatures.

ADJUSTMENT

ADJUSTMENT NOTE: All adjustments, except "Float Level" can be made with carburetor installed on ngine.

CARBURETOR RECONDITIONING NOTE: After r - conditioning, adjust "Accelerating Pump & Bowl Vent" and "Fast Idle Index" in this order (see below), befor proceeding with other adjustments.

Idle Speed & Mixture

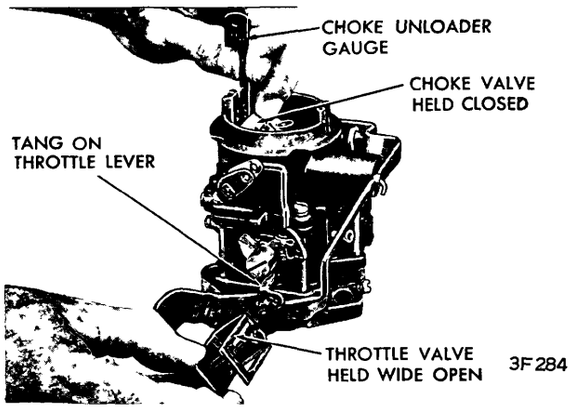


On automatic transmission cars, unsnap ball joint connection at accelerator shaft bellcrank. Adjust idle speed to correct engine RPM (see specifications) with choke valve wide open and fast idle screw not contacting fast idle cam. Adjust idle mixture screw to obtain highest engine RPM, then turn idle mixture screw inward (leaner) until speed starts to drop. Turn screw in opposite direction (richer) just far enough to recover the lost engine speed. *NOTE - This procedur assures idle mixture being set to lean st possibl mixture for smooth idle.* Reconnect ball joint at bellcrank.

(Continued)

CARTER BBS SINGLE BARREL CARBURETORS (C nt.)

Fast Idle Speed



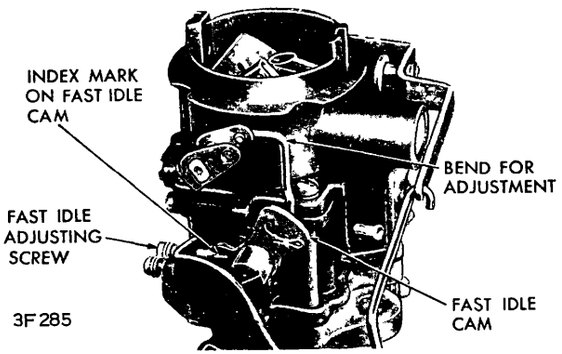
With engine running and at normal operating temperature, open throttle slightly and rotate fast idle cam so fast idle screw is in contact with second step of fast idle cam (see illustration). Release throttle, then turn fast idle screw to obtain correct fast idle speed (see specifications).

FAST IDLE SPEED ADJUSTMENT

Unloader

Hold throttle in wide open position and insert a drill of proper size (see specifications) between upper edge of choke valve and wall of air horn (see illustration). If no drag is felt, or if too much drag is apparent, bend unloader tang on throttle lever to obtain correct clearance.

UNLOADER ADJUSTMENT CHECK



Fast Idle Cam Index

Open throttle valve and hold choke in fully closed position, then close throttle valve. Index mark on cam (see illustration) should be aligned with center of fast idle adjusting screw. To adjust, bend fast idle connector rod at angle. Make final fast idle adjustment with carburetor installed on engine *(see "Fast Idl Sp d" abov).*

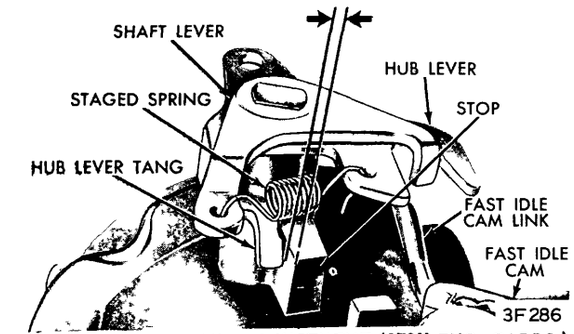
① - All Models, with headlights turned ON. Air Conditioning ON (if so equipped). ② - See procedure below.
③ - Turns open from a lightly seated position. ④ - 1300 RPM (Synchro-mesh); 1400 RPM (Auto. Trans.).

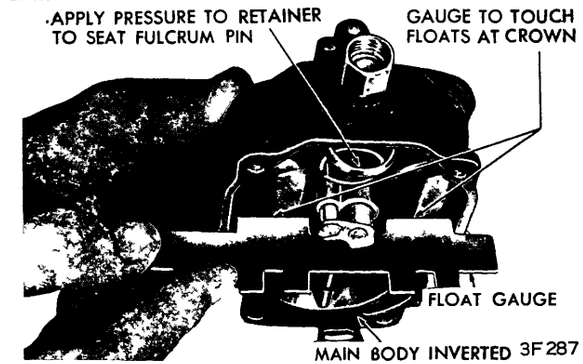
FAST IDLE CAM INDEX ADJUSTMENT

Automatic Choke



See specifications (above). *CAUTION - This unit is serviced as a complete assembly. Do not attempt to repair unit or change the adjustment.*

Spring Staged Choke



170" Engine Carbs - *NOTE - This unit not used on other carburetors.* With fast idle cam index properly adjusted, check adjustment of spring staged choke assembly as follows: Hold choke valve closed, then measure clearance between choke tang and boss on air horn (see illustration). If clearance is not within limits (see specifications), bend fast idle link slightly as necessary.

Float Level

With carburetor off engine, remove fuel bowl cover and invert carburetor main body so that weight of float only is holding needle valve against seat (hold finger against pin retainer to fully seat fulcrum pin). Use gauge or drill of proper size (see the specifications) and measure distance between surface of fuel bowl and crown of each float at center. To adjust, bend lip of float lever. *CAUTION - Do not adjust float s tting without r moving float from carburetor. R silient tip of n edl valve can be compressed sufficiently to caus a false setting.*

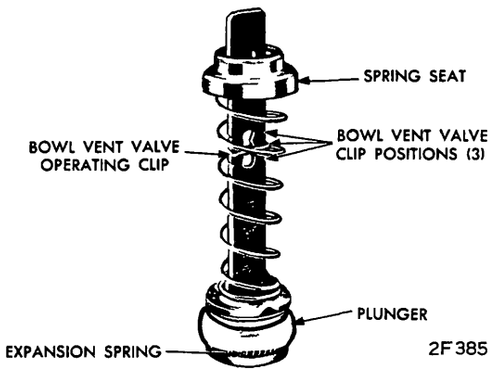
SPRING STAGED CHOKE ADJUSTMENT (170" ENG. CARBS.)

FLOAT LEVEL ADJUSTMENT

Accelerating Pump & B wl Vent

NOTE - Three holes are provided in throttle lever for pump connector rod engag ment to allow s asonal pump setting as indicated below. With throttle stop-screw backed off and throttle valve fully closed, place connector rod in center hole (Exc. 3287S); inner hole (3287S) of throttle lever and plunger pin in center groove (Exc. 3287S); in upper groove (3287S). *See illustration.* Close throttle valve and measure distance between bowl vent and air horn *(se illustration).* To adjust, bend pump operating rod at lower angle.

CARTER BBS SINGLE BARREL CARBURETORS (C nt.)



Pump S asonal Setting - Standard setting is with pump connector rod engaged in center hole (Exc 3287S SA), inner hole (3287S,SA) of throttle lever *NOTE - Outer hole of throttle lever provides greater discharg , inner hole less Whenever connector rod is moved, a corresponding change must be made in pin on pump plunger as follows Center hole (center groove of plunger), inner hole (upper groove of plunger), outer hol (lower groove of plunger)*

CARTER AS SINGLE BARREL CARBURETORS

	Carter No.
CHECKER SUPERBA	
Overhead Valve Engine	3290S
RAMBLER	
Classic Six, Auto Trans.	3536S
STUDEBAKER	
Lark 6 (Taxi)	3186S

DESCRIPTION

Single barrel downdraft type with automatic choke

ADJUSTMENT

Idle Speed & Mixture

With engine at normal operating temperature and idle speed adjusted to specified engine RPM, turn idle mixture screw to obtain highest steady manifold vacuum and maximum idle speed Readjust engine idle speed

Float Level

NOTE - "Split Type" float, used in Checker Superba carburetors. "Single Type" float used in all other carburetors.

FLOAT SETTING NOTE - Resilient type inlet valve seats used in some carburetors. When bending float lever to adjust height on carburetors with resilient type floats, do not allow float lever to contact inlet needle as seat can be compressed enough to cause a false setting

"Split Type" Floats - Remove bowl cover gasket and float pin retainer, then check each float separately while holding lip of float arm against seated needle. *CAUTION - Float pin must be at bottom of guide slots.* Distance from top of float at free end to top of gasket surface on bowl should be as indicated in "Specification Table". Adjust by bending lip on float arm. Install float pin retainer, then invert carburetor so that both floats rest against seated needle. Clearance between overlapping tangs on float levers should be .010-.015". Adjust by bending long tang on left hand float. Recheck float level.

"Single Type" Floats (Resilient Needle Seat) - With body gasket removed, invert bowl assembly while holding float pin lever retainer in place so weight of float only is resting on needle. Distance from top of float at free end to top of gasket surface on bowl should be as indicated in "Specification Table". To adjust, remove float lever pin retainer and install float holding tool, T-109-389 and bend float lip as necessary. *NOTE-Tool T109-389 prevents needle from pushing against resilient needle valve seat.* After adjustment, remove tool and install lever pin retainer, then recheck float setting.

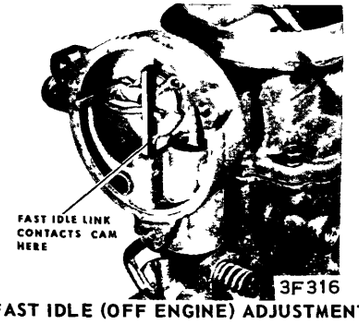
CARBURETOR ADJUSTMENT SPECIFICATIONS

Carter Carb. No.	Idle Speed (Eng. RPM) ①	Initial Idle Mixture ③	Fast Idle (Off Eng.)	Float Level	Unloader	Auto. Choke
3186S	550	½-2	065"	5/16"	3/16"	1 Lean
3290S	500	½-1¾	030"	1/4" ⑤	9/64"	1 Rich
3536S	400 ②	¼-1½	.037"	3/32" ④	1/8"	Centered

① - Auto Trans in "N" (Neutral)
② - Air Conditioner turned ON.
③ - Turns open from a lightly seated position
④ - Resilient type needle seat.
⑤ - Solid type needle seat

"Single Type" Floats (Solid Needle Seat) - With gasket removed, invert bowl assembly and measure distance from top of float at free end to gasket surface on bowl This distance should be as indicated in "Specification Table" To adjust, bend float lip.

Accelerating Pump



Top of pump arm that engages slot in pump shaft must be parallel to top surface of bowl cover with throttle in wide open position. Adjust by bending pump arm up or down as necessary

Metering Rod

With throttle wide open, metering rod should just bottom in carburetor casting To adjust, bend metering rod arm. When metering rod is properly adjusted, some movement can be noted around eye of metering rod retainer clip when throttle is moved slightly from wide open position. If rod is too low, it will tend to push metering rod retainer clip up. If rod is too high, it will be possible to push rod down.

Fast Idle (Off Engine)

NOTE - Fast idle speed will be correct after "Fast Idle (Off Engine)" adjustment is complete. There is no "Fast Idle (On Engine)" adjustment required. Remove thermostatic coil housing, gasket and baffle plate, then crack throttle valve and hold choke valve closed to rotate fast idle cam to fast idle position Close throttle, then measure distance between edge of throttle valve and bore on side opposite idle ports. This distance should be as indicated in "Specification Table" To adjust, bend choke connector rod at lower angle

FAST IDLE (OFF ENGINE) ADJUSTMENT

Unloader

Hold throttle valve wide open and close choke valve without forcing it Clearance between upper edge of choke valve and inner wall of air horn should be as indicated in "Specification Table" To adjust, bend choke shaft unloader arm

UNLOADER ADJUSTMENT

Automatic Choke

Loosen cover retaining screws and rotate cover to align index with proper calibration on housing. See "Specification Table"

OVERHAUL

See 1962 Final Data, Page 250 for complete overhaul procedures.

4 Cyl. "F" Head Fleetvan (Others)	938SD
4 Cyl. "F" Head Forward Control	938SD
6 Cyl. "L" Head All Models	2467S

DESCRIPTION

Single barrel downdraft type with manual choke control. Same design as previous models.

ADJUSTMENT

Idle Speed & Mixture

NOTE - If idle mixture adjustment required to warm-up engine, turn idle mixture screw out (see specifications) from a lightly seated position.

With engine at normal operating temperature, choke valve wide open and fast idle inoperative, adjust throttle stopscrew for correct engine idle speed (see specifications). Adjust idle mixture screw for smoothest engine operation, highest vacuum and highest RPM. Recheck idle speed.

Float Level

Invert air horn and float cover assembly, allowing float to hang free. Distance from top of float to gasket surface on cover (gasket removed) should be as indicated in specifications. To adjust, bend lip that contacts inlet needle valve (do not bend float arm). If resilient type needle valve seat is used, do not allow float lip to contact needle valve when adjusting as seat can be compressed and cause a false setting.

WILLYS CARBURETOR FLOAT SETTING NOTE: A "spring loaded" intake needle valve is used on all models. Do not compress this spring when checking float level.

CHEVY II CARBURETOR FLOAT SETTING NOTE: If a resilient type inlet needle valve seat is used to replace the solid seat, adjust float level to 7/16".

Float Drop

NOTE - This adjustment not required on all carburetors. See specifications.

With bowl cover assembly held in upright position, distance between outer end of float and bowl cover should be as indicated in specifications. To adjust, bend stop tabs on float arm.

Accelerating Pump

NOTE - This adjustment is not required on Willys 4-Cyl. Eng. carburetors.

Make this adjustment before adjusting metering rod. Check the adjustment each time carburetor is assembled. With throttle valve seated in bore, press down on upper end of diaphragm shaft until it reaches bottom position and hold in this position. Metering rod arm should now contact pump lifter link at center end nearest the springs. To adjust, bend pump connector link at its lower angle. *CAUTION - Bending connector rod at another place will cause pump lifter link to bind.*

Metering Rod

With throttle valve seated in bore, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber and hold in this position. Metering rod should touch bottom of metering rod well, and metering rod arm should contact lifter link at outer end nearest springs and at supporting lug. To adjust, bend lip of metering rod arm to which metering rod is attached.

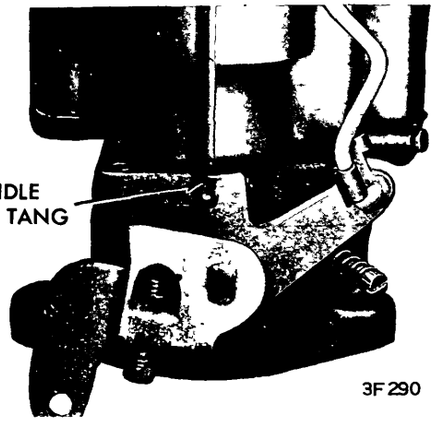
Idle Vent

NOTE - This adjustment required on Chevy II & Chevrolet Truck carburetors only.

After completing accelerating pump and metering rod adjustment, seat throttle valve in bore. Clearance between idle vent valve and inside of bowl cover should be as indicated in specifications. To adjust, turn screw in vent valve.

Fast Idle

With choke valve held in wide open position, lip of fast idle arm should contact boss on body casting. To adjust, bend choke connector link at offset.



Manual Choke

With air cleaner removed, pull choke knob on instrument panel out 1/8". Loosen choke cable clamp at carburetor bracket and adjust cable through clip until choke valve is wide open, then tighten cable clamp at carburetor bracket. Check choke operation for full closed and full open positions. Install air cleaner.

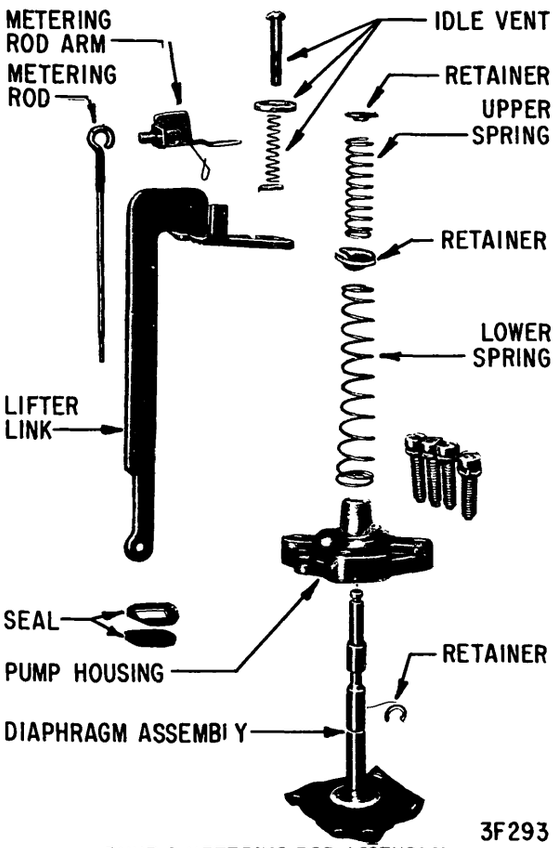
⑦ - Set to ½" if spring loaded needle valve and resilient type inlet valve seat is used.
⑧ - Float drop setting not required.

FAST IDLE ADJUSTMENT

ACCELERATING PUMP ADJUSTMENT



IDLE VENT ADJUSTMENT

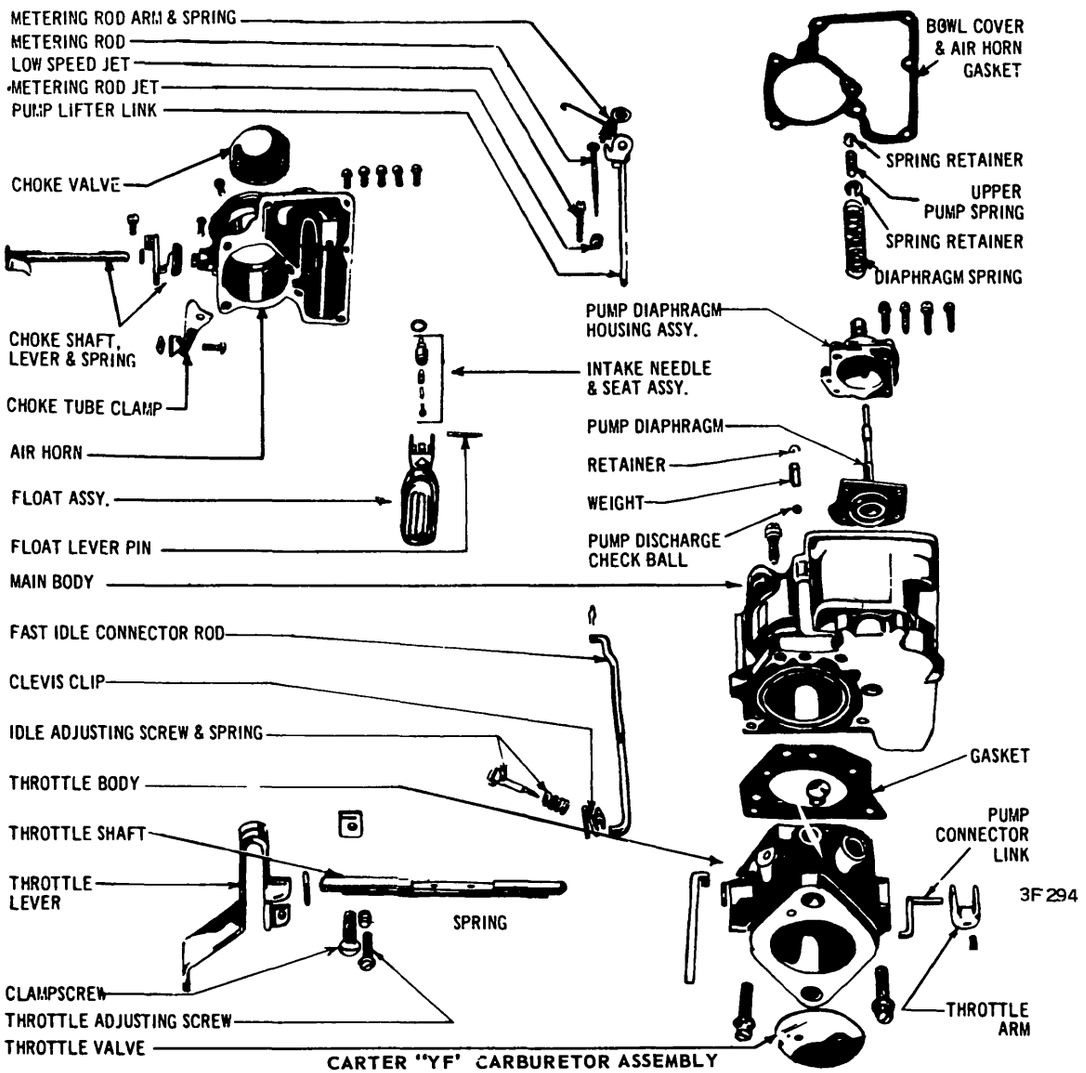
CARTER YF SINGLE BARREL CARBURETORS (C nt.)

OVERHAUL

Disassembly

1) Remove fast idle connector rod, then remove inlet filter nut, filter, spring and gaskets from fuel inlet housing.
2) Remove bowl cover from main body and place cover upside down on a flat surface. Remove hinge pin, float and float needle, then remove needle seat.
3) Hold finger over pump discharge passage on main body (to retain discharge needle) and operate pump plunger a few times to check operation of diaphragm, ball check, needle, and passage restriction.
4) Empty gas from fuel bowl of main body and remove pump discharge needle. Loosen throttle shaft pump arm lock screw and remove arm and pump connector link, then remove diaphragm housing screws and lift out entire pump, metering rod, and idle vent assembly.
5) Remove metering rod from arm, then compress upper pump springs and remove retainer, springs, metering rod arm, and pump lifter link assembly. If necessary, remove idle vent screw assembly from lifter link. Compress lower spring and remove spring retainer, then remove lower spring.

PUMP & METERING ROD ASSEMBLY



6) Remove pump housing screws from housing and diaphragm, then remove diaphragm shaft retaining ring and slide diaphragm assembly out of housing. Remove main metering jet and low speed (idle) jet. *CAUTION - Do not remove pressed-in parts.*
7) Remove idle mixture screw and remaining body-flange attaching screws and remove body and gasket from throttle flange. *NOTE - Do not remove throttle valve and shaft unless to correct a binding condition or install new parts.*
8) If necessary to remove throttle valve and shaft, file staked ends of throttle valve screws flush with throttle shaft. Remove screws and throttle plate, then slide shaft out of flange and remove fast idle arm.
9) Remove choke valve, if necessary, in same manner as for throttle valve. To remove choke cam lever, pry off retaining ring, then slide lever and spring from mounting boss.

Cleaning & Inspection

Wash all parts in carburetor cleaning solution. *CAUTION - Do not immerse diaphragm assembly, pump check disc, or seals in solution.* Inspect all parts for wear or damage and replace if necessary. Blow out all passages with air.

Reassembly

Reverse disassembly procedure and note the following: Install new gaskets. Install throttle valve with lettering toward manifold side of flange and part number opposite idle port. Make sure pump connector link and pump lifter link do not bind in any throttle position. If necessary, loosen lock screw and adjust slightly.

CARTER "YF" CARBURETOR ASSEMBLY

CARTER YH HORIZONTAL CARBURETORS

CORVAIR — **Carter Carb. No.**

1963 Monza (Supercharged Engine) — 3311S

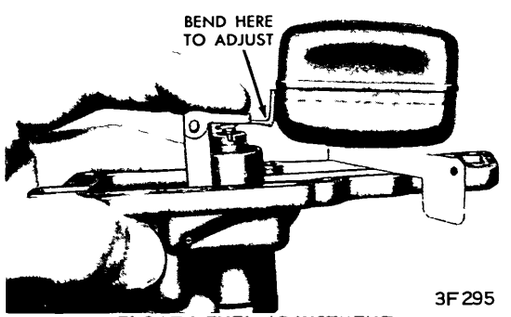
DESCRIPTION

Single barrel, side draft (horizontal) type with diaphragm operated metering rod (vacuum and mechanically controlled by action of accelerator pump assembly). An automatic choke assembly is used on all models. Heated fresh clean air is drawn from carburetor air cleaner through choke heat passages in turbine housing-to-exhaust pipe attaching flange, then into choke housing for automatic choke control.

SUPERCHARGER NOTE - See "Corvair Supercharger" in 1962 Final Data, Page 256.

ADJUSTMENTS

Idle Speed & Mixture



With engine at correct idle speed (see "Specification Table"), adjust idle mixture screw to obtain highest vacuum. Readjust idle speed and repeat idle mixture adjustment.

Throttle Return Check

With engine at normal operating temperature and correct idle speed (choke valve fully open and fast idle not operating), measure distance between throttle valve lever and return check valve bolt. This distance should be as indicated in "Specification Table". To adjust, hold wrench on flat of diaphragm stem and turn self-locking nut as necessary.

Float Level

Invert bowl cover and measure distance between float at center and gasket surface of bowl cover (gasket removed). Distance should be as indicated in "Specification Table". To adjust, bend float arm.

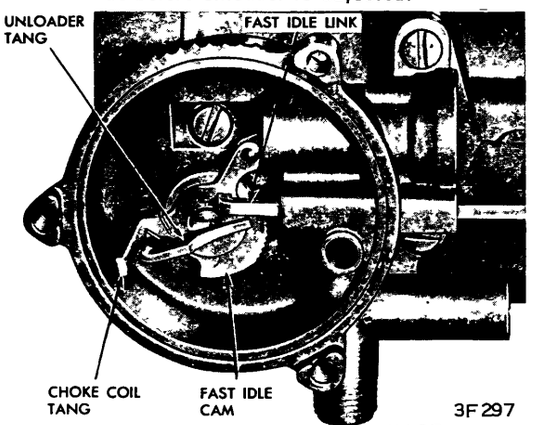
FLOAT LEVEL ADJUSTMENT

Float Drop

Hold bowl cover upright so float is hanging free. Distance between gasket surface (gasket removed) and float seam at free end should be as indicated in "Specification Table". To adjust, bend tang at hinge end of float.

Automatic Choke

Loosen choke coil housing retaining screws and rotate cover to align index mark on cover with proper graduation on housing See "Specification Table"



CARBURETOR ADJUSTMENT SPECIFICATIONS

Carter Carb. No.	Idle Speed Eng. RPM	Initial Idle Mix. Screw Ⓒ	Float Level	Float Drop	Auto. Choke	Off Engine Fast Idle	Unloader	Metering Rod Gauge No.	Throttle Return Check
3311S	850	3/4	5/8"	2 3/8"	1 Rich	030"	7/16"	T109-104	.030"

Ⓒ - Turns open from a lightly seated position.

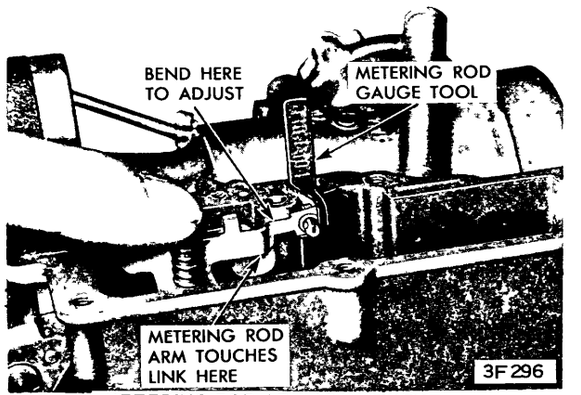
Fast Idle (Off Engine)

NOTE- Fast idle adjustment (on engine) is not required. Hold choke valve tightly closed and close throttle valve as far as it will go (fast idle link on high step of fast idle cam). Clearance between throttle valve and bore on side opposite idle port should be as indicated in "Specification Table". To adjust, bend fast idle connector link. *NOTE - Fast idle adjustment must be made before unloader is adjusted.*

CHOKE HOUSING & FAST IDLE LINKAGE

Unloader

With fast idle properly adjusted, open throttle to wide open position while holding tension on choke valve. Distance between edge of choke valve on side opposite vent tube should be as indicated in "Specification Table". To adjust, bend unloader tang on fast idle cam.

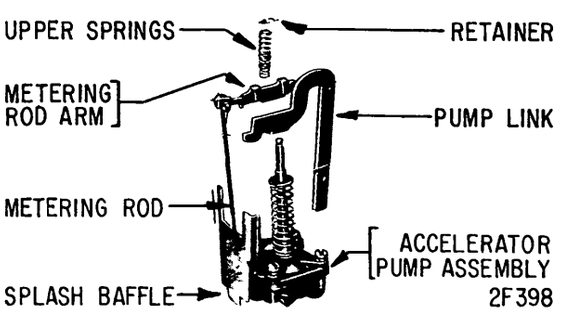


Metering Rod

With throttle valve held tightly closed, remove metering rod and install correct metering rod gauge (see "Specification Table") in metering jet. Push down on pump diaphragm rod until metering rod arm just touches lifter link At this point metering rod arm pin should just contact top gauging surface of tool To adjust, bend metering rod arm at undercut portion. Remove gauge and reinstall metering rod.

OVERHAUL

Disassembly



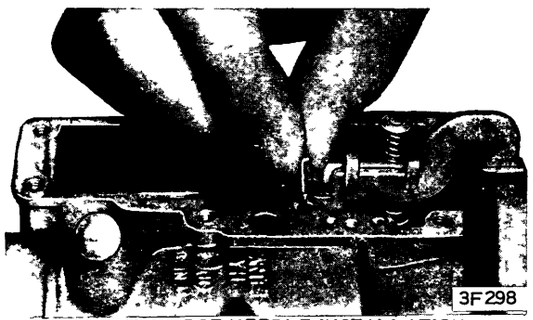
Remove inlet screen, then remove bowl cover. Remove float and float needle and seat. Remove bowl cover gasket and tip carburetor and remove pump discharge needle valve. Loosen pump lever screw from throttle shaft and slide lever off shaft and link. Depress small

METERING ROD ARM ADJUSTMENT

spring on pump with a screwdriver and remove spring seat and spring, then lift metering rod arm and rod from pump rod and metering jet. Raise pump arm enough to remove link, and remove pump arm. Remove diaphragm pump assembly, splash deflector plate and metering jet. Remove choke link clip and choke link, then remove choke housing cover, gasket and baffle plate, and slide choke lever out of housing. Remove throttle body flange assembly from carburetor main body, then remove idle speed screw and spring from throttle body. *NOTE - Do not remove choke valve, choke piston, or throttle valve unless shaft and piston are binding or if parts must be replaced.* File staked ends of throttle plate and choke plate screws level with shaft, then remove screws and plates. Remove throttle shaft by sliding out of throttle body. Rotate choke shaft until piston comes out of bore, then slide shaft assembly from main body. Remove choke housing and discard vacuum passage "O" ring.

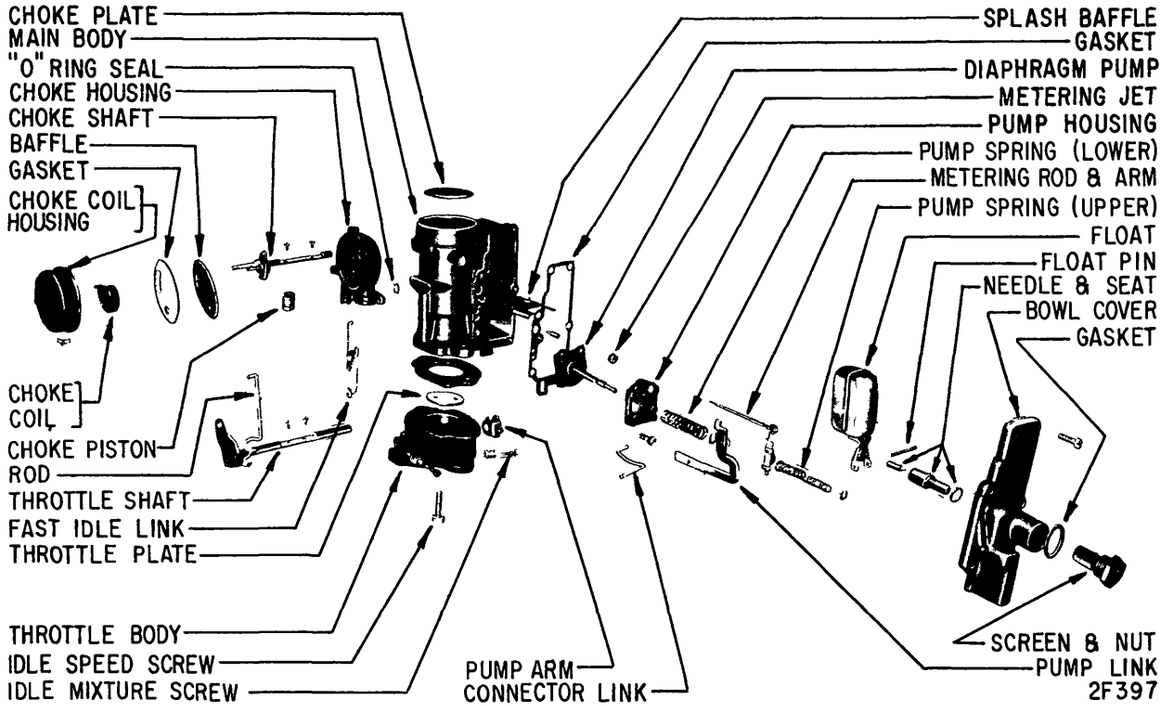
(Continued)

ACCELERATOR PUMP & LINKAGE



CARTER YH HORIZONTAL CARBURETORS (C nt.)

Inspection



Wash all parts except choke coil housing assembly in cleaning solution. Remove all carbon from throttle body bore and blow out all passages with air. If choke piston is not free in housing bore, remove welch plug from housing and clean cylinder bore with fine sandpaper if necessary Install a new welch plug so it is air tight Inspect all parts for wear or damage and replace if necessary.

Reassembly

If throttle shaft assembly was removed, slide shaft into throttle body and position throttle plate on flat of shaft with numbered side to shaft, then install screws loosely. Center throttle plate on shaft and in throttle bore, then tighten screws and peen securely. If choke shaft was removed, install a new "0" ring seal and position choke housing on air horn. Tighten attaching screws just snug. Slide choke shaft into air horn part way, then install piston to shaft and position shaft by rotating while installing piston into cylinder bore. Tighten choke housing screws securely. Position choke plate on flat of shaft so identification numbers are on air cleaner side, then complete installation in same manner as for throttle plate. Install throttle body on main body and tighten attaching screws securely (use a new gasket). Install diaphragm assembly in diaphragm housing, then install lower spring and retainer. Install metering jet (no gasket), then install

PUMP DISCHARGE NEEDLE INSTALLATION

CARTER "YH" CARBURETOR ASSEMBLY

diaphragm housing screws and thread them in two or three turns to hold diaphragm in alignment and install diaphragm assembly in carburetor bowl. Tighten attaching screws securely. Install splash shield between metering rod jet and pump housing, then install metering rod onto rod arm, hook spring, and install clip. Place pump lifter link in guide opening and insert throttle lever connector link onto pump lifter link (connector must be installed before lifter link assembly is completely in position) then place lifter arm down over pump rod. Place metering rod in jet with arm over pump rod and lifter arm, then place upper springs over pump rod. Compress springs with a screwdriver and install retainer. Install throttle shaft pump lever over throttle shaft and pump link, then tighten retaining screw. Adjust metering rod (see above). Install float needle seat, needle valve, and float assembly in bowl cover (float hinge pin shoulder to outboard side of of bowl), and adjust float level and drop. Install pump discharge needle, then install bowl cover (and a new gasket) and tighten cover screws. Install fast idle link into choke housing and hook unloader projection over tang on fast idle cam assembly. Install choke link connector link to throttle lever keyed hole, then to choke link with a clip. Adjust fast idle (see above), then adjust unloader. Install choke baffle plate, gasket, choke coil housing, retainer clips and screws. Adjust automatic choke (see above).

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 RAMBLER CARBURETOR STEP-UP DIAPHRAGM COVER RETAINER PRODUCTION CHANGE & SERVICE INSTALLATION NOTE:* Carburetors with date code K-2 or later (stamped on carburetor flange) have a new method of retaining the step-up rod diaphragm cover. On carburetors prior to date code K-2, install a split wire ring, Part No. 3204528 and conical washer, Part No. 3204529 as outlined under "Overhaul" below. The above parts are also included in Overhaul Kit, Part No. 3204290.

►*1963 STUDEBAKER CARBURETOR NO. 3538S (WITHOUT BLUE DOT ON CARBURETOR BOWL COVER) LOOSE, LEAKING, OR MISSING DIAPHRAGM CHAMBER COVER CORRECTION:* Install Repair Kit, Part No. 1560178, following the installation procedures included with repair kit. The above carburetors will have a code date prior to L-2 stamped on carburetor flange. Later carburetors (after code date L-2) and all carburetors having a blue dot on bowl cover were revised in production.

►*1963 STUDEBAKER HARD STARTING WITH COLD ENGINE CORRECTION (Early Carburetors with Code Date Prior to "L-2"):* Set automatic choke to 1 Point Rich instead of Centered (On Index).

DESCRIPTION

Single barrel, concentric bowl type with a vacuum diaphragm controlled step-up. Carburetor assembly consists of a single aluminum casting with a pressed steel bowl.

ADJUSTMENT

Idl Speed & Mixture

With engine at normal operating temperature, adjust throttle stopscrew to obtain correct engine RPM, then adjust idle mixture screw for highest steady vacuum, maximum idle speed, and smoothest engine operation. If necessary, readjust engine idle speed.

Float Level

With carburetor assembly inverted (bowl and bowl gasket removed) and with weight of float only resting on inlet needle, measure distance from machined surface of casting to top of "bump" at each end of float (see illustration and specifications). To adjust, remove float from carburetor and bend bracket at narrow portion. *NOTE - If adjustment is made with float in carburetor do not allow any pressure to be placed on resilient inlet needle seat.*

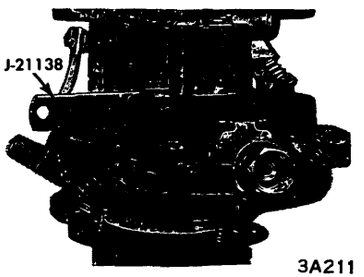
Step-Up Rod

This adjustment is required whenever step-up rod is removed from diaphragm assembly. Invert carburetor and press in lower end of step-up rod until upper end of diaphragm assembly touches retainer (resistance will be felt at this point, then continue to press rod inward until tip of rod extends .040" outward from lower surface of jet. Install step-up rod spring.

Accelerating Pump

NOTE - This adjustment must be made each time carburetor is disassembled and must be made before fast idle and unloader adjustment. Back out idle speed screw and hold choke valve wide open so throttle valve seats in bore. Turn pump adjusting nut to obtain proper clearance (see specification table) between washer on pump plunger and boss on bowl cover.

Fast Idle



Rotate fast idle cam and align index mark on cam with center of tang on throttle lever. Clearance between throttle valve and carburetor bore on idle port side should be as indicated in specification table. To adjust, bend tang on throttle lever. With choke valve closed and fast idle connector rod against end of slot in cam (see illustration), index mark on cam should align with tang on throttle lever. To adjust, bend connector rod at offset portion.

FLOAT ADJUSTMENT

STEP-UP ROD ADJUSTMENT

PUMP ADJUSTMENT

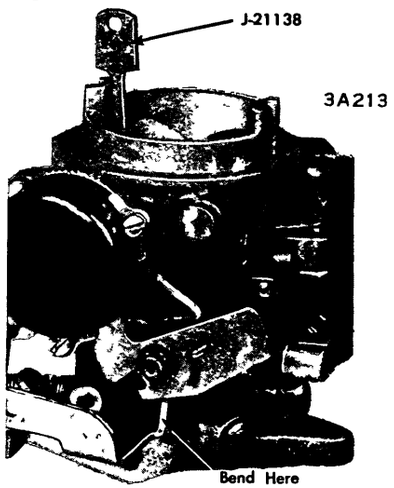
FAST IDLE ADJUSTMENT

CARTER RBS SINGLE BARREL CARBURETORS (C nt.)

Unloader

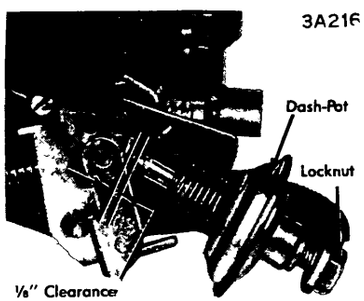
With throttle valve wide open, clearance between upper edge of choke valve and wall of air horn should be as indicated in table. To adjust, bend tang on throttle lever (see illustration).

Dash Pot



Close throttle valve by backing off idle speed screw, then depress dashpot diaphragm stem fully. Obtain proper clearance between end of stem and throttle lever by turning dashpot in or out. See illustration. Tighten locknut securely.

OVERHAUL



Disassembly

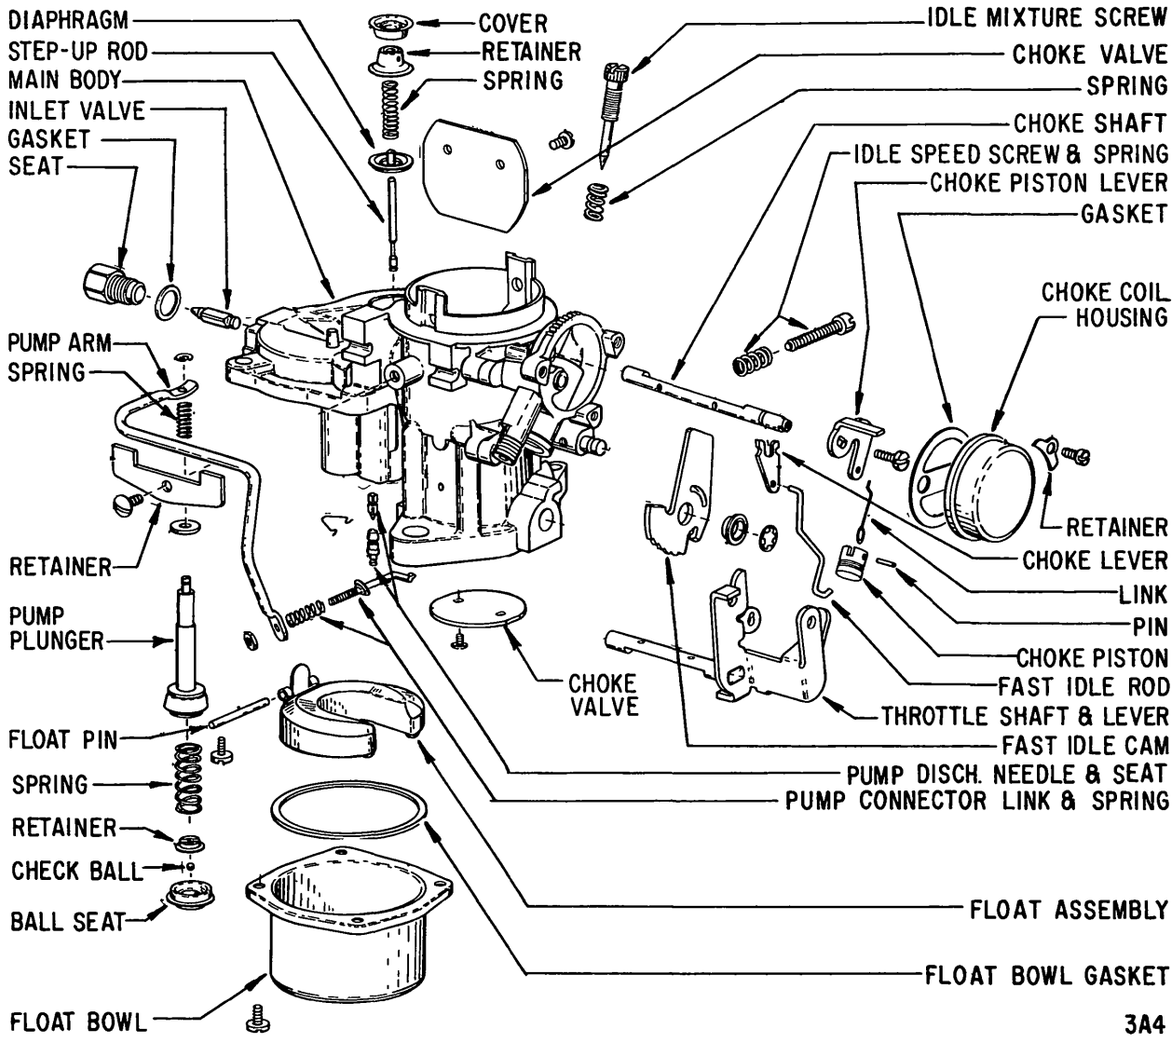
1) Remove pump adjusting nut, then push plunger down and remove spring and washer. Remove pump plunger shaft retainer, then remove pump arm retainer and arm, upper plunger spring and washer.

2) Remove fast idle cam and disengage cam from connector rod. Remove thermostatic coil housing and gasket. *NOTE - Do not remove choke valve unless it is necessary for cleaning or repair.* To remove choke, remove choke piston lever and slide piston out of cylinder, then disconnect choke piston link (wire). Spread fork of choke lever with a screwdriver and slide from shaft. Remove choke valve screws and valve, and slide shaft out of air horn.

UNLOADER ADJUSTMENT

DASHPOT ADJUSTMENT

3) Remove bowl and gasket, then remove float pin attaching screws, float, pin, and needle and seat assembly. Remove step-up rod retainer spring. Press pump plunger shaft down as far as it will go, then hold in place and tap upper end of shaft with a light hammer. *NOTE - Catch plunger, spring, intake ball retainer, and ball and seat as they are driven out at lower end of cylinder.*



4) If it is necessary to remove pump discharge check needle seat from bottom of casting, use suitable tool (see "Carburetor Tools" below). To remove diaphragm cover and diaphragm assembly, remove the cover by piercing with a sharp tool and pry from casting. *NOTE - A split ring and washer located above cover will come out of casting with the cover. If the carburetor does not have a split ring and washer above cover, make sure that the repair kit being used contains these parts (see "Changes, Cautions, Corrections" above).* Remove lower retainer, spring, diaphragm assembly and step-up rod.

5) If necessary to remove throttle valve, file upset end of attaching screws, then remove screws, valve, and slide shaft and lever assembly out of casting. Remove idle mixture screw and idle speed screw.

Cleaning & Inspection

Clean casting and parts in a suitable cleaning solution. *NOTE - Do not immerse diaphragm, seat,*

(Continued)

CARTER RBS (SINGLE BARREL) CARBURETOR

CARTER RBS SINGLE BARREL CARBURETORS (C nt.)

plunger, or float in cleaning solution. If diaphragm assembly has not be n removed, do not immerse casting in cl aning solution. Blow out all passages with air and remove all gum and carbon from carburetor bore. Inspect all parts for damage and replace as necessary.

Reassembly

1) Invert carburetor casting and install pump plunger, spring, ball retainer, ball and check ball seat. Press check ball seat down into position and place tool (see "Carburetor Tools" below) over end of seat. Tap tool lightly with a hammer until seat is pressed tightly into position. *NOTE - Make sure tool contacts outer surface of ball check seat.*

2) If pump discharge needle and seat were removed, insert needle in passage with point of needle toward seat, and install seat by driving into place (tap on protruding lip of seat) until it is just flush with lower edge of casting.

3) Place a new diaphragm assembly on top of cavity (clip end for step-up rod downward), then place brim of hat-shaped retainer (without spring) against diaphragm and use it as a tool to press diaphragm and its gasket firmly against gasket ledge in casting. Remove hat-shaped retainer and examine diaphragm for even assembly, making sure diaphragm stem is near vertical position. Install spring in cupped-shaped plate on top of diaphragm, then install hat-shaped retainer (brim down) on top of spring. Position diaphragm cover in casting and use special tool (see "Carburetor Tools" below) and tap cover into place with a hammer until cover is tightly in position. Place split wire ring inside diaphragm cover and place conical washer over ring (small end of cone upward). Place a 7/16" socket attached to a suitable extension over inside diameter of washer and tap with a hammer until conical washer is flat. *CAUTION - Do not use a smaller tool which will enter cover or strike center portion of cover any time conical washer is being installed. Do not drive washer beyond the flat position.* Install step-up rod in place, making sure end of rod is in hollow end of stem of diaphragm.

4) If throttle shaft assembly was removed, attach connector link and insert shaft into position, then install valve with new attaching screws (do not tighten screws). *NOTE - Trade mark on valve should extend toward idle port when viewed from manifold flange side.* Tap valve lightly with screwdriver to seat valve in bore, then hold valve in position and tighten attaching screws. Upset ends of attaching screws.

5) Install upper pump washer and spring, then install washer and pump delayer spring on connecting link. Install pump arm, making sure connector link extends through hole in lower end of arm, and upper end of arm is over pump plunger. Install rod retainer, then install adjusting nut on connector link and retainer clip on plunger shaft.

6) If choke was completely disassembled, install choke valve and shaft. Center valve in bore by tapping with a screwdriver and install attaching screws. Attach fast idle connector rod to choke lever and install choke lever on shaft. Crimp forked ends of lever with pliers to secure in place. Attach fast idle cam to lower end of connector rod and install fast idle cam, washer, and retainer. Assemble choke piston and link (wire) to choke piston lever. Slide piston into cylinder, then position lever on end of shaft and secure with attaching screw. Install choke housing gasket, thermostatic coil housing, and secure in position.

7) Invert carburetor and install fuel intake needle and seal, then insert float pin into float bracket and install in carburetor. Secure float pin with attaching screws.

Carburetor Tools

J-8249 (Rambler) & J-2152-1 (Studebaker) - Use to remove pump discharge check needle seat.
J-21202(Rambler) & J-21252-2 (Studebaker) - Use to install pump discharge check needle seat.
J-21202 (Rambler) & J-21252-7 (Studebaker) - Use to seat diaphragm cover in casting.

PAXTON SUPERCHARGER

Studebaker & Avanti (1963)
(With Supercharg d J t-Thrust Engine)

DESCRIPTION

Supercharger system consists of a belt driven centrifugal, fixed ratio, single-stage unit combined with a sealed Carter AFB 4-Barrel carburetor and a special fuel pump that utilizes supercharger pressure to increase fuel pressure as required. Air pressure is boosted a maximum of 5 psi, to provide a denser air-fuel mixture to combustion chambers. An internal oil sump which holds 8 ounches of Automatic Transmission Fluid Type "A" (Suffix "A") supplies the self contained lubrication system. A bayonet type oil gauge marked "Safe Operating" level and "Add Oil" level is located in bearing housing assembly. Periodic service adjustments are not required.

REMOVAL & INSTALLATION

REMOVAL - Push belt tensioning arm toward center of engine and remove drive belts, then remove inlet hose. Remove discharge hose at supercharger. Disconnect fuel pump air hose at supercharger, then disconnect supercharger from mounting bracket. *NOTE - Hold supercharger in normal operating position and remove unit from engine.*

INSTALLATION - Reverse removal procedure. *CAUTION - Do not operate supercharger above idle speed when supercharger discharge hose is disconnected from carburetor air horn adapter.*

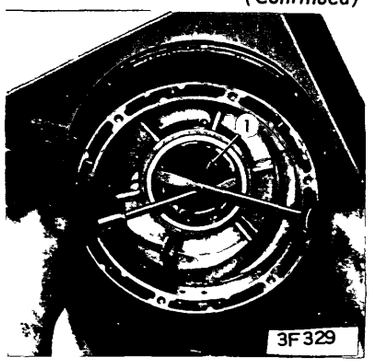
OVERHAUL

DISASSEMBLY - **1)** Drain lubricant and place unit in Holding Fixture J-6689, then remove cover from scroll housing. Install Impeller Holding Tool J-6684 and remove impeller capscrew and washer, then remove tool.

2) Insert Impeller Puller Tool J-6690 and turn until impeller is lifted off shaft. Turn supercharger over so pulley side is upward and position dowel pins on face of scroll in holes of holding tool. Hold pulley hub from turning and remove pulley screws and washers.

3) Remove pulley from shaft and remove drive key and front seal washer. Scribe an index mark on scroll housing and bearing housing for reassembly in original position, then remove bearing housing-to-scroll housing capscrews. Remove bearing housing by twisting it free of scroll housing. *CAUTION - Do not use any kind of tool to pry housings apart.*

4) Pry air hole cover from scroll, then tap pulley end of input shaft with a rubber hammer and drive input shaft assembly out of bearing housing. To remove input shaft seal, press seal into housing. Remove two "O" ring seals from grooves in bearing housing.



5) Use Puller Plate J-1298, Collets J-6729, Center Button J-6686 and Puller J-8305 and pull front bearing and input shaft seal spacer from input shaft. Remove oil pump screen retainer and screen, plunger spring retainer screw, plunger spring and plunger from oil pump body. Slide pump body from input shaft. Remove ball driver from shaft.

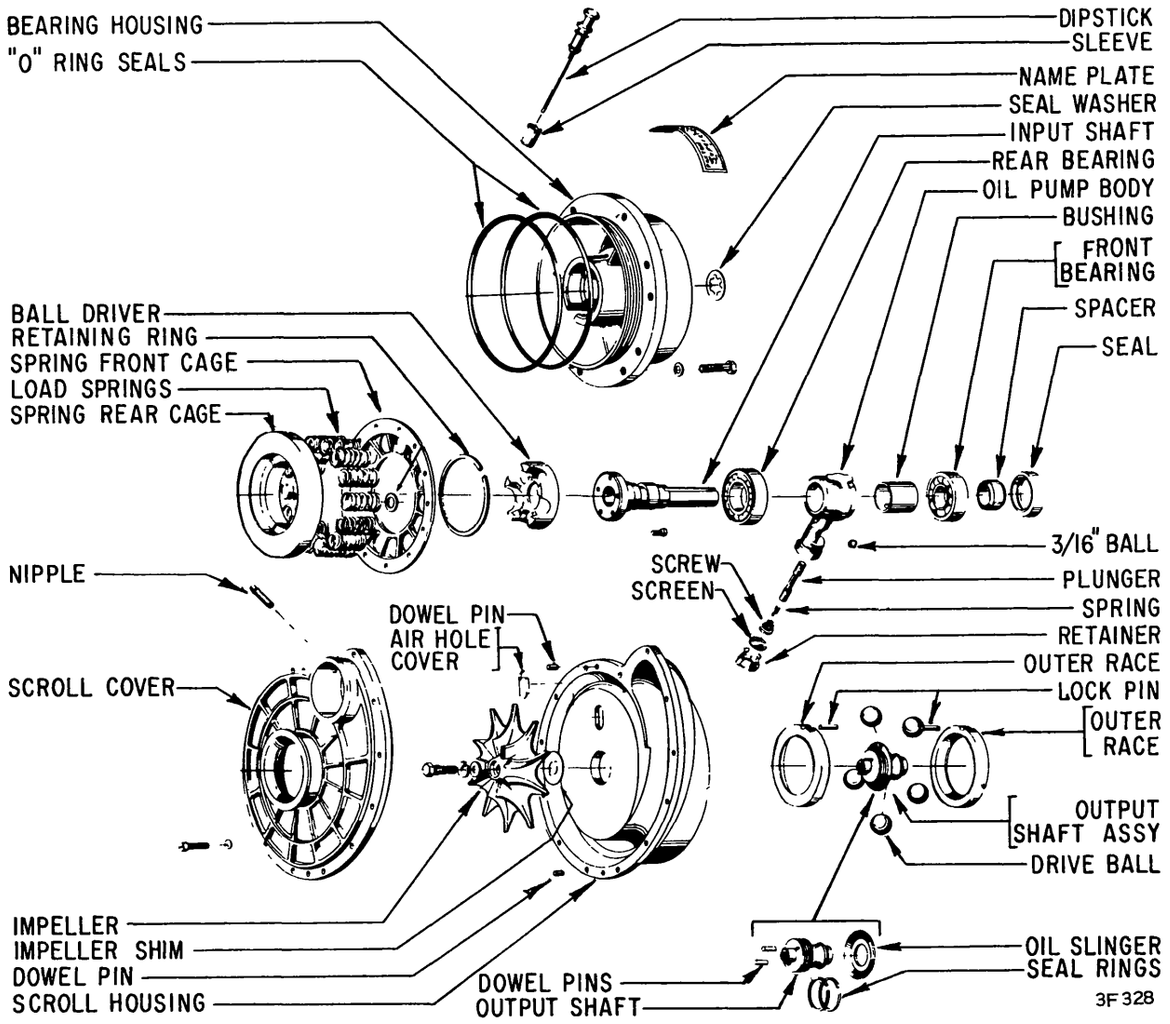
6) Remove race load assembly from scroll housing, then use a suitable punch to tap ball race out of race load assembly being careful not to lose race lockpin. Use a lint free cloth and lift five drive balls of planetary system from ball race and output shaft in the scroll housing, then remove output shaft. Remove two oil seal rings from output shaft. Insert Anvil Tool

(Continued)

TOOL J-6684

TOOL J-6690

TOOL J-6687 (1)



PAXTON SUPERCHARGER (Continued)

J-6687 into output shaft base in scroll housing. Use two large screw drivers, pry against anvil and ball race and remove race. Do not lose ball race lock pin.

INSPECTION - *CAUTION - DO NOT handle steel parts (balls, races, or ball race portion of output shaft) with bare hands. This would result in rusting and oxidation and would require installation of new parts. Keep steel parts submerged in clean oil after removal.*
1) Inspect bearings for roughness and bushings for score marks. Check impeller wheel for chipping, deep surface scratches or gouging. Inspect shafts for gouging.
2) Inspect housing for cracks. Install new rubber seals. Replace drive balls, if ball shows any sign of surface abrasion or pits, regardless of size. Oil all moving parts with Automatic Transmission Fluid Type "A" (Suffix "A") as they are assembled.

REASSEMBLY - **1)** Install race lock pin in side of ball race housing, then place ball race in position in scroll housing over lockpin and tap lightly into place. Install oil seal rings in first and third grooves of output shaft with chamfer on top ring toward impeller end of shaft. Position rings so gaps are 180° apart, then install oil slinger.
2) Insert output shaft (with dowel pins down) into center bore of scroll housing, being careful not to break rings. Install five drive balls around output shaft. *CAUTION - Drive balls, output shaft and ball races are serviced as a matched set. Do not install less than complete set.*

3) Install race lockpin in recess in inside of race load assembly, then place ball race in position in housing and tap lightly into position. Install race load assembly over drive balls in scroll housing and install drive ball retainer on end of input shaft. Tighten screws to 30 inch lbs. Use Tool J-6688 and press the large ball bearing onto input shaft until it seats against shaft shoulder. *NOTE - Lettering on bearing must face away from oil pump.*
4) Slide oil pump body onto input shaft with offset on pump intake away from drive ball retainer. Use Tool J-6688 and press small ball bearing in place on input shaft. *NOTE - Lettering on bearing should be upward, away from oil pump.* Install oil pump plunger with solid end of plunger toward input shaft. Install spring in bore of plunger, then install spring plug screw, pump screen and retainer.
5) Press input shaft seal into place inside bearing housing with lip of seal facing rearward or toward impeller. Install "O" ring seals in groove of bearing housing shoulder. *NOTE - Do not install "O" ring in center groove.* Fill bore of oil pump (through screen) with Automatic Transmission Fluid "A" (Suffix "A"). Hold pump body and rotate shaft until oil can be seen pulsating under screen (indicating oil pump is operating).
6) Install shaft seal spacer over pulley end of input shaft, then install input shaft assembly in bearing housing. Note the alignment marks made at disassembly and install bearing housing on scroll housing. Install attaching capscrews evenly and tighten to 100 inch lbs. Place front seal washer over input shaft, then slide drive key in keyway of shaft and install pulley (with counterbore down) onto shaft. Tighten pulley attaching screw to 200 inch lbs.
7) Invert unit (pulley down) into holding fixture. Install air hole cover with open end of cover away from output shaft, and tap lightly into position. Install two dowel pins in output shaft.
8) Measure distance between face of diffuser section (flat surface of scroll housing) and face of output shaft. Add .012" ± .004" to this measurement (this will be total thickness of shim pack required for proper clearance of impeller). *NOTE* - Shims are furnished in thicknesses of .026-.028"; .030-.032"; .034-.036"; .038-.040"; .042-.044"; .019-.021"; .006-.007".
9) Place selected shim pack on output shaft over shaft dowels, then install impeller. Use impeller holding tool and install center impeller capscrew and washers, and tighten to 200 inch lbs. Use a feeler gauge and check clearance between impeller and face of scroll housing at several points around impeller. Clearance should be .012" ± .004". If necessary, add or remove shims to obtain proper clearance.
10) Install scroll cover on housing and tighten capscrews securely, then rotate input shaft to make sure impeller is not dragging against housing or cover and that unit is not binding internally. Fill oil sump with 8 ounces of Automatic Transmission Fluid Type "A" (Suffix "A"), then rapidly turn input shaft pulley to prime oil pump.

PAXTON SUPERCHARGER

CRUISE CONTROL & AUTOMATIC SPEED CONTROL

Cadillac (1963)
Ch vr let (1963)
Chrysl r & Imperial (1963)
Linc ln (1963)
M rcury (1963)
Oldsm bil (1963)
P ntiac (1963)

DESCRIPTION

This control unit is governed directly by car speed and acts as a speed warning device and as an automatic speed control. A calibrated control unit in drivers compartment allows selection of a desired operating speed. When used as a speed warning device the selector is set at desired position and when car reaches the selected speed a reaction pressure of 5-7 lbs. is felt at accelerator pedal. Selected speed may be exceeded by overcoming the pressure and depressing the accelerator. When used as an automatic speed control, procedure is the same as for speed warning, except that when pre-selected speed is reached, the automatic unit is placed in operation by depressing a button or moving a lever (depending on car model). Pre-selected speed will be maintained without foot pressure on accelerator pedal until brake pedal is depressed (also clutch pedal on some cars), turning ignition switch to OFF position, or on some car models, moving selector or control switch to OFF position. Accelerator control will then return to manual control and it will be necessary to repeat the above procedure to again place control unit in operation.

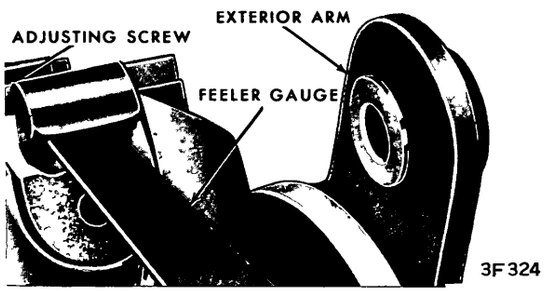
ADJUSTMENT

Control Cable

Rotate selector dial or knob counterclockwise (to low speed position) as far as it will go without forcing, then loosen screw on dust shield (retains cable in bottom of dust shield) and pull cable out of dust shield, making certain that ferrule at end of cable is free in bottom of dust shield. Reinsert ferrule in dust shield, pushing in lightly on control cable until it stops. *CAUTION - Do not force cable beyond this point.* Again try to rotate selector dial or knob **counterclockwise**, to make sure it is at low setting. Carefully tighten screw on dust shield, being sure not to change cable position when tightening setscrew.

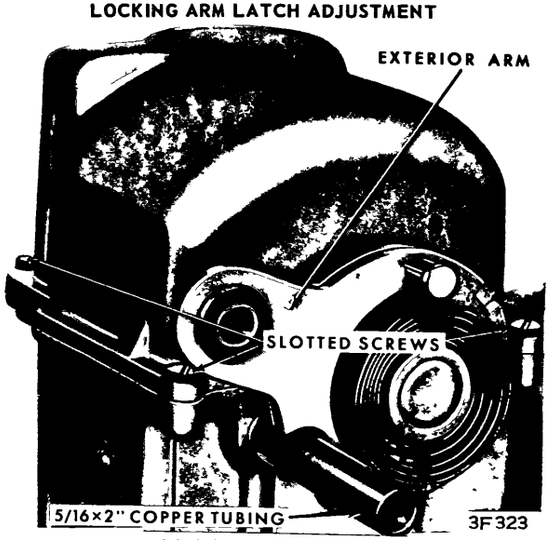
Linkage

With throttle linkage properly adjusted (see Car Model pages) and engine running at slow idle speed, remove cotter pin from accelerator linkage and pull linkage from exterior arm of speed control unit. Insert gauge sleeve, Tool J-7652 (Cadillac, Chevrolet, Oldsmobile, Pontiac); C-3844 (Chrysler & Imperial) over gauge bolt (see illustration). *NOTE - If gauge tool is not available, use a piece of 5/16" copper tubing, 2" long.* Adjust swivel on throttle linkage until it aligns with and freely enters hole in exterior arm, then replace linkage and cotter pin and remove gauge pin.



Locking Arm Latch

NOTE - There are two sets of electrical grounding points that operate Cruise Control motor in forward and reverse direction. One grounding point on motor side of magnet controls acceleration, while the other grounding point on locking arm side of magnet controls deceleration. Adjust locking arm latch BEFORE adjusting grounding points.

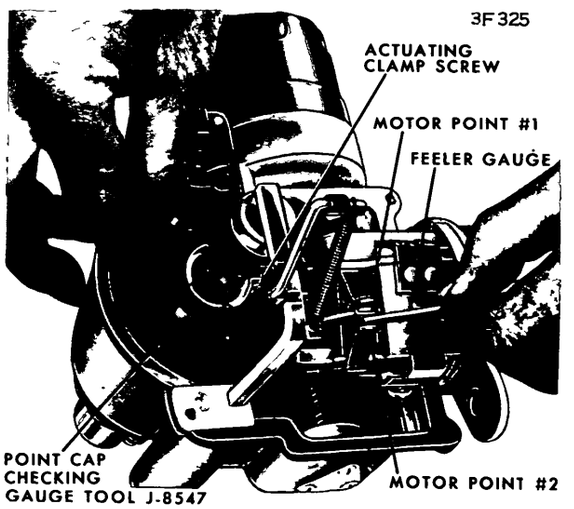


Disconnect electrical connector at front of power unit and accelerator linkage rod from exterior arm. Remove speed control cover, then move locking arm up against magnet and press down on armature plate to latch the unit (simulating automatic control). Use a feeler gauge to measure gap between locking arm and latch on armature plate (see illustration) Clearance should be .001-.006". If not within limits, adjust gap by turning adjusting screw.

Point Gap

CAUTION - These points are operative when backened and pitted; however, any build-up on points should be removed. When filing points use a cloth to catch filings. Disconnect drive cable at base of power unit, then move contact arm against either grounding point and use a feeler gauge to measure the full gap between contact arm and other point. This gap should be .090" ± .010". If not within limits, bend either grounding point on magnet assembly as necessary to obtain correct gap. Insert gauge sleeve (see "Linkage" adjustment) over gauge bolt, then turn ignition switch on and move contact arm against ground point on locking arm side. When magnet assembly is in low position, disconnect plug from terminal block while still holding contact arm against point. *CAUTION - Do not use a screwdriver to turn drive screw.* Turn governor weights until they are parallel with drive screw, then place Governor Weight Wedge, J-8547 (Cadillac, Chevrolet, Lincoln, Oldsmobile, Pontiac); C-3842 (Chrysler & Imperial) between governor weights, pressing down on wedge until weights are held out of their stop position. Use a feeler gauge to measure gap between contact arm and either grounding point on magnet assembly. This gap should be approximately one-half of the full gap measurement (see above). If gap is not within limits, contact arm is not centered properly. To adjust, loosen screw on actuator clamp and rotate actuator until contact arm is centered between grounding points on magnet assembly, then tighten clampscrew and recheck gap. Remove locking arm gauge and governor weight wedge. Turn drive screw to move magnet all the way toward motor side of housing to avoid any contact between contact arm and grounding point on motor side of magnet (this is to prevent preloading of governor spring by the contact arm before adjusting compressor rod). Hold housing in an upright position, and install ball socket on compressor rod, then turn ball socket until compressor cap on compressor rod just rests on governor spring without exerting pressure against spring. **Loosen ball socket one complete turn and tighten locknut.** *NOTE - This will provide correct low speed calibration for the power unit.* Install cover, making certain that rubber seal and felt seal are properly seated in grooves of cover and housing. Tighten cover screws.

LOCKING ARM LATCH ADJUSTMENT



LINKAGE ADJUSTMENT

Limit Switch

Points of limit switch which are mounted on the terminal block (inside power unit), must be together until magnet assembly reaches the wide open throttle position. At this time there should be at least .025" clearance between the points. Adjust as necessary.

(Continued)

POINT GAP ADJUSTMENT

CRUISE CONTROL & AUTOMATIC SPEED CONTROL (C nt.)

Pedal Release Switch

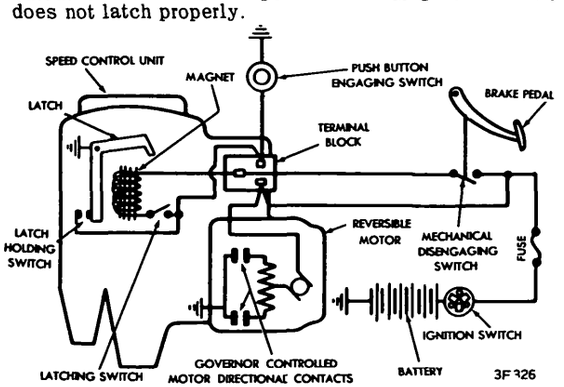
Connect a test lamp to brake pedal release switch (located adjacent to brake pedal lever) and adjust switch so switch circuit is opened during first ¼" travel of brake pedal. *NOTE - On some models with synchro-mesh transmission, a similar switch is also mounted adjacent to clutch pedal lever. Adjust this switch in same manner as for brake pedal switch.*

REMOVAL & INSTALLATION

Power Unit

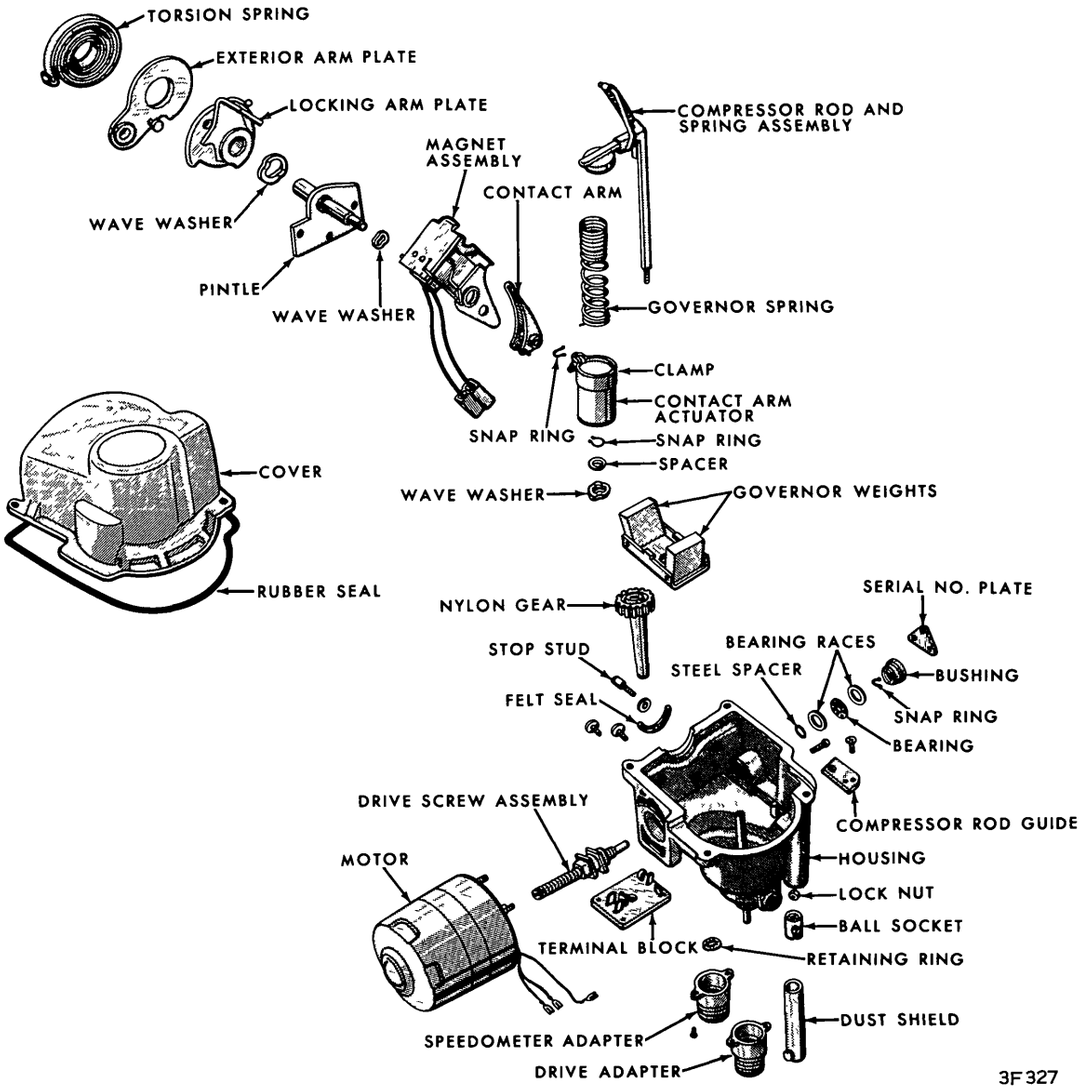
NOTE - When a faulty power unit is removed, the car can be driven with the speedometer operating by removing the power unit cables from speedometer and transmission, and installing a standard speedometer cable and housing assembly between transmission and speedometer.

Removal - Disconnect electrical connection at power unit, then remove dust shield from housing and slide dust shield down cable and slip ball end of Bowden cable out of socket. Disconnect accelerator linkage from exterior arm on power unit, then remove two bolts securing power unit to mounting bracket and remove power unit, leaving mounting bracket attached to car.



Installation - Reverse removal procedure and adjust linkage and control cable.

TROUBLE SHOOTING & DIAGNOSIS



Blowing Fuses - Short or ground in wiring circuit. Improper linkage adjustment. Defective motor. Locked drive screw.

No Cruise Control Response - Accelerator linkage broken or disconnected. Blown fuse. Loose connections or broken wires.

No Automatic Control When Using Selector Switch - Driver riding brake pedal or driver does not hold accelerator against back pressure when depressing selector button. No current at No. 2 terminal on power unit. Loose or disconnected ground wire between selector control and No. 3 terminal on power unit. Inoperative cutout switch on brake pedal lever. Magnet assembly does not latch properly.

CRUISE CONTROL WIRING DIAGRAM (TYPICAL)

CRUISE CONTROL POWER UNIT ASSEMBLY

Constant Pressure on Accelerator Pedal Regardless of Dial Setting - Blown fuse. No current at No. 1 terminal on power unit. Control cable improperly adjusted or defective. Inoperative motor or locked drive screw.

Automatic Control Engages At Selected Speed Without Using Selector Switch - Continuous ground in ground circuit or switch.

Automatic Control Remains Engaged When Brake Pedal is T uch d - Inoperative cutout switch on brake pedal lever.

Unit Does N t Remain In perative in Th "OFF"P siti n (Cadillac) - Limit switch in power unit not properly adjusted.

Pulsating Accelerator Pedal - Speedometer cable or drive cable kinked or lack of lubrication. Improper accelerator linkage adjustment.

Carburetor Does Not Return T N rmal Idl - Improper carburetor or accelerator linkage adjustment. Weak throttle return spring.

Unit Does Not Control At S l ct d Sp d - Improper control cable adjustment. Selected dial or knob not installed properly.

Sp edometer D s N t R gister r Unit D s N t Op rat - Speedometer drive gear in transmission defective. Broken drive cable from transmission to power unit. Damaged drive gear or nylon gear in power unit.

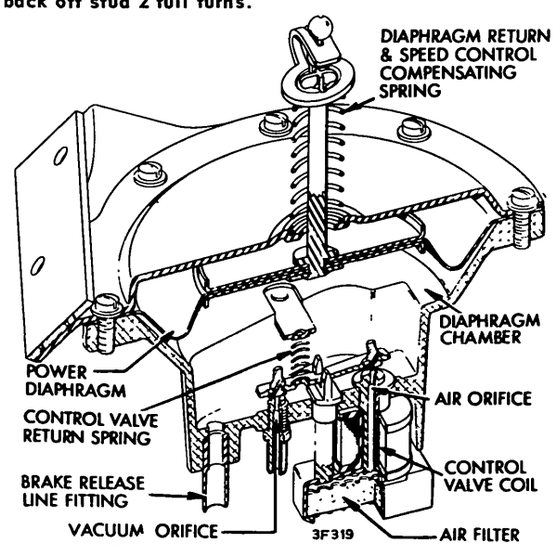
ELECTRO-CRUISE AUTOMATIC SPEED CONTROL (BUICK)

Buick, S ries 4400,4600,4700,4800 (1963)

DESCRIPTION

Electronic-pneumatic system used for controlling and regulating car speed at any point between 30 and 90 MPH. This system compares a measurement of car speed with the selected speed to maintain the selected speed under varying road conditions and over a wide range of road loads. The system consists of a power unit, mounted on cowl in engine compartment and connected to throttle linkage through a bead chain; an amplifier and relay control assembly mounted under dash on instrument panel mounting bracket; a speed transducer which is integral with the speedometer; an engagement switch and "Cruise" lamp assembly, mounted on top edge of instrument cluster assembly; and a release switch located on brake pedal arm bracket.

OPERATION



Electrical signals from the speed transducer operates a vacuum switch which ports engine vacuum to power unit. Through constant signals from transducer, the power unit assumes its proper position to control the throttle opening. The electronic amplifier, engagement switch and brake release switch are the auxiliary units to engage and disengage the speed control.

ADJUSTMENT

CAUTION - Do not lubricate power unit bead chain or its pulley.

Power Unit Bead Chain

Disconnect bead chain from thread stud on throttle rod bracket, then adjust engine hot idle speed to specifications (See "Car Model" pages) and turn engine off. Attach bead chain to throttle rod bracket and set carburetor at hot idle position. *There should be a slight amount of slack in bead chain.* To adjust chain tightness, loosen jam nut on threaded stud on throttle rod bracket and rotate stud until chain is just taut, **then back off stud 2 full turns.**

ELECTRO-CRUISE POWER UNIT

Brake Release Switch

Disconnect wiring connector from brake release switch, then connect an ohmmeter or test lamp across terminals of switch. *NOTE - Cruise lamp in engagement switch may be used as a test lamp by unplugging connector to the speed transducer in speedometer and leaving release switch wiring connector on switch. Turn ignition switch on and press cruise engagement lever which will cause cruise light to be on.* Loosen screws retaining switch to brake pedal support, then position switch to open circuit within ¼" brake pedal travel. When brake pedal is at released position the circuit must be closed for Electro-Cruise unit to operate. Tighten adjusting screw and recheck adjustment of switch by depressing brake pedal several times with test lamp or ohmmeter connected. Readjust as necessary and connect wiring connector .

TROUBLE SHOOTING & DIAGNOSIS

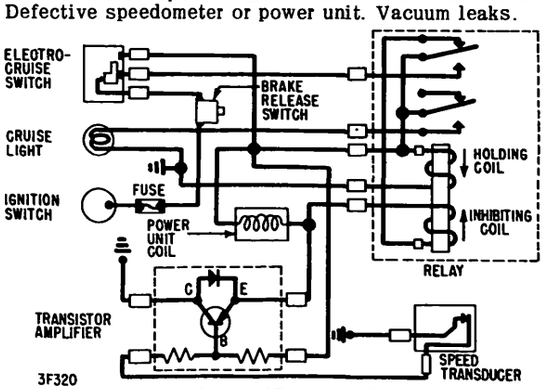
No Action When Lever is Pushed - Disconnected electrical connections or open wiring. Blown fuses. Brake release switch not properly adjusted. Vacuum leakage. Power unit coil open. Defective transistor amplifier.

"Cruise" Lamp Comes On When Lever is Pushed And No Car Response - Harness to speedometer unplugged or loose. Defective speed transducer. Defective transistor amplifier. Defective relay.

"Electro-Cruise" Remains Engaged When Brake is Touched - Brake release switch not adjusted properly. Shorted brake release switch. Shorted wire harness.

Blows Fuses - Shorted wiring. Shorted relay, cruise lamp, or power unit coil. Shorted transistor amplifier.

Engine Races As Soon As Car is Started When Engage Lever is Not Pushed In - Shorted wire harness. Shorted engage switch. Shorted relay. Vacuum orifice leak in power unit. Stuck accelerator linkage.



"Electro-Cruise" Will Not Lock In After Set Speed is Attained - Relay or engage switch is defective.

Car Continues Accelerating Past Set Speed - Wire harness shorted. Shorted speedometer. Relay or transistor amplifier is defective.

Automatically Locks in "Cruise" When Car Goes Over Bump - Relay assembly is defective.

Drops Out of "Cruise" Control When Car Goes Over Bump - Relay is defective. Loose electrical connections. Brake release switch not adjusted properly.

Erratic Cruise Speed - Loose electrical connections. Defective speedometer or power unit. Vacuum leaks.

ELECTRO-CRUISE WIRING DIAGRAM

Slow Response - Check for vacuum leakage.

Hunts At Slow Speed - Defective speedometer. Check bead chain adjustment. Accelerator linkage is too stiff. Vacuum leakage. Brakes dragging.

Does Not Engage When Engage Lever is Pulled Out - Wire harness shorted. Engage switch shorted. Relay is defective.

"Cruise" Lamp Does Not Light - Burned out lamp bulb. Relay is defective. Disconnected electrical connections or broken wiring.

Engine Will Not Idle At Slow Speed When Electro-Cruise is Not Engaged - Check for vacuum leakage. Check bead chain adjustment.

Speed Setting Pointer and Speedometer Needle Do Not Coincide in Speed When in Cruise - Throttle linkage is stiff. Check for vacuum leakage. Speedometer out of calibration. Kink in speedometer cable.

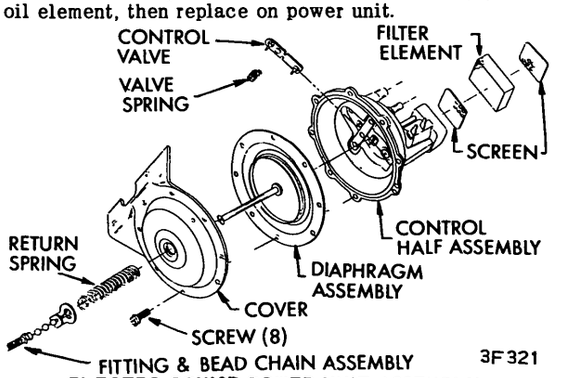
OVERHAUL

Speedometer

Speedometer assembly should be serviced only by an authorized repair station.

Power Unit

Removal - Disconnect bead chain at threaded stud on throttle rod bracket, then remove wiring harness connector from power unit coil. Remove engine vacuum and brake release switch lines from power unit and remove power unit from cowl.



Disassembly - Depress diaphragm return spring and remove bead chain from shaft (turn fitting 90° and slip off shaft). Remove capscrews holding power unit to its mounting bracket, then remove control valve return spring by depressing with a knife blade and pushing sideways. Remove control valve and the air filter from

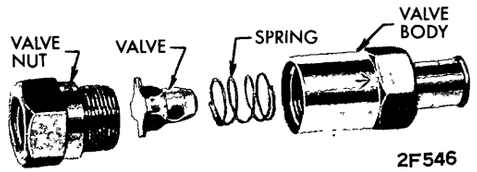
Inspection - Wash power unit in a good detergent, then examine diaphragm for cracks and pin holes. Replace if necessary. Check control valve pads and sealing surface for dirt, chips, or burrs. Clean or replace filter.

Reassembly - Reverse disassembly procedure and note the following: When the light capscrews are placed back on the mounting bracket, tighten opposite sets of screws one at a time and repeat this procedure until all are tight.

Installation - Reverse removal procedure, then adjust bead chain and check unit for vacuum leakage.

AIR FILTER MAINTENANCE NOTE - Every 6,000 miles, remove air filter and outer screen by bending back the four tabs. Clean screen and element in a suitable cleaner. Squeeze cleaner out of element (do not oil element, then replace on power unit.

ELECTRO-CRUISE POWER UNIT ASSEMBLY



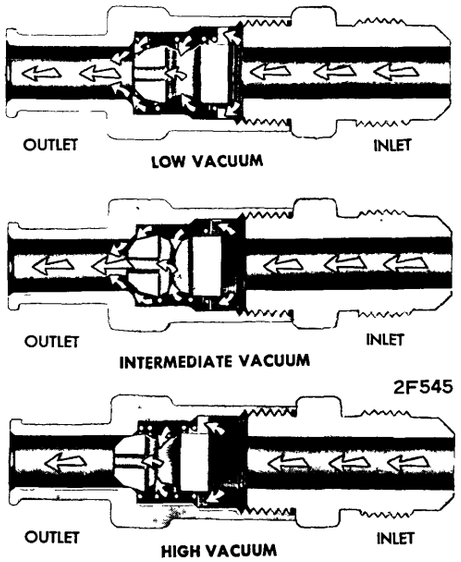
CLOSED CRANKCASE VENTILATION SYSTEMS (ALL CAR MODELS)

Description

Closed crankcase ventilation systems utilize vacuum in intake manifold to remove unburned gases from engine crankcase and return them to the combustion chambers to be burned. This unit which consists of a check valve, hose, and carburetor adapter or carburetor connection, replaces the conventional crankcase ventilator tube.

Operation

The crankcase vent valve automatically meters flow of gases so that normal operation of engine is not disturbed. Under high vacuum conditions such as at idle speed or during deceleration, the valve is held closed and only small amounts of gases are allowed to pass through a metered orifice and into intake manifold. During periods of low vacuum in intake manifold, a spring holds the valve open and larger amounts of gases pass through to intake manifold. Fuel vapor is prevented from entering crankcase by the vent valve which is held closed by any reverse air flow.



CRANKCASE VENT VALVE ASSEMBLY (TYPICAL)

Testing

See "Crankcase Ventilator Valve" on individual car model pages for testing procedures.

Servicing

See table below for servicing intervals. *NOTE - Indicated intervals are for normal operation. If car is operated under low temperature conditions; in "stop and go" service, or in dusty areas, ventilating system should be cleaned or serviced more frequently. A clogged system will result in erratic idle speed, stalling at low speed, or stumble on acceleration.* Remove ventilator hose from connections and blow out with air (replace hose if necessary). Remove crankcase vent valve. If the vent valve is "crimped" type, it cannot be disassembled for cleaning and service. Replace the valve assembly. If the valve is one that can be disassembled, unscrew connector and remove check valve and spring. Clean all parts in carburetor cleaner and blow dry with air. Clean out metering orifice using a suitable size drill to remove varnish and carbon accumulation. *CAUTION - Do not enlarge metering hole.* Inspect all parts for damage or excessive wear and replace valve if necessary. Install spring on valve until spring is properly seated in groove in valve, then place valve and spring in valve body and install connector. *CAUTION - Do not stretch or distort valve spring.* On all ventilating systems, clean crankcase and intake manifold (or carburetor) connections. Clean crankcase filler cap in solvent and blow dry with air. If necessary, install a new oil filler cap. Reinstall ventilating system.

CRANKCASE VENT VALVE OPERATION

Ⓣ Maximum Servicing Intervals

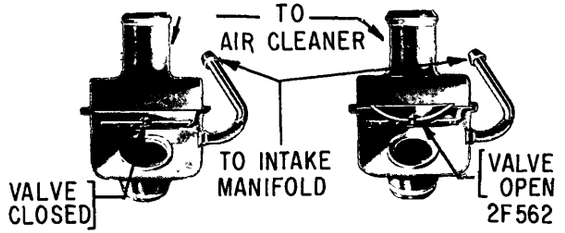
Ⓣ - If car is operated in cold temperature, "stop & go" service or in dusty areas, clean system more frequently.
② - Vent valve cannot be disassembled. Replace unit.
③ - Every 6,000 miles or 6 months.
⑩ - Service at time of engine oil change.
⑤ - Every 12,000 miles or 12 months.
⑥ - At each tune-up, overhaul, or as required.
⑦ - Test every 6,000 miles or 60 days. Replace when necessary.

OLDSMOBILE

Description



Vacuum diaphragm type ventilator check valve located on left hand rocker arm cover controls flow of crankcase vapors between crankcase breather cap and intake manifold and air cleaner.

Operation

At idle, and low engine RPM, crankcase vapors are drawn into intake manifold from crankcase side of diaphragm valve (valve is closed) through a small tube connected to carburetor throttle body. At higher engine RPM, air flow through carburetor air cleaner snorkel opens diaphragm valve allowing major portion of crankcase vapors to be drawn through large tube into air cleaner. Orifices in breather cap assembly control this flow.

Servicing

Every 12,000 miles, remove hoses and blow out with air. Remove diaphragm check valve assembly and clean in kerosene. *NOTE - Diaphragm check valve cannot be disassembled.* Install valve and hoses.

OLDSMOBILE POSITIVE CRANKCASE VENT VALVE

STUDEBAKER (WITH JET-THRUST ENGINE)

Description

The crankcase is ventilated by air entering through the oil filler caps on rocker arm covers and flowing out through the adapter tube in oil pan into carburetor air cleaner and carburetor. Oil filler caps have metered holes to allow a controlled amount of fresh air to circulate through the crankcase. At higher engine speeds the main flow of air is carried from engine crankcase through a hose to carburetor air cleaner, while at idle and slower engine speeds the air flow is through the small hose on the "Y" connection of main adapter tube to check valve at base of carburetor. A check valve permits air to enter the intake manifold when manifold is not pressurized. When the manifold becomes pressurized, the check valve seats and prevents blow-back of pressure to engine crankcase.

Servicing

Every 10,000 miles (more frequently if necessary), remove and clean check valve and hose. DO NOT attempt to disassemble check valve. Wash check valve in a suitable carburetor cleaner and blow dry with air. If valve cannot be properly cleaned, replace valve.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 V8 PASS. CAR & TRUCK CARBURETOR MAIN METERING JET SIZE "TAILORING" TO CORRECT FOR RICHNESS OR LEANNESS:* A one size rich or leaner jet may be installed in place of the standard jet for better performance, depending on the particular condition *NOTE - Make sure any factors contributing to a rich or lean condition have been eliminated before changing jets.*

►*1958-63 V8 ENGINE STUMBLE & HESITATION (ON ACCELERATION) CORRECTION:* Install cavity filler, Part No C3OZ-9F565-A,in accelerator pump cavity (if not so equipped). This filler decreases pump cavity and improves pump response and rate of delivery *NOTE - The filler has b en used intermittently in production on late 1962 and early 1963 models.*

►*1963 ENGINE STALLING CORRECTION:* This condition may be caused by engine coolant tag being drawn into air cleaner opening To correct, shorten tag wire and relocate tag

►*HESITATION ON ACCELERATION CORRECTION (EARLY CARS):* This condition may be caused by improperly seated (staked) accelerator pump check balls. To correct, imbed check ball into seat with a suitable drift and hammer. Strike ball lightly but firmly enough to assure adequate forming of seat to provide a mating surface for ball Make sure ball is free in seat before reassembling carburetor.

① - Automatic transmission in "D" (Drive).
② - Turns open from a lightly seated position.
③ - Maximum variation is 2 points from initial setting.
④ - 500-550 RPM (S.M. Trans.) 475-525 RPM (Auto. Trans.)

DESCRIPTION

Downdraft types with automatic choke (manual choke used on truck models). Secondary throttle valves are operated by a vacuum diaphragm and connected through linkage to primary throttle to insure positive closing.

ADJUSTMENT (ON ENGINE)

Idle Mixture & Idle Speed

Bring engine to normal operating temperature. *NOTE - On Air Conditioned cars, operate engine for 20 minutes before setting engine idle speed.* Adjust engine idle speed to correct engine RPM (Automatic Transmission in "D") as indicated in specifications. *NOTE - On Ford Trucks with automatic transmission, adjust engine speed slightly above idle speed specification with transmission in "N", then check idle speed with transmission in "D". Repeat procedure as necessary to obtain correct idle speed.* With idle speed properly adjusted, turn idle mixture screws inward until engine runs rough from a lean mixture, then turn idle screws outward until engine begins to roll from rich mixture. Finally turn screws in until engine runs smoothly. *NOTE - Each of the idle mixture screws should be turned approximately th sam distanc . Always favor a slightly rich mixtur .* Readjust idle speed as necessary.

Fast Idle

Automatic Choke Carbs. - Rotate fast idle cam and place fast idle speed screw on next to highest step of cam (against shoulder of highest step), then adjust fast idle screw to obtain specified engine RPM (see specifications).

Manual Choke Carbs. - With engine at normal operating temperature, pull choke cam and lever to a full choke position, then rotate fast idle adjusting screw to obtain specified engine RPM (see specifications).

Accelerating Pump Stroke

NOTE - Pump over-travel lever has four holes (No. 1 hole nearest throttle shaft and No. 4 hole furthest from throttle shaft). Accelerating pump plunger lever has two holes.

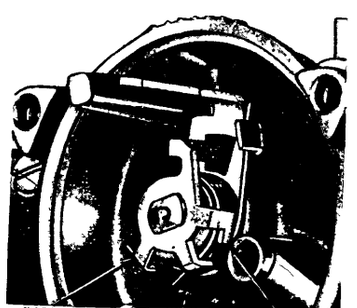
221" & 260" Engines - Accelerating pump operating rod must be installed in No. 4 hole (furthest from throttle shaft) for all operating conditions. Install opposite end of pump rod in inner hole (nearest pump plunger) of pump plunger lever.

(Continued)

FORD 2 & 4-BARREL CARBURETORS (Cont.)

292", 352" & 390" Engines - Install pump operating rod in proper hole of over-travel lever as indicated below for various operating conditions. No. 1 hole (above 80°F); No. 2 hole (40°F to 80°F); No. 3 hole (below 40°F); No. 4 hole (below - 15°F). *NOTE - For 5000 ft. altitude operation, place rod in No. 1 hole to suit operating condition.* Install opposite end of pump rod in inner hole (nearest pump plunger) of pump plunger lever.

Fuel Level



NOTE - Float setting (on bench) should be used as a guide only. Check and adjust fuel level as follows: With engine at normal operating temperature, air horn and gasket removed from carburetor, temporarily install air horn gasket in position on carburetor main body and start engine. Allow engine to idle a few minutes, then remove air horn gasket. With engine idling, measure vertical distance from top machined surface of main body to level of fuel in fuel bowl. *NOTE - Make this measurement at least ¼" from any vertical surface.* If fuel level is not within specifications (see table), stop engine and bend float tab contacting fuel inlet valve as necessary. Restart engine and check fuel level after each float tab adjustment. *CAUTION - Allow fuel to stabilize by running engine at idle speed for approximately 3 minutes after each adjustment until specified level is obtained.*

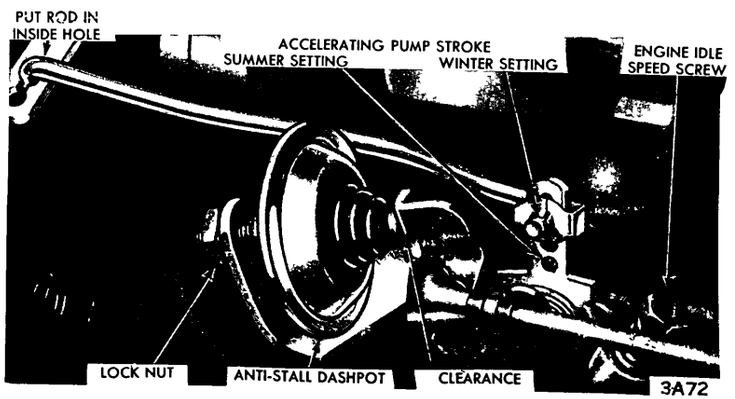
Automatic Choke

Loosen thermostatic coil housing clamp screws and align index mark on coil housing with proper mark on choke housing (see specifications).

Torsion Spring

NOTE - After a cold start at low temperatures, if engine stumbles or hesitates (caused by lean mixture) or if engine runs rough (caused by rich mixture), change torsion spring tension as follows: Remove thermostatic spring housing and place short tang of spring in left prong to increase tension and correct leanness. Place tang of spring in right prong to decrease tension and correct for richness. *NOTE - Normal position of spring tang is in center prong .*

CHOKE TORSION SPRING ADJUSTMENT



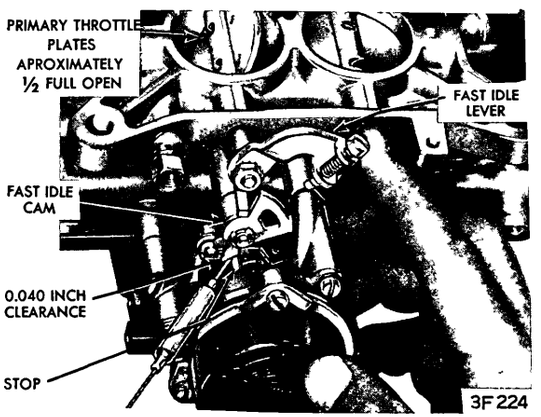
Choke Valve Pulldown

Automatic Choke Carbs. - Turn choke coil housing 90° counterclockwise to position choke linkage in fully closed choke position, then press choke valve toward open position until resistance is felt. *CAUTION - Do not use force or tang on lever in choke housing will be bent.* Clearance between edge of choke valve and vertical wall of air horn should be as indicated in specifications table. To adjust clearance, loosen setscrew on choke plate operating lever clevis with a 1/16" Allen wrench and move choke plate operating lever up or down as necessary to obtain correct clearance. Recheck fast idle-to-stop clearance and adjust if necessary .

Manual Choke Carbs. - This adjustment must be made with carburetor "Off Engine" (see below).

FLOAT LEVEL ADJUSTMENT

ADJUSTMENT LOCATIONS (ALL MODELS)



Anti-Stall Dashpot

With carburetor hot or slow idle speed correctly adjusted, hold throttle valve closed. Clearance between dashpot plunger and throttle lever with dashpot plunger fully depressed should be .060-.090". Adjust by loosening locknut and turning dashpot in bracket.

ADJUSTMENT (OFF ENGINE)

Float Level

CAUTION - Fuel inlet needle valve is "Viton" tipped. Do not place excessive force on needle as damage will result. With air horn removed, raise float so needle valve is seated, then check distance between gasket surface of main body and top of float at a point 1/8" from free end of float and 5/16" in from side of float adjacent to inside wall of fuel bowl should be as indicated in specifications. To adjust, bend tab on float arm. *NOTE - Secondary float setting on 4-Barrel carburetors is same as primary float.*

FAST IDLE CAM & BELLCRANK LEVER ADJUSTMENT

Fast Idle Cam & Lever

Open throttle valves (primary throttle valve on 4-Barrel carburetors) so fast idle adjusting screw will not interfere with fast idle cam when bellcrank is rotated, then hold choke valve in closed position by turning choke housing shaft to left (counterclockwise). Clearance between cast stop on back of choke housing and edge of fast idle cam should be .050" (221" & 260" Engs.); .040" (352" & 390" Engs.). To adjust, loosen bellcrank lever screw and turn bellcrank lever as necessary to obtain correct clearance. *NOTE - To maintain proper vertical alignment between bellcrank lever and fast idle cam, bellcrank lever must be positioned against "E" clip retainer on choke housing shaft.*

(Continued)

FORD 2 & 4-BARREL CARBURETORS (C nt.)

Fast Idl

Automatic Ch ke Carbs. - With fast idle screw resting on lower step of fast idle cam and against shoulder of highest step, turn fast idle adjusting screw until clearance between throttle valve and carburetor bore on side onposite idle ports is within specifications (see table).

Manual Ch k Carbs - Close throttle valve and pull choke cam and lever to full choke nosition, then turn fast idle adjusting screw in until gauge or drill of proper thickness (see specifications) can be inserted between throttle valve and carburetor bore on side opposite idle ports.

Choke Valve Pulldown

Manual Choke Carbs. - Close throttle valves, then pull choke cam and lever to full choke position. Turn choke pulldown rod adjusting nut down until a gauge or drill of proper size (see specifications) can be inserted between long side of choke valve and wall of air horn (against tension of pulldown rod spring).

OVERHAUL

S 1958 Final Data, Page 269, or lat r Manual Edi - tion and note the following

Automatic Choke Housing

Removal & Disassembly - Remove choke shield, fast idle cam retainer, thermostatic spring housing, clamp and gasket. Remove choke housing and gasket, then remove choke housing lever retaining nut, spacer and lever. Loosen screw on bellcrank clamp and slide bellcrank off choke housing shaft. Remove fast idle cam pickup rod from fast idle cam and bellcrank lever. Remove retainer from choke housing shaft and slide assembly out of choke housing. Remove spacer, lever, and torsion spring from shaft.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 144", 170" & 223" ENGINE SLOW RETURN TO IDLE SPEED CORRECTION:* Reduce the number of turns inward on dashpot adjusting screw to 2 turns (normal setting is 3¼-3¾ turns in from initial contact)

►*1963 144" & 170" ENGINE FAILURE TO IDLE DOWN TO NORMAL IDLE SPEED CORRECTION:* This condition may be caused by a restriction in idle passage To correct, remove air horn and clean idle passage

►*1963 144", 170" & 223" ENGINE ROUGH IDLE, POOR PERFORMANCE & FUEL ECONOMY CORRECTION: See "Tune-Up" on Car Model pages.*

►*1963 FALCON 144" ENGINE CARBURETOR JET PRODUCTION CHANGE (FOR IMPROVED FUEL ECONOMY):* One size leaner jets (stamped 52F) used on later carburetors with yellow or green paint on code tag If a lean condition is encountered, install a one size richer jet (stamped 53F)

►*1963 6 CYL. ENGINE (WITH MANUAL CHOKE) HARD STARTING CORRECTION:* This condition may be caused by excessive length of choke control wire interfering with pull-down rod or choke shaft lever To correct, shorten length of choke wire, making sure that choke wire housing extends ¼-½" beyond the clamp

►*HESITATION ON ACCELERATION CORRECTION (EARLY CARS):* This condition may be caused by improperly seated (staked) accelerator pump check balls To correct, imbed check ball into seat with a suitable drift and hammer Strike ball lightly but firmly to assure forming of a seat to provide a mating surface for check ball Make certain ball is free on seat before reassembling carburetor

►*1963 ECONOLINE TRUCK (144" & 170" ENGINE) SURGING OR HESITATION CORRECTION:* These conditions which occur at part throttle steady speed or wide open throttle, caused by an excessively lean fuel mixture, may be corrected by installing a main metering jet one number size larger and by installing four additional calibrating shims, Part No 375910-S, on the power valve rod (see illustration) *CAUTION - Total number of shims on power valve rod must not exceed eight (8)*

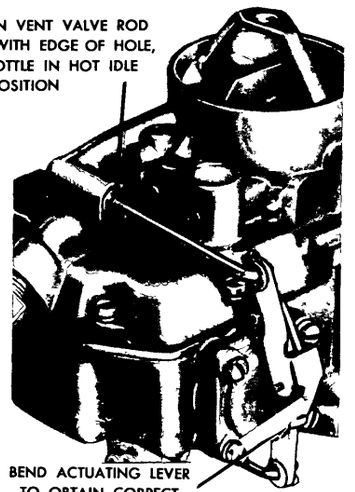
ℂ - Automatic transmission in "D" (Drive).

℃ - Turns open from a lightly seated position.

DESCRIPTION



Single barrel down-draft type with automatic or manual choke assembly. Carburetors used on automatic transmission cars have an integral diaphragm type dashpot assembly built into carburetor fuel bowl.

ADJUSTMENT (ON ENGINE)

►*ADJUSTMENT NOTE - All of the following adjustments except "Idle Speed & Mixture" can be performed with carburetor "Off Engine".*

Idle Mixture & Idl Speed

With engine at normal operating temperature, adjust idle speed to correct engine RPM (see specifications), then turn idle mixture screw in until engine runs rough from lean mixture. Turn idle mixture screw outward until engine begins to roll from rich mixture. Finally turn screw inward until engine runs smoothly. *NOTE - Favor a slightly rich mixture.* Readjust engine idle speed if necessary.

VENT VALVE ADJUSTMENT

(Continued)

FORD SINGLE BARREL CARBURETORS (C nt.)

Fast Idle Speed

Manual Ch k Carbs. - Fast idle speed will be correct when Hot Idle Speed is properly adjusted.
Aut matic Ch k Carburetors - *NOTE - This adjustm nt must b mad with carburetor "Off Engine"*

Vent Valve

With carburetor throttle linkage in hot idle position, groove in vent valve rod should be even with open end of vent valve rod retainer. To adjust, bend arm on vent valve rod actuating lever (see illustration).

Automatic Choke

Loosen thermostatic coil housing retaining screws and rotate coil housing for correct setting (see specifications)

Anti-Stall Dashpot

Place throttle valve in normal (hot) idle position, then turn dashpot adjusting screw (see illustration) until it just contacts plunger, then turn adjusting screw in an additional 3¼-3¾ turns (2 turns to correct slow return - see Slow Return to Idle Speed Correction).

Accelerating Pump Lever

Insert roll pin in lower hole ("HI") position in pump lever (see illustration), then position a drill or gauge (see specifications for proper size) between roll pin and cover. Bend pump actuating rod as necessary for correct clearance. For operation in ambient temperatures of less than 50°F, place roll pin "HI" hole of lever. For temperature of 50°F and above, or for altitudes above 5000 ft., place roll pin in "LO" hole of lever. *NOTE - Roll pin must be in "HI" hole of lever when pump lever is checked for clearance.*

Choke Valve Pulldown

Automatic Choke Carbs. - *NOTE - This adjustment must be made with carburetor "Off Engine" after "Fast Idle Speed" is adjusted (see below).*
Manual Choke Carbs. - With choke valve linkage in full choke position, clearance between choke valve and wall of air horn should be as indicated in specifications. To adjust, turn choke pulldown rod nut to just contact swivel on cam lever while holding choke valve closed against a drill or gauge of proper thickness (see specifications).

Float Level

Invert upper body assembly and measure distance from gasket surface to crown of float (highest point). Distance should be as indicated in specifications (see illustration). To adjust, bend float arm tab. *CAUTION - Do not apply pressure on fuel inlet needle valve. Viton tip of valve may be damaged and caus a false setting.*

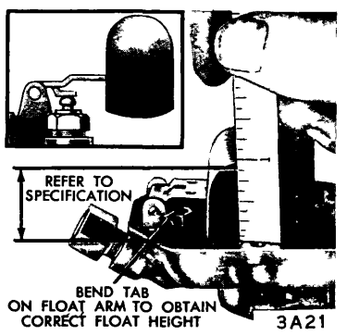
ADJUSTMENT (OFF ENGINE)

Fast Idle (Initial Setting)

Insert a gauge pin or drill of correct size (see specifications) between throttle valve and side of throttle bore (see illustration), then turn fast idle screw in until it just contacts fast idle cam.

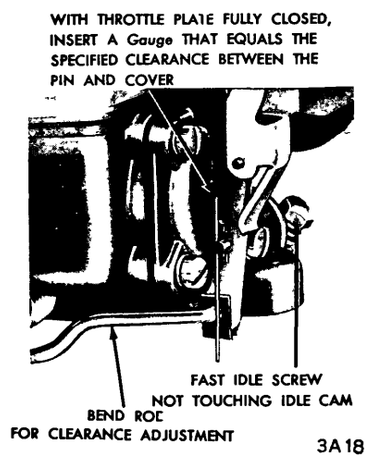
Choke Linkage (Pulldown)

Automatic Choke - *NOTE - Make this adjustm nt after idle speed is adjusted (see above).* Insert a gauge pin or drill of correct size (see specifications) between choke valve and wall of air horn, then close valve on drill or gauge and hold it securely. Close throttle until fast idle screw touches fast idle cam and adjust plastic nut to just contact swivel on choke lever assembly.



OVERHAUL

Disassembly



1) On automatic choke carburetors, disconnect choke control rod at choke shaft and pulldown rod at throttle lever. Remove thermostatic coil housing and gasket, then remove choke control lever and spring. Slide choke shaft out of coil housing. Remove choke control rod from lever and remove choke pulldown rod adjusting nut from rod. Slide rod out of swivel.

2) On manual choke carburetors, depress tangs on fast idle cam lever retainer and remove retainer from stud, then remove fast idle cam lever and rod assembly. Move lever and rod assembly clockwise and remove it from choke shaft lever. Remove rod adjusting nut and

AUTOMATIC CHOKE FAST IDLE ADJUSTMENT

AUTOMATIC CHOKE LINKAGE ADJUSTMENT

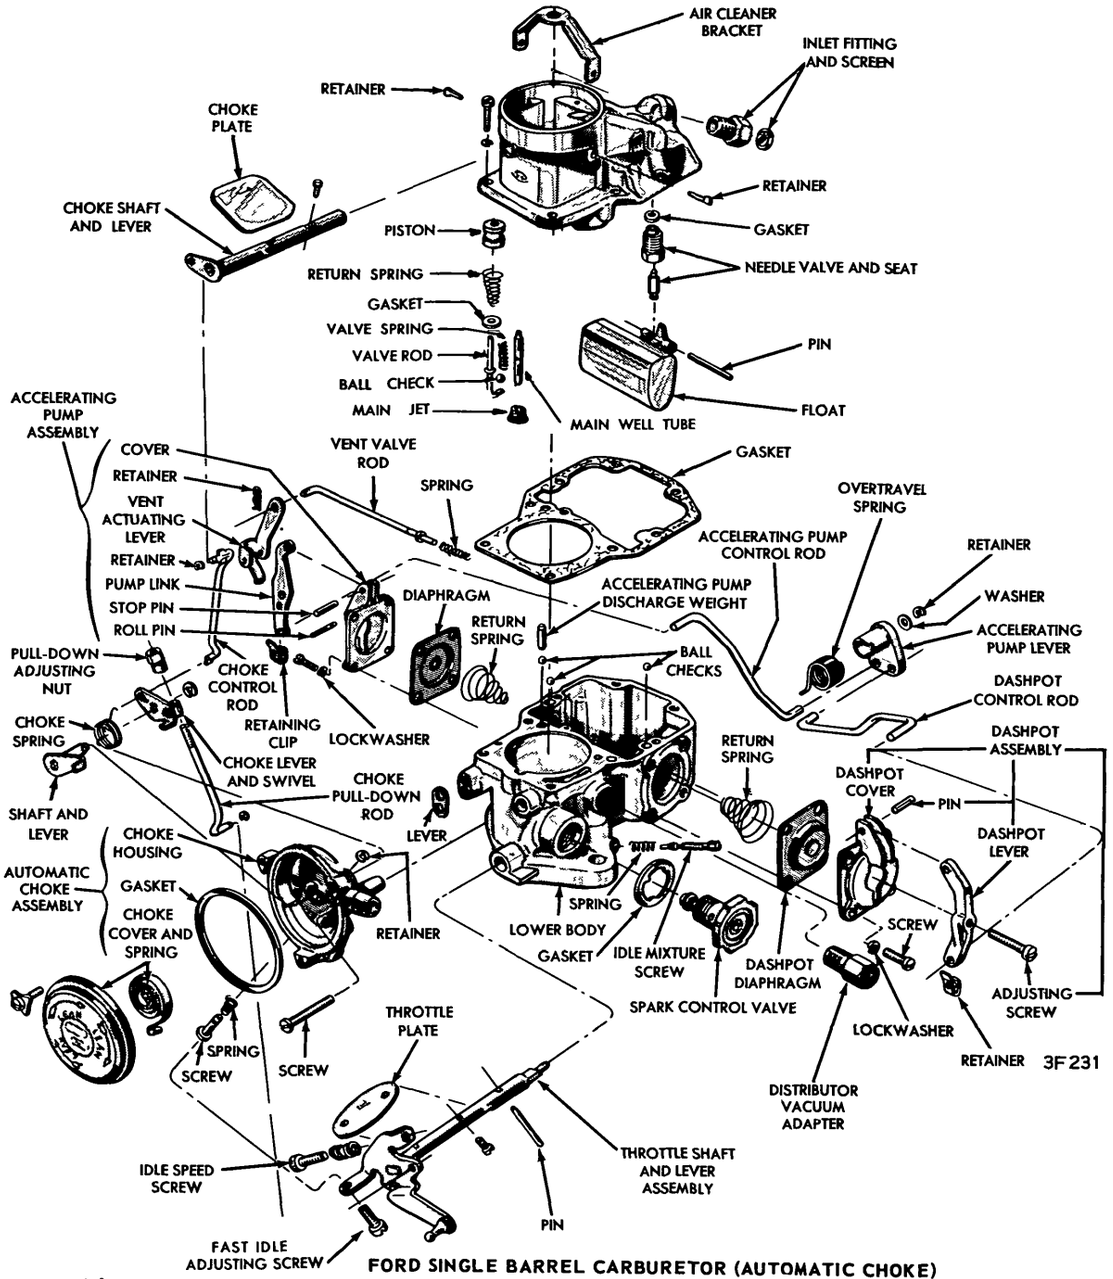
FORD SINGLE BARREL CARBURETORS (C nt.)

spring from rod and slide rod out of swivel. Remove fast idle cam stud and choke cable bracket assembly.

3) Proceed as follows for all carburetors: Remove fuel vent rod bushing, rod, and return spring. Remove screws and separate upper body from lower body, then invert lower body assembly and allow accelerating pump discharge weight and ball check, inlet ball check, and dashpot ball check to fall into hand.

4) Remove float retaining pin and float assembly, needle valve and seat. Remove main jet, then remove inlet fitting and strainer. Remove retaining roll pins securing air cleaner bracket to air horn. *NOTE - Use pliers and rotate roll pins in a direction that will coil the pins to a smaller diameter.* Pull air cleaner bracket out of channels.

5) If necessary to remove choke valve and shaft, lightly scribe choke valve along shaft so that choke valve can be installed in same position during installation. Remove valve attaching screws and remove valve from top of air horn by sliding plate out of shaft. Remove shaft from air horn.



6) Remove accelerating pump lever and overtravel spring from throttle shaft. Remove accelerating pump cover screws and remove cover assembly. If necessary, separate pump diaphragm and spring from cover or body. Depress tab on pump lever and rod retaining clip and slide rod out of lever. Remove clip from lever. If necessary, remove fuel vent rod actuating lever-to-cover retaining pin and the accelerating pump lever-to-cover retaining pin. Remove lever and rod from cover.

7) If carburetor is equipped with a dashpot, remove dashpot cover assembly, and if necessary, remove diaphragm and spring from cover or body. Disconnect rod from dashpot lever. If necessary, remove lever-to-cover pin and remove lever from cover. Remove vacuum outlet adapter. If carburetor is equipped with a spark valve, remove valve and gasket.

8) Remove idle mixture adjusting screw. If necessary to remove throttle valve and shaft, scribe a light line along valve shaft so throttle valve can be installed in same position, then remove valve retaining screws and slide valve out of shaft. *NOTE - Retaining screws are staked to shaft. If necessary, file off flared end of screws.* Remove overtravel spring tension pin from throttle shaft and slide shaft out of body.

Cleaning & Inspection

Wash all parts except accelerating pump diaphragm, power valve diaphragm, and dashpot assembly in a suitable carburetor cleaner and rinse in kerosene, then blow dry with air. Blow out all passages. Check all parts for burrs, wear, or damage and replace as necessary. Check power valve for free movement of piston and rod assembly. *CAUTION - P w r valv is not s rviceabl . Do n t remove shims for cleaning or v r-haul op rati ns.* Inspect Viton tipped needle valve for grooving or damage.

FORD SINGLE BARREL CARBURETOR (AUTOMATIC CHOKE)

Reassembly

1) If choke valve and shaft were removed, install shaft assembly and insert choke valve into its original position with valve indention facing upward and toward pump side of carburetor. Install valve retaining screws but do not tighten. Check operation of choke valve for freeness by moving plate from closed to open position. If valve and shaft is free, tighten valve retaining screws while holding valve in fully closed position. Support shaft and valve on a wood block to prevent bending shaft, then stake valve retaining screws.

(Continued)

FORD SINGLE BARREL CARBURETORS (Cont.)

2) Install fuel inlet screen and adapter, then install main jet in main fuel well. Install needle valve seat and gasket, and insert needle valve. Position float assembly in carburetor body and install float hinge pin. Adjust float setting (see "Adjustment"). Install air cleaner bracket in air horn channels and insert retaining pins.

3) If throttle valve and shaft were removed, install shaft in body with lever on shaft located opposite fuel bowl. Insert throttle valve through slot in shaft with valve indentation facing bottom of body and pointing toward accelerator pump. Install valve retaining screws but do not tighten. Align scribed mark on valve with shaft, then snug screws down, but not too tight. Rotate throttle shaft while lightly tapping throttle valve within bore. Check for free rotation of shaft. Hold carburetor body up to light (little or no light should show between throttle valve and body). With valve properly located, hold valve closed and tighten retaining screws. Stake ends of screws in same manner as for choke valve (see above).

4) Install distributor vacuum outlet fitting. If rod and lever were removed from accelerating pump cover, position top hole of lever between top bracket holes in cover, then install retaining roll pin. Position vent rod lever over pump cover bracket. Line up hole in lever with holes in bracket and install retaining roll pin. Install roll pin in "HI" (lower) lever stop hole.

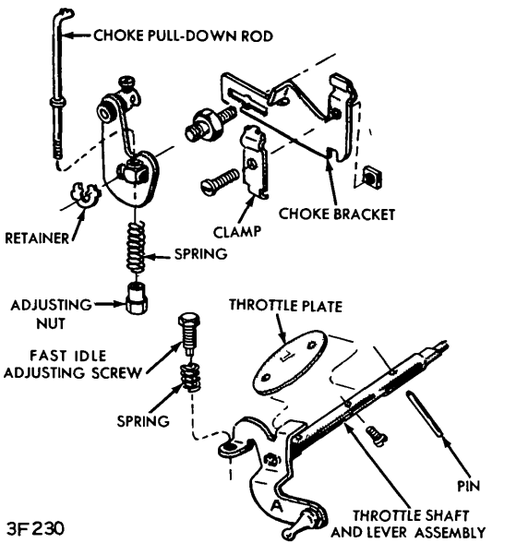
5) Position small diameter end of diaphragm spring into boss in accelerating pump chamber, then position diaphragm assembly in pump cover and line up the holes. Position cover and diaphragm assembly over return spring and onto body. Install cover screws finger tight. Push diaphragm assembly inward and fully tighten retaining screws. Position pump actuating rod clip over hole in pump lever, with tab side of clip toward carburetor barrel. Depress tab and insert short end of rod through lever and clip. Adjust accelerating pump (see "Adjustment" above).

6) If carburetor is equipped with a dashpot, position dashpot lever in bracket and install retaining roll pin, then install adjusting screw. Position small diameter of diaphragm spring into boss in dashpot chamber and line up holes. Position cover and diaphragm assembly over return spring and onto body. Install cover retaining screws finger tight, then push diaphragm assembly inward and tighten retaining screws. Position dashpot actuating rod retaining clip over hole in dashpot lever, then depress tab and insert short end of rod through lever and clip. Adjust dashpot (see "Adjustment" above).

7) Place overtravel lever on accelerating pump lever and hook tang of spring on lever. Position overtravel spring and lever onto throttle shaft and insert pump actuating rod and dashpot actuating rod into the two holes in lever. Install washer and retainer ring. Install overtravel tension retaining pin in throttle shaft, then pull arm of overtravel spring over retaining pin to apply spring tension to overtravel lever.

8) If carburetor is equipped with a spark valve, install gasket and spark valve into carburetor body and tighten securely. Install idle mixture adjusting screw and turn it in until it is lightly seated, then back screw off correct number of turns (see "Specifications").

9) Place ball check and accelerator pump weight into pump outlet passage, then install a ball check into pump inlet passage. Install a ball check into dashpot inlet passage (if so equipped). Install gasket on lower body (word "Top" on gasket facing upward), then install upper body and retaining screws.



10) Insert fuel vent valve return spring into vent passage in upper body, then install vent valve rod retaining ring onto rod. Insert piston end of vent rod valve into passage and tap retaining ring into vent hole. Position vent valve retaining clip over hole in actuating lever, with tab side of clip toward air horn, then connect rod to lever. Adjust vent valve (see "Adjustment" above), after carburetor is completely assembled.

11) On manual choke carburetors, position choke cable bracket onto lower body and install stud. Insert threaded end of choke shaft to cam lever rod through cam lever swivel. Install spring and adjusting nut onto rod. Position rod end into keyhole in choke shaft lever, then insert rod and turn it counterclockwise. Position cam lever assembly over stud and install retainer.

12) On automatic choke carburetors, insert thermostatic choke shaft assembly into choke housing, then position shaft assembly with arm of lever toward bimetal spring side of housing. While facing cam side of choke housing, position choke shaft spring over bushing hub with hook of spring on right side of cam finger. Position choke control lever onto shaft with short tang of lever on left side of cam finger and spring tang on left side of short lever tang. Install lever retaining screw.

13) Insert threaded end of choke pulldown rod through swivel (from bottom) and install retainer. Position short end of choke rod into keyhole in choke housing choke lever. Insert choke assembly retaining screws into choke housing, then position gasket and choke housing onto lower body. Start retaining screws into body, then insert end of choke pulldown rod into throttle lever and install retainer. Check position of gasket and tighten retaining screws.

14) Position thermostatic spring cover and gasket on housing, making sure loop end of thermostatic coil spring is on choke lever. *NOTE - Spring must wind clockwise toward center when viewed from chok housing side of carburetor.* Align index mark with proper mark on choke housing (see "Adjustment" above). Secure cover to housing with retaining screws.

ℂ - Holley Part Number and American Motors Part Number are stamped on fuel bowl. *NOTE - The complete Holley Part Number (Example: R-2555-1A) may not appear on carburetor. The "R" indicates carburetor and the "A" indicates assembly.* Suffix figure "1" etc., indicates modifications. If an asterisk (*) is used, further modification is indicated.

►CHANGES, CAUTIONS, CORRECTIONS

► *1963 AMERICAN (OHV ENGINE) CONSTANT THROTTLE SURGE & ACCELERATION STUMBLE CORRECTION: Corrections are different for early and later cars as follows:*

Cars Before Sequence No. E-40006 - Install carburetor, Holley Part No. R-2387-1A which is the later production carburetor used on Classic Six models.

Cars After Sequence No. E-40005 - Install carburetor kit, American Motors No. 3204569 which contains one No. 60 Main Jet, a .028" Drill, and a Fuel Bowl Gasket. Remove carburetor bowl cover (not necessary to remove carburetor from engine), then remove original No. 58 Main Jet and install jet from kit. Use the No. 70 (.028") drill and enlarge idle feed restriction, see illustration. *CAUTION - Use care when drilling (rotate drill by hand using drill shank as a handle) and blow out any chips.* Adjust dry float setting to 27/64".

ℂ - 500 RPM on Air Cond. Cars. ② - See "Adjustment" below. ③ - Turns open from a lightly seated position.

DESCRIPTION

Single barrel downdraft type with automatic choke. This carburetor consists of two main sub-assemblies (air horn and main body) with throttle body assembly integral with main body. The float is made of plastic material and the fuel inlet needle valve is tipped with "Viton". Accelerating pump is plunger type.

ADJUSTMENT

Idle Speed & Mixture

With engine at normal operating temperature, adjust engine idle speed to specification (see above), then adjust idle mixture screw to provide highest steady manifold vacuum and smoothest running at maximum idle speed. Readjust engine idle speed if necessary, after idle mixture adjustment.

Fast Idle Speed

On Engine - With engine at normal operating temperature and fast idle screw on highest step of fast idle cam, adjust fast idle screw to obtain correct engine RPM (see specifications).

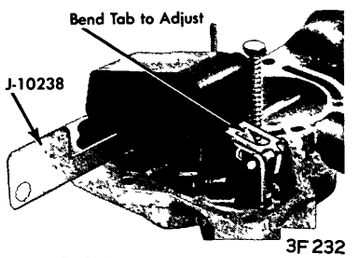
Off Engine - With fast idle screw on high step of fast idle cam, turn screw to obtain correct clearance (see specifications) between throttle valve and bore of carburetor on side opposite idle ports.

Float Level

Invert air horn and measure distance between top of float and machined surface of air horn at a point ¼" from free end of float. To adjust, bend tab of float that contacts fuel inlet needle valve. *CAUTION - Do not place any pressure, other than w ight f float, on inlet needle valve. Tip of ne dle valv is "Vit n" material and damage or a fals setting would result.*

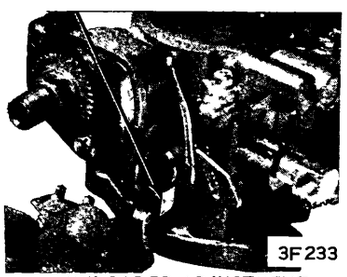
Unloader

Clearance between choke valve and wall of air horn should be as indicated in specifications with throttle valve in wide open position and unloader tab on throttle lever contacting fast idle cam. To adjust, bend tab on throttle lever.



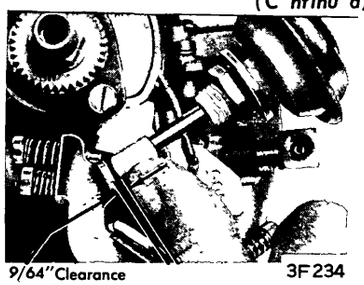
Dashpot

With engine "hot" idle properly adjusted, depress dashpot plunger stem until it bottoms. Clearance between plunger stem and throttle lever should be as indicated in specifications. To adjust, loosen locknut and turn dashpot as necessary to obtain proper clearance.



Automatic Choke

Rotate thermostatic coil cover so mark on cover is aligned with proper mark on housing (see specifi- specifications). *CAUTION - Do not adjust ch k more than two graduations from sp cified s tting*



(C ntinu d)

FLOAT LEVEL ADJUSTMENT

UNLOADER ADJUSTMENT

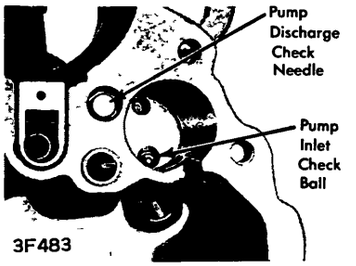
DASHPOT ADJUSTMENT

HOLLEY SINGLE BARREL MODEL 1909 CARBURETORS (Continued)

OVERHAUL

Disass mbly

1) Remove carburetor air cleaner bail, then remove fuel inlet fitting, and the dashpot bracket screw (if so equipped). Remove fast idle cam retainer screw and slide choke operating rod from choke shaft.



2) Remove choke thermostatic coil assembly, clamp and gaskets from air horn, then remove air horn screws and separate air horn from main body. Remove float assembly and air horn gasket, then remove fuel inlet needle (needle is held in position with a staked washer).

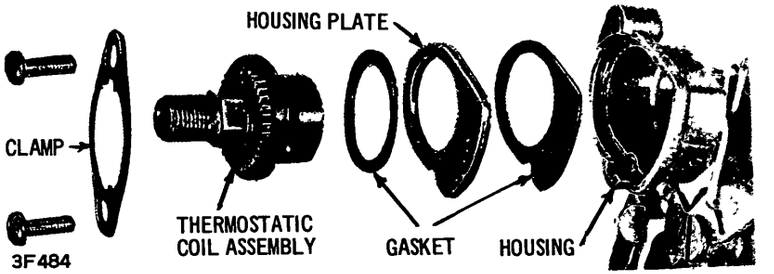
3) Remove power piston assembly with a suitable tool (J-10235). Invert main body and allow accelerator pump discharge needle to drop out. Remove nut and lock washer from end of throttle shaft, then remove accelerator pump lever and link (note proper position of link and lever for installation in the same position). Remove accelerator pump rod and stem assembly from main body and separate the pump assembly.

4) Invert main body and allow pump inlet check ball to fall out. Remove baffle plate from inside fuel bowl and remove main jet. Remove power valve assembly with a suitable tool (J-10185). Remove idle mixture screw and spring. *NOTE - Removal of choke and throttle plates and shafts is not recommended. If necessary to remove, staked ends must be filed off the screws.*

Cleaning & Inspection

Clean all metal parts in a suitable carburetor cleaner and rinse as directed, then blow dry with air. Inspect

ACCELERATOR PUMP CHECK VALVES



all parts for wear, damage, nicks and burrs. Replace parts as required. *CAUTION - Do not clean passages with a drill, wire, or similar tool as the passage may be distorted. Do not use a buffing wheel, wire brush, file or other sharp instrument to remove carbon deposits.*

Reassembly

1) Install power valve assembly with same tool used for removal, then install main jet. Slide fuel baffle into fuel bowl and install accelerator pump inlet ball check into pump cavity (see illustration).

2) Assemble accelerator pump rod and stem assembly, then slide pump assembly into pump cavity in main body (make sure pump cup is not damaged or wrinkled during installation). Depress accelerator rod fully into main body, then insert pump link into outer hole of pump operating lever and install lever on throttle shaft Install lockwasher and tighten securely.

3) Install accelerator pump discharge needle into passage in main body (see illustration). Install idle mixture screw and spring, and turn needle in until it seats lightly, then back off one turn.

AUTOMATIC CHOKE ASSEMBLY

4) Install power valve piston assembly into air horn with a suitable tool (J-10236) and tap tool lightly with a hammer. Stake power valve assembly into air horn using a suitable tool (J-10237). Install fuel inlet needle valve and retainer washer and stake the retainer in place with a suitable tool (J-10240).

5) Position float assembly on air horn and install float hinge pin, then adjust float level (see above). Remove float and hinge assembly and install body gasket on air horn, then reinstall float assembly. Install air horn on main body and tighten attaching screws.

6) Insert fast idle cam rod into choke shaft lever and into fast idle cam and tighten cam shoulder screw. Install choke thermostat cover, adapter plate and gaskets. Insert clamp and tighten screws. Adjust choke to specifications (see above). Install dashpot and bracket (if so equipped).

7) Install fuel inlet fitting and distributor vacuum spark fitting, then install carburetor air cleaner ball.

① - Holley Part Number is stamped on fuel bowl.
NOTE - The complete Holley Part Number (Example R-2533-A) may not appear on carburetor. The "R" indicates carburetor and the "A" indicates assembly. A suffix figure "1" etc., indicates modifications.

DESCRIPTION

Single barrel downdraft type consisting of a single casting (air horn, main body, and throttle body are integral). A separate fuel bowl cover is used to enclose the float assembly. Power valve (economizer) and accelerating pump assemblies are diaphragm type. Choke lever assemblies used on 170" Eng. carburetors have a "spring staged" feature which reduces choke valve closing torque when engine is cranked at temperatures below zero, resulting in better starting mixtures at both low and moderate temperatures.

ADJUSTMENT

"ON ENGINE" ADJUSTMENT NOTE: Engine must be at normal operating temperature when making adjustments. When adjusting idle speed, headlights must be ON. If car is equipped with air conditioning, turn air conditioner ON.
CARBURETOR RECONDITIONING NOTE: After reconditioning, check and adjust "Fast Idle Cam Index" (see below) before proceeding with other adjustments.

Idle Speed & Mixture

On automatic transmission cars, unsnap the ball joint connection at accelerator shaft bellcrank. Adjust idle speed to correct engine RPM (see specifications) with choke valve wide open and fast idle adjusting screw not contacting cam. Adjust idle mixture screw to obtain highest engine RPM, then turn idle mixture screw inward (leaner) until speed starts to drop. Turn screw in opposite direction (richer) just enough to recover the lost engine speed. *NOTE - This procedure assures idle mixture being set to leanest mixture possible for smooth idle.* Readjust idle speed screw if necessary, to obtain correct engine idle speed.

Fast Idle Speed

Open throttle slightly and turn fast idle cam so fast idle screw contacts second step of fast idle cam, then release throttle. Adjust fast idle screw to obtain correct engine RPM (see specifications).

Fuel Level

With engine running and car on a level floor, remove economizer diaphragm assembly and measure fuel level through opening (see illustration). Measurement should be as indicated in specifications. If measurement is not correct, readjust float level (see below).

CARBURETOR ADJUSTMENT SPECIFICATIONS

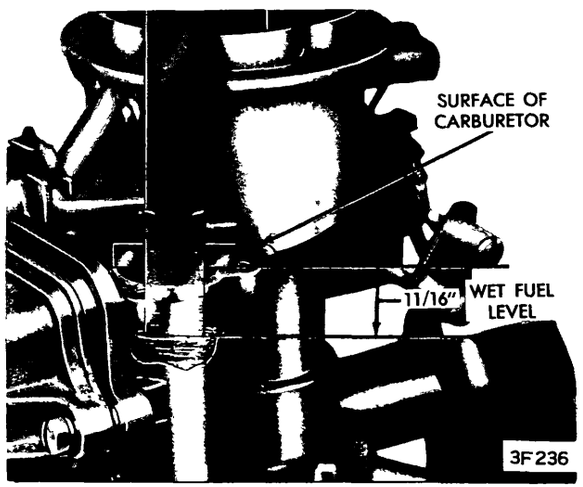
2538A		550 ①	1500	1	C-3903	11/16"	2 Rich	1/16"	.....

① - Headlights ON and Air Cond. ON. Auto. Trans. in "N" (Neutral).
② - See "Adjustment" below.
③ - Turns open from a lightly seated position.

Float Level



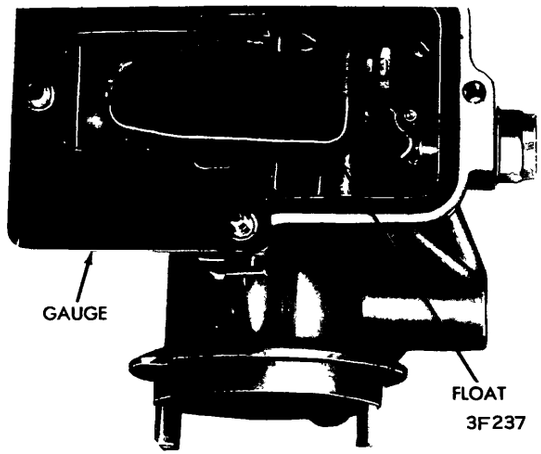
With carburetor off engine, remove fuel bowl cover and invert carburetor. Install Float Level Gauge (see specifications) as shown in illustration. Float should just contact "touch" leg of gauge. Reverse gauge and check "no touch" leg. Float should just clear gauge. To adjust, bend tab on float which touches head of fuel inlet needle valve. *CAUTION - Do not allow float tab to contact head of inlet needle valve while adjusting float level.*

Bowl Vent

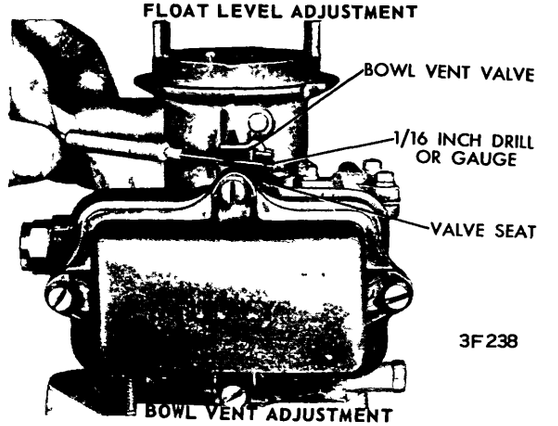
With throttle valve at curb idle, it should be possible to insert a drill of proper size (see illustration and specifications) between bowl vent and seat. To adjust, bend tab on operating arm until correct clearance is obtained. *CAUTION - Be sure vent rod does not bind in guide after adjusting.*

Unloader

Unloader will be properly adjusted when fast idle cam is properly indexed (see below).



FUEL LEVEL CHECK



Fast Idle Cam Index

Open throttle valve and hold choke valve in fully closed position, then close throttle valve. Index mark on cam should be centered on end of fast idle adjusting screw (see illustration). To adjust, bend fast idle connector link at the angle as necessary to center mark on screw.

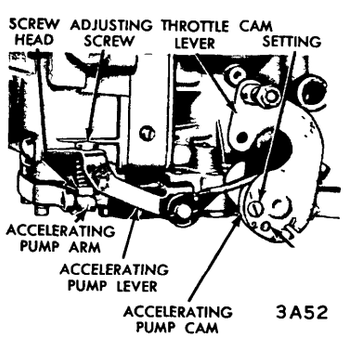
Holley 2640	590-600④	⑥	025"⑨	½	Index	3/16"

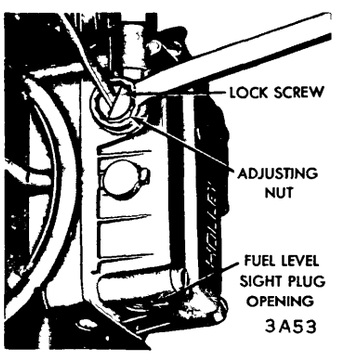
① - Ford Motor Co Part No. except where indicated.
② - Part No. on choke plate flange or on main body
③ - Automatic Transmission in "D" (Drive).
④ - Automatic Transmission in "N" (Neutral)
⑤ - 500 RPM on Air Cond cars with compressor ON.
⑥ - Fast idle correct when hot idle properly adjusted
⑦ - 475-525 RPM automatic transmission in "D" (Drive).
⑧ - Clearance between fast idle cam and fast idle screw.
⑨ - Clearance between throttle valve & throttle bore wall.
⑩ - Turns open from a lightly seated position
⑪ - Index (Front Carburetor), 90° from index (Rear Carburetor)

ADJUSTMENT



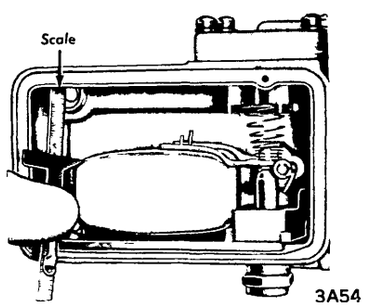
Idle Mixture

One Carb. - With engine at normal operating temperature and transmission selector lever in "N" (Neutral), turn both idle mixture screws in until engine runs rough from a lean mixture, then turn screws out until engine rolls from a rich mixture Finally turn screws in just enough for smooth idling at highest RPM and highest vacuum Reset engine idle speed to correct RPM (see "Specification Table").

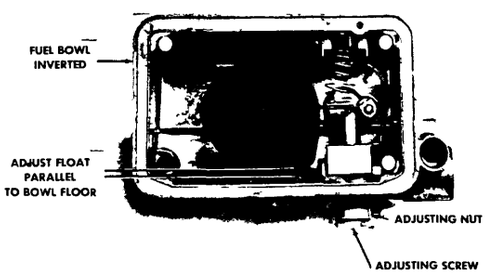


Two Carbs. - With engine at normal operating temperature and transmission selector lever in "N" (Neutral), adjust idle speed to 750 RPM (turn throttle stopscrew on each carburetor equally and alternately) Adjust each idle mixture screw (front carburetor first, rear carburetor last) by turning screw in until engine runs rough from a lean mixture, then turn screw out until engine runs rough from a rich mixture Finally turn screw in just enough for smooth operation (will provide a slightly rich mixture) *NOTE - Final setting of adjusting screws must be equal within 1/8 turn.* Readjust engine idle speed to correct RPM (see "Specification Table").

Triple Carbs. - Adjust each carburetor separately in the same manner as for "One Carb " and "Two Carb " models (above) Start with center carburetor, followed by front carburetor, then rear carburetor.



(Continued)



ADJUSTMENT POINTS (ALL CARBURETORS)

FUEL LEVEL ADJUSTMENT (ALL MODELS)

FLOAT LEVEL ADJUSTMENT (EXCEPT RAMBLER & JEEP)

FLOAT LEVEL ADJUSTMENT (RAMBLER & JEEP)

HOLLEY 2 & 4-BARREL CARBURETORS (Cont.)

Idle Speed (Initial)

Two Barrel Carbs. - Turn throttle stopscrew on each carburetor in 3 full turns from point where throttle valves are tightly closed. Make final adjustment on engine with engine at normal operating temperature.

Three Barrel Carbs. - With throttle stopscrews on front and rear carburetors backed off to allow throttle valves to seat in throttle bores, turn stopscrews in until they just contact throttle shaft arm, then turn in one full turn additional. Make final adjustment on center carburetor only, with engine at normal operating temperature.

Synchronizing Linkage

Two Barrel Carbs. - 1) Disconnect inter-connecting linkage at front and rear carburetors and at bellcrank lever. Disconnect accelerator rod at left side bellcrank lever (on manifold).

2) Adjust primary carburetor rod to a length of 4 3/16" (from center of hole to center of bent end), then install rod on bellcrank lever and upper stud of front carburetor lever. Move bellcrank lever so front carburetor throttle valves are in wide open position and hold in this position.

3) Install slotted end of secondary carburetor throttle rod on rear carburetor throttle lever, then move lever to wide open position and adjust rod so that hole in rod engages stud on bellcrank lever freely, and connect rod.

4) Move left side of bellcrank assembly (on manifold) so that throttle valves on both carburetors are wide open. *CAUTION - Accelerator lever must be engaged between pin and pad of accelerator pedal.* Have someone press accelerator pedal to floor and hold pedal in this position. Accelerator rod pin should engage bellcrank lever. Adjust as necessary.

Triple Carbs. - 1) Insert a 1/8" diameter gauge pin in gauging hole (see illustration) in bellcrank lever and bracket on left side of engine near distributor (at anti-stall dashpot if so equipped) to lock lever in closed throttle position.

2) Disconnect throttle rods at both front and rear carburetor throttle levers, then disconnect center carburetor throttle rod at bellcrank lever. Adjust length of front carburetor throttle rod so that with rod installed, throttle lever of front carburetor will be completely closed when center carburetor throttle lever is closed against idle speed adjusting screw stop (normal idle position).

3) Adjust rear carburetor in same manner, then install front and rear throttle rods to throttle levers and tighten locknuts.

4) With center carburetor throttle lever against idle stop, adjust throttle rod so trunnion will just engage in hole in bellcrank lever, then install rod retainer clip. Remove gauge pin and adjust anti-stall dashpot as required.

Idle Speed (Final)

IDLE SPEED SETTING NOTE (TWO CARBS. & TRIPLE CARBS.) - Idle speed adjustment is made on center carburetor only (Triple Carbs.). On Two Carb. models, adjust stopscrew on each carburetor equally and alternately.

With engine at normal operating temperature, fast idle screw backed off so it does not touch fast idle cam, choke valve wide open, and transmission in neutral (Synchro-mesh); in proper range (Auto. Trans. - See Specification Table), adjust engine speed to correct RPM (See Specification Table).

TRIPLE CARB. IDLE SPEED NOTE - If engine will not idle at specified RPM, readjust front and rear carburetors (see "Idle Speed, Initial" above).

Accelerating Pump

Override Adjustment - Hold throttle valves wide open and depress pump arm fully. Distance between pump lever adjusting screw head and pump arm should be .015". Turn adjusting screw as necessary.

Pump Stroke (Exc. Rambler) - *NOTE - This is a seasonal adjustment.*

Normal (Summer) Setting - Install pump cam screw in No. 1 hole in cam (for minimum stroke).

Winter Setting - Install pump cam screw in No. 2 hole in cam (for maximum setting).

Pump Stroke (Rambler) - Install pump cam screw in No. 2 hole for all normal driving. Use No. 1 hole for leaner pump discharge.

Bowl Vent

Rambler - With throttle valves fully closed, distance between top of fuel bowl and vent button should be .050-.070". To adjust, bend vent arm at accelerating pump lever. *CAUTION - Do not bend vent valve rod.*

Ford & Mercury - No adjustment required.

Float Level (On Bench)

NOTE - This is a preliminary adjustment only. After carburetor is installed on engine, fuel level must be checked and adjusted (see "Fuel Level").

Ford, Mercury, Thunderbird & Ford Truck - With fuel bowl inverted, distance between bottom of float and floor of fuel bowl should be 7/8" (primary float); ¾" (secondary float). To adjust, loosen lock screw on needle and seat assembly and rotate adjusting screw. See illustration.

Rambler & Willys - With fuel bowl inverted, top of float must be parallel with top of fuel bowl (see illustration). To adjust, loosen lock screw on needle and seat assembly and rotate adjusting screw.

Fuel Level

With car on a level floor, bring engine to normal operating temperature, then remove air cleaner and stop engine. Remove sight plug in end of fuel bowl (use container to catch fuel). Fuel level within bowl should be at lower edge of sight plug hole (±1/16"). To adjust, proceed as follows:

Fuel Level Too High - With engine stopped, loosen lockscrew on top of fuel bowl just enough to allow rotation of nut underneath. *CAUTION - Do not unlock lockscrew or attempt to adjust fuel level with engine running.* Turn adjusting screw ½ turn clockwise to lower fuel level below specifications. Tighten lockscrew, then run engine to stabilize fuel level. Check fuel level at sight plug hole. If level is not below specified level, repeat above step. With fuel level below specified level, turn adjusting nut in increments of 1/6 turn until correct fuel level is obtained. *NOTE - 1/6 turn of adjusting nut will change fuel level at sight plug opening 3/64".*

Fuel Level Too Low - Proceed as for "Fuel Level Too High" except that it will not be necessary to initially decrease fuel level below specifications.

Unloader

Rambler - With throttle valves in wide open position, distance from top of choke valve to wall of air horn should be as indicated in "Specification Table".

Fast Idle (Off Engine)

Rambler - With choke valve fully closed and fast idle adjusting screw on high step of fast idle cam, the clearance between throttle valve and bore on side opposite idle ports should be as indicated in "Specification Table". To adjust, turn fast idle adjusting screw.

Ford Pass. Cars & Mercury with 4-Bbl. Carbs. - With fast idle cam in slow idle position (bottom step of cam contacting fast idle screw), turn fast idle screw until it just touches lowest step of cam, then back off screw ¼ turn (.005-.008" clearance between cam and fast idle screw).

Fast Idle (On Engine)

Ford Pass. Cars & Mercury with 4-Bbl. Carbs. - With fast idle screw on top step of fast idle cam, engine at normal operating temperature, adjust fast idle screw (front carburetor only with Two Carbs. Center carburetor only with Triple Carbs.) to obtain correct fast idle speed (see "Specification Table").

Ford Trucks with 4-Bbl. Carbs. - With engine at normal operating temperature and "hot" idle speed adjusted, place primary throttle valves in closed position and check clearance between fast idle cam and head of fast idle screw. Clearance should be .010-.015". If clearance not correct, remove governor housing and insert a .060" gauge (wire rod) into hole in end of fast idle screw fitting to prevent it turning, then turn fast idle screw as necessary for desired clearance. *NOTE - ¼ turn of screw will change clearance approximately .008".*

Rambler - With engine at normal operating temperature, place fast idle screw on high step of fast idle cam and adjust engine speed to specifications (see "Specification Table").

Jeep - Fast Idle will be properly adjusted when engine hot idle speed is adjusted.

Automatic Choke

All Models (Exc. Ford Trucks & Jeep) - Loosen choke cover retaining screws and rotate cover to align index mark on cover with correct mark on choke housing as indicated in "Specification Table".

OVERHAUL

See 1958 Final Data, Page 274, or later Manual edition and note the following:

Balance Tube

Ford Truck (4-Bbl. Carbs.) - Install balance tube "O" rings and washers so balance tube extends equally from faces of primary and secondary metering bodies.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 BUICK SPECIAL HESITATION ON ACCELERATION CORRECTION:* If accelerator pump system is not defective, trouble may be due to incorrect pump stroke setting ("Pump Rod Position") which depends on average daytime temperature, and is a seasonal setting. *See "Accelerating Pump Adjustment" below.*

►*1963 BUICK SPECIAL HESITATION DURING WARM-UP CORRECTION (CARBURETORS BEFORE "B" STAMPED ON CODE TAG):* Install Flat Spot Package, Part No. 7026678. *CAUTION - Ignore instructions found in package.*

Automatic Transmission Cars - Replace .046" primary main metering jets with .048" jets. Adjust choke piston exactly flush with end of its cylinder. Press .125" restriction bushing in choke housing inlet **flush** with casting. Adjust choke setting to "Index". After installing all parts in package, install new "B" carburetor code tag Check to make sure accelerating pump rod is in proper hole of arm (see "Accelerating Pump Adjustment" below). Adjust idle speed and mixture.

Synchro-mesh Transmission Cars - Install .048" primary main metering jets found in package. DO NOT install the .125" restriction bushing in choke housing inlet. DO NOT change any carburetor adjustment. Install new "B" carburetor code tag. Check to make sure accelerating pump rod is in proper hole of arm (see "Accelerating Pump Adjustment" below). Adjust idle speed and mixture.

DESCRIPTION

4-Barrel downdraft types with automatic choke. Carburetor design is similar to previous carburetor models.

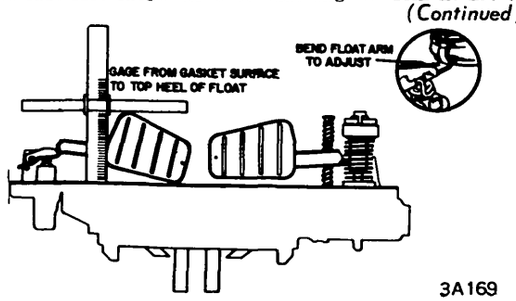
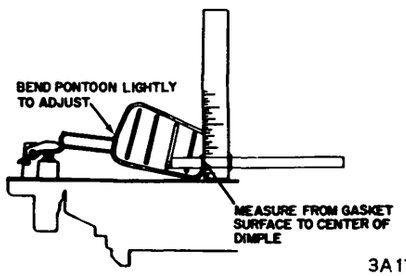
⑫ - Fast idle screw on high step of cam.



ADJUSTMENT

Idle Speed & Mixture

IDLE SETTING CAUTION (CARS WITH IDLE COMPENSATOR) - Make sure that idle compensator is closed when adjusting idle speed. If necessary idle compensator valve can be closed with a pencil. After idle speed is adjusted, press down on idle compensator valve to see if speed is affected. If speed drops, readjust idle speed, being sure that idle compensator valve is closed.



Buick, Buick Special, Chevrolet, Oldsmobile & Oldsmobile F-85 - If preliminary adjustment required to warm-up engine, set both idle mixture screws 1½ turns open from a lightly seated position. With engine at normal operating temperature (choke valve wide open and fast idle inoperative so that engine idles at hot or

FLOAT LEVEL ADJUSTMENT (CHEV. 327" ENG.)

ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

slow idle speed) set throttle stopscrew for correct idle speed as indicated in "Specification Table" Adjust both primary idle mixture screws equally so that engine idles smoothly and RPM is at maximum (see special notes below)

BUICK NOTE - Turn each adjusting screw in until engine begins to lag or run unevenly from lean mixture, then turn screw out until engine begins to roll from rich mixture, finally turn screw in just enough to provide smoothest operation Adjust both screws alike

CHEVROLET NOTE - Turn adjusting screw in to lean mixture until ngine is moderately rough (slight vacuum and RPM drop), then turn screw out ¼ turn to enrich mixture Adjust both screws alike

OLDSMOBILE NOTE - After adjusting idle mixture screws (above) for smoothest idle with highest RPM, turn each adjusting screw out ¼ turn (vacuum and RPM will drop slightly)

Cadillac & Pontiac Tempest (4-Cyl. Engine) - On Cadillac, disconnect parking brake vacuum diaphragm line at diaphragm then connect vacuum gauge to line On all cars, with engine at normal operating temperature, transmission in "N" (Neutral), choke valve fully open and carburetor on slow idle speed (throttle valves fully closed), connect a tachometer to engine On Cadillac, loosen front and rear throttle valve jam nuts at carburetor throttle lever trunnion On all cars place transmission in "D" (Drive), then adjust engine to correct idle speed as indicated in "Specification Table", using the idle air bypass screw (idle speed adjusting screw on throttle body) Turn one idle mixture screw until highest engine RPM and highest vacuum are obtained at the same time then repeat this operation with other idle mixture screw Check and reset engine idle speed Repeat idle mixture adjustment until turning the idle mixture screws will not increase engine speed and where the smoothest idle is produced *CAUTION - Idle mixture screws must be adjusted last and must always be readjusted when th idle speed screw setting is changed*

Anti-Stall Dashpot & Throttle Return Check

See "Throttle Linkage Adjustment" under CARBURETOR On car model pages

Float Level (Pri. & Sec.)

All Models (Exc. Chevrolet 327" Eng.) - *NOTE - Two adjustments ("heel" and "toe") required on each float as follows*

Float Heel - With air horn inverted and air horn gasket in place, check height of each float at "heel" (see illustration) Distance should be as indicated in specification table To adjust bend float at point shown in illustration

Float Toe - With air horn inverted and gasket in place, measure distance from gasket to center of dimple at float toe Distance should be as indicated in specification table To adjust, bend toe of float pontoon while holding float arm at point shown in illustration *NOTE - Always recheck "float heel" if toe adjustment is required*

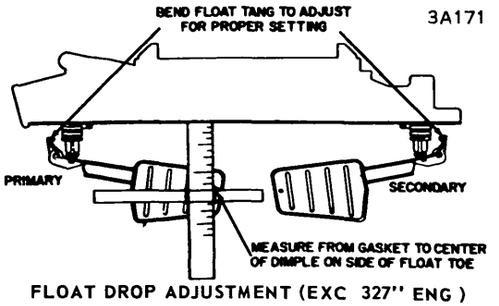
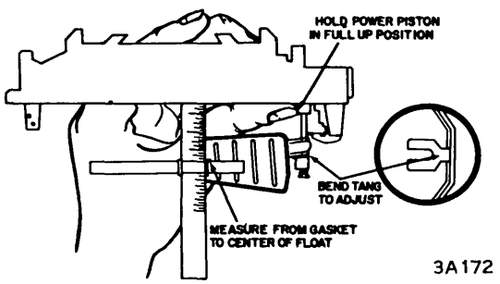
(13) - With fast idle speed adjusted Place fast idle screw on high step of cam Vent valve should just be closed Bend tang on pump lever

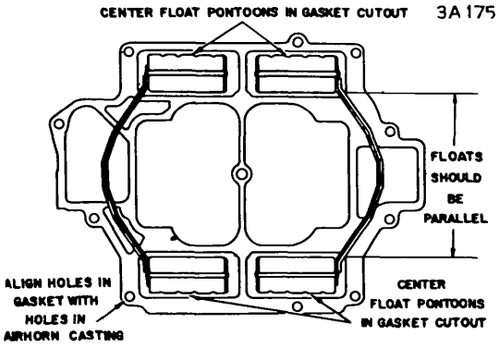


(14) - There are five holes in pump arm (Inner hole is No 1) Normal setting is with rod in No 3 (Center) hole Install in other holes to provide satisfactory performance Adjust idle vent after moving pump rod from one hole to the other

Chevrolet 327" Engine - Invert air horn (gasket in place) and measure distance from gasket surface to top of float (see illustration) Distance should be as indicated in specification table To adjust bend float arm at rear of float assembly



(Continued)



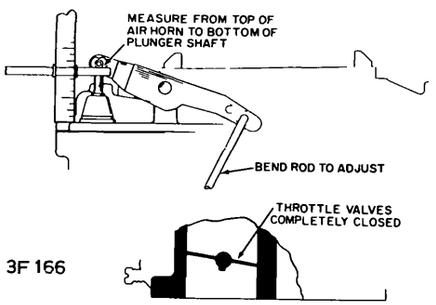
FLOAT DROP ADJUSTMENT (CHEV 327" ENG)

FLOAT DROP ADJUSTMENT (EXC 327" ENG)

VACUUM ASSIST SPRING ADJUSTMENT

FLOAT ALIGNMENT

ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)



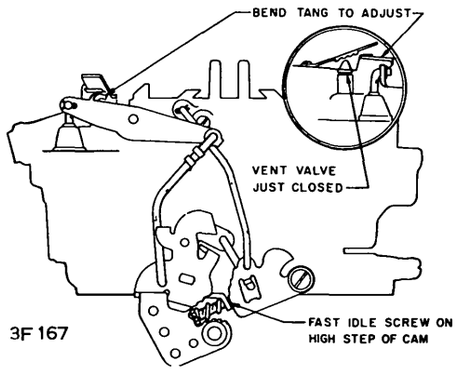
Float Drop (Pri. & Sec.)

All Models (Exc. Chevrolet 327" Eng.) -Hold air horn upright (power piston extended), then measure distance from gasket to center of dimple on toe of float (see illustration) Distance should be as indicated in specif ication table To adjust, bend tang at rear float hanger **Chevrolet 327" Engine** - Hold air horn upright and measure distance from gasket surface to bottom of float, with float hanging free Distance should be as indicated in specification table To adjust, bend float tang

Vacuum Assist Spring (Pri. Float)

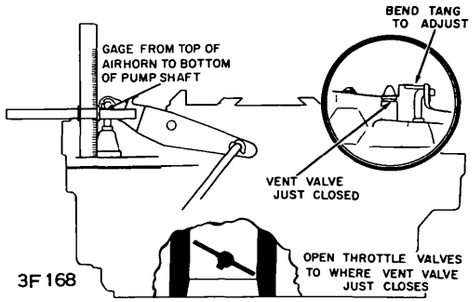
NOTE - This adjustment required on Cadillac, Chevrolet (409" Engine) and Oldsmobile (Exc F-85) Not required on other carburetors

Hold air horn upright and level (see illustration), then hold power piston in full upward position Jounce pontoon slightly to make sure cup retainer on vacuum assist spring is not binding on upper power piston stem Measure distance from gasket to center of dimple at toe of float pontoon Distance should be 1 3/32" (Cadillac), 1 7/32" (Chevrolet 409" Eng), 1 1/16" (Oldsmobile, Exc F-85) To adjust, bend tang at center of float arms as indicated



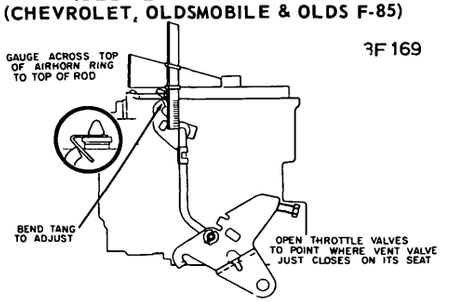
PUMP ROD ADJUSTMENT

Float Alignment



Align floats so they are parallel, then align screw holes in gasket with screw holes in air horn Make sure pontoons are centered in cut-out sections of gasket and that sides of pontoons are parallel with adjacent edges of gasket

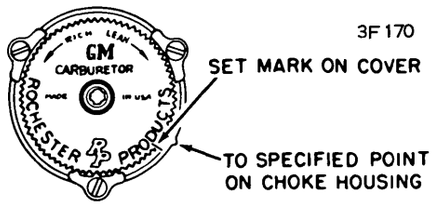
Accelerating Pump



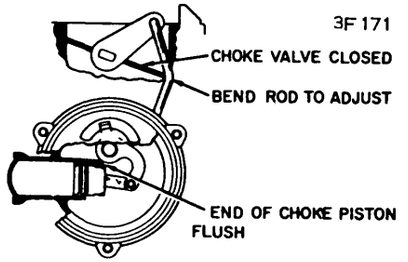
► *1963 BUICK SPECIAL HESITATION ON ACCELERATION CORRECTION: If accelerator .pump system is not defective, trouble may be due to incorrect pump stroke setting ("Pump Rod Position") which depends on average daytime temperature as follows Below 0°F (place rod in INNER hole), 0° to 60°F (place rod in CENTER hole), Above 60° (place rod in OUTER hole) For checking and adjusting, place rod in CENTER hole After adjustment is completed, replace rod in proper hole.*

IDLE VENT ADJUSTMENT (CADILLAC)

IDLE VENT ADJUSTMENT (CHEVROLET, OLDSMOBILE & OLDS F-85)

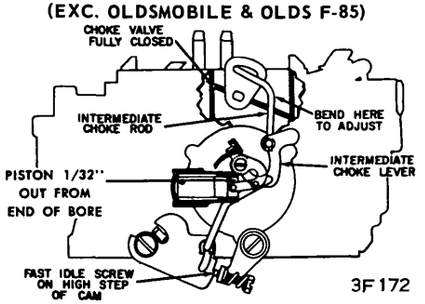


IDLE VENT ADJUSTMENT (PONTIAC TEMPEST)



Back out slow idle speed and fast idle speed screws until throttle valves are completely closed Make sure pump rod is connected in proper hole of arm as indicated in "Specification Table" Hold throttle valves in closed position and use gauge or scale to check pump adjustment *NOTE - If a gauge is used, place it on top of air horn next to pump plunger* End of pump shaft should slide freely into hole in gauge marked "Pump" If a scale is used, measure distance from top of air horn casting to bottom of pump plunger shaft If height is not correct, adjust by bending pump rod

Atmospheric Idle Vent



Cadillac - *NOTE - Make fast idle speed adjustment before adjusting idle vent* With fast idle screw on high step of fast idle cam, vent valve should just be closed

AUTOMATIC CHOKE ADJUSTMENT

INTERMEDIATE CHOKE ROD ADJUSTMENT (EXC. OLDSMOBILE & OLDS F-85)

INTERMEDIATE CHOKE ROD ADJUSTMENT (OLDSMOBILE & OLDS F-85)

To adjust, bend tang on pump lever

Chevrolet, Oldsmobile & Pontiac T mpest (All Mod ls) - *NOTE - Idle vent not used on Buick models* Open throttle valve to point where vent valve is just closed, then hold in this position Distance from top of air horn to bottom of pump plunger shaft (Exc Pontiac Tempest), to top of plunger shaft (Pontiac Tempest) should be as indicated in "Specification Table" To adjust, bend tang on pump lever

Automatic Choke

Loosen three retaining screws and rotate thermostat cover until index mark is in alignment with correct calibrated mark on housing as indicated in "Specification Table" Tighten cover retaining screws *NOTE - "Centered" point on housing is indicated by a raised section on housing casting*

Intermediate Choke Rod

NOTE - Intermediate choke rod connects lever on chok valve shaft to choke l ver on automatic choke housing

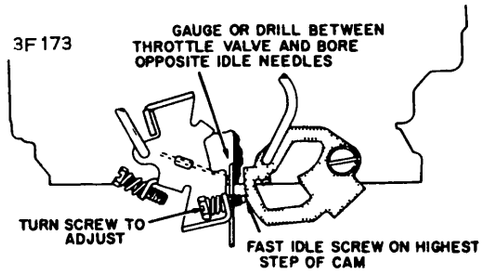
All Models (Exc. Oldsmobile & Olds F-85) - Hold choke valve completely closed and bend intermediate

(Continued)

ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

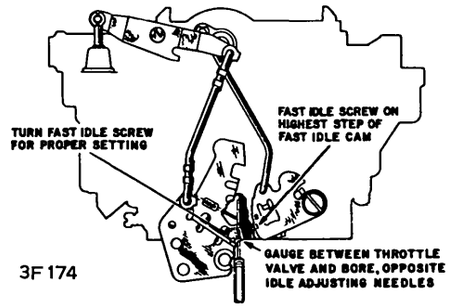
choke rod as necessary so choke piston is flush with end of choke piston bore or sleeve. *See illustration.*

Oldsmobile & Olds F-85 - With fast idle properly adjusted, place fast idle screw on high step of fast idle cam and raise intermediate choke lever to its full up position Make sure all lash is removed from rods in slots Choke piston should be flush with end of choke piston bore when choke valve is fully closed To adjust, bend intermediate choke rod as necessary to correctly position piston *See illustration.*



Fast Idle Setting

NOTE - Chevrolet fast idle setting will be correct when "slow idle" speed and choke rod adjustments have been made. On other models, the "On Engine" fast idle adjustment must be made after carburetor is installed to insure proper warm-up performance.



"Off Engine" Adjustment - Turn fast idle screw against high step of fast idle cam until throttle opening or clearance between edge of throttle valve and bore on side opposite idle mixture adjusting screws is correct as indicated in "Specification Table".

"On Engine" Adjustment - With engine at normal operating temperature, rotate fast idle cam so that fast idle adjusting screw is on high step of fast idle cam (Exc Buick & Buick Special); on low step of cam (Buick & Buick Special). Start engine and adjust fast idle speed for correct engine RPM as shown in "Specification Table"

UNLOADER ADJUSTMENT (CADILLAC)

UNLOADER ADJUSTMENT (OLDSMOBILE & OLDS F-85)

ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

Choke Rod

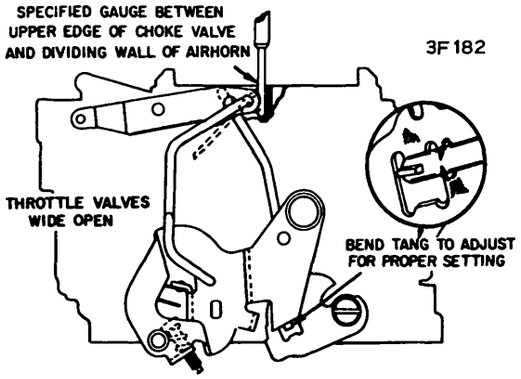
NOTE - On all carburetors except Oldsmobile & Olds F-85, the choke rod connects choke valve shaft to fast idle cam. On Oldsmobile & Olds F-85 carbu- r tors, the rod connects intermediate choke lever to fast idle cam.

Rotate choke valve and fast idle cam until fast idle screw (slow idle screw on Chevrolet) is in contact with SECOND step of fast idle cam and against shoulder of highest step of fast idle cam. On Oldsmobile & Olds F-85, raise the intermediate choke lever to full up position making sure that intermediate rod and choke rod are at upper limit of travel in slots and that all lash is removed. On all models, bend choke rod to obtain specified clearance between choke valve and dividing wall of air horn (see "Specification Table").

Unloader

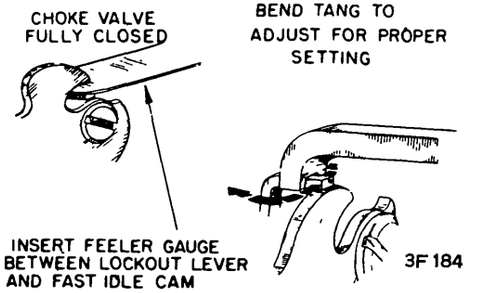
With throttle valves wide open, clearance betweer upper edge of choke valve and dividing wall of air horn should be as indicated in "Specification Table". To adjust, bend tang on fast idle cam. *See illus- tration.*

Secondary Throttle Lockout



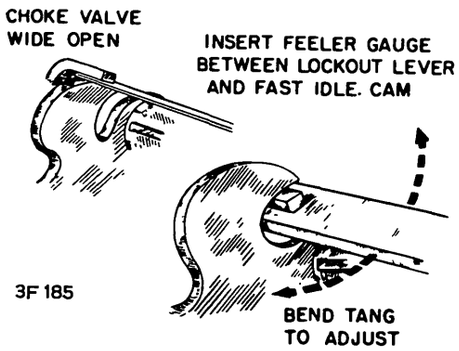
Close choke valve fully so that lockout lever tang is engaged in slot of fast idle cam. Measure clearance between side of lockout lever tang and edge of slot in cam *(see illustration).* Clearance should be .015" (all models). Adjust by bending tang on fast idle cam.

Secondary Throttle Contour



Open choke valve fully so that tang on lockout lever is positioned over contoured section of fast idle cam *(see illustration).* Measure clearance between tang edge of fast idle cam with a feeler gauge. If clearance is not .030" (Buick, Buick Special, Oldsmobile, Olds F-85 & Pontiac Tempest); .015" (Cadillac & Chev- rolet), adjust by bending tang up or down.

OVERHAUL



See 1958 Final Data, Page 279, or later Manual editions for complete overhaul procedure.

UNLOADER ADJUSTMENT (CHEVROLET)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 BUICK SPECIAL V6 ENGINE FLAT SPOT DURING WARM-UP CORRECTION (CARBURETORS BEFORE CHANGE LETTER "A" OR "B" ON CODE TAG).* Modify carburetors as follows *NOTE - Ignore instructions found in package*

Automatic Transmissi n Cars - Install Flat Spot Package, Part No 1396331 as follows On carburetors before change letter "A" on code tag install new choke baffle which will hold choke on slightly longer On carburetors before change letter "B" on code tag, install new cluster assembly After installing the above parts, install the "B" code tag found in package If the exhaust manifold valve thermostat spring does not have a 1/8" "notch" in hook end, install the new type spring which will provide more heat to carburetor

Synchro-mesh Transmission Cars - Install Flat Spot Package, Part No 1396332 as follows· On carburetors before change letter "A" on code tag, install new cluster assembly, then install the "A" code tag from package If the exhaust manifold valve thermostat spring does not have a 1/8" "notch" in hook end, install the new type spring which will provide more heat to carburetor Increase accelerating pump stroke by bending pump rod as required to obtain a 7/8" setting

►*1963 BUICK SPECIAL V8 ENGINE WITH AUTO TRANS FLAT SPOT DURING WARM-UP CORRECTION (CARBURETOR NO 7023046)* Install Flat Spot Package, Part No 7026697 *NOTE - Ignore instructions found in package* Replace 046" main metering jets with 047" jets and replace venturi cluster assembly Remove and discard choke piston and link, and fast idle cam Drill through choke housing inlet into choke housing using a 5/32" drill Blow out all chips, then press in 078" restriction flush with casting Install the new choke piston and link from package, then install choke housing cover and set at INDEX Install air horn on carburetor and install new fast idle cam from package Adjust choke rod and fast idle cam (see "Choke Rod Adjustment" below) After installing all parts from package install new part number (7023142) code tag Adjust idle speed and mixture

DRILLING CHOKE HOUSING INLET

►*1963 PONTIAC TEMPEST (EARLY CARS) EXCESSIVE RICHNESS (LOADING) AFTER STARTING WARM ENGINE* On early automatic transmission cars excessive loading on restart after a short stop can be corrected as follows Remove choke coil cover and choke baffle then rotate fast idle cam so screw is on high step of cam Rotate choke piston lever counterclockwise as far as possible (choke should be fully closed) If choke piston is not extending out of cylinder 060- 080' bend choke intermediate rod as necessary to obtain this measurement

DESCRIPTION

2-Barrel downdraft types with manual choke (2G), automatic choke (2GC) Carburetor design is similar to previous carburetor models

ADJUSTMENT

Idle Speed & Mixture

IDLE SETTING CAUTIONS (CARS WITH IDLE COMPENSATOR) - Make sure that idle compensator is closed when adjusting idle speed If necessary, idle compensator valve can be held closed with a pencil. After idle speed is adjusted, press down on idle compensator valve to see if speed is affected If speed drops, readjust idle speed, being sure that idle compensator valve is closed

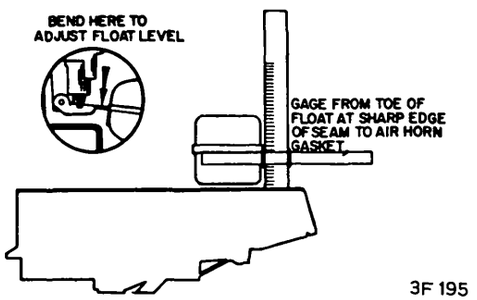
All Models - If preliminary adjustment required to warm engine, turn both idle mixture screws in until lightly seated then turn each screw out 1½ turns Operate engine until normal operating temperature is reached with choke valve wide open and fast idle inoperative Connect tachometer and vacuum gauge to engine, then adjust throttle stopscrew for correct engine idle speed (see "Specification Table") Adjust each idle mixture screw for smoothest idle performance with highest vacuum and engine RPM *See Special notes below*

CAUTION - On cars with Idle Compensator, make sure valve is closed when adjusting idle speed

CHEVROLET NOTE - Idle mixture adjustment can be made by leaning the mixture (turn screws in) for a moderately rough idle and slight vacuum and RPM loss, and then richening the mixture by turning screws out ¼ turn

OLDSMOBILE NOTE - After adjusting both idle mixture screws for highest manifold vacuum and engine RPM turn each screw out ¼ turn for slightly richer mixture Recheck idle mixture and idle speed after air cleaner installed

Carb-Airator Adjustment (Cars so Equipped) - *NOTE - Make sure Carb-Airator valve closes when engine is started after normal idle speed adjustment (70°F)* If in extreme hot temperatures (95° outside temperature) engine idle is rough and erratic or stalling occurs tighten the temperature screw (upper screw on Carb-Airator) one turn and road test *CAUTION - Do not upset normal idle and do not overtighten temperature screw* If engine idles too fast under extreme hot conditions tighten the air screw (lower screw on Carb-Airator)



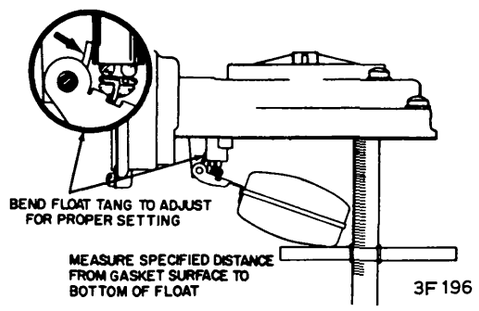
Throttle Linkage

See CARBURETOR on Car Model pages

Float Level

With air horn inverted and gasket in place, distance from air horn gasket to lower (sharp) edge of float seam at outer end should be as indicated in specifications To adjust bend float arm at rear

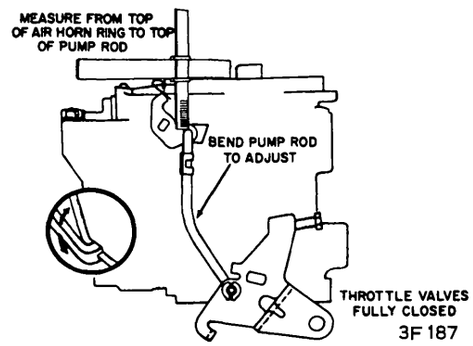
(Continued)



FLOAT LEVEL ADJUSTMENT

ROCHESTER 2G & 2GC 2-BARREL CARBURETORS (Cont.)

Float Drop



Hold air horn assembly upright (gasket in place) and measure distance from gasket to bottom of float pontoon (see illustration) Distance should be as indicated in specifications To adjust, bend tang on float

FLOAT DROP ADJUSTMENT

Accelerating Pump

NOTE - If there are two holes in pump shaft lever, place pump connector rod in OUTER hole (furthest from pump shaft) With throttle stopscrew (and fast idle screw is so equipped) backed out so that the throttle valves are completely closed, measure distance from top of air horn ring to top of connector rod, using a scale or combination gauge (see "Specification Table") To adjust, bend pump connector rod

ACCELERATING PUMP ADJUSTMENT

Idle Vent

NOTE - Idle vent is not used on all carburetor models
Adjust after accelerating pump rod has been adjusted Set "T" scale to proper dimension (see "Specification Table") and place scale in position shown in illustration Slowly open throttle valves to the point where rubber vent valve just closes on seat Lower edge of gauge leg should just touch top of pump rod To adjust, bend tang on pump lever

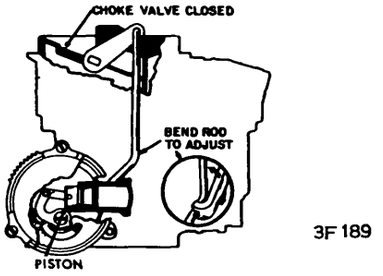
① - See procedure below
② - Auto Trans in 'D' (Drive)
③ - 550 RPM with air conditioner OFF
④ - Auto Trans in "N" (Neutral)
⑤ - 525 RPM with air conditioner OFF
⑥ - With air conditioner OFF
⑦ - 540-560 RPM with air conditioner OFF

Intermediate Choke Rod (Choke Piston)

NOTE - This adjustment is not required on carburetors having automatic choke housing attached directly to air horn assembly

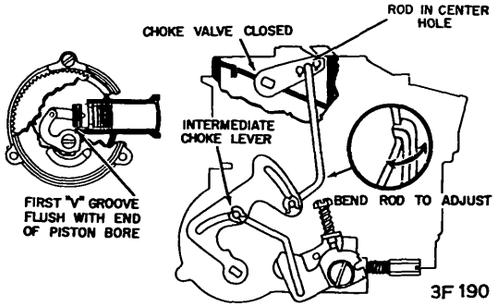
IDLE VENT ADJUSTMENT

Buick (Exc. Special), Pontiac & Pontiac Temp st - With choke thermostat cover, coil assembly and inner baffle plate removed, hold choke valve completely closed and bend intermediate choke rod so that end of choke piston is 1/32" out of end of the choke piston bore (Buick), flush with end of choke piston bore (Pontiac & Pontiac Tempest)



Oldsmobile (Exc. F-85) - *NOTE - There are three holes in upper choke lever Make the following adjustment with intermediate choke rod connected in CENTER hole See note below for "Tailoring" choke setting*
With choke thermostat cover, coil assembly and inner baffle removed, open throttle valve and hold choke valve completely closed by pushing up on intermediate choke lever Bend intermediate choke rod so the first "V" groove of piston is flush with end of choke piston bore

OLDSMOBILE (EXC F-85) CHOKE SETTING "TAILORING" FOR CLIMATIC & TEMPERATURE CONDITIONS - Moving intermediate chok rod to next OUTER



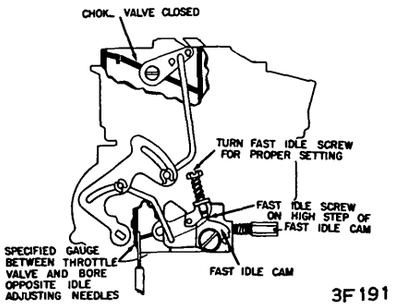
(Continued)

ROCHESTER 2G & 2GC 2-BARREL CARBURETORS (C nt.)

hole (away from choke shaft) will provide richer mixture during warm-up for acceleration and load. Moving intermediate rod to next INNER hole will provide leaner mixture under same operating conditions.

INTERMEDIATE CHOKE ROD ADJUSTMENT (EXCEPT OLDSMOBILE)

INTERMEDIATE CHOKE ROD ADJUSTMENT (OLDSMOBILE, EXC. F-85)



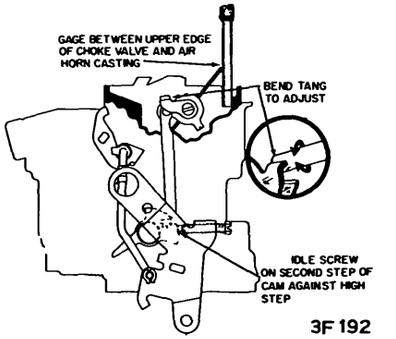
Automatic Choke (2GC Carbs.)

Loosen three retaining screws and rotate thermostat cover until index mark is in alignment with correct calibrated mark on housing as indicated in "Specification Table". Tighten cover retaining screws. *NOTE - "C ntered" point on housing is indicated by a raised section on housing casting.*

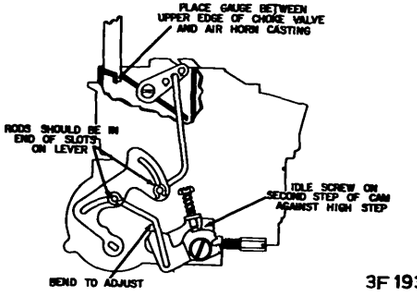
Fast Idl (2GC Carbs.)

NOTE - A separate fast idle adjustment is not required, except n cars indicated below, as fast idle speed is properly s t when hot (or slow) idle speed is adjusted (with ch k rod in proper adjustment).

Oldsm bile (Exc. F-85) - As a preliminary adjustment (with carburetor off engine), close choke valve and place fast idle screw on high step of fast idle cam. Adjust fast idle screw for a throttle valve opening of .030" measured between edge of valve and carburetor bore on side opposite idle mixture adjusting screws. Make final adjustment on engine as follows: Connect tachometer, place transmission selector l ver in "N" (Neutral) position, then rotate fast idle cam so fast



FAST IDLE ADJUSTMENT (OLDSMOBILE, EXC. F-85)



idle screw is on high step of cam. With engine at normal operating temperature, adjust fast idle screw to obtain an engine speed of 1900 RPM. *NOTE - For sub-zero operation, set fast idle speed to 2200 RPM.*

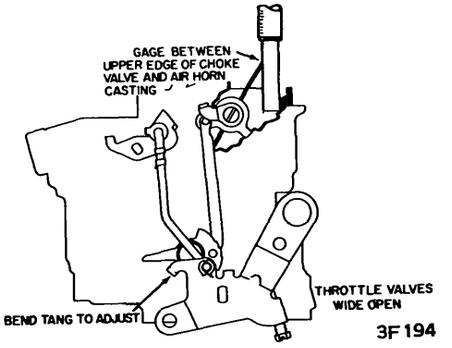
Choke Rod (2GC Carbs.)

All Models (Exc. Oldsmobile) - Turn idle speed screw to normal idle position (1½ turns), then place idle speed screw on second step of fast idle cam and against shoulder of high step. Distance between upper edge of choke valve and wall of air horn should be as indicated in "Specification Table". To adjust, bend counterweight tang.

CHOKE ROD ADJUSTMENT (EXCEPT OLDSMOBILE)

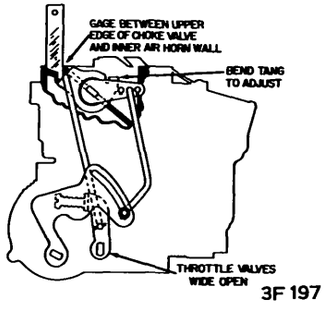
CHOKE ROD ADJUSTMENT (OLDSMOBILE, EXC. F-85)

Oldsm bil (Exc. F-85) - Place fast idle screw on second step of fast idle cam and against shoulder of high step. *NOTE - Make sure int rmediat ch k rod and choke rod are in the ends of slots in intermediate choke lever by pushing upward on lever.* Distance between upper edge of choke valve and wall of air horn should be as indicated in "Specification Table". To adjust, bend choke rod.



Unloader (2GC Carbs.)

With throttle valve held wide open, distance between upper edge of choke valve and wall of air horn should be as indicated in "Specification Table". To adjust bend tang on throttle lever.



PONTIAC UNLOADER CHECKING NOTE - It is recommended that the throttle valves be opened by depressing accelerator pedal forcibly to the floor (by someone sitting in drivers seat) to simulate actual driving conditions. Make certain that pedal does not strike hump over transmission. The above procedure will eliminate all variances in floor mat, linkage, or pedal location.

OVERHAUL

See 1960 Final Data, Page 301, or later Manual edition.

UNLOADER ADJUSTMENT (EXCEPT OLDSMOBILE)

UNLOADER ADJUSTMENT (OLDSMOBILE, EXC. F-85)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 (EARLY) CHEVROLET & CHEVY II SIX CYLINDER ENGINE PART THROTTLE SURGE CORRECTION: NOTE - Carburetors having a date code of "A-3C" ("A" indicates January; "3" indicates 1963; "C" indicates third change made in carburetor) or later have the following changes made in production.* Install main metering jet, Part No. 7002959 (Carb. No. 7002300); 7002660 (Carb. No. 7023003); 7002659 (Carb. No. 7023108); 7002660 (Carb. No. 7023105), to replace original jets.

FUEL STRAINER NOTE - Strainer screen (under fuel inlet fitting nut) can be removed for cleaning. Replace filter every 15,000 miles or sooner if needed.

DESCRIPTION

Single barrel downdraft types with manual choke (Model B); integral automatic choke (Model BC); separate automatic choke (Model BV). Carburetor design is similar to previous carburetor models. *NOTE - The Model B carburetor used on the Pontiac Tempest has an adjustable positive idle stop (eccentric washer)*

ADJUSTMENTS

Idle Mixture & Speed

If a preliminary setting is required to warm up engine, turn idle mixture screw in until lightly seated, then back screw out 1½ turns (Chev. Pass. & Pontiac Tempest); 2 turns (Chevy II); 1½-2½ turns (Chev. Truck). Start engine and allow to idle until normal operating temperature is reached, then adjust as follows:

Idl Mixtur - With engine at normal operating temperature and idling at correct speed (see "Specification Table"), turn idle mixtur adjusting screw in or out until smoothest engine performanc is obtained. Recheck idle speed.

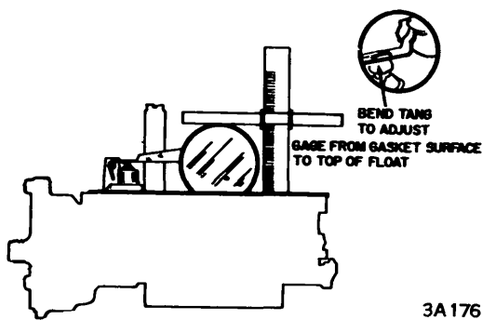
7023108	.....	500 ②	1 9/32"	1 3/4"	.050"	.160"	.060"	.350"	⑤

① - See procedure below.
② - Auto. Trans. in "D" (Drive).
③ - 680-700 RPM Air Conditioner OFF.
④ - 630-650 RPM Air Conditioner OFF.
⑤ - See "BV" automatic choke adjustment below.

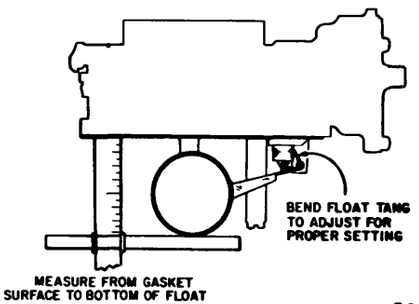


Idle Speed - With engine at normal operation temperature, adjust throttle stopscrew for correct idle speed (see "Specification Table"). *CAUTION - On "BC" & "BV" carburetors, stopscrew must be resting on lowest step of fast idle cam.*

Throttle Return Check

If carburetor is equipped with a throttle return check, see CARBURETOR on Car Model pages.

Float Level



Invert air horn (gasket in place), and measure distance from air horn gasket to top of each float (see illustration). Distance should be as indicated in specifications. To adjust, bend float arm tang contacting inlet needle. *NOTE - Align floats so they are parallel and centered in air horn gasket cutout. Recheck float level if adjustment required.*

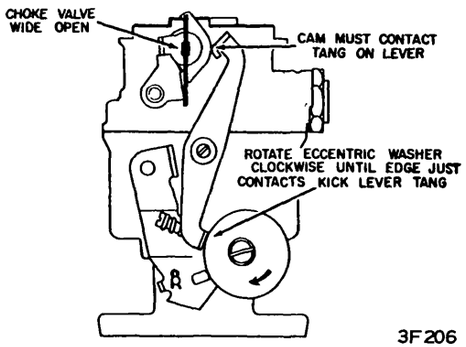
FLOAT LEVEL ADJUSTMENT

Float Drop

Hold air horn assembly upright with floats hanging free, then measure distance from surface of air horn gasket to bottom of float (see illustration). Distance should be as indicated in specifications.

FLOAT DROP ADJUSTMENT

Idle Stop Eccentric

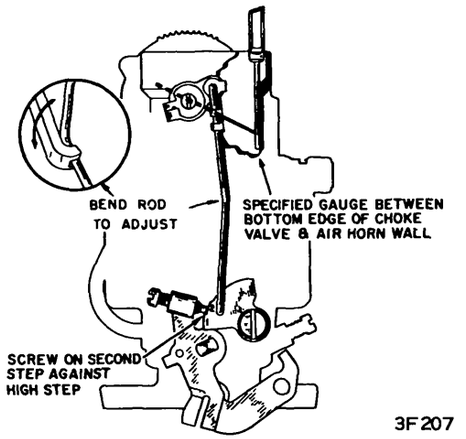


Pontiac Tempest (Manual Ch k Carb.) - *NOTE - It is not necessary to adjust the "Positive Idle Stop Eccentric" unless eccentric b com s loos or is r moved.* With choke valve wide open, rotate eccentric washer to a position where a clearance of .001-.006" is maintained between upper end of "kick-lever" and the "kick-cam". Secure eccentric washer in place with screw.

Fast Idle

"BC" & "BV" Carbs. - Fast idle speed is automatically set when hor or slow idle speed and choke rod are properly adjusted.

(C ntinued)



ROCHESTER B, BC, BV SINGLE BARREL CARBURETORS (C nt.)

IDLE STOP ECCENTRIC ADJUSTMENT

Chok Rod

"BC" & "BV" Carbs. - With idle screw on second step of fast idle cam and against highest step, bend choke rod as necessary to obtain proper clearance between lower edge of choke valve and wall of air horn. See specifications.

CHOKE ROD ADJUSTMENT

Unloader

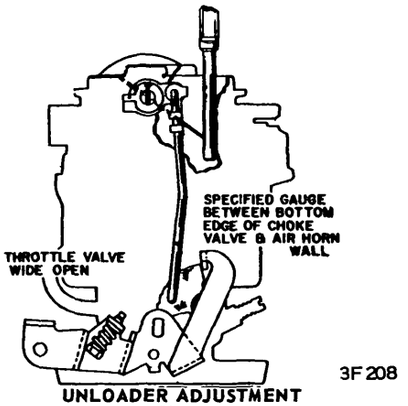
"BC" & "BV" Carbs. - With throttle valve wide open, clearance between lower edge of choke valve and wall of air horn should be as indicated in "Specification Table". To adjust, bend unloader tang on throttle lever.

Idle Vent

All M d ls (Exc. P ntiac T mp st) - With idle speed properly adjusted and screw on low step of cam, idle vent valve should be open as specified (see specifications). To adjust, turn valve on top of air horn.

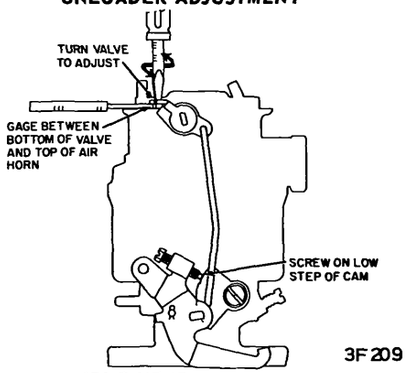
Vacuum Break

"BV" Carbs. - *NOTE - This adjustment not required on other carburetor models.* Push vacuum break diaphragm plunger in until seated, making sure that choke valve is closed so that connecting rod is at end of slot. Hold in this position and adjust rod so that clearance between lower edge of choke valve and wall of air horn is as indicated in specifications. Bend connector rod as indicated in illustration.



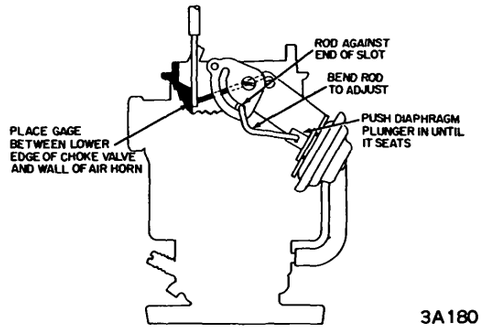
Automatic Choke

Integral Type ("BC" Carbs.) - Loosen three retaining screws and rotate thermostat cover until index mark is in alignment with correct calibrated mark on housing as indicated in "Specification Table". Tighten cover retaining screws. *NOTE - "Centered" point on housing is indicated by a raised section on housing casting.*



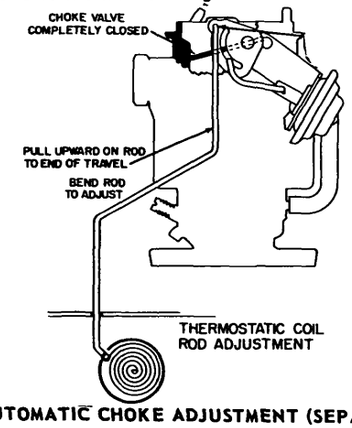
Separate Type ("BV" Carbs.) - With automatic choke rod disconnected from carburetor choke lever, hold choke valve closed and pull automatic choke rod up against stop in thermostat housing while checking and adjusting rod length as follows:

"Index" Setting - Bottom edge of automatic choke rod end should align with top edge of hole in the choke lever (equivalent to one rod diameter above hole).



Leaner Setting - Bend automatic choke rod in area of offset to decrease rod effective length. At the maximum allowable lean setting, at least the upper quarter of rod end should overlap top edge of lever hole.

UNLOADER ADJUSTMENT



IDLE VENT ADJUSTMENT

VACUUM BREAK ADJUSTMENT

Richer Setting - To adjust for a choke setting equivalent to "2" notches rich, bend automatic choke rod in area of offset to increase rod effective length to bring rod end two diameters above hole in choke lever. *NOTE - After making any change in choke setting (rod length), check for free operation as interference may exist at manifold end of rod. If a lean adjustment is made, make sure that it is possible for choke valv to close at the new setting.*

AUTOMATIC CHOKE ADJUSTMENT (SEPARATE TYPE)

OVERHAUL

See 1961 Final Data, Page 261 and note the following:

Heat Suction Tube

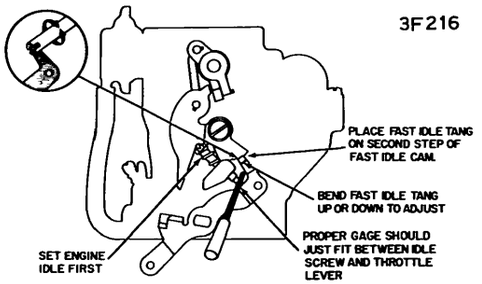
If tightening of loose seal with Tool BT-45 does not correct leakage, install new seal as follows: With carburetor fully assembled, loosen throttle body-to-bowl casting screws, then insert flared end of heat suction tube into hole in throttle body and tap seal lightly into position with Tool BT-45. Rotate tube while tapping to insure starting uniformly into throttle body. Tighten coupling nut at upper end of tube finger tight, using new packing on tube. Use a light hammer and Tool BT-45 to spread seal securely in throttle body (rotate tool to secure uniform spreading of seal). Loosen coupling nut at upper end of tube and check tube tightness in throttle body (tube should not turn). Tighten coupling nut securely, then tighten throttle body-to-bowl casting screws. Check seal for leaks after carburetor is installed on engine.

ROCHESTER H SINGLE BARREL CORVAIR CARBURETOR

Car Model	Rochester No.
Corvair, All Models (Synchro-mesh)	7023101
Corvair, All Models (Auto. Trans.)	7023100
Corvair Pass. Cars (High Performance)	7023102

DESCRIPTION

Single barrel downdraft type with automatic choke, fast idle and unloader. The automatic choke assembly consists of a thermostatic coil assembly mounted to lower side of engine cylinder head and linked directly to carburetor choke valve shaft. A vacuum break diaphragm mounted on carburetor air horn replaces the conventional choke vacuum piston.

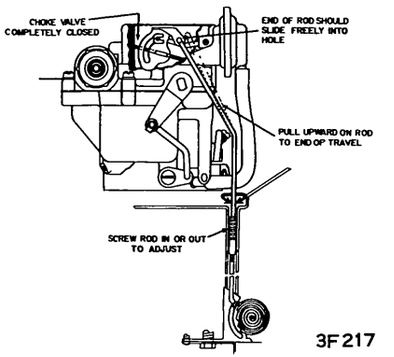


ADJUSTMENTS

Final Adjustment

Make all final adjustments with carburetor installed on engine.

Synchronization, Idle Speed & Mixture - *See CARBURETOR on Car Model pages for complete procedure.*

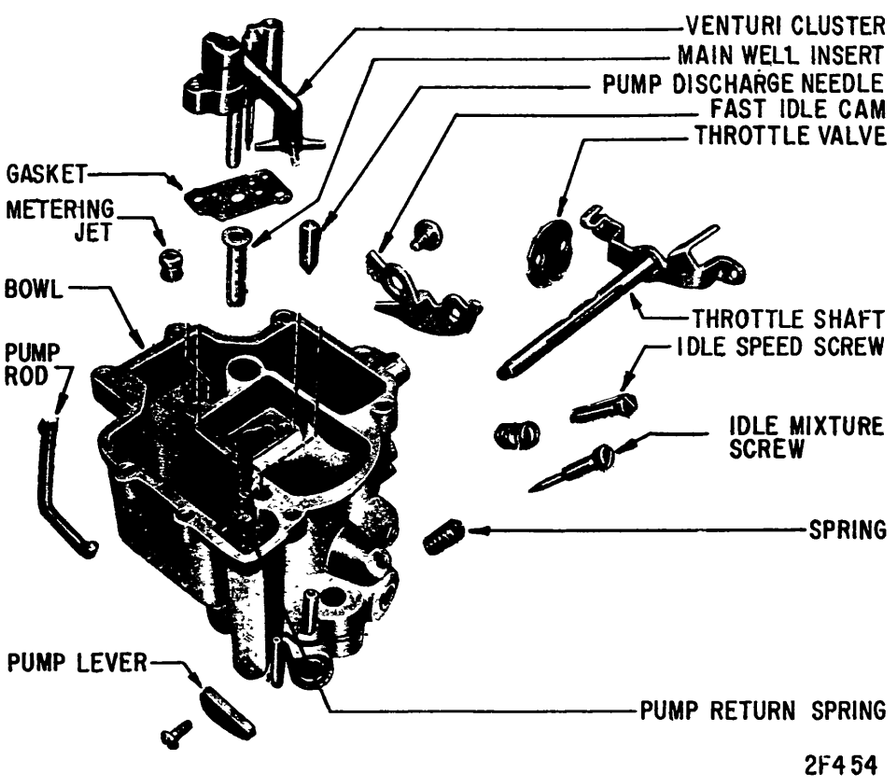


Fast Idle - *NOTE - Make this adjustment after final idle mixture and speed adjustment is completed.*

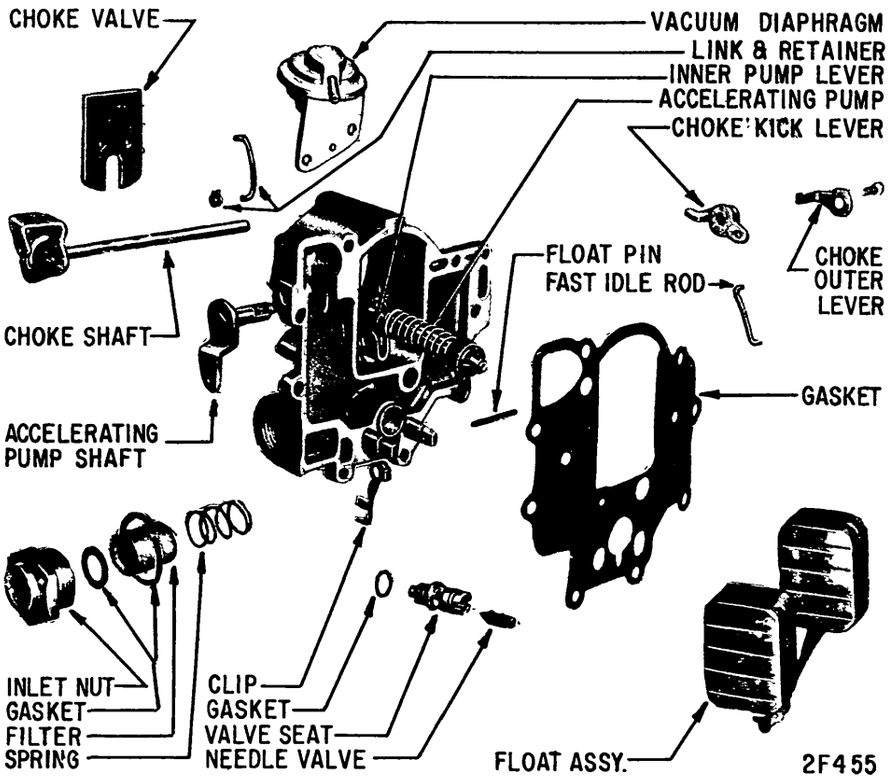
FAST IDLE ADJUSTMENT

Stop engine and place throttle lever on second highest step of fast idle cam. Bend tang on throttle lever to obtain .078" clearance between idle speed screw and throttle lever. Recheck idle speed.

Automatic Choke Rod Adjustment - Stop engine and disconnect automatic choke control rod at choke shaft lever. With choke valve held closed, pull control rod up against stop in thermostat bracket and adjust control rod until it freely enters hole in choke shaft lever, **then lengthen rod 2 full turns.** *CAUTION - Turn rod in vertical portion. Do not "crank" rod at offset part.* Check choke position after engine is at normal operating temperature. Choke valve should be open and fast idle cam clear of throttle lever.



AUTOMATIC CHOKE ROD ADJUSTMENT

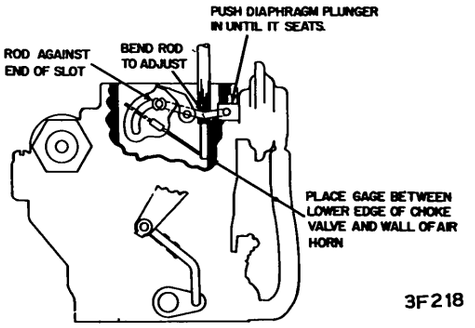


Initial Adjustment Carburetor Off Engin

Idle Speed - Back out idle speed screw, then open choke valve so throttle lever does not touch fast idle cam. Place a .003" feeler gauge between idle speed screw and throttle lever, then turn idle speed screw in until it just touches feeler gauge. Turn idle speed screw in an additional 1½ turns.

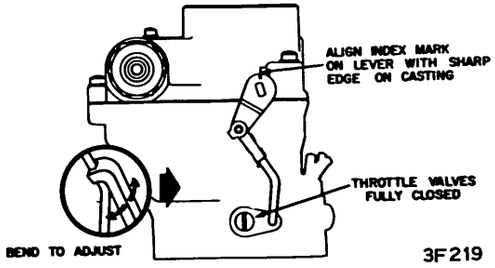
(Continu d)

ROCHESTER "H" CARBURETOR BOWL ASSEMBLY



ROCHESTER "H" CARBURETOR COVER ASSEMBLY

ROCHESTER H SINGLE BARREL CORVAIR CARBURETOR (Cont.)

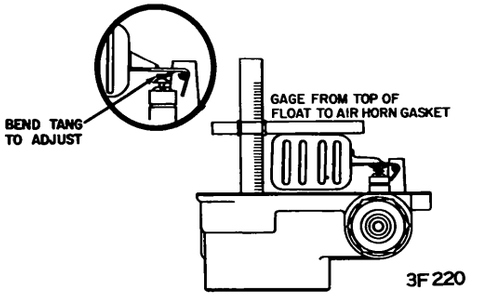


Idl Mixtur - Turn idle mixture screw out 1½ turns from a lightly seated position.

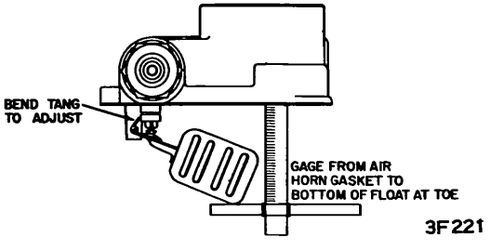
Vacuum Br ak Diaphragm - Hold diaphragm arm in against diaphragm and measure clearance between lower edge of choke valve and air horn wall. Clearance should be .160-.175". To adjust, bend diaphragm link. *NOTE - Throttle lever fast idle tang should rest on second st p f fast idle cam when making this adjustm nt. If n c ssary, bend outer choke shaft lev r tang.*

VACUUM BREAK DIAPHRAGM ADJUSTMENT

Pump Rod - Back out idle speed screw until throttle valve is completely closed, then bend pump rod as necessary to align ind x mark on upper pump lever with sharp edge on air horn casting. *NOTE - On cars with Powerglide (with two holes in lower pump lever), adjustment should be made with rod in outer hole. After adjustment is completed, move rod to inner hole f l ver for proper operation.*



PUMP ROD ADJUSTMENT

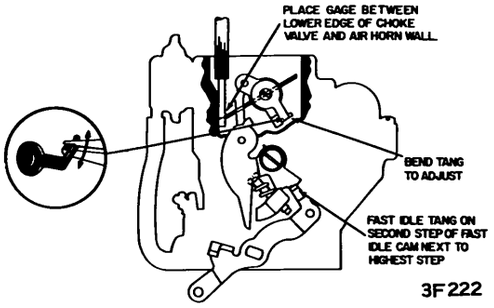


Fl at L vel - 1 13/64" (Gauge BT-174) between air horn gasket and top surface of float with air horn inverted. Floats must be parallel with air horn. To adjust, bend tang at rear of floats.

Float Drop - With air horn assembly held upright and floats hanging free, distance from gasket to bottom of float at lowest point should be 1¾" (Gauge BT-174). To adjust, bend tang at end of float hinge arm.

Choke Rod - With fast idle tang on second step of cam next to highest step, close choke valve so trip lever on choke shaft just contacts choke tang on plastic lever and collar assembly. Clearance between lower edge of choke valve and inner wall of air horn should should be .161" (BT-194). Bend Tang on trip lever.

FLOAT LEVEL ADJUSTMENT



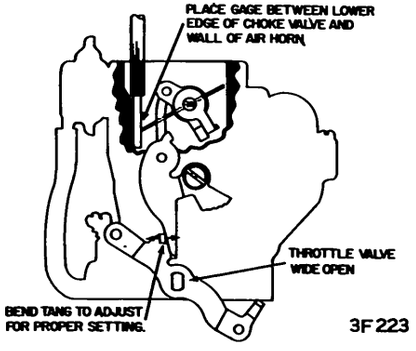
FLOAT DROP ADJUSTMENT

Unloader - Hold throttle valve wide open (accelerator pedal depressed to floor) and measure clearance between lower edge of choke valve and inner wall of air horn. Clearance should be .250". To adjust, bend unloader tang on throttle lever.

OVERHAUL

Disassembly

Disconnect accelerating pump rod from accelerating pump lever, then remove fuel filter element and spring. Remove choke trip lever attaching screw and levers from choke shaft. Remove vacuum diaphragm assembly by rotating the assembly to align notch and free it from



CHOKE ROD ADJUSTMENT

link. Remove float assembly and float needle, seat and gasket. Remove clip from accelerator pump and remove pump, then remove clip, shaft and lever. Remove screws from venturi cluster and lift out cluster, gasket and main well insert. Remove pump discharge valve, idle mixture adjusting needle and main metering jet.

Reassembly

Install the throttle shaft and valve, then carefully centering and seating valve in shaft end bore. Tighten screws securely. Install venturi cluster and gasket and install screws and lockwashers. Install accelerator pump assembly and pump return spring, then install pump discharge needle. Install choke valve, choke kick lever and outer lever cam. Tighten choke valve screws securely. Make sure choke shaft assembly rotates freely without binding. Install float needle valve seat and needle valve, then install a new air horn gasket and install float assembly. Adjust float level and float drop (see above), then install air horn assembly on bowl and install screws and lockwashers in their original positions. Replace filter return spring, filter gasket, gasket and inlet nut. Install pump rod.

UNLOADER ADJUSTMENT

ROCHESTER TRIPLE CARBURETORS

PONTIAC (389" ENG.) Synchro-mesh Cars	Rochester Carb. No.
Front	7013063
Center	7023075
Rear	7013065
Automatic Transmission Cars	
Front	7013063
Center (3-Spd. Roto Hydra-Matic)	7023073
Center (4-Spd. Super Hydra-Matic)	7023077
Rear	7013065

PONTIAC (421" ENG.) Synchro-mesh Cars	Rochester Carb. No.
Front	7023078
Center	7023161
Rear	7023079
Automatic Transmission Cars	
Front	7023078
Center	7023162
Rear	7023079

DESCRIPTION

Two-barrel downdraft types of same design as previous carburetor models. The center carburetor contains all conventional systems. Front and rear carburetors contain only the float, pump, and main metering systems.

ADJUSTMENT

Idle Speed & Mixture

Center Carb. Only - *NOTE - Front and rear carburetor throttle valves must be completely closed.* With engine at normal operating temperature, choke valve fully open and fast idle inoperative, place automatic transmission in "D" (Drive). Adjust idle speed to correct engine RPM (see specifications), then turn one idle mixture screw to obtain highest vacuum and engine speed. Repeat adjustment with other idle mixture screw. Readjust engine idle speed to specification, then readjust idle mixture screws to obtain highest vacuum and engine speed with smoothest engine operation. Adjust idle speed, if necessary.

IDLE SPEED ADJUSTMENT NOTE (Carburetors with Idle Compensator): This valve must be closed when idle speed is adjusted. Press in on button located in idle compensator cover plate to hold valve closed during idle speed adjustment.

Float Level

Invert float bowl cover and measure distance between cover gasket and sharp edge of float seam (at free end of float). If measurement is not within limits (see specifications), adjust by bending float arm near hinge

Float Drop

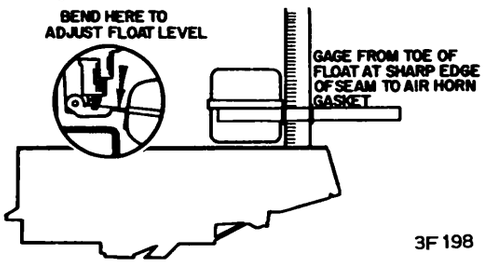
Hold bowl cover upright with float hanging down at bottom of travel. Distance from lower face of cover gasket to bottom of float at free end should be within specifications. To adjust, bend float tang on rear of float arm.

Accelerating Pump

NOTE - This is a linkag adjustment and not a seasonal setting, and is required n all three carburetors.

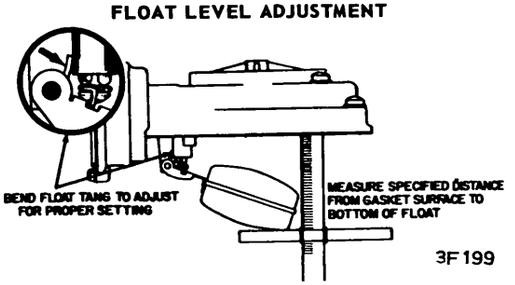
CARBURETOR ADJUSTMENT SPECIFICATIONS

Carburetor	Idle Speed② (Eng.RPM)	Initial Idle Mix. Screw④	Float Level ①	Float Drop ①	Choke Setting	Choke Rod①	Accel. Pump ①	Idl Vent	Vacuum Switch①	Unl ad r①
Center	③	1½	23/32"⑤	1¾"Min.	Index	.056"	1 1/8"⑥	1 1/32"⑦	1 3/32"	.143-.183"
Front & Rear	.....	.....	23/32"⑤	1¾"Min.	.....	.....	55/64"⑥	.....	.....	.....



① - See procedure below.
② - Auto. Trans. in "D" (Drive).
④ - Turns open from a lightly seated position.
⑤ - ± 1/16". ⑥ - ± 1/32". ⑦ - ± 1/64"

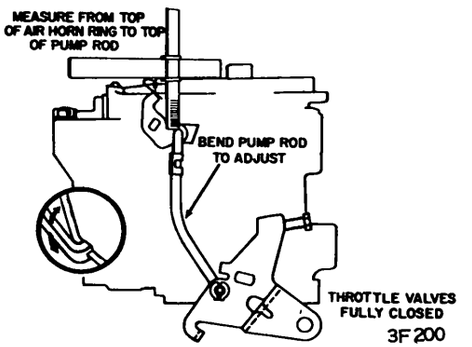
③- **389" Engine** - 480-500 RPM (Auto. Trans. in "D" range). 540-560 RPM (Air Conditioned Cars with Air Cond. OFF).
421" Engine - 640-660 RPM (Auto. Trans. in "D" range). 690-710 RPM (Air Conditioned Cars, with Air Cond. OFF).



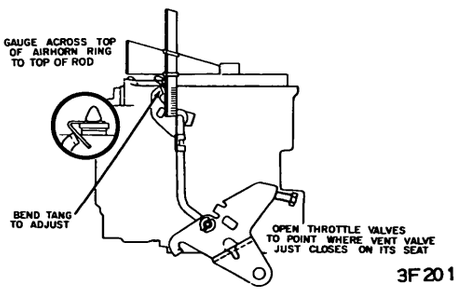
With throttle valves completely closed (back off throttle stopscrew on center carburetor), measure distance from top of air horn to top of pump connector rod. If not within specifications, adjust by bending pump connector rod.

Idle Vent

Center Carb. Only - *NOTE - Make this adjustment after accelerating pump rod has been adjusted.* Slowly open throttle valves to point where idle vent just closes, then hold throttle in this position and measure distance between top of air horn and top of pump rod. If measurement is not within specifications, bend vent valve actuating tang on pump lever up or down as necessary.

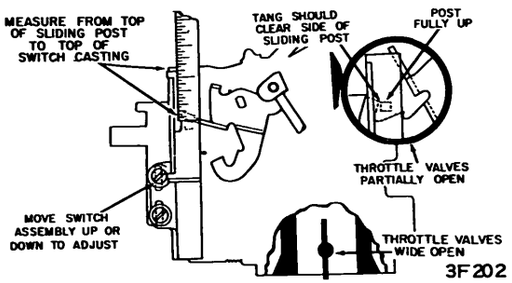


FLOAT LEVEL ADJUSTMENT



FLOAT DROP ADJUSTMENT

Vacuum Switch



With throttle valves wide open, measure distance between top of switch housing to top of sliding switch post. If not within specifications, loosen two switch retaining screws holding switch on bracket, then move switch up or down as necessary. Check adjustment by opening and closing throttle valves with sliding switch post in upward position. Inside edge of vacuum switch closing tang must clear side of switch post. *(C ntinued)*

PUMP ROD ADJUSTMENT

IDLE VENT VALVE ADJUSTMENT

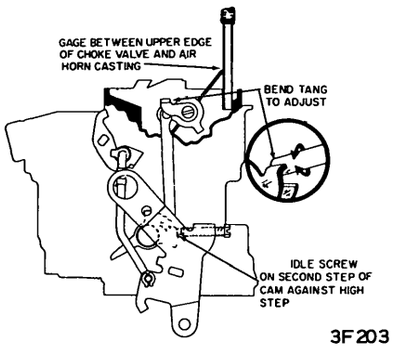
VACUUM SWITCH ADJUSTMENT

ROCHESTER TRIPLE CARBURETORS (C ntinu d)

Automatic Choke

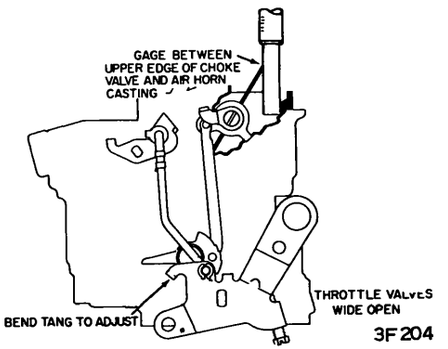
C nt r Carb. Only - Adjust by loosening choke cover retaining screws and rotating thermostatic coil assembly to correct mark (see specifications). *NOTE - With this setting, choke valve should be lightly closed at 75°F.*

Fast Idle



Fast idle speed will be correct after "Slow Idle" speed and choke rod adjustments have been completed.

Choke Rod



C nt r Carb. Only - Place idle speed screw on second step of fast idle cam next to high step. With choke trip lever in contact with choke counterweight lever, clearance between upper edge of choke valve and air horn wall should be as indicated in specifications. To adjust, bend tang on choke counterweight lever.

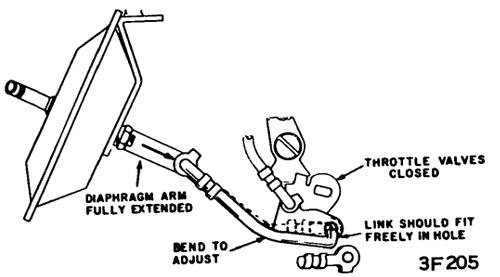
Unl ader

With throttle valves held wide open, clearance between upper edge of choke valve and air horn wall should be as indicated in specifications. To adjust, bend tang on throttle lever to provide proper clearance.
NOTE - For unloader adjustment, it is recommended that throttle valves be opened by depressing accelerator pedal to floor by someone in drivers seat to simulate actual driving conditions.

CHOKE ROD ADJUSTMENT

UNLOADER ADJUSTMENT

Throttle Actuating R d



Fr nt-t -R ar Carbs. - Disconnect throttle rod at rear carburetor throttle lever. With front and rear carburetor throttle valves completely closed, throttle rod should center in slot in throttle lever. Adjust by bending rod at existing bend, then connect rod.

Vacuum Diaphragm Link

With throttle valves closed and arm on vacuum diaphragm in fully extended position, bend vacuum unit actuating link so that it just fits into hole in throttle lever.

OVERHAUL

See 1960 Final Data, Page 301, or later Manual edition for overhaul procedures.

VACUUM DIAPHRAGM LINK ADJUSTMENT

ROCHESTER FUEL INJECTION

C rvett (1963)

DESCRIPTION

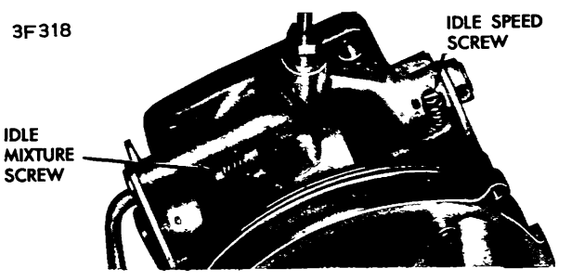
Fuel injection system design is similar to previous models except for the following changes.

Intak Manifold - Two-piece design without internal bulkheads.

Air Met r - A new warm air choke system similar to design of conventional carburetor choke systems.

Throttl Shaft - Horizontal shaft replaces former vertical shaft assembly. Related throttle linkage is new.

ADJUSTMENT (ON ENGINE)



►*ADJUSTMENT NOTE: All "On Engine" adjustments must be mad with engine at normal operating temperature.*

Idle Speed & Mixtur

With idle mixture screw turned 1½ turns out from a fully closed position (initial setting), start engine and adjust idle speed screw to obtain an engine speed of 800-850 RPM. Adjust idle mixture screw to obtain best engine idle characteristics, then readjust engine idle speed to 800-850 RPM if necessary.

Fast Idle Speed

2200 RPM (engine hot). *NOTE - Before adjusting fast idle speed, check to make sure there is clearance between fast idle screw and edge of fast idle cam when cam is in "off" position. If necessary, bend connecting rod to provide a small amount of clearance (see illustration).* With engine off, crack throttle valve and manually position cold enrichment valve to its closed position. Release throttle valve, allowing fast idle screw to be positioned on fast idle cam, then release cold enrichment valve and start engine. Adjust fast idle screw to obtain 2200 RPM (engine hot).

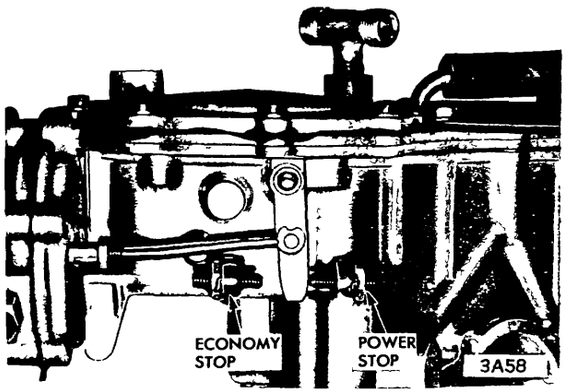
IDLE SPEED & MIXTURE SCREWS

Cold Enrichment (Choke)

3 Notches Lean. Loosen retaining screws and rotate thermostatic coil spring cover on housing.

(Continued)

FAST IDLE SPEED ADJUSTMENT



ROCHESTER FUEL INJECTION (Continued)

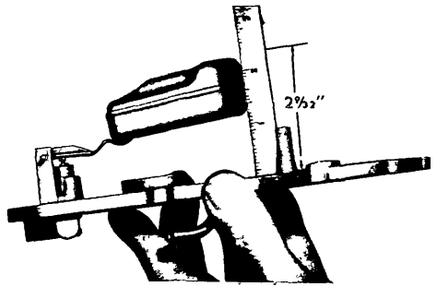
Ratio Lever Stops

Manometer Installation - Install Tool J-7090 in same manner as for 1962 models. *See 1962 Final Data, Page 274.*

Economy Stop - .08"Hg.±.1" Hg. With engine at normal operating temperature, Tool J-7090 installed, check to see that unit is operating on economy stop. ***NOTE - If engine will not start with cranking signal valve line disconnected, reconnect line during initial starting procedure.*** Increase engine speed until a reading of 0.5" is obtained in water manometer, then hold engine at this speed (use fast idle screw and cam). Record reading on mercury manometer, then return engine to a lower speed and repeat the above procedure. Take three readings, the average of which should be within specifications (see above). To adjust, rotate "Economy Stop" setscrew on Fuel Meter (see illustration) as necessary to obtain correct reading.

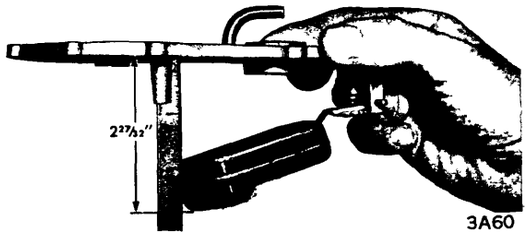
Power Stop - 1.2" Hg. ± .1" Hg. With manometer connected as for "Economy Stop" (above), disconnect and plug vacuum line going to enrichment diaphragm (this will cause unit to operate on "Power Stop" only). ***NOTE - Prolonged operation on "Power Stop" will cause spark plug fouling.*** Take three mercury manometer readings in same manner as for "Economy Stop" (above). Average of the three readings should be within specifications. To adjust, rotate "Power Stop" setscrew on Fuel Meter (see illustration) as necessary to obtain correct reading.

ECONOMY & POWER STOPS



ADJUSTMENT (OFF ENGINE)

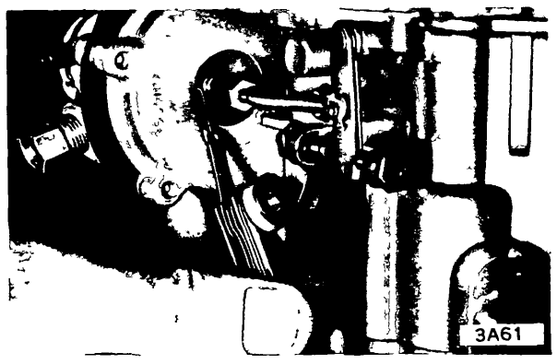
Float Level



2 9/32" with Fuel Meter cover inverted (see illustration). To adjust, bend float arm.

Float Drop

2 27/32" with Fuel Meter cover held upright and float assembly hanging free (see illustration). To adjust, bend tang on float arm.



FLOAT LEVEL ADJUSTMENT

FLOAT DROP ADJUSTMENT

Enrichment Diaphragm

.040" minimum clearance between diaphragm and diaphragm housing (see illustration). To adjust, change rod length as necessary. *CAUTION - Hold shaft securely while loosening locknut.*

ENRICHMENT DIAPHRAGM CLEARANCE

TROUBLE SHOOTING & DIAGNOSIS

Fails To Start

No fuel in fuel meter (check fuel supply and engine fuel pump). No fuel at nozzles (check for broken fuel meter pump drive cable). No vacuum signal at main control diaphragm (check for leaking or ruptured main control diaphragm, defective cranking signal valve, or broken main control diaphragm linkage).

Difficult Starting

Improper cold starting procedure (check fast idle cam setting and operation; check for choke valve stuck open) Improper hot starting or unloading procedure (use wide open throttle when starting; check for defective cranking signal valve or cold enrichment housing; check for vacuum leaks at main control diaphragm or signal line).

No Idle

NOTE - High speed operation not affected - Idle adjusting screws out of phase *(see "Adjustments" above).* Idle speed too low and (or) distributor advance incorrect (adjust idle speed, check distributor, check air meter throttle valve clearance). Idle fuel screw turned all the way out (check for dirty air meter passages, vacuum or air leaks, or defective main diaphragm). Idle fuel screw turned all the way in (check vent tubes and nozzles for plugged condition, check nozzle-to-insulator gaskets for defects). No idle boost signal (check for defective cranking signal valve; check for plugged main control diaphragm vent tube, check for sticking spill plunger, check for main diaphragm shrinkage).

Rough Idle

NOTE - High speed operation not affected - Idle adjusting screws out of phase *(see "Adjustments" above).* Excessive fuel at idle (purge system by accelerating a few times to clear manifold, check for defective cranking signal valve, check for plugged nozzles and nozzle vent tubes, check main diaphragm vent tube for obstruction, check engine valve lash setting).

Erratic Idle Speed

NOTE - High speed operation not affected - Engine idle speed fails to return to same speed each time throttle is operated (check for sticking throttle valve shaft at air meter bushings or for linkage binding, check for sticking spill plunger or choke valve).

Poor Acceleration

NOTE - Idle and wide open throttle operation not affected - Unit will take throttle when applied slowly (check for defective fuel meter pump drive cable or pump drive shaft, check for dirty signal tube, check for interference between enrichment housing and diaphragm, check for improper "Power Stop" setting, check for sticking spill plunger).

Poor Performance

Hesitation or flat spot (check for defective main control diaphragm or vacuum leaks, faulty spill plunger operation; check for incorrect "Economy Stop" setting). Surging at steady engine speed (check for plugged nozzles or nozzle vent tubes; check for incorrect "Economy Stop" setting; check for faulty integral siphon breaker operation; check for plugged main control diaphragm vent tube). Wide open throttle engine missing (check fuel meter pump drive cable and drive shaft for out of square condition; check engine fuel pump; check for dirty air cleaner or fuel filter; check for defective spark plugs). Excessive fuel consumption (check for defective cranking signal valve or cold enrichment housing valve sticking; check for open electric choke coil; check for fuel leakage or faulty integral siphon breaker operation; check for fouled plugs).

OLDSMOBILE F-85 JETFIRE CARBURETOR & FLUID INJECTION SYSTEM

Olds F-85 J tfir (1963)

DESCRIPTION

Carburetor and fluid injection system is same design as used on previous models. *See 1962 Final Data, Pag 282.*

ADJUSTMENT

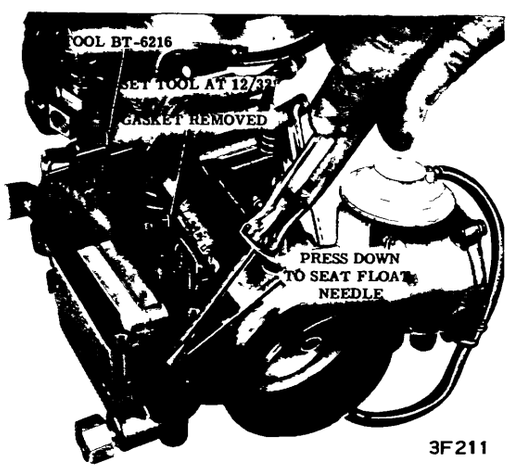
NOTE - Adjustments are not required on turbo-charger or fluid inj ction systems.

Throttle Linkage & Return Check

Se CARBURETOR on Car Model page.

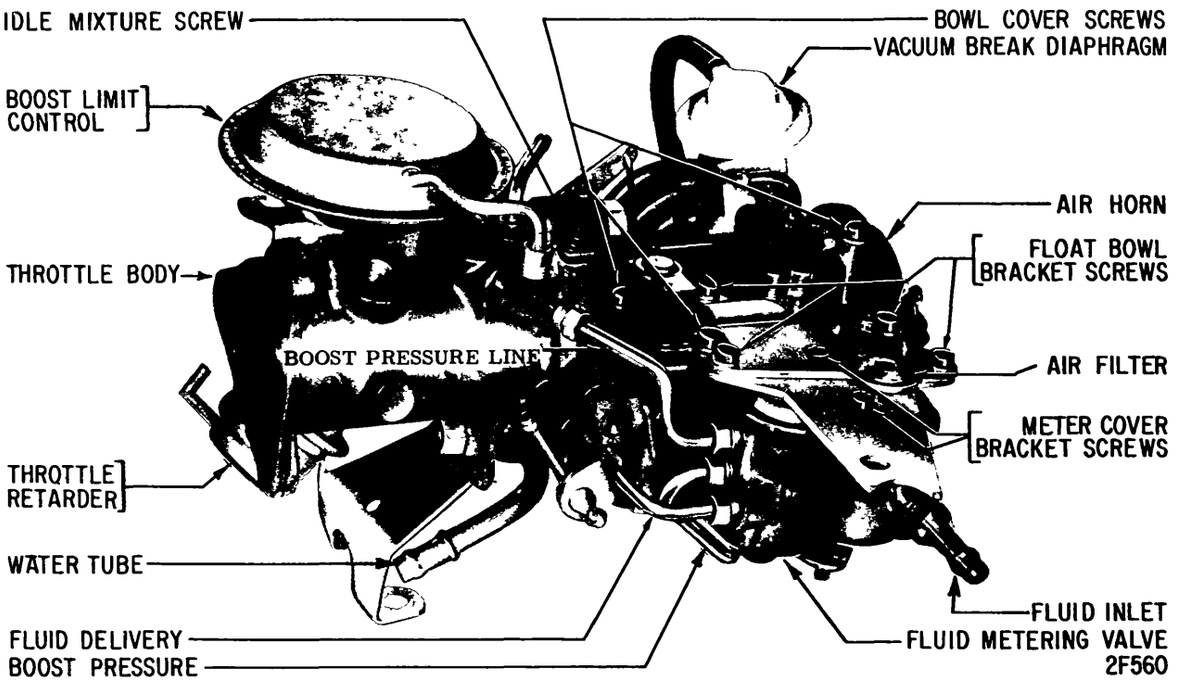
Idle Sp ed & Mixture

Idl Mixtur - For initial adjustment, turn idle mixture screw out approximately 1½ turns from a lightly seated position. After engine is brought to normal operating temperature, adjust idle mixture screw for highest manifold vacuum and engine RPM, then turn screw out ¼ turn for a slightly richer mixture.



Idl Sp d - 600 RPM (Air Conditioner OFF). Automatic transmission in "D" (Drive).

Fast Idl - Aut . Trans. - 1500 RPM with fast idle screw on second step of fast idle cam.



Synchr -m sh - 2400 RPM with fast idle screw on high step of fast idle cam.

Float Level

12/32" measured from machined surface of bowl flange (gasket removed and carburetor upright) to top of float at end opposite fuel inlet with float needle seated by pressing downward at rear of float arm. *NOTE - If Gaug BT-62-16 is us d, top corner of float should just touch gaug .* To adjust, bend float pontoon at float arm. Check to make sure that float is centered in bowl and is not rubbing side walls.

FLOAT LEVEL ADJUSTMENT

CARBURETOR & FLUID METERING VALVE ASSEMBLY

Float Drop

Float drop adjustment is not required on this carburetor.

Vacuum Break

5/32" clearance (use gauge or drill) between edge of choke valve and inner wall of air horn with diaphragm seated. To adjust, bend tang on linkage. Make sure that when diaphragm is rele ased, choke valve closes completely. *NOTE - If a second method of adjustment is required, linkage may be bent slightly.*

Choke Rod

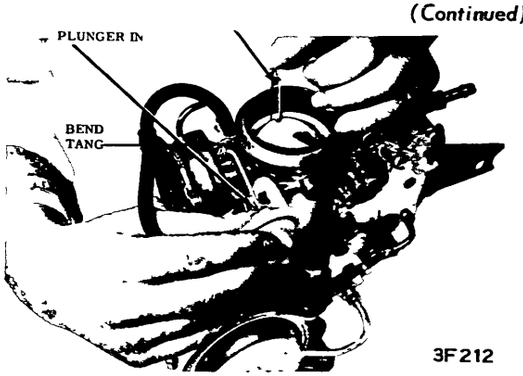
.140-.160" clearance between edge of choke valve and inner wall of air horn with fast idle screw on second step of fast idle cam and against highest step. To adjust, bend choke rod (rod between fast idle cam and choke shaft lever) at center angle.

Unloader

.308-.348" clearance between edge of choke valve and inner wall of air horn with throttle valve wide open. To adjust, bend t ang at fast idle cam.

Thr ttle R tard Unit

With throttle valve wide open and throttle retard plunger fully extended, connecting rod must freely enter hole in throttle lever. To adjust, bend rod at center angle.



Automatic Choke

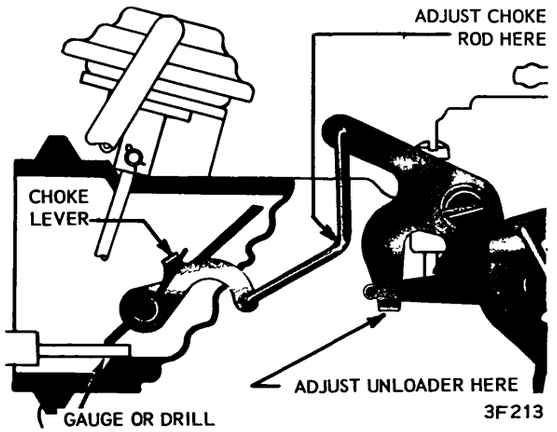
Loosen three retaining screws and rotate thermostat cover until index mark is in alignment with "Centered" mark on housing. Tighten cover retaining screws. *NOT E - "Centered" point on housing is indicated by a raised section on housing casting.*

Manual Choke

Pointer Adjustment - Loosen pointer screw, then with throttle held open to prevent weight of fast idle cam from affecting the adjustment, rotate pointer counter-

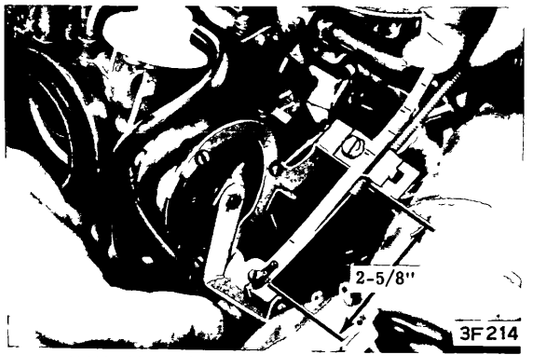
(Continued)

VACUUM BREAK ADJUSTMENT



OLDSMOBILE F-85 JETFIRE CARBURETOR & FLUID INJECTION SYSTEM (Cont.)

clockwise, then clockwise until choke valve just closes. Continue rotating clockwise three notches, then tighten pointer screw.



Cable Adjustment - With choke cable wire setscrew loosened and choke knob pushed all the way in, adjust choke wire so that distance between choke valve lever and edge of cable conduit clamp is 2 5/8". Tighten cable setscrew and bend end of wire so it cannot contact adjacent hoses

TESTING & TROUBLE SHOOTING

See 1962 Final Data, Page 283 for "Testing", "Trouble Shooting & Diagnosis"

CHOKE ROD & UNLOADER ADJUSTMENTS

MANUAL CHOKE CABLE ADJUSTMENT

REMOVAL & INSTALLATION

Fluid Tank

Removal - Loosen fluid filter clamp and lift filter up from mounting bracket, then disconnect and clamp fluid supply hose at fluid metering valve. Lower hose and filter to underside of car, then release clamp and drain fluid into a clean container. Disconnect gauge wire and remaining hoses at tank. Remove attaching bolts and nuts at each side of tank and remove tank.

Installation - Reverse removal procedure, then fill tank and check for leakage.

Check & Relief Valve

Removal - Disconnect hoses and remove coil, valve assembly, and nylon gasket. Lift connector, large washer, and "O" ring from intake manifold.

Installation - Reverse removal procedure and tighten valve to 12-18 ft. lbs.

Fluid Metering Valv

Rem val - *NOTE - It is not necessary to remove carburetor.* Remove metering valve bracket-to-cowl screws, then remove three copper tubes, being careful not to damage rubber gaskets, and then remove valve assembly.

Installati on - Connect the three copper tubes, middle tube first, making sure that all tubes are in line with holes before tightening. Install valve bracket-to-bowl attaching screws.

Carburetor

Removal - *NOTE - If engine is warm, releas pressur in cooling system by loosening radiator cap.* Remove hood, then remove air cleaner. Disconnect steel line from filter-to-carburetor inlet at carburetor, and compressor housing-to-throttle body water hoses at throttle b dy. Disconnect line from turbo-charger-to-bottom of float bowl at tee on bottom of float bowl, then disconnect carburetor rod. Disconnect choke cable if so equipped. Disconnect turbo-rocket fluid supply hose from metering valve, then disconnect check valve-to-throttle body hose. Disconnect crankcase ventilation valve-to-throttle body hose, then remove carburetor lower mounting bracket bolts. Remove nuts attaching carburetor-to-turbo-charger. Remove remaining water hose and remove carburetor.

Installation - Reverse removal procedure and note the following: Install a new gasket between carburetor and turbo-charger. Tighten carburetor-to-turbo-charger attaching nuts to 9-12 ft. lbs. Oil mounting bracket-to-intake manifold bolts with engine oil and tighten to 20-25 ft. lbs.

OVERHAUL

See 1962 Final Data, Page 282 for compl t v rhaul procedures.

OLDSMOBILE F-85 JETFIRE SUPERCHARGER

Olds F-85 Jetfire (1963)

DESCRIPTION

Exhaust driven turbo-supercharger assembly consisting of the following units:

Turbine & Compressor - Turbine wheel and compressor wheel are mounted on a common shaft (turbine wheel is welded to shaft and compressor wheel is pressed onto shaft and retained with a nut). The turbine wheel and compressor impeller are enclosed in separate housings and the balanced shaft is supported in the center housing by two floating bushings which are lubricated by engine oil pumped through housing and drained back to right hand rocker arm cover.

C ntroller Assembly - The poppet type valve located in turbine housing is operated by the controller. When engine is first started the bypass valve is closed, causing increased engine RPM (and increased exhaust) to turn turbine at a greater speed. The bypass valve controls the amount of exhaust pressure used to turn turbine and compressor, thereby controlling engine power output and speed of turbo-charger. The controller unit bolted to compressor housing, with two passages to compressor housing, senses compressor inlet and outlet pressures. When pressure differential is enough to overcome controller spring (within controller), controller opens bypass valve to divert exhaust gases from turbine wheel. The controller limits the pressure the turbo-charger will deliver to engine to 5-6 p.s.i.

Lubrication

Periodic lubrication, other than changing engine oil at specified periods, is not required.

REMOVAL & INSTALLATION

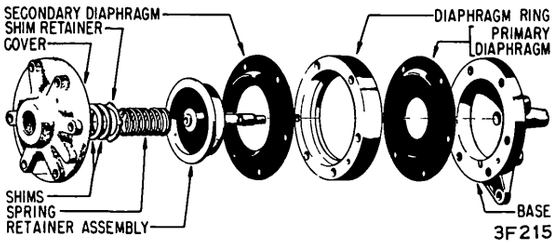
CAUTION - Clean as much dirt as possible off unit and carburetor. Cover oil inlet and outlet ports with plastic plugs to prevent dirt entering unit.

Turbo-Charger

Removal - Remove carburetor (see "Oldsmobile F-85 Jetfire Carburetor & Fluid Injection System" in this section), then remove turbo-charger exhaust inlet pipe by disconnecting at upper and lower flanges. *CAUTION - Install Tool BT-6219 at turbo-charg r and manifold opening (or cover op nings with tape).* Disconnect turbo-charger exhaust outlet pipe at upper flange, then drain coolant below level of turbo-charger. Disconnect oil feed line at center housing and disconnect oil return line. Disconnect compressor water inlet hose at compressor housing. *NOTE - D not close compressor housing wat r hand shut- ff valv .* Remove turbo-charger-to-intake manifold attaching nuts and remove turbo-charger.

Installation - *NOTE - Before installing Turbo-Charger, inspect intake manifold flange s al. If n cessary, s al can be replaced by removing sock t head scr ws r - taining turbo-charger-to-intak manifold flange. Aft r seal is installed, tighten sock t head scr ws t 14-17 ft. lbs.* Install turbo-charger by reversing removal procedure. Tighten turbo-charger-to-intake manifold nuts to 25-30 ft. lbs. Install new oil return line flange gaskets and tighten bolts to 10-15 ft. lbs. Tighten nuts at turbo-charger exhaust pipe connections to 10-18 ft. lbs.

Controller Assembly



Rem val - *NOTE - Controller can be removed for*

(C ntinued)

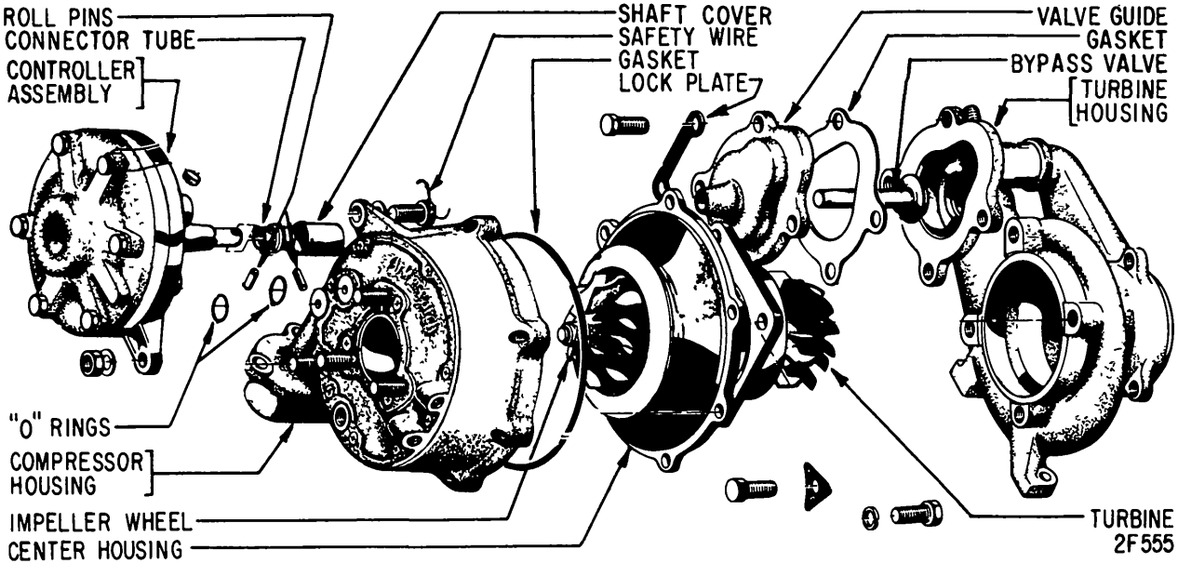
OLDSMOBILE F-85 JETFIRE SUPERCHARGER (Cont.)

service without removing turbo-charger. Cut and remove safety wire, then loosen bolt at top of controller and nut at bottom mounting ear (remove carburetor rod to gain access to bottom nut) Slide cover on shaft toward controller and remove roll pin from bypass valve end of controller tube Remove bolt and nut attaching controller to turbo-charger, then hold throttle valve wide open and remove controller Remove sensing port "O" rings Remove shaft cover and remaining roll pin, then remove controller tube

Installation - Install two new sensing port "O" rings, then install connector tube and secure in place with the roll pin installed through tube and controller stem. Slide shaft cover, safety wire end first, over connector tube, then pull out bypass valve and position connector tube over valve stem Temporarily install a cotter pin through connector tube and bypass valve Position controller on turbine housing and install lock washers, bolt and nut, and tighten to 8-9 ft lbs Remove cotter pin and install the roll pin, then install a new safety wire Connect carburetor rod (if removed)

SUPERCHARGER CONTROLLER ASSEMBLY

Bypass Valv



Rem val - *NOTE - Bypass valve can be removed for service without removing turbo-charger.* With controller assembly removed, straighten lock tabs at bypass valve guide bolts and remove bolts, guide, gasket and valve

Installation - Install valve in valve guide, then position a new gasket and install guide assembly on turbine housing Install guide lock plates and valve guide bolts and tighten bolts to 8-9 ft lbs.

OVERHAUL

Turbo Charger

Disass mbly - Remove controller and bypass valve. Scribe a line across compressor and center housing, then remove compressor housing-to-center housing bolts. Tap compressor housing lightly and separate both housings, then remove gasket. Remove housing cover and gasket from compressor housing (11 countersunk screws). Inspect housing and cover for cracks or indications of leakage. Scribe a line across center housing and turbine housing, then straighten lock-tabs on center housing-to-turbine housing bolts and remove bolts and lockplates. Carefully separate the two housings. *NOTE - C nt r housing and rotating ass mbly is s rviced nly as a c ampl t unit.*

OLDS F-85 JETFIRE SUPERCHARGER ASSEMBLY

Cleaning & Inspection - Before cleaning, inspect parts for burning, rubbing or other damage. Soak all parts EXCEPT CENTER HOUSING ASSEMBLY in clean carburetor solvent. After soaking, use a stiff bristle brush to remove all dirt, then dry parts with clean air. Inspect all parts for damage, corrosion, deterioration and wear. Threads must not be nicked, stripped, or crossed. Turbine wheel must not show signs of rubbing, and the vanes must not be eroded to a feather edge. *NOTE - A slight build-up of carbon will not affect operation.* Compressor impeller must not show signs of rubbing and must be completely free of dirt and other foreign material. Housings must not show signs of having been in contact with rotating parts. Oil, air and water passages must be clean and free of any obstruction. Rotating assembly must rotate without any signs of roughness. A slight drag due to spring loaded carbon seal is normal. Heat shield must not rub turbine wheel.

Controller Assembly

Disassembly - Scribe a line on edge of the controller then remove four of the six cover bolts and loosen the two remaining bolts about 1/8". *CAUTION - Cover is under spring tension.* Apply air pressure (15-20 p.s.i.) to pressure port first, then to vacuum port to free diaphragms. Remove remaining bolts while holding cover and spring compressed, then remove cover and spring. Remove shim retainer and shims from spring seat. *NOTE - Count number of shims. If spring is to be replaced, discard shims and retainer. Service springs are calibrated to be used without shims and retainer. Service springs are identified by a blue stripe.* Separate controller base, diaphragm and diaphragm ring, then remove diaphragm retainer, diaphragms and ring. Remove ring from retainer by slipping over stem end of retainer. Remove diaphragms from stem side of retainer.

Reassembly - Install turbo-charger turbine housing on center housing with scribe marks aligned, then install lockplates and bolts and tighten to 8-9 ft. lbs. *NOTE - Check for turbine clearance by pushing shaft towards turbine housing while rotating shaft. Ther should not be any contact between wheel and housing.* Install compressor housing-to-center housing gasket, then position center housing on compressor housing with scribe marks aligned. Install attaching bolts and tighten to 8-10 ft. lbs. Install compressor housing-to-cover gasket, then install cover and tighten attaching screws to 25-30 inch pounds. *NOTE - Check compressor impeller-to-housing clearance by pushing on turbine end of shaft while rotating shaft. There should not be any contact between compressor impeller and housing.* Install bypass valve and controller (see below).

Reassembly - Install the secondary diaphragm on the retainer assembly with raised ring on diaphragm toward retainer. Make sure diaphragm is firmly seated into groove of retainer. Install diaphragm ring over retainer with relieved side of ring toward secondary diaphragm. Install primary diaphragm into groove of retainer with raised ring of diaphragm toward retainer, then align pressure passage holes and bolt holes of diaphragms and diaphragm ring. Install two guide pins (use 1/4" x 3" U.S.S. bolts) in controller base, then install retainer assembly with diaphragms and diaphragm ring over guide pins with all holes aligned. Clamp retainer stem in a soft jawed vise so controller base is upward, then install shims and retainer in cover. Install spring in position on retainer assembly and position controller cover over guide pins. Compress spring with controller cover and install two opposite bolts finger tight. Remove guide pins and install remaining bolts. With diaphragms centered in the assembly and with 1/8" of diaphragms exposed all the way around, tighten bolts alternately to 40-50 inch pounds.

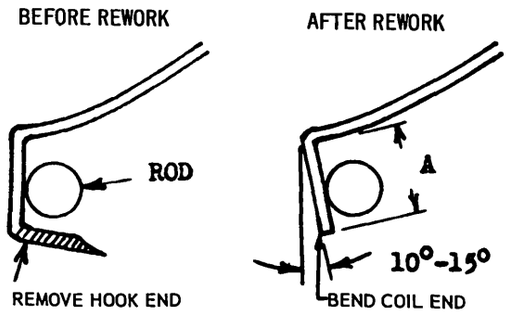
STROMBERG WWC 2-BARREL (CHRYSLER & DODGE) CARBURETORS

CHRYSLER & DODGE	Stromberg Code No.
Chrysler Newport 361" Eng. Early	WWC 3-221
Chrysler Newport 361" Eng. Late	WWC 3-221A
Dodge Custom 880 361" Early	WWC 3-221
Dodge Custom 880 361" Eng. Late	WWC 3-221A



►CHANGES, CAUTIONS, CORRECTIONS

►*HARD COLD WEATHER STARTING CORRECTION:* Hard starting may be caused by choke piston sticking. To correct, remove air cleaner and squirt carburetor cleaner, lacquer thinner or alcohol through piston link opening while operating choke to clean out gum formation.

►*1963 361" ENGINE HARD STARTING & SLOW WARM-UP CORRECTION:* Remove choke unit and note position of index mark on indexing disc. If choke is indexed two notches lean, reindex to 1 notch rich.

►*1963 CHRYSLER & DODGE (361" ENG.) STALLING AFTER COLD START CORRECTION & CARBURETOR PRODUCTION CHANGE:* Stromberg WWC 3-221 has been replaced in production with WWC 3-221A to correct the above condition. To rework WWC 3-221, proceed as follows: Remove choke vacuum piston assembly from air horn and increase the size of bleed holes (4 holes) in piston, using a No. 54 drill. Adjust choke vacuum piston (see "Adjustments" below) so a 7/64" drill will fit between choke valve and air horn wall. Install a welch plug and seal cylinder, then adjust hot idle and fast idle speeds to specifications.

►*1963 361" ENGINE HARD STARTING (DUE TO CHOKE NOT OPERATING PROPERLY):* This condition which may occur intermittently could be caused by choke thermostat coil catching on cast surface of choke pocket. To check if coil is caught, a "twanging" noise will be heard when choke assembly is unbolted and removed from choke well. To correct, mark location of index mark on disc, then loosen choke coil adjusting locknut and rotate coil so free end of coil hangs down. Grind away the outer bend (see illustration), keeping contact face of coil as long as possible. Bend contact face of coil 10-15° toward choke rod, being careful not to distort coils of thermostat. Remove any sharp edges caused by grinding, then turn index disc until notch is opposite the 1 notch rich mark and tighten locknut.

CHOKE COIL REWORK

CARBURETOR ADJUSTMENT SPECIFICATIONS										
Stromberg Code No.	H t Idl Speed (Eng. RPM)	Initial Idle Mixture③	Fast Idle (Eng. RPM)	Fast Idle Cam Index	Float Level Setting	Unloader Setting	Bowl Vent	Acc l. Pump Trav l	Ch k Pist n Setting	Aut . Ch k Setting
WWC 3-221	500①②	1 1/2	1400	1/4"	1/8"	15/16"	5/64"	7/16"	.170"	1 Rich
WWC3-221A	500①②	1 1/2	1400	1/4"	1/8"	15/64"	5/64"	7/16"	7/64"	1 Rich

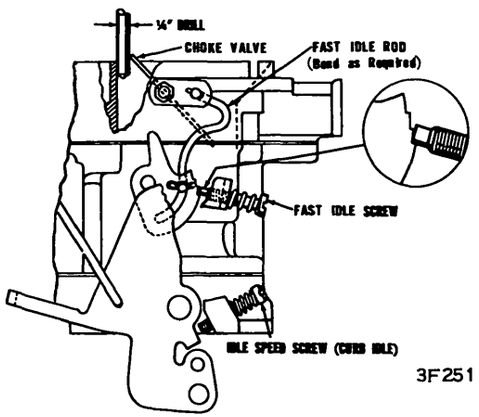
① - Auto. Trans. in "N" (Neutral).
② - All models with headlights turned ON.
③ - Turns open from a lightly seated position.

DESCRIPTION

2-barrel downdraft type of same design as previous carburetors.

ADJUSTMENT

Idle Mixture & Speed

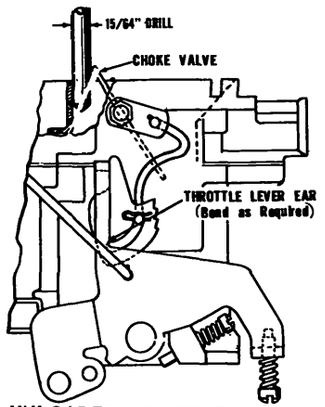


Adjust idle speed to specifications with engine at normal operating temperature, then turn both idle mixture screws in equally until engine begins to run rough. Turn both idle mixture screws out until engine rolls from rich mixture. Now turn both screws in to a point about halfway between these two points where smoothest idle is obtained. *NOTE - Both idle mixture screws must be turned equally.* Readjust idle speed to specifications.

Fast Idle (On Car)

With engine at normal operating temperature and fast idle screw on top step of fast idle cam, adjust fast idle screw to obtain correct engine speed (see "Specification Table").

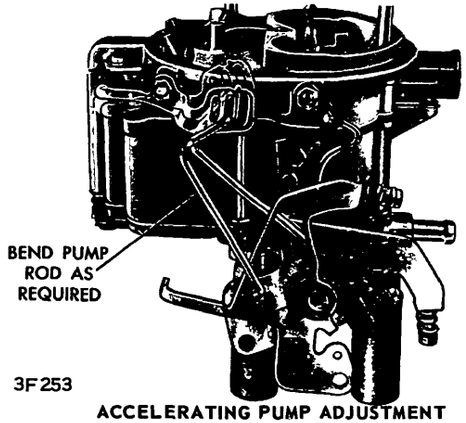
Fast Idle (Off Car) & Cam Position



Back throttle stopscrew out far enough to clear throttle lever tang when throttle valves are closed, then hold throttle valves in closed position. Turn fast idle screw out so it can be positioned on **second step** of cam (against top step), **and turn fast idle screw in 3½ turns.** Distance between edge of choke valve and air horn should be as indicated in "Specification Table". To adjust, bend fast idle rod at upper angle.

FAST IDLE CAM POSITION

Unloader

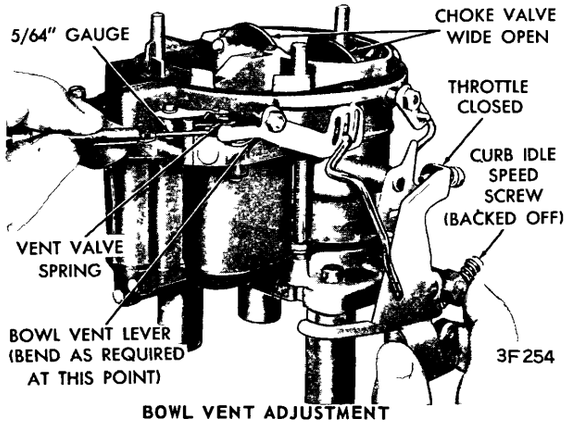


With choke valve held lightly closed, open throttle valves to wide open position. Clearance between top edge of choke valve and wall of air horn should be 15/64" (use 15/64" drill to measure). To adjust, bend tang (long narrow extension) on throttle lever. Make sure throttle valves fully open and close when choke valve is wide open.

UNLOADER ADJUSTMENT

Accelerating Pump

With throttle valves fully closed, pump travel from fully closed to fully open positions should be as indicated in "Specification Table", measured at small raised boss near connecting rod end of pump lever. To adjust, bend pump rod at right angle bend. *NOTE - Pump rod must be installed in center slot of pump arm.*

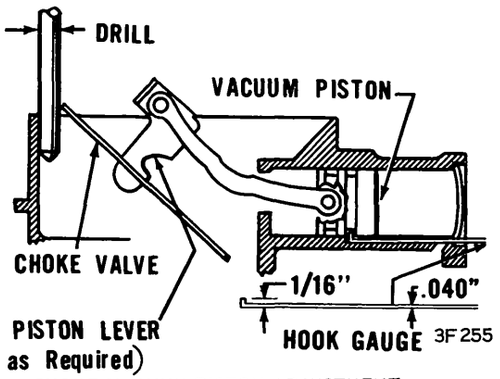


ACCELERATING PUMP ADJUSTMENT

STROMBERG WWC 2-BARREL (CHRYSLER & DODGE) (C ntinu d)

Bowl Vent

With idle speed screw backed out, hold throttle valves in closed position and choke valve wide open Opening of vent valve at center of hole with rubber valve hanging free should be as indicated in "Specification Table" To adjust, bend bowl vent lever (extension of accelerating pump lever) *CAUTION - Make sure that vent valve is not distorted and that it properly seals the bowl vent hole when throttle valve is open.*



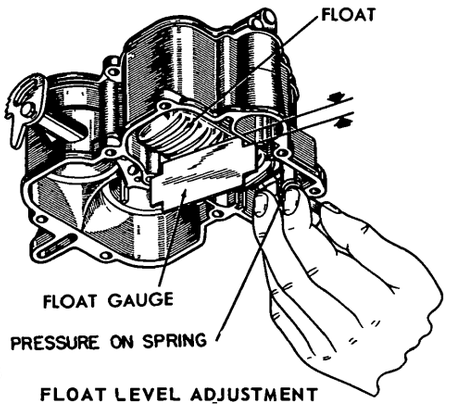
BOWL VENT ADJUSTMENT

Choke Vacuum Piston

Remove welch plug from choke piston cylinder and insert a hook gauge (036" to 040" diameter) into slot in piston wall Rotate hook end so that it engages end groove in piston Apply a light closing pressure against choke valve so that hook gauge is gripped between groove in piston and end of slot With choke piston in this position, clearance between choke valve and air horn should be as indicated in "Specification Table" To adjust, bend bracket on choke valve

Float Level

With float installed in float bowl and lip of float held against inlet needle, distance from top of float at center to top of float bowl (gasket removed) should be as indicated in "Specification Table" . To adjust, bend lip of float



CHOKE VACUUM PISTON ADJUSTMENT

Automatic Choke

Cross-over type, mounted in well in intake manifold Do not change setting

OVERHAUL

See 1960 Final Data, Page 310, or later Manual edition, for complete overhaul procedure.

FLOAT LEVEL ADJUSTMENT

① - Auto Trans. in "N" (Neutral)
② - All models with headlights turned ON.
③ - Turns open from a lightly seated position

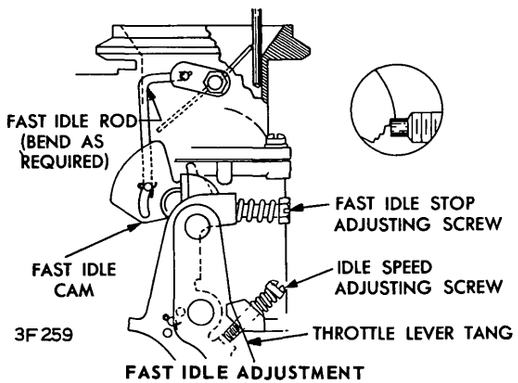
ADJUSTMENT

Idle Mixture & Speed

Adjust idle speed to specifications with engine at normal operating temperature, then turn both idle mixture screws in until engine begins to run rough Turn both idle mixture screws out until engine rolls from rich mixture Now turn both screws in to a point about halfway between these two points where smoothest idle is obtained *NOTE - Both idle mixture screws must be turned equally*. Readjust idle speed to specifications.

Fast Idle (On Car)

With engine at normal operating temperature and fast idle screw contacting top step of fast idle cam, adjust engine speed to specifications (see "Specification Table" above)

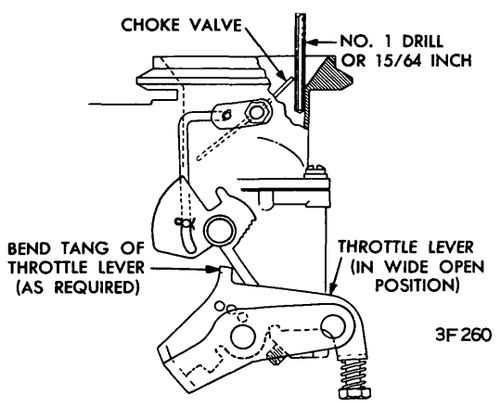


Fast Idle (Off Car) & Cam Position

Back throttle stopscrew out far enough to clear throttle lever tang when throttle valves are closed, then hold throttle valves in closed position. Turn fast idle screw

(Continued)

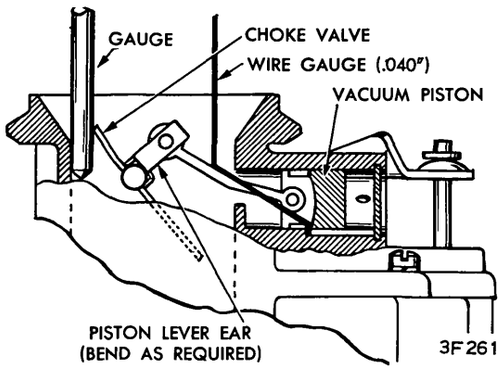
STROMBERG WW 2-BARREL (DODGE & PLYMOUTH) (C ntinu d)



in so it can be positioned on **second step** (against top step), and **turn fast idle screw in 7 turns.** Distance between edge of choke valve and air horn wall should be 13/64". To adjust, bend fast idle rod at upper end.

FAST IDLE ADJUSTMENT

Unloader



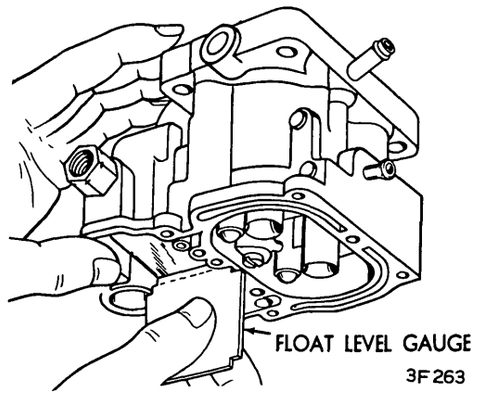
Close choke valve lightly and fully open throttle valves. Clearance between choke valve and wall of air horn should be 15/64". To adjust, bend tang on throttle lever.

UNLOADER ADJUSTMENT

Choke Vacuum Piston

Bend a .040" wire gauge so it will engage slot at bottom of choke vacuum piston cylinder, then with gauge in place, lightly close choke valve until inner end of piston grips gauge at end of slot. Measure choke valve opening or clearance between upper edge of choke valve and air horn wall Clearance should be as indicated in "Specification Table". To adjust, bend ear on piston lever.

CHOKE PISTON ADJUSTMENT



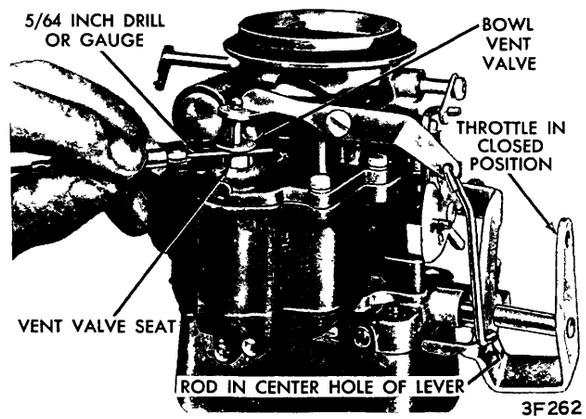
Accelerating Pump & Idle Vent

NOTE - This is a combination adjustment. Accelerating pump travel is automatically set when bowl vent is properly adjusted. Back off idle adjusting screw and open choke valve so that when throttle valves are closed, fast idle screw will not contact cam. Place pump rod in center hole in throttle lever and pump vent clip (located on pump stem under bowl vent valve) in center notch. With throttle valves closed tightly, clearance between bowl vent seat and bowl vent should be as indicated in "Specification Table". To adjust, bend pump rod at lower angle

ACCELERATING PUMP ADJUSTMENT NOTE - If pump rod is moved to either the short or long stroke position, a corresponding change must be made in location of bowl vent clip, and the amount of lift of bowl vent rechecked and adjusted.

Float Level

NOTE - Fuel inlet needle is tipped with synthetic rubber. Weight of float only should force needle against the seat. Invert float bowl and check distance between surface of fuel bowl (gasket removed) and top of float at center. This measurement should be as indicated in "Specification Table". To adjust, hold float at bottom of bowl and bend tang on float as necessary. *CAUTION - When bending float tang, do not allow tang to push against needle. When float is correctly set, float tang should be perpendicular to needle or slanted not more than 10° away from needle.*



FLOAT LEVEL ADJUSTMENT

Automatic Choke

Cross-over type mounted in well in intake manifold. Do not change setting

OVERHAUL

See 1958 Final Data, Page 294, or later Manual edition for complete overhaul procedures

BOWL VENT & ACCEL. PUMP ADJUSTMENT

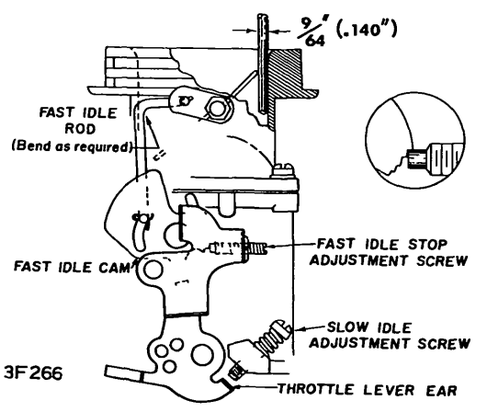
STROMBERG WW 2-BARREL (STUDEBAKER) CARBURETORS

STUDEBAKER V8 Engine — **Stromberg Code No.** WW 6-130

DESCRIPTION

2-barrel downdraft type similar to previous models Automatic choke housing is mounted on throttle body and connected to choke shaft lever by linkage

ADJUSTMENT



Adjust idle speed to specifications with engine at normal operating temperature then turn both idle mixture screws in until engine begins to run rough Turn both screws out until engine rolls from rich mixture Now turn both screws in to a point about halfway between the above two points where smoothest idle is obtained *NOTE - Both idle mixture screws must be turned equally* Readjust idle speed to specifications

Accelerating Pump

No seasonal adjustment Three holes are provided in throttle lever for pump connector rod engagement
C nt r H l - Normal operating conditions
Upp r H l - Shorter stroke, less fuel discharge
Low r H l - Longer stroke, more fuel discharge

Float L vel

NOTE - Fu l inlet needle is tipped with synthetic rubb r Weight of float only should force needle against the seat Invert float bowl and check distance between surface of fuel bowl (gasket removed) and top of float at center This measurement should be as indicated in "Specification Table" To adjust, hold float at bottom of bowl and bend tang on float lever as necessary *CAUTION - When bending float tang, do not allow tang to push against n edl*

FAST IDLE CAM ADJUSTMENT

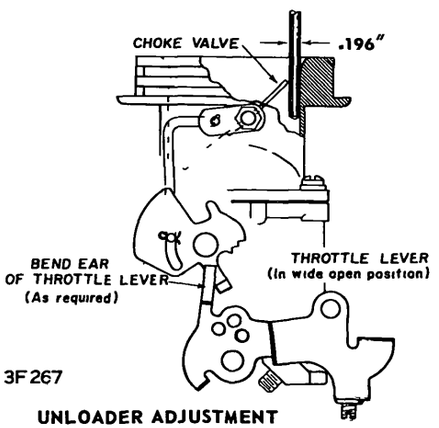
CARBURETOR ADJUSTMENT SPECIFICATIONS

Stromberg Code No.	Hot Idle Speed (Eng. RPM)	Initial Idle Mixture③	Fast Idle (Eng. RPM)	Fast Idle Cam Index	Float Level Setting	Unloader Setting	Bowl Vent	Accel. Pump Travel	Choke Piston Setting	Auto. Chok Setting
WW6-130	550①	1¼"		9/64"	3/16"	196"			228"	Index

Fast Idle (Off Engine)

With choke valve closed and high step of fast idle cam touching fast idle screw, adjust fast idle screw so that a 030" gauge wire can be inserted freely between throttle valve and throttle body on idle port side

Fast Idle (On Car)

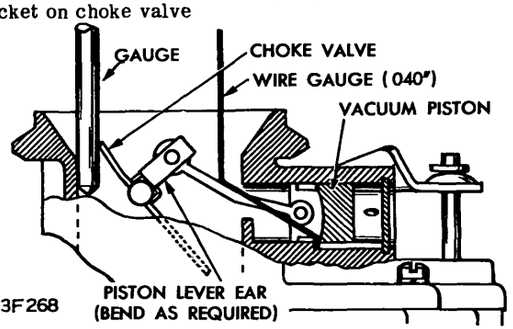


With fast idle screw aligned with index mark on fast idle cam, adjust screw to obtain desired engine RPM

Fast Idle Cam

Place fast idle screw on highest step of fast idle cam, then close choke valve until fast idle rod contacts upper end of slot in fast idle cam With choke valve in this position, clearance between top edge of choke valve and air horn wall should be as indicated in "Specification Table" To adjust, bend fast idle rod

Unloader



To check setting, hold choke valve closed lightly, then open throttle valves to wide open position so throttle lever stop rests against throttle body stop Clearance between choke valve and wall of air horn should be as indicated in "Specification Table" To adjust, bend ear on throttle lever

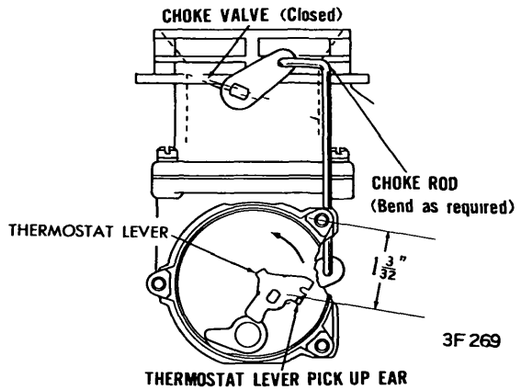
UNLOADER ADJUSTMENT

Choke Vacuum Piston

Open choke valve and place end of 040" wire gauge in inner end of choke piston housing slot *NOTE - Bend wir as n c ssary t ins rt into chok piston housing from within air horn* Close choke valve until end of wire gauge is gripped between skirt end of vacuum piston and end of slot Clearance between top edge of choke valve and air horn wall should be as indicated in "Specification Table" To adjust, bend piston lever bracket on choke valve

CHOKE VACUUM PISTON ADJUSTMENT

Choke Spring Operating Lever



With thermostatic coil cover assembly removed, and with choke valve closed, distance between top of tang on thermostat lever and center of screw hole directly above lever should be as indicated in "Specification Table" To adjust, bend rod connecting thermostat lever to lever on choke shaft

Automatic Choke

Loosen cover screws and rotate cover as necessary to align index mark on cover with correct mark on housing See "Specification Table" for correct setting

OVERHAUL

See 1962 Fi nal Data, Page 294 for complete overhaul procedures

THERMOSTATIC SPRING OPERATING LEVER ADJUSTMENT

STROMBERG WA SINGLE BARREL CARBURETORS

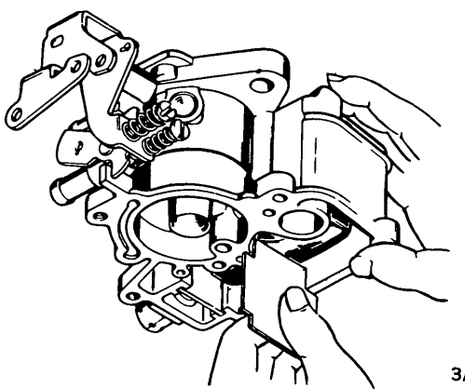
DODGE, PLYMOUTH VALIANT	① Stromberg No.
170" & 225" 6 Cyl. Engs. (Early)	WA 3-219
170" & 225" 6 Cyl. Engs (Late)	WA 3-219A

① - Carb. number stamped adjacent to fuel inlet fitting.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 DODGE & PLYMOUTH HARD STARTING, STUMBLING (REPEATED STOPPING AFTER STARTING) CORRECTION:* May be caused by choke coil hanging in choke pocket. To check, allow engine to cool, then open throttle and note choke valve position. If choke valve closes partly or fully, it is operating properly If choke valve does not close at all, yet moves freely by hand, choke is caught in pocket. Correct by replacing choke unit with Part No. 2463271 which is identified by "57" (or "53" and a dot of yellow paint) stamped on housing

►*HARD COLD ENGINE STARTING CORRECTION:* Hard starting may be caused by choke piston sticking To correct, remove air cleaner and squirt carburetor cleaner, lacquer thinner or alcohol through piston link opening while operating choke to clean out gum formation



DESCRIPTION

Single barrel down-draft type with separate "well type" automatic choke. Carburetor assembly consists of two sub-assemblies (air horn and main body). Throttle body assembly is integral with main body.

ADJUSTMENT (ON ENGINE)

Idle Mixture & Idle Speed

Adjust idle mixture to leanest mixture possible with a smooth idle. On automatic transmission cars, unsnap ball joint connection at accelerator shaft bellcrank. After idle speed is adjusted, screw ball joint connector up or down until ball will exactly mate with socket. On all models, turn headlights on high beam to compensate for alternator load.

3A9

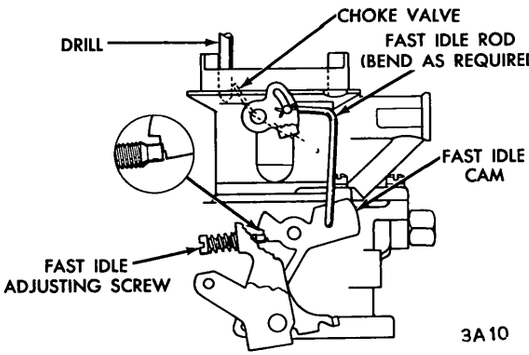
FLOAT LEVEL ADJUSTMENT

CARBURETOR ADJUSTMENT SPECIFICATIONS

Carb. No.	Idl Spe d (Eng. RPM) Hot	Idl Spe d (Eng. RPM) Fast	Initial Idle Mixture ①	Float Setting	Float Gauge No.	Choke Setting	Fast Idle Cam Index	B wl V nt	Unl ad r S tting	Vacuum Kick Setting
WA 3-219, A	550②	1400③	3/4-1	11/32"	④ 73725	2 Rich	19/64"	.060"	③11/32"	⑤ .2280"

① - Turns open from a lightly seated position. ② - Headlights on High Beam. Air Cond. ON.
③ - Fast idle screw on second stop of fast idle cam. ④ - Stromberg No. ⑤ - Use suitable size drill.

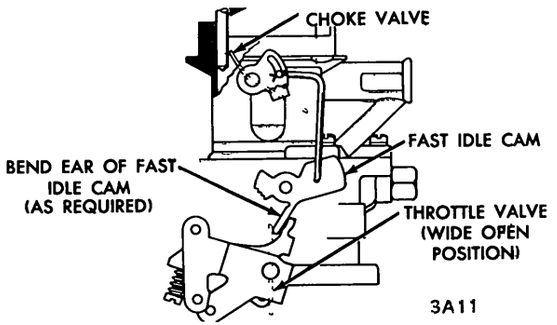
Fast Idle Speed



Adjust fast idle with fast idle speed screw on second step of fast idle cam (see illustration).

ADJUSTMENT (OFF ENGINE)

Float Level



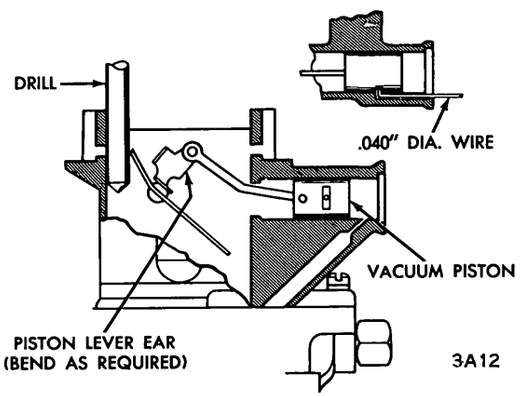
With air horn and gasket removed, invert main body so that weight of float only is forcing needle against seat. Distance from flange surface of fuel bowl to top of float at center should be as indicated in specification table. To adjust, hold float at bottom of bowl, then bend float lip toward or away from needle with Tool 73605. ***CAUTION - When bending float lip, do not allow lip to push against needle. Needle is rubber tipped and would cause a false setting.***

►***ADJUSTMENT NOTE: The following adjustments must be made in the sequence indicated.***

3A10

FAST IDLE SPEED & CAM INDEX ADJUSTMENT

3A11



UNLOADER ADJUSTMENT

Fast Idle Speed & Cam Index

Turn idle speed screw out so it clears tang on throttle lever when throttle valve is closed, then hold throttle valve in closed position and turn fast idle screw out until fast idle cam can be positioned as indicated in illustration. Turn fast idle screw in until it just touches second step of fast idle cam, then turn in **4 turns**. Hold fast idle screw in this position and move choke valve with a light pressure toward closed position. With fast idle rod at lower end of slot in choke shaft lever, clearance between choke valve and wall of air horn should be as indicated in specifications. To adjust, bend fast idle rod (see illustration.

Unloader

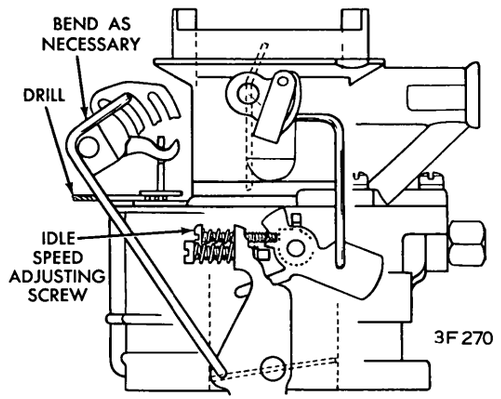
Hold choke valve lightly closed and open throttle valve fully. Choke valve should open sufficiently to allow a drill (see specifications for proper size) to be inserted between choke valve and wall of air horn. To adjust, bend ear on fast idle cam (see illustration).

3A12

CHOKE PISTON ADJUSTMENT

Choke Piston (Vacuum Kick)

Insert bent end of a .040" diameter wire (see illustration) into slot on side of piston bore. Apply a light closing pressure on choke valve, then with wire held in place between piston and slot, clearance between choke valve and wall of air horn should be as indicated in specifications. To adjust, bend ear on choke piston lever. Install a new welsh plug.



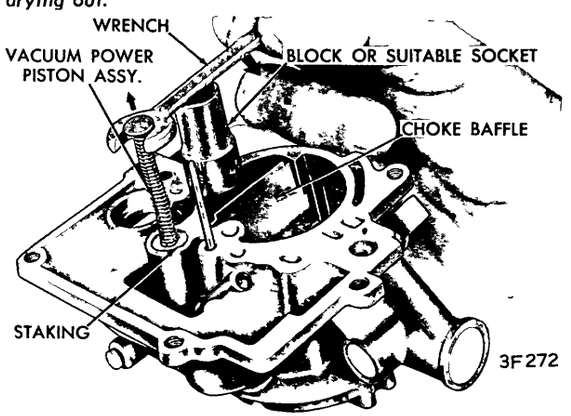
B wlVent (Accelerator Pump)

NOTE - Acc l rator pump trav l will be automatically adjusted when bowl v nt is properly adjust d. Back off idle speed adjusting screw, then pen ch ke valve so

(C ntinued)

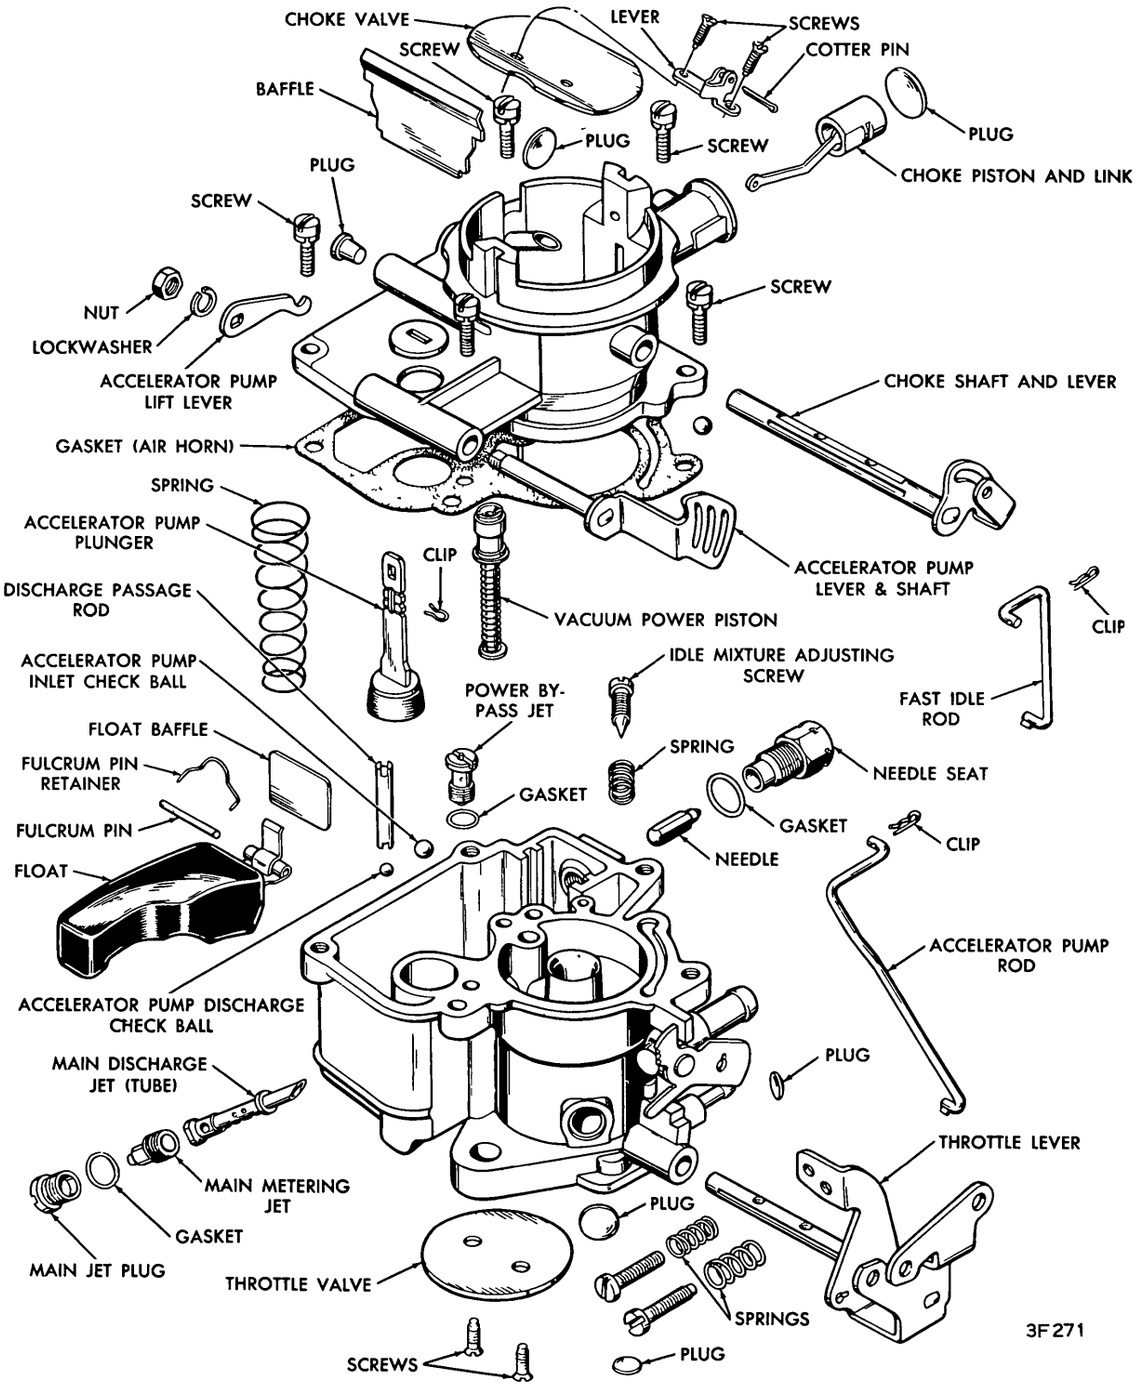
STROMBERG WA SINGLE BARREL CARBURETORS (Cont.)

fast idle screw does not contact cam. With pump rod in center (medium stroke) slot in throttle lever, and bowl hairpin clip on pump stem in center groove, close throttle valve tightly. Clearance between bowl vent and vent seat should be as indicated in specifications. To adjust, bend accelerator pump rod (see illustration). *CAUTION - If pump rod is moved to either short or long stroke position, a corresponding change must be made in location of bowl vent hairpin clip on pump stem. Clearance between bowl vent and vent seat must also be reset and adjusted.*



BOWL VENT (PUMP) ADJUSTMENT

OVERHAUL



Disassembly

1) Disengage pump rod from slot in pump lever and from throttle lever, then remove fast idle rod from pump lever and fast idle cam. Remove air horn assembly. *CAUTION - Be careful not to damage idle orifice tube. This tube is pressed into place and must not be removed.*

2) Remove pump lift lever from pump shaft and remove accelerator pump assembly and vent valve. *NOTE - Place pump plunger in gasoline to prevent leather drying out.*

POWER PISTON REMOVAL

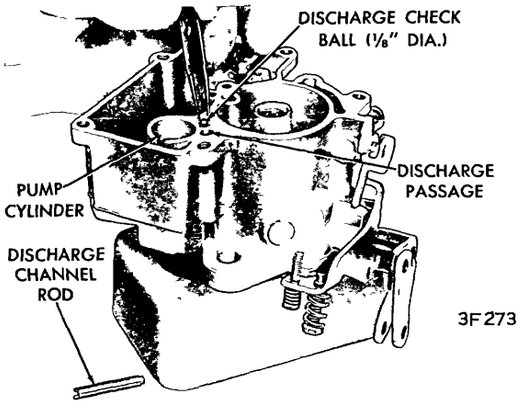
STROMBERG "WA" CARBURETOR

STROMBERG WA SINGLE BARREL CARBURETORS (C nt.)

3) Remove vacuum power piston from air horn by prying it out as indicated in illustration. *NOTE - This assembly is staked in place. Be careful when removing it.* Pierce choke piston cylinder welch plug and pry it out, then disconnect choke piston link from bracket on choke valve and slide piston out of cylinder.

4) Invert carburetor main body and allow accelerator pump inlet and discharge check balls and discharge channel rod to drop out. Do not lose these parts. Remove fuel inlet needle valve seat and gasket, then remove float baffle. Use a small screwdriver and pry out float fulcrum pin retaining spring (prevent spring from flying out), then remove float and pin assembly.

5) Remove power bypass jet and gasket. Invert carburetor main body and remove main jet plug with Tool 73598 and Tool 73609. Remove main jet with Tool 73606. Remove main discharge jet (or tube) with Tool 73608. *NOTE - Tool 73608 has a tapered right hand thread and should be screwed into jet. Threads formed in jet during removal will not damage jet.* Remove idle mixture adjusting screw and spring.



6) *NOTE - Do not remove throttle valve and shaft unless a new shaft is to be installed.* Mark valve so it can be installed in original position, then remove valve attaching screws and slide valve out of shaft. *NOTE - Screws are staked in position. Use care when removing so as not to break screws in shaft.* Slide throttle shaft out of main body.

Inspection

Wash all metal parts in a suitable carburetor cleaner and blow dry with air. Blow out all passages and jets with air pressure. Do not clean jets with a wire or drill. Inspect all parts for wear or damage and replace as necessary.

Reassembly

1) If throttle valve and shaft were removed, install new shaft in main body and slide throttle valve down into position, aligning marks made at disassembly. Install new screws but do not tighten. Hold valve in place by pressing on high side of valve, then tap valve lightly with a screwdriver to seat in throttle bore.

PUMP DISCHARGE CHECK INSTALLATION

Hold valve firmly in place and tighten screws. Stake screws in place by squeezing with pliers.

2) Install idle mixture screw and spring in carburetor, then turn screw in until it is lightly seated. Back out idle mixture screw for initial adjustment (see specifications).

3) Place main discharge jet (tube) firmly on Tool 73608 and position in main body so diagonal cut end is facing opposite side of small venturi. *NOTE - This jet must be seated firmly in main body.* Insert main metering jet in body over discharge jet (tube) and tighten securely with Tool 73606. Install a new copper gasket in main jet plug opening, then install plug and tighten securely.

4) Install float pin through float hinge and install float assembly in float bowl. Assemble fuel inlet needle valve, seat and gasket, then insert in position in main body and tighten securely. Install float pin retaining spring in position and force under lip of boss to keep pin in position. Adjust float lever (see "Adjustment" above).

5) Install pump inlet check ball (3/16" Dia.) at bottom of pump cylinder, then install pump discharge ball check (1/8" Dia.) in orifice next to pump cylinder. Install discharge channel rod over check ball. Install power bypass jet in fuel bowl, using a new gasket, and tighten securely.

6) *NOTE - Check accelerator pump as follows:* Install pump plunger in cylinder, then pour clean gasoline into fuel bowl. Work plunger up and down to expel air, then remove channel rod from discharge passage. Use a clean brass rod and press down firmly on discharge ball check. Raise pump plunger and press downward. No fuel should be emitted from either inlet or discharge passage. If leakage is indicated, clean passage, then place a piece of drill rod on ball and rap sharply with a hammer to form a new seat. Install a new check ball. Pour gasoline out of carburetor and remove pump plunger, then reinstall channel rod.

7) Clean choke cylinder sealing surface, then slide piston into cylinder. Engage link with bracket on choke valve and install cotter pin. *NOTE - Do not install welsh plug until final adjustment is made.*

8) Insert bowl vent valve clip in center groove of pump plunger stem, then install compression spring. Slide accelerator pump shaft and lever into position in air horn, then slide pump plunger stem and spring through air horn. Install vent valve over stem and engage with pump lift lever. Install locknut and washer.

9) Install vacuum power piston and plunger in air horn, then lock in position by prick punching on retainer rim. Compress piston plunger to make sure no binding exists. Install a new air horn gasket and install air horn on main body. *NOTE* - Be sure pump leather does not curl or fold back as plunger is inserted in cylinder. Install air horn retaining screws. Install fast idle rod in fast idle cam and in slotted hole in choke lever, securing rod in lever with a clip.

10) Install accelerator pump rod in throttle lever and engage other end in center slot of pump lever. Secure rod in lever with clip. Make all "Off Engine" adjustments (see above) and install a new welch plug in choke piston cylinder.

2098840	40 amps	2098300

►CHANGES, CAUTIONS, CORRECTIONS

BATTERY INSTALLATION, BATTERY CHARGING, OR USING A BATTERY BOOSTER TO START ENGINE

CAUTION - Reversed polarity or excessive voltage will result in extensive damage to alternator system. *NOTE THE FOLLOWING TO PREVENT DAMAGE.*

Battery Installation - Negative battery terminal must be connected to **ground.** Positive terminal must be connected to starter lead. *DO NOT REVERSE BATTERY LEADS.*

Charging Battery - If a "Fast Charger" is used, both of the car's battery cables must be disconnected from battery. *DO NOT use a "Fast Charger" to provide starting voltage.*

Description

Main alternator components are the two end housings, stator, rotor and rectifiers. Housings are vented at both ends and around the circumference and are held together by three through bolts. The rotor consists of a field coil encased between two six-fingered overlapping sections which are the pole pieces, and produces a 12 pole magnetic field. Ends of field coil are connected to slip rings and the battery is connected to field windings through brushes and the slip rings. The rotor shaft is supported at drive end by ball bearings and at the opposite end by a roller bearing. Both bearings are pre-lubricated. Three silicone diode rectifiers having negative polarity are pressed into the end housing, and three similar diodes having positive polarity are pressed into a die-cast aluminum sink. Alternator output is controlled by a voltage regulator.

Specifications

Performance Data (Cold - 70°F)

Alternator	Amperes	Volts	Eng. RPM
2098835	26.0 ± 3	15.0	1250
2098830	34.5 ± 3	15.0	1250
2098840	39.0 ± 3	15.0	1250

Rotation - Clockwise at drive end.
Field Coil Draw - 2.38-2.75 amps maximum at 12 volts, with alternator rotor turned manually.
Capacitor Capacity - .50 microfarad ± 20%.

TROUBLE SHOOTING & DIAGNOSIS

Alternator Does Not Charge

Blown fusible wire in regulator. Drive belt loose. Brushes or slip rings worn. Brushes sticking. Field or charging circuits open. Rectifiers open. Stator windings open.

Low Output or Low Battery

High resistance in charging circuit. Regulator setting too low. Rectifier shorted or open. Stator winding grounded.

Low or Unsteady Charging Rate

Drive belt loose. High resistance in charging circuit, battery terminals or engine-to-body ground strap. Stator windings open.

Excessive Charging Rate

Regulator setting too high or contacts stuck. Regulator base not grounded. Regulator windings open. Rectifier open.

Regulator Contacts Oxidized

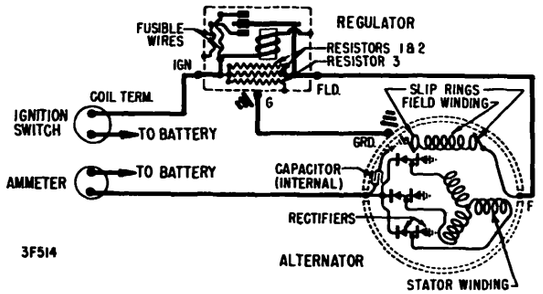
Regulator setting too high or rotor field coil winding shorted.

Regulator Contact Points Stuck

Poor ground connection between alternator and regulator. Open resistor element.

Alternator Noisy

Alternator mountings loose. Bearings worn. Drive belt worn. Interference between rotor fan and stator leads or rectifiers. Rotor or rotor fan damaged. Rectifier open or shorted. Stator winding open or shorted.



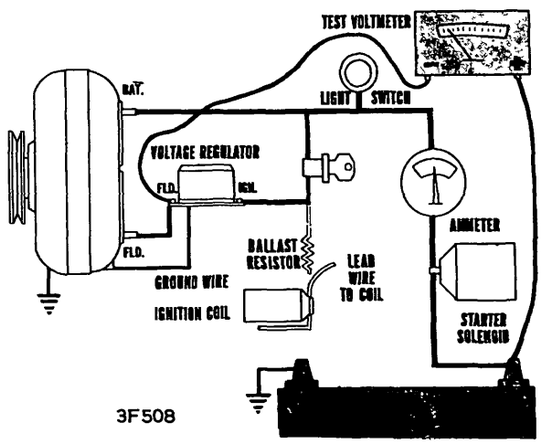
TESTING (ALTERNATOR IN CAR)

NOTE - Following tests are with battery fully charged and with engine at normal operating temperature.

►*CAUTION - DO NOT ground field circuit between alternator and voltage regulator as regulator will be damaged.*

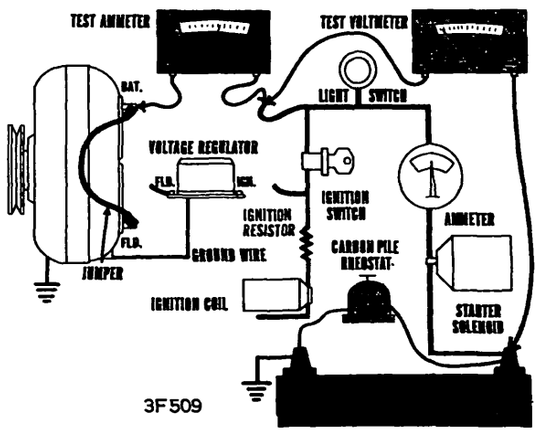
Field Circuit Resistance

With ignition wire at coil side of ballast resistor disconnected, connect a voltmeter as shown in illustration, then, with no lights or accessories turned on, turn ignition switch ON and turn voltmeter selector switch to low voltage scale. Voltage should not exceed .55 volt. If reading is greater, high resistance in field circuit between battery and regulator field terminal is indicated. If resistance is high, move negative voltmeter lead to each connection along the circuit toward battery. A sudden drop in voltage indicates a loose or corroded terminal or connection between that and the last point tested. *NOTE - Excessive resistance in regulator wiring circuit will cause fluctuation in the ammeter.*



ALTERNATOR & REGULATOR CIRCUIT DIAGRAM

Charging Circuit Resistance

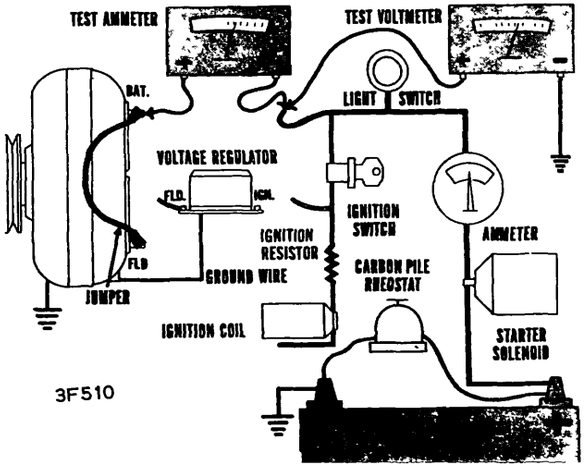


NOTE - Before making test connections, disconnect battery ground cable at battery negative post to avoid accidental shorting of charging or field circuits.

Disconnect lead at alternator "BAT" terminal and connect a 0-50 ampere scale D.C. ammeter in series between "BAT" terminal and "BAT" lead which was disconnected from the terminal (see illustration). Connect positive lead of D.C. voltmeter to the "BAT" lead and connect negative voltmeter lead to battery positive terminal. Disconnect field lead at alternator

(Continued)

FIELD CIRCUIT RESISTANCE TEST



CHARGING CIRCUIT RESISTANCE TEST

CHRYSLER CORP ALTERNATOR (Cont.)

"FLD" terminal and the ignition lead at regulator "IGN" terminal, then connect a special jumper between the alternator "FLD" terminal and alternator "BAT" terminal. Reconnect battery ground at battery. Connect a "Battery-Starter" tester (with variable carbon pile) to battery terminals, then start and operate engine at a speed to obtain 10 amperes flowing in circuit. Note the voltmeter reading which should not exceed .3 volt. If a higher voltage drop is indicated, inspect, clean and tighten all connections in charging circuit. *NOTE - If necessary, test voltage drop at each connection to locate connection with excessive resistance.* Before disconnecting test equipment, disconnect battery ground cable.

Current Output

With test connections made as for "Charging Circuit Resistance", disconnect voltmeter negative lead from positive terminal of battery and reconnect to ground (see illustration). Connect a tachometer to engine, then start engine and operate at 1250 RPM. Adjust carbon pile to obtain a reading of 15 volts on test voltmeter and note reading on ammeter. Current output should be within specifications (see "Performance Data" above). *NOTE - If output is slightly less (5-7 amps) than specified, it may be an indication of possible "open" rectifier or other alternator internal problem. If output is considerably lower, it may be an indication of a possible "shorted" rectifier or other alternator internal problem. Remove alternator and "bench test" before disassembly*

CURRENT OUTPUT TEST
(ALTERNATOR ON BENCH)

Field Coil Draw

Connect positive lead of test ammeter to positive terminal of fully charged battery. Connect a jumper wire to negative terminal of battery, and ground it to alternator end shield. Connect test ammeter negative lead to field terminal of alternator. Slowly rotate alternator rotor by hand and note ammeter reading. Coil draw should be 2.3 amps to 2.7 amps at 12 volts. *NOTE - A low coil draw is an indication of high resistance in field coil circuit (brushes, slip rings, or rotor coil). A higher rotor coil draw indicates a possible shorted coil or a grounded rotor.*

Internal Field Circuit (Testing for Ground)

Remove ground brush and touch one test probe from a 110 volt test lamp to alternator insulated brush terminal and the other test probe to the end shield. If rotor assembly or insulated brush is not grounded, lamp will not light. If lamp lights, remove insulated brush assembly (noting how parts are assembled) and separate the end shields by removing the through bolts. Again test by placing one of the test probes to a slip ring and the other to the end shield. If lamp lights, rotor assembly is grounded and should be replaced. If lamp does not light after removing insulated brush and separating end shields, the cause of the ground (at first ground test) was grounded insulated brush. Install insulated brush holder, terminal, insulated washer, shake proof washer and screw. *NOTE - If the parts were not assembled in this order or if the wrong screw was used, this could be the cause of the ground condition.*

Rectifier (Diode) Test

NOTE - Rectifiers may be tested with a test lamp or with Tester C-3829 as follows:

Test Lamp Method - Disassemble alternator and separate wires at "Y" connector of stator. Use a test lamp with a No. 67 (4 cp) bulb and a 12 volt battery. Test each rectifier in turn as follows: Touch outer case of rectifier with one probe and wire in center of rectifier with other probe. Reverse the probes, moving the probe from outer case to rectifier wire and the probe at rectifier wire to outer case. If lamp lights in **one** direction, the rectifier is good. If lamp **does not** light in either direction, the rectifier is open. If lamp lights in **both** directions, the rectifier is shorted.

Tester Tool C-3829 Method - Remove alternator brushes and through bolts and separate rectifier end housing and stator from drive end housing and rotor.

Positive Rectifiers - With stator assembly on an insulated surface, connect test lead clip to alternator "BAT" terminal and plug tool into 110 volt A.C. power supply. Touch probe to **bare wire** connection of each rectifier. *CAUTION - DO NOT break sealing around rectifier lead wire or on inner end of rectifier (will accelerat corrosion).*

N gativ R ctifi r - Connect test tool lead clip to rectifier end housing and touch bare wire connection of each rectifier with probe.

T st R sults - Good rectifiers will produce a reading of 1¾ amps or more and will be approximately the same for the three rectifiers tested. If two rectifiers are good and one is shorted, the reading on the good rectifiers will be low and the shorted one will be zero (with bad rectifier disconnected, reading on other two will be satisfactory). If one rectifier is open, its reading will be approximately 1 amp and the other two rectifiers will show a satisfactory reading. Positive and negative rectifiers will read on opposite side of scale on tool.

Stator Test

Test stator for grounds with a 110 volt test lamp. *Insulate stator from end housing.* With one probe of test lamp on stator pole frame, touch each of the stator leads with other probe. If lamp lights, stator windings are grounded. To test windings for continuity, touch one lamp probe to **all thr** stator leads at "Y" connection and other probe to each of the three stator leads (disconnected from rectifiers). If lamp does not light at each of the three rectifier leads, stator winding is open.

OVERHAUL

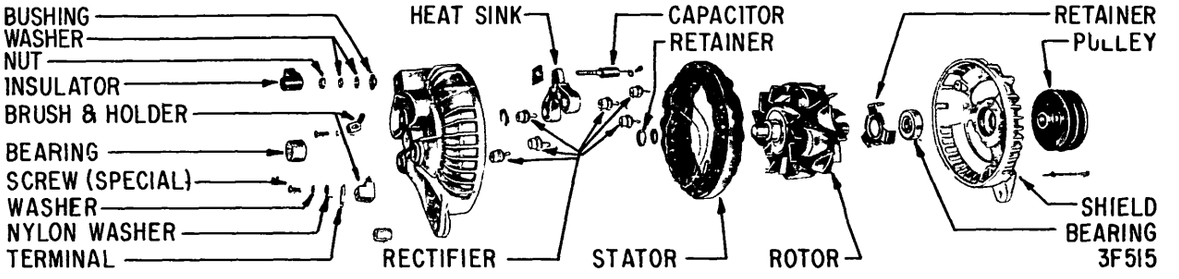
Disassembly

ALTERNATOR BEARING LUBRICATION & REPLACEMENT CAUTION - Alternator front and rear bearings are lubricated for life. If bearings become dry, install new bearings. DO NOT attempt to lubricate. Install new bearings with shield toward rotor.

Remove insulated brush holder retaining screw, flat washer, nylon washer, and the field terminal, then carefully lift the plastic brush holder (with spring and brush assembly) from the end housing. Remove retaining screw from ground brush holder, then lift clip, spring and brush assembly from end housing. Remove through bolts and pry between stator and drive end housing with a thin blade screwdriver. *CAUTION - Stator is laminated, do not burr stator or end housing.* Carefully separate drive end housing, pulley and rotor assembly from stator and rectifier housing assembly. Remove three nuts and washers and while supporting the end frame, tap rotor shaft with a plastic hammer and separate rotor and end housing. To remove drive end bearing from rotor shaft, use Tool C-3615 and adapters C-3375. *CAUTION - Make sure low r nd of adapters are equally spaced under the bearing and that tool sleeve is bottomed on bearing.* Remove DC output terminal nuts and washers, terminal screw (and inside capacitor, if so equipped). If necessary, heat sink and insulator can be removed. To remove rectifiers from heat sink or end housing, cut rectifier wire at point of crimp, then support rectifier housing on Tool C-3771. *NOTE - This tool is cutaway and slott d to fit over wires and around boss s in housing.* Make sure that bore of tool completely surrounds rectifier, then press rectifier out of housing with Tool SP-3380. To remove roller bearing in end housing, support housing with Tool SP-3925, then press bearing out with Tool C-3770.

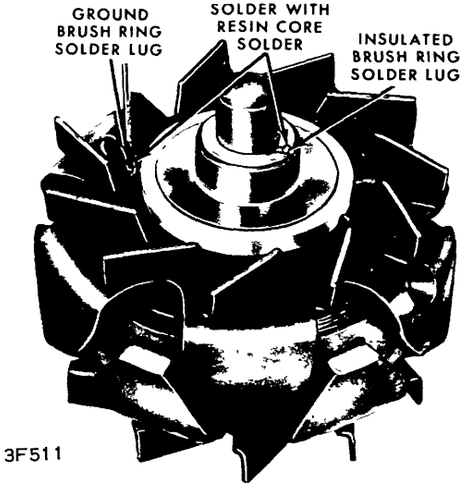
(Continued)

CHRYSLER CORP ALTERNATOR (Cont.)



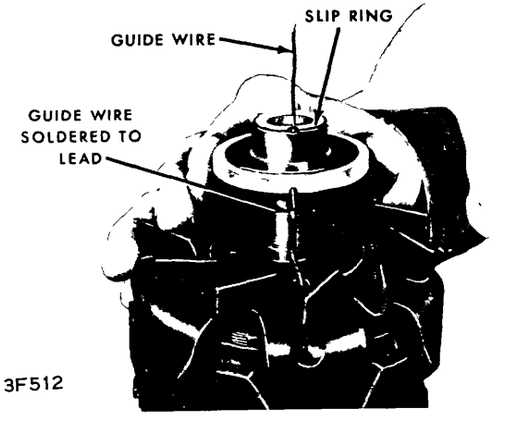
Slip Ring Replacement

Cut through rotor grease retainer with a chisel and remove retainer and insulator, then unsolder field coil leads at solder lugs. Cut through copper of both slip rings at points 180° apart, with a chisel, then break insulator and remove old ring. Clean ends of field coil lead wires. Tin one end of a bare 18 gauge wire (3" long) which will be used as a guide, then lap tinned end of guide wire over field coil lead-to-insulated ring and solder the two wires together. Position a new slip ring over guide wire and rotor shaft so wire will lay in slip ring groove (groove in slip ring must be in line with insulated brush field lead to provide room for the lead without damaging it). Place installing tool, C-3900 over rotor shaft with the guide wire protruding from slot in tool. Position rotor, slip ring and tool assembly in an arbor press, then pull on guide wire to guide insulated field lead into slip ring groove. While guiding insulated field lead through the groove, press slip ring on shaft. When slip ring is bottomed on rotor fan, end of field lead should be visible at solder lug. Unsolder guide wire from slip ring lead, then press field lead into the solder lug and and solder lug with rosin core solder. *CAUTION - Be sure solder bead does not extend beyond surface of plastic material.* Coil ground brush ring field lead around solder lug and solder with rosin core solder. Test slip rings for ground with a 110 volt test lamp by touching one probe to rotor pole shoe and other probe to slip rings Test lamp should not light. If lamp lights, slip rings are grounded (possibly due to grounding insulated field lead when installing slip ring). If rotor is not grounded, lightly clean with "00" sand paper and assemble alternator. Install new insulator and grease shield with Tool C-3921.



Reassembly

NOTE - Make sure the correct rectifier is being installed. Identifying part numbers are stamped on case of rectifier and the rectifiers are also identified by paint marks. Red for positive and black for negative.



Support heat sink or rectifier end shield on installer adapter SP-3820 of Tool C-3928, then carefully apply pressure with screw until installer tool, rectifier, rectifier and shield or heat sink are in alignment. With rectifier started squarely in the casting, slowly apply pressure with screw of tool until collar of rectifier bottoms against casting. *NOTE - Make sure that installer support adapter fits squarely around inner boss of rectifier and that pressure is applied to outer rim of rectifier. DO NOT use a hammer to start rectifier in its bore. Damage to silicon wafer will result if rectifier is handled roughly.* If stator leads were disconnected, clean leads and bend rectifier wire loop snugly around stator lead and solder with a rosin core solder. *NOTE - Hold rectifier lead wire with pliers just below joint while sold ring (pliers will absorb heat from soldering and protect rectifier).* After soldering, push stator leads down into slots cast into end shield and cement in position with MoPar Cement, Part No. 2299314 (to prevent interference with rotor fan). Test each replacement rectifier to make sure rectifier was not damaged by soldering or pressing operations. Support end shield on Tool C-3925 so that notch in support tool will clear raised section of heat sink and press bearing into position with Tool SP-3381. *NOTE - New bearings are pre-lubricated and additional lubrication is not required.* Insert drive end bearing in shield and install bearing retainer plate. Position bearing and shield on rotor shaft and, while supporting base of rotor shaft, press bearing and shield into position with an arbor press and Tool C-3769. *NOTE - Make sure bearing is installed squarely. Bearing must be pressed on shaft until it contacts shoulder on shaft.* Install pulley on rotor shaft (support rotor so that all pressing force is on pulley hub and rotor shaft), then press into position with an arbor press. *CAUTION - Do not use a force greater than 6,800 lbs.* Pulley should just contact bearing inner race. Make sure heat sink insulator is in place (alternator capacitor is mounted internally), then install capacitor stud through heat sink and end shield, and install insulating washers, lockwashers and lock nuts, then make sure heat sink and insulator are in position and tighten lock nut. Position stator on rectifier end shield, then position rotor end shield assembly on stator and rectifier end shield. Align through bolt holes in stator, rectifier end shield and drive end shield, then compress stator and both end shields by hand and install through bolts, washers and nuts. Install insulated brush in rectifier end and place the bronze terminal on plastic holder with tab of terminal in recess in plastic holder. Place nylon washer on bronze terminal and install lockwasher and attaching screws. Install ground brush and attaching screw. Rotate pulley slowly by hand to be sure that rotor fans do not hit rectifiers, capacitor lead, and stator connections.

CHRYSLER CORP. ALTERNATOR ASSEMBLY

SOLDERING POINTS (SLIP RING INSTALLATION)

ALIGNING SLIP RING WITH GUIDE & FIELD WIRE

CHRYSLER CORP. ALTERNATOR REGULATOR

VOLTAGE REGULATOR

Car Model	Chrysler Part No.
All Models	2098300

►*EXCESSIVE AMMETER FLUCTUATION CORRECTION:* This condition usually indicated by excessive ammeter pointer flutter, headlight flicker and heater blower motor speed variations at steady engine speeds, and may be caused by high resistance in field circuit to alternator or voltage regulator improperly set For proper diagnosis and correction, proceed as follows· Run engine at various steady speeds with heavy electrical load (headlights and accessories on) to determine degree of fluctuation. Stop engine, disconnect lead at "IGN" terminal of regulator and install a jumper wire from "IGN" terminal to positive terminal of battery. Operate engine at 1250 RPM and observe flutter

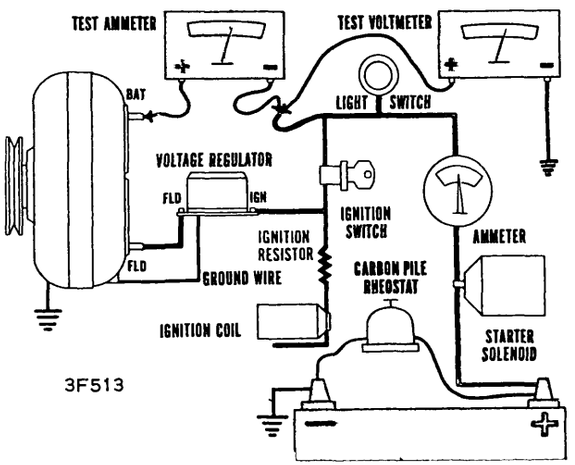
1) If ammeter is normal, trouble is corrosion or other high resistance in field circuit connectors Clean and tighten all connections. *NOTE* - On cars with 7½ ampere fuse in circuit, clean fuse and holder terminals and tape fuse holder to prevent dirt and moisture entry.

2) If jumper wire did not correct the trouble or if ammeter fluctuation is excessive regardless of engine speed or electrical load, remove voltage regulator from car and solder a piece of copper wire between 38 ohm resistor terminal connected to "IGN" terminal of regulator and regulator base. *CAUTION* - Use only rosin core solder and be sure regulator base is heated enough for proper metal fusion.

3) Install regulator and adjust according to procedures and specifications below

►*REGULATOR 2098300 FUSIBLE WIRE REPLACEMENT NOTE:* To replace fusible wire, proceed as follows Cut blown wire from connection at rivet in regulator base (do not unsolder as voltage coil wire may be damaged), and unwind wire from regulator contact bracket Use rosin core solder only, tin one end of Fusible Wire No 2275242 and hold wire in recess in rivet against old fuse wire Put a drop of solder on wires When cool, pull fusible wire up and wrap around contact bracket and solder wire to bracket to be sure of a good connection

Description



Field control type Temperature compensated, vibrating type voltage regulator with two sets of contacts using a common armature Upper stationary contact bracket is connected to "IGN" terminal by a fusible wire, and lower stationary contact bracket is connected to ground by another fusible wire Regulator operates on either upper or lower contacts (both sets never in operation at same time) depending on load and battery requirements as follows

Upper Contact Operation (Low Speed & High Load) - Armature travel opens and closes upper contacts, cutting regulator resistance in and out of field circuit, and limiting alternator field current

Lower Contact Operation (High Speed & Low Load) - Armature travel opens and closes lower contacts, grounding the regulator field terminal and bypassing alternator field coil (contacts closed), or cutting resistance in field (contacts open), and limiting field current

Checking Regulator

Upper Contact Test - Connect a test ammeter, voltmeter, and carbon pile rheostat as shown in illustration *NOTE - Connections are the same as for "Current Output Test" (see "Testing - Alternator on Car" above), except that field lead is connected at alternator "FLD" terminal and the regulator ignition terminal lead is connected to ignition terminal* Start and operate engine at 1250 RPM, then adjust carbon pile rheostat to obtain a 15 amp output as indicated on test ammeter *NOTE - No current reading on test ammeter would indicate either a low set regulator or a blow fuse wire inside voltage regulator between upper stationary contact and "IGN" terminal* Operate engine for 15 minutes with a 15 amp load at 1250 RPM to stabilize system, then check ambient temperature at regulator Check test voltmeter With a 15 amp load, voltmeter reading should be within specifications at the indicated ambient temperature (see "Voltage Setting - Ambient Temperature" below) If upper contact voltage setting is not within specifications, adjust voltage setting (see below)

VOLTAGE REGULATOR TEST

Lower Contact Test - Increase engine speed to 2200 RPM and change the carbon pile rheostat to decrease current load to 7 amps output Voltage should **increase** and the amperage should **decrease.** *NOTE - There will be a slightly higher voltage at engine speeds above 2200 RPM (increased voltage must not exceed specifications by more than 7 volt at any temp rature range)*

AMBIENT TEMPERATURE NOTE - The ambient temperature is the temperature registered on a reliable thermometer positioned ¼" from regulator cover

Voltage Setting - Ambient Temperature

Temp. (°F)	Voltage	Temp. (°F)	V ltage
47°	13 8-14 4	117°	13 5-14 1
70°	13 7-14 3	140°	13 4-14
93°	13 6-14 2	163°	13 3-14 9

Adjustment

Upper Contact Voltage Setting - Adjust as necessary by bending regulator lower spring hanger down to **increase** voltage setting, up to **decrease** voltage setting Use an insulated tool to bend spring hanger *NOTE - Regulator must be installed, correctly connected and retested after each adjustment of lower spring hanger*

Lower Contact Voltage Setting - If voltage regulator lower contact setting is outside the 2- 7 volt setting limits, adjust lower contact point gap If lower contact gap is correct and voltage regulator setting is still not within specifications, adjust the air gap

Contact Point Gap - 014' ± 002" To adjust, bend lower stationary contact bracket, making sure points are in alignment

Air Gap - 048- 052" (nominal setting) To adjust, connect a dry cell test lamp in series with "IGN" and "FLD" terminals of voltage regulator, then insert a 048" wire gauge between regulator armature and core of voltage coil next to stop pin on spring hanger side Press down on armature (not on contact reed) until armature contacts wire gauge The upper contacts should just open and the test lamp should be dim Insert a 052" wire gauge between armature and voltage coil core next to stop pin on spring hanger side Press down on armature until it contacts wire gauge Upper contacts should remain closed and test lamp should remain bright If an adjustment is required to obtain the difference between upper contact voltage and lower contact voltage of 2 to 7 volt, adjust the air gap by loosening stationary contact bracket screw and moving bracket up or down as necessary to obtain proper air gap setting as follows If difference is above 7 volt reduce air gap to a minimum of 045" (contacts open, test light dim) 048" contacts closed (test light bright) If difference is below 2 volt, increase air gap to maximum of 052" (contacts open test light dim), 055" (contacts closed, test light bright) Make sure air gap is checked with stationary contact bracket attaching screw fully tightened

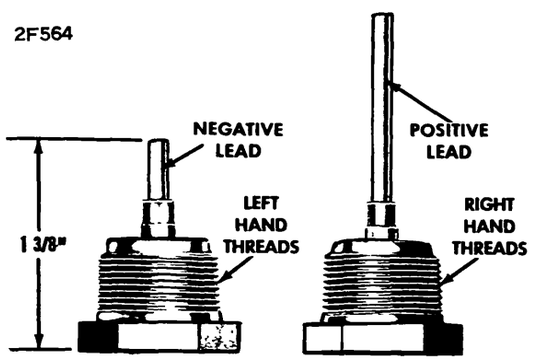
DELCO-REMY DELCOTRON (1-D, 2-D, 3-D, 4-D SERIES)

►CHANGES, CAUTIONS, CORRECTIONS

►*BATTERY INSTALLATION, BATTERY CHARGING OR USING A BOOSTER BATTERY TO START ENGINE CAUTIONS: R v rs d polarity or excessive voltage will result in xt nsiv damage to alternator system. NOTE THE FOLLOWING TO PREVENT DAMAGE:*

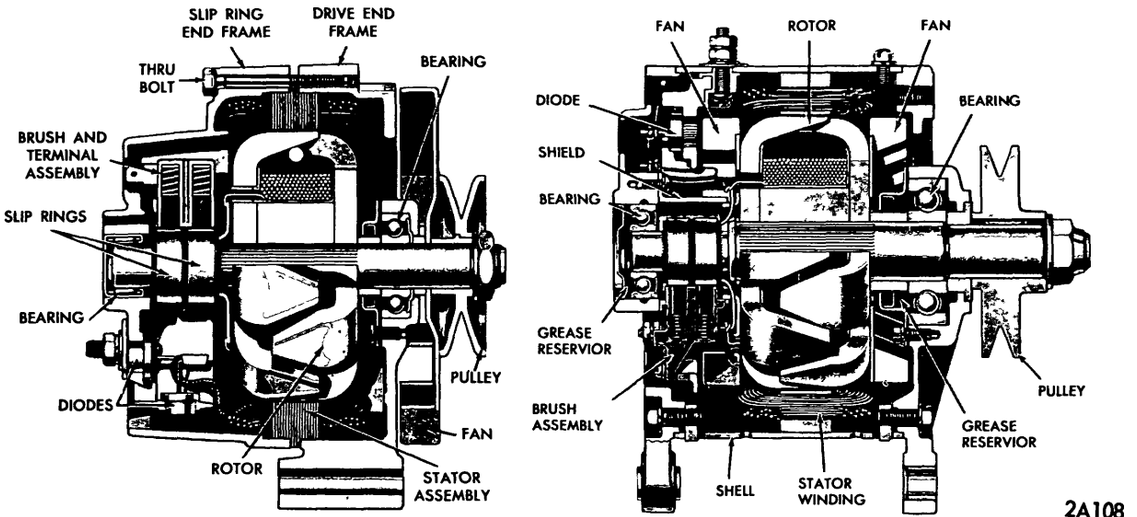
Batt ry Installati n - Alternator polarity determines which battery terminal is grounded. For negative polarity alternators, **n gativ** battery terminal must be grounded. *DO NOT REVERSE BATTERY LEADS or r ctifi rs will b damag d.*

Charging Batt ry - If a "Fast Charger" is used, both car battery cables must be disconnected from battery. *DO NOT use a "Fast Charger" to provide starting voltage.*



B st r Batt ry (Us d To Start Engine) - Booster battery must be connected with negative lead to negative terminal of battery and positive lead to positive terminal of battery. *DO NOT REVERSE BATTERY LEADS.*

►*ALTERNATOR CIRCUIT NOTE:* Alternators may be either "A" or "B" circuit type. On "B" circuit types, ground brush is grounded directly to end housing and "F2" terminal position (if provided) is not used. *NOTE - Both slip rings are insulated from rotor shaft.*



DESCRIPTION: Conventional three-phase, self-rectifying type alternators. Alternators are of various series depending on design differences (regardless of part number series). Each series may be different in construction to the extent of having heavy duty or long-life components. All series, except 3-D Series, have a single field winding wound on rotor shaft and encased between two multi-fingered overlapping iron pole pieces assembled on rotor shaft. Field winding (all Series) is connected to two slip rings assembled on, but insulated from, rotor shaft.

LUBRICATION: No periodic lubrication required. At time of overhaul, if bearings reusable (except slip ring end needle-roller bearings), pack grease reservoir ¼-½ full with Delco-Remy Lubricant, No. 1948791, and also pack bearings with same lubricant. *NOTE - R place b arings if lubricant supply exhausted. DO NOT att mpt t r lubricate or reuse needle-roller type b aring.*

THREADED TYPE DIODE IDENTIFICATION

1-D SERIES 2-D SERIES 2A108

DELCO-REMY "DELCOTRON" ALTERNATORS

2F563

DELCO-REMY "DELCOTRON" ALTERNATOR (3-D SERIES)

OUTPUT TEST

►*CAUTION: 1) Do not short across or ground any of the terminals on alternator or regulator.*

2) Do not polarize alternator as it is not required and doing so will damage entire system.

3) D n t p rat alt rnator n p n circuit. Mak sure all c nn cti ns are s cure and tight.

4) B for making t st c nnections, ignition switch must b ff.

OUTPUT TEST: Connect an ammeter in series at alternator "BAT" terminal, and a voltmeter from alternator "BAT" terminal to ground. Connect alternator field directly to battery (regulator out of circuit) with a jumper wire. Turn on switch and slowly increase alternator speed and check for rated output *(see Car Model Pages for specifications). CAUTION - L ad battery (carbon pile rheostat or turn headlights and other accessories on) to prevent high v ltag . Do not all w alternator v ltage to exceed voltag setting f r gulator.*

OVERHAUL

See 1962 Final Data, Pag 300.

DELCO-REMY DOUBLE CONTACT ALTERNATOR REGULATORS

►CHANGES, CAUTIONS, CORRECTIONS

►*BATTERY INSTALLATION, BATTERY CHARGING, OR USING A BOOSTER BATTERY TO START ENGINE CAUTIONS: Reverse polarity or excessive voltage will result in extensive damage to alternator system. Observe all cautions as detailed on appropriate alternator data pages.*

►*CIRCUIT TYPE NOTE:* These units are "B" circuit type (field winding grounded at alternator).

DESCRIPTION: Regulators are conventional design. Four different types containing a double contact voltage regulator alone or in combination with a field relay or an indicator light relay, are used as follows:

Type 1 - Identified by conventional lug-type terminals. Units may contain voltage regulator, field relay, and indicator light relay. If used on applications where an ammeter is used instead of an indicator light, regulator will contain a voltage regulator and field relay only.

Type 2 - Identified by blade type terminals to fit matching car wiring harness connector. Unit contains a voltage regulator and a field relay. This type used in circuits with an indicator light but a separate indicator light relay is not used. Indicator light circuit is such that closing of field relay contacts causes indicator light to go out.

Type 3 - Identified by blade type terminals to fit matching car wiring harness connector. Unit contains a voltage regulator and a field relay. Used in circuits with either an ammeter or an indicator light. When used with indicator light, a separate double contact indicator light relay is also used.

Type 4 - Identified by blade type terminals to fit matching car wiring harness connector. Unit contains a voltage regulator only; has three terminals and is used in circuits with an ammeter.

TESTING & TROUBLE SHOOTING

See 1962 Final Data, Page 302.

Open Resistor: Type 2 - *NOTE - Test is not applicable to other types.* Connect a voltmeter from No. 4 terminal of wiring harness (regulator disconnected) to regulator base (ground). Turn ignition switch to "ACC" position. If voltmeter reading is zero, resistor on "ACC" terminal of ignition switch is open. *NOTE - Resistor may be a separate unit or a resistance wire.* Resistance value is 10 ohms; wattage is 6.25 watts minimum.

Field Relay: Type 1 - Connect voltmeter from regulator "F" terminal to ground. Turn on ignition switch (do not start engine). Voltmeter should read battery voltage. If reading zero, see *"Checking & Adjusting"*

Type 2 - If indicator light functions normally, field relay is operating normally. If indicator light does not go out when alternator operating, determine if field relay or alternator is faulty as follows: With regulator in circuit, connect a voltmeter from No. 2 terminal to ground. Run alternator at moderate speed and note voltmeter reading. If reading 5 volts or above and indicator light does not go out, relay is faulty. If voltmeter reading is below 5 volts, alternator is faulty.

Type 3 - With regulator in circuit, connect a voltmeter from "F" terminal to ground. Turn switch to "IGN" and note voltmeter. Reading should be battery voltage. If reading is zero, line between switch and regulator No. 2 terminal is open, or field relay is faulty.

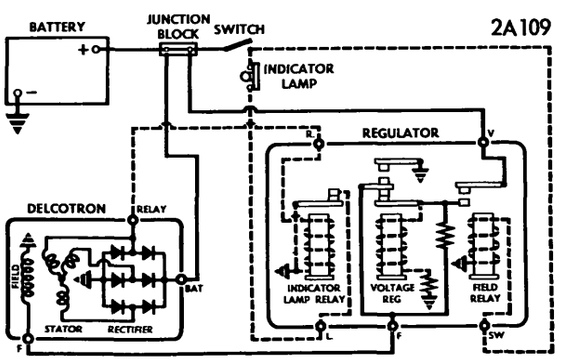
High Circuit Resistance: Type 1 - *NOTE - Test is not applicable to other types.* Connect the voltmeter from battery positive terminal to alternator "F" terminal. Turn on ignition switch (do not start engine). If voltmeter reading exceeds .3 volt, there is excessive line resistance. After terminals and connections tightened and cleaned, if voltage reading still exceeds .3 volt, clean all regulator contact points. If reading still more than .3 volt, check alternator field by removing lead from regulator field terminal and connecting an ammeter in series with alternator field winding. Field coil draw must be within specifications.

Alternator Output: All Types - Connect an ammeter in series at alternator "BAT" terminal, and a voltmeter from alternator "BAT" terminal to ground. Connect alternator field directly to battery (regulator out of circuit) with a jumper wire. Turn on ignition switch and slowly increase alternator speed and check for rated output. *CAUTION - Load battery (carbon pile rheostat or turn on headlights and other accessories) to prevent high voltage. Do not allow alternator voltage to exceed voltage setting of regulator.*

OVERCHARGED BATTERY: Check for shorted battery cell, high circuit resistance (see "Undercharged Battery" above), or high voltage regulator setting.

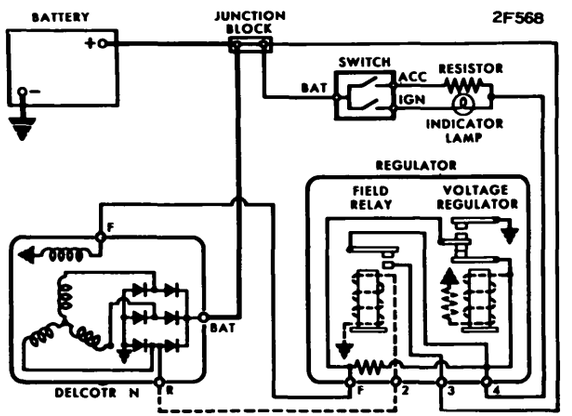
►*VOLTAGE SETTING TAILORING NOTE:* If no circuit defects are found during all of the above tests and battery remains constantly over, or undercharged, voltage regulator setting may be raised or lowered .3 volt to compensate for various operating conditions.

ADJUSTMENT



►*CAUTION: Observe all cautions listed under "Testing & Trouble Shooting" above.*

VOLTAGE REGULATOR



Contact Gap: Measure upper contact gap with lower contacts just touching. To adjust, bend upper contact arm. *Do not bend hinge.*

Air Gap: Measure gap between armature and core with lower contacts just touching. To adjust, turn nylon nut on contact support (Types 2, 3 & 4). To adjust Type 1, loosen contact support bracket screw 1/8-1/4 turn, insert screwdriver into slot in contact support and into molded insulator. Raise screwdriver handle to increase air gap, lower handle to decrease gap. Tighten contact support bracket screw.

TYPE 2 REGULATOR CIRCUIT DIAGRAM

TYPE 4 REGULATOR CIRCUIT DIAGRAM

TYPE 3 REGULATOR CIRCUIT DIAGRAM
(WITH INDICATOR LIGHT & SEPARATE RELAY)

DELCO-REMY DOUBLE CONTACT ALTERNATOR REGULATORS (C ntinued)

►*NORMALIZING THE REGULATOR:* Before checking or adjusting voltage regulator, bring regulator to operating temperature of 125°F by connecting a ¼ ohm fixed resistor and an ammeter in series with battery and alternator "BAT" terminal, and operating alternator for 15 minutes at approximately 3500 RPM (1500 Engine RPM) with 10 amperes or less output, with the regulator cover in place, until regulator heated and stabilized. Accessories and lights must be turned off. After warm-up completed, cycle alternator by stopping and restarting.

Voltage S tting: T st M t r Connections - Leave ammeter and ¼ ohm resistor connected as described under "Normalizing The Regulator" above. Connect a carbon pile rheostat across battery. Make other test connections as follows:

Typ 1 - Connect a 25 ohm, 25 watt variable resistor in series with field winding at regulator "F" terminal. Disconnect lead from regulator "V" terminal. Connect a voltmeter from "V" terminal to regulator base (ground), and a jumper wire from "V" terminal to alternator "BAT" terminal.

Types 2, 3 & 4 - Maintain connections at No 2 & 4 terminals (No 4 not used on Types 3 & 4) Connect a 25 ohm, 25 watt variable resistor in series at "F" terminal. Disconnect No. 3 terminal lead from wiring harness connector and connect a jumper lead from No. 3 adapter wire to alternator "BAT" terminal, and a voltmeter from No. 3 adapter wire to regulator base (ground).

Cycling - To cycle alternator during testing, proceed as follows: Turn variable resistor in field circuit to full resistance position. Momentarily disconnect and reconnect jumper lead from "V" terminal (Type 1), lead at No. 4 terminal on wiring harness connector (Type 2), jumper lead at alternator "BAT" terminal. (Types 3 & 4) *CAUTION - Do not disconnect leads with variable resistance in "no resistance" position.*

Checking Proc dur - 1) Bring engine speed to 2500 RPM (approximately 6000 Alternator RPM) and note voltage reading which should be as specified in table below. Regulator should be operating on upper contacts. *NOTE - Best m thod of determining which contacts ar in us is t us earphones to note the transfer. If r gulator will not operate on upper contacts, partially recharg batt ry.* Adjust voltage within specifications for ambient temperature (see table below) by turning adjusting screw to adjust armature spring tensior Cycle alternator (see above), recheck and readjust upper contact setting.

2) To check operation on lower contacts, operate engine at 2500 RPM (approximately 6000 Alternator RPM), and slowly turn variable resistance into the circuit until regulator operates on lower contacts, and note voltage which should be .1-.3 volt lower than when operating on upper contacts. *NOTE - If turning resistance into circuit does not make regulator operate on lower contacts, turn variable resistance out, load battery (carbon pile or turn headlights on), then adjust variable resistor for lower contact operation.* To increase difference in voltage between upper and lower contacts, increase armature air gap slightly; to decrease difference, decrease air gap slightly. *NOTE - This adjustment can be made with regulator operating. If necessary to make adjustment, recheck voltage setting of both sets of contacts.*

►*VOLTAGE SETTING TAILORING NOTE:* If battery consistently over- or undercharged after voltage regulator properly set and all other checks indicate no circuit defects, voltage regulator setting may be raised or lowered .3 volt to compensate for various underhood temperatures and other operating conditions. Allow reasonable length of time to check performance. Proper setting is obtained when battery remains fully charged with minimum use of water.

Voltage Regulator Specifications

Regulator Model	Air Gap	Contact Gap	Voltage Setting
1119500,2,3,5,8	Ⓒ	016"	Chart No 1
1119511	Ⓒ	015"	Chart No 1
1119506,7,12	Ⓒ	014"	Chart No 1
1119513, 14, 15	Ⓒ	014"	Chart No 1

Ⓒ - Adjust air gap (see above) ONLY when necessary to obtain specified difference between voltage settings of upper and lower contacts **After bench repair only,** set air gap to approximately 067" Final air gap must be whatever is required to obtain specified difference in voltage between upper and lower sets of contacts

Voltage Setting - Ambient Temperature (Chart No. 1)

Temp.	Ⓒ Setting	Temp.	Ⓒ Setting
65°F	13.9-15.0	145°F	13.4-14.2
85°F	13.8-14.8	165°F	13.2-14:0
105°F	13.7-14.6	185°F	13.1-13.9
125°F	13 5-14 4		

Ⓒ - Operating on upper contacts 1 4 volts lower when operating on lower contacts.

FIELD RELAY

Air Gap: Check air gap between armature and core with contacts just touching. To adjust, carefully bend flat contact support spring.

Contact Gap: Type 1 - Normally not adjusted. If air gap and closing voltage within specifications, relay will operate satisfactorily even if contact gap not exactly as specified.

Typ 2 & 3 - Adjust by bending armature stop.

Closing Voltage: Test Meter Connections - Make meter connections as follows:

Type 1 - Connect a 50-75 ohm variable resistor in series at "SW" regulator terminal. Connect a voltmeter from "SW" terminal to regulator base (ground).

Type 2 & 3 - Connect voltmeter from regulator base to regulator No. 2 terminal. Connect a 50-75 ohm variable resistor from regulator No. 2 terminal to wiring harness connector No. 3 terminal. *Other leads from regulator t wiring harness must be disconnected.*

Checking Procedure - Turn all resistance into circuit, turn on ignition switch, then slowly decrease resistance and note closing voltage of relay. If not as specified, adjust by bending armature heel iron as necessary.

Field Relay Specificati ns

Regulator Model	Air Gap	Contact Gap	Closing Voltag
1119500	.015"		6.5-8.5 volts
1119502	.015"		6.5-8.5 volts

INDICATOR LIGHT RELAY

Air Gap: Measure air gap with contacts just touching (integral type - Type 1), with upper contacts closed (separate type - Type 3). To adjust, bend upper contact support.

Contact Gap (Separate Relay): Measure upper contact gap with lower contacts just touching.

Voltage Setting: *NOTE - On integral type relays, setting is contact opening voltage. On separate type relays, setting is lower contact closing voltage.* Connect a voltmeter from regulator "R" or No. 4 (Center) terminal to regulator base (ground). Connect a 50-75 ohm variable resistor in series with this same terminal and the battery. With all resistance turned into circuit, slowly decrease resistance and note opening (or closing) voltage. If not correct, adjust by bending armature heel iron.

Indicator Light Relay Specifications

DELCO-REMY TRANSISTORIZED ALTERNATOR REGULATORS ("B" CIRCUIT TYPE)

►CHANGES. CAUTIONS, CORRECTIONS

►*BATTERY INSTALLATION, CHARGING, & BOOSTER BATTERY CAUTIONS: Observe the cautions for battery installation, battery charging, and using a booster battery as detailed at beginning of appropriate alternator data pages.*

CIRCUIT TYPE NOTE: These units are "B" circuit type (field winding grounded at alternator). For "A" circuit type (field winding grounded at regulator), see 1961 Final Data, Page 283.

DESCRIPTION: Transistorized type with two diodes. Transistor works with a conventiona! type voltage regulator unit to limit alternator voltage to pre-set value. Diodes prevent damage from possible transient voltages in system. Assembly also contains a field relay for control of alternator field (also controls light on Reg. No. 9000595). When an indicator light is used on instrument panel, a separate indicator light relay is used (except with Reg. No 9000595) for control of this system.

TESTING & TROUBLE SHOOTING

►*CAUTION: 1) Do not short across or ground any of the terminals on alternator or regulator.*
2) Do not polarize alternator as it is not required and doing so will damage entire system.
3) Do not operate alternator on open circuit. Make sure all connections are secure and tight.
4) Before making test meter connections, Ignition switch must be off.

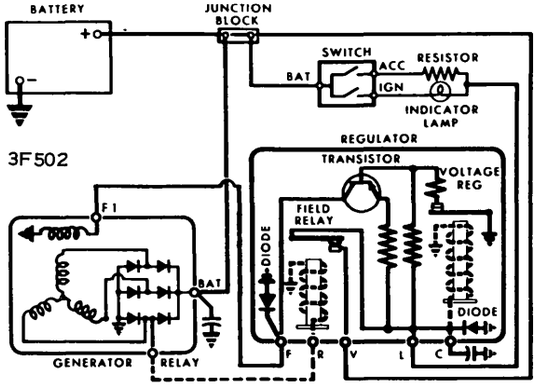
INDICATOR LIGHT RELAY CHECK (Units With Separate Light Relay): If indicator light stays on with alternator operating, connect a voltmeter from indicator light "R" terminal and note voltage with alternator operating. If voltage is above 11-11 6 volts, relay is faulty.

INDICATOR LAMP CIRCUIT CHECK (Units With Light Controlled Through Field Relay): If lamp does not light, turn ignition switch to "IGN" position, but do not start engine. Momentarily (for not more than 10 seconds) connect a jumper lead from "L" terminal of harness connector (to regulator). If lamp does not come on, check for burned bulb, or an open in wiring between battery and jumper lead. If lamp comes on, connect the jumper between "F" and "L" terminals of adapter. If the lamp comes on again, the circuit is open in the regulator If it does not come on, there is an open in the field lead between regulator and alternator or in alternator field. If the lamp does not go out with generator in operation, see "Undercharged Battery" below. Also, if lamp fails to go out when ignition switch is turned off, the alternator probably has a shorted diode in the heat sink.

UNDERCHARGED BATTERY: Drive belt loose or battery defective. Alternator faulty, high circuit resistance, low voltage regulator setting, field relay faulty or open transistor, faulty diodes.

Alt rnat r Output: Connect an ammeter in circuit at alternator "BAT" terminal and voltmeter from alternator "BAT" terminal to ground. Remove lead from regulator "F" terminal and connect to regulator "V" terminal. Slowly increase alternator speed and check for rated output. *CAUTION - Load battery (carbon pil rheostat or turn on headlights and other accessories) to prevent high voltage. Do not allow alternator voltage to exceed voltage setting of regulator.*

High Circuit Resistance: Connect a voltmeter from battery insulated terminal to regulator "V" terminal. Turn on ignition switch (do not start engine) and note voltage drop. If voltage drop exceeds .3 volt, high circuit resistance is indicated.



Low Voltage Regulator Setting: Connect a voltmeter from regulator "F" terminal to regulator base (ground). Turn on ignition switch (do not start engine). If voltmeter reads 9 volts (Exc Reg. No 9000595); 8 volts (Reg No. 9000595) or above, voltage regulator setting is too low If reading is below the above voltages, field relay contacts are not closed, or resistor and transistor are burned out.

Diodes Faulty: Disconnect "F" and "V" leads from regulator, remove cover, and unsolder both diode leads. Connect an ohmmeter from diode case to diode lead and note reading. Reverse ohmmeter connections and note reading. If both readings less than 2 ohms, diode is faulty. If both readings are very high (infinite), diode is faulty. A good diode will give one low reading and one high reading. Check other diode in same manner. *CAUTION - Use ohmmeter with 1½-volt cell and use lowest range scale. When replacing diode, limit solder time to minimum as high heat will damage diode.*

OVERCHARGED BATTERY: Make all tests as listed under "Undercharged Battery" above, and check for shorted transistor as follows:

Transistor Shorted: Connect a voltmeter from regulator "F" terminal to ground. Remove regulator cover, turn on ignition switch, and hold voltage regulator contacts open. If voltage reading above 9 volts, transistor is shorted and must be replaced. *NOTE - Replace transistor by removing attaching screws and unsoldering connections directly above transistor. Limit soldering time to minimum as high heat will damage transistor.*

►*VOLTAGE SETTING TAILORING NOTE:* If no circuit defects are found during all of the above tests and battery remains constantly over- or undercharged, voltage regulator setting may be raised or lowered .3 volt to compensate for various operating conditions.

REGULATOR CIRCUIT WIRING DIAGRAM
(COMBINATION FIELD & LIGHT RELAY)

ADJUSTMENT

►*CAUTION: Obs rv all cautions listed und r "T sting & Trouble Shooting" above.*

FIELD RELAY

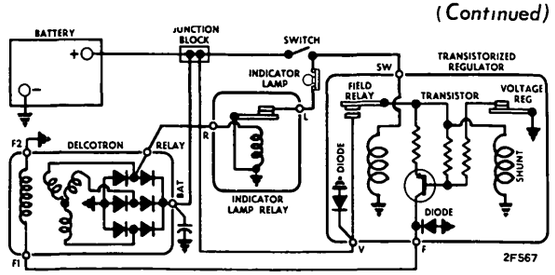
Air Gap: Check air gap between armature and core with contacts just touching. To adjust, carefully bend flat contact support spring.

Contact Gap: Normally not adjusted. If air gap and closing voltage within specifications, relay will operate satisfactorily even if contact gap not exactly as specified.

Closing Voltage: Connect a 50 ohm variable resistor in series from ignition switch to regulator "SW" terminal. Connect a voltmeter from regulator "SW" terminal to regulator base (ground). Turn all resistance into circuit, turn on ignition switch, and slowly decrease resistance and note relay closing voltage. If not as specified, adjust by bending armature heel iron as necessary.

Field Relay Sp cifications

Regulator Model	Air Gap	Contact Gap	Closing Voltag
9000558 566 ..	014"	. 027"	5-9.5 volts
9000567, 574	014"	027 '	5-9.5 volts
9000595	015"	.027"	2 3-3.5 volts



VOLTAGE REGULATOR

Air Gap: Measure air gap with armature pressed down to point where contacts just touch. To adjust, move upper contact support bracket as necessary.

Voltage Setting: 1) Connect an ammeter in ignition switch lead at alternator "BAT" terminal. Disconnect lead at regulator "V" terminal and connect a jumper wire from "V" terminal to alternator "BAT" terminal. Connect a voltmeter from regulator "V" terminal to regulator base (ground). Place a carbon pile rheostat across battery.

2) Bring regulator to ambient temperature of 125°F by operating alternator at 3000 RPM for 15 minutes with 3-10 amperes output, with regulator cover in place. After warm-up completed, cycle alternator by turning off switch, stopping alternator, and temporarily disconnecting jumper lead at regulator "V" terminal. Reconnect jumper lead, operate alternator at 3000 RPM

(Continued)

REGULATOR CIRCUIT WIRING DIAGRAM
(SEPARATE LIGHT RELAY)

DELCO-REMY TRANSISTORIZED ALTERNATOR REGULATORS ("B" CIRCUIT TYPE) Cont.

and note voltage reading. If not within specifications listed below, adjust by turning adjusting screw to adjust armature spring tension. Recycle, recheck, and readjust if necessary. *NOTE - Always make final adjustment by turning adjusting screw clockwise. If alternator voltage drops below 3 amperes minimum, load battery with carbon pile rheostat or turn on headlights and other accessories to obtain 3-10 amperes alternator output.*

Voltage Regulator Specifications

Regulator	Air Gap	Voltage Setting
9000558	075"	Chart No. 1
9000566	075"	Chart No. 1
9000567	075"	Chart No. 1
9000574	.075"	①② 13.5-14.5
9000595	075"	Chart No. 1

① - This is a flat compensated regulator; therefore adjust voltage to specified setting regardless of temperature

② - Adjust voltage to 14.0 volts

Voltage Setting - Ambient Temperature (Chart No. 1)

Temp.	Setting	Temp.	Setting
65°F	13.6-14.5	125°F	13.2-14.2
85°F	13.4-14.5	145°F	13-14
105°F	13.3-14.3	165°F	12.8-13.8

►*VOLTAGE SETTING TAILORING NOTE:* If battery consistently over or undercharged after voltage regulator properly set and all other checks indicate no circuit defects, voltage regulator setting may be raised or lowered .3 volt to compensate for various underhood temperatures and other operating conditions. Allow reasonable length of time to check performance. Proper setting is obtained when battery remains fully charged with minimum use of water.

DELCO-REMY TRANSISTOR ALTERNATOR REGULATORS

BATTERY INSTALLATION, CHARGING, & BOOSTER BATTERY CAUTIONS - Observe cautions for battery installation, battery charging, and using a booster battery as detailed at beginning of appropriate alternator data pages.

Description

This externally adjusted transistor regulator contains two transistors and five diodes to control the alternator field current and limit alternator voltage to a preset value. There are no moving parts in this unit and it cannot be disassembled for service.

Testing

CAUTION - Do not short between or ground any of the terminals on the alternator. DO NOT attempt to polarize the alternator.

BATTERY NOTE - Battery specific gravity must be 1.220 or above before checks are made as outlined below.

Battery Undercharged - 1) Connect an ammeter in circuit at alternator "BAT" terminal, then connect a voltmeter from "BAT" terminal of alternator to ground.

2) Disconnect wiring harness connector from alternator "F" terminal and connect a jumper lead from alternator "F" terminal to alternator "BAT" terminal.

3) Operate alternator at specified RPM (see car model page) and turn on the necessary accessories to obtain specified voltage. *CAUTION - Make sure there is sufficient load on the system so that high voltages are avoided.* If current output is low, remove and check alternator.

NOTE - If alternator failure was caused by a defective stator or diodes, the paired alternator may be installed back in car and no further checks are needed. If alternator failure was caused by a defective field winding, the repaired alternator may be installed back on car, and the following steps must be made to locate possible damage to transistor regulator.

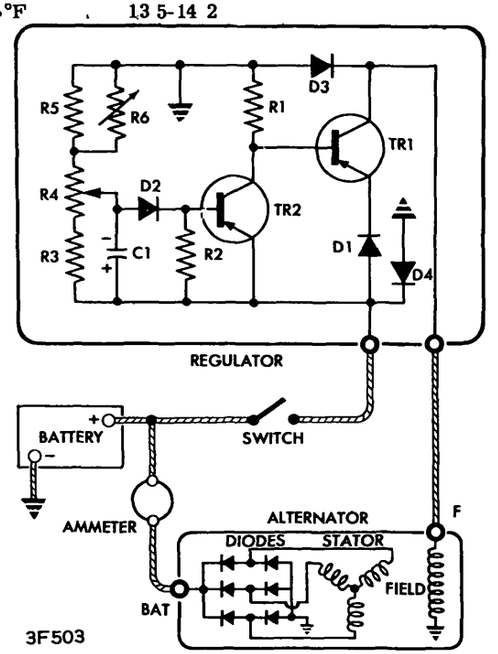
4) If current output is within specifications. Remove jumper lead and reconnect wiring harness connector to alternator "F" terminal, then turn ignition switch on, but do not start engine.

5) Connect voltmeter positive lead to battery positive terminal and negative lead prod into regulator connector body to make connection at the regulator. Record the voltage drop.

6) Connect voltmeter to negative terminal of battery and ground positive lead at regulator. Record the voltage drop. If the addition of both voltage readings is greater than 3 volt, check ignition switch for poor contacts and system wiring for high resistance.

7) If total voltage is less than 3 volt, connect voltmeter positive lead to regulator terminal and voltmeter negative lead to generator "F" terminal. Slide voltmeter lead prods into connector body terminals to make connections. If the voltage is 9 volt or less, replace the regulator (regulator transistor is shorted). If voltage is 2.0 volts or greater, replace the regulator (regulator transistor is open). If the voltage is between 9 and 2.0 volts, proceed as follows:

8) Operate engine at approximately 1500 RPM for 10 minutes with headlight lower beam on, then with engine running, record voltage reading from regulator positive terminal to ground. Slide voltmeter lead prod into regulator connector body **black** lead terminal to make connection. Compare reading with specification table (below). If not within specifications, replace regulator.



9) If voltage reading is within specifications (at proper ambient temperature), charging system is satisfactory, and only an adjustment is required to compensate for an undercharged or overcharged battery.

Adjustment

Remove pipe plug on regulator and insert a small screwdriver into slot and turn counterclockwise for an undercharged battery one or two notches to increase setting. For an overcharged battery, turn clockwise one or two turns to decrease setting. *NOTE - For each notch moved, voltage setting will be changed by .3 volt. Check for an improved battery condition over a service period of reasonable length.*

Voltage Setting (Ambient Temperature)

Temp.	Setting	Temp.	Setting
65°F	13.6-14.5	125°F	13.4-14.1
85°F	13.7-14.4	145°F	13.3-14
105°F	13.5-14.2

DESCRIPTION

Alternator

Three phase, self-rectifying type using three negative and three positive rectifying diodes. Initial field excitation is provided through the charge indicator light which is shunted with a 15 ohm resistor to supply starting field current if charge indicator light burns out.

Regulator

Consists of a relay for field excitation which closes when voltage supplied by neutral terminal of alternator is sufficient to operate relay armature. A double contact voltage regulator which is temperature compensated, controls amount of current supplied to rotating field. With upper contacts closed, full system voltage is supplied to field, and with lower contacts closed, zero current flows to field. A 10.5 ohm resistor reduces field current when armature floats between contacts.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 INTERMITTENT, LOW, OR NO OUTPUT CORRECTION:* This condition may be caused by excessive charging circuit resistance. Check for open or loose connection at multiple connectors, located on engine side of firewall. Loose or open connection at instrument panel cluster charge indicator feed wire terminal, located behind top center of instrument cluster. Poor connection at alternator or regulator terminals.

SERVICE PRECAUTIONS - When testing or servicing alternator or regulator, take the following precautions to avoid damage to components:

Battery - Do not reverse battery connections. Negative terminal must be connected to ground. When charging battery, cables must be disconnected from battery before connecting charger. *DO NOT use charger as a booster for starting engine.* If a booster battery is used to start engine, negative cable of booster battery must be connected to car battery negative terminal.

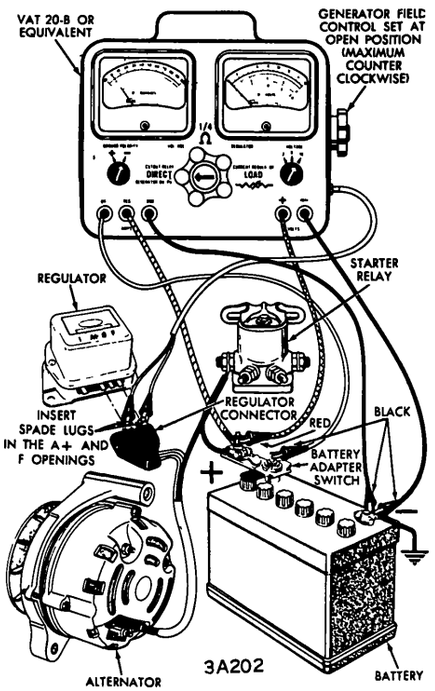
Alternator - DO NOT ground field circuit between alternator and regulator or operate alternator on an open circuit with field winding energized. DO NOT ground output terminal or attempt to polarize alternator. Polarization is not required.

Regulator - Turn ignition switch off when working on regulator. Use care to prevent a short circuit between voltage regulator relay and regulator base when working on regulator. Use an insulated tool when making adjustments.

TESTING ALTERNATOR

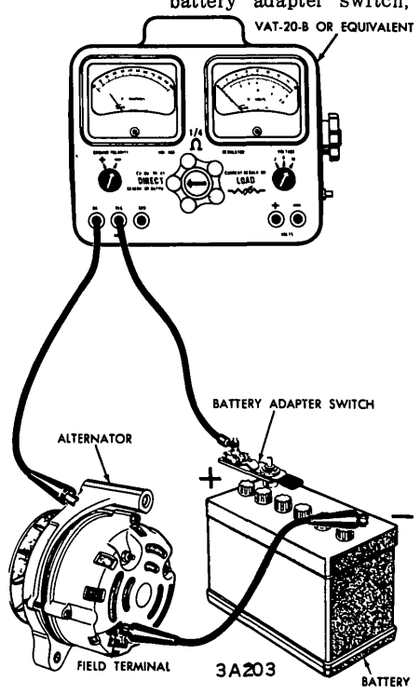
ADJUSTMENT NOTE - All of the following tests (except diodes) are made with a Sun VAT-20-B test set. If equivalent tester is used, follow manufacturers instructions.

Output



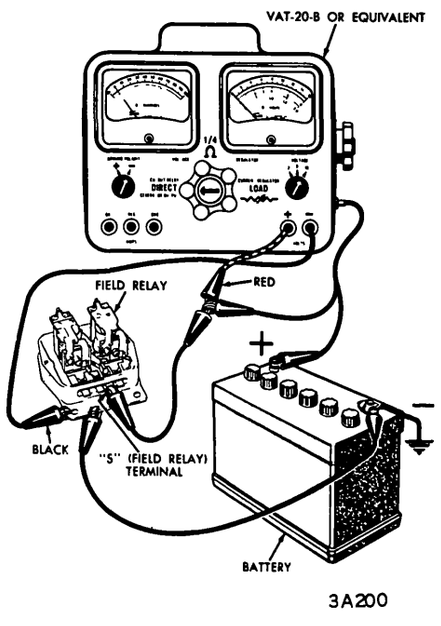
Connect tester as shown in diagram, making sure that Generator Field Control on tester is OPEN. Close battery adapter switch, then start engine and open battery adapter switch (all electrical accessories turned off). Increase engine speed to exactly 2900 RPM. *NOTE - Do not exceed this speed.* Adjust Generator Field Control for a voltage reading of exactly 15 volts. Note ammeter reading and add 5 amps to this reading to obtain total alternator output which should be same as alternator rated output (30 amps or 40 amps). *CAUTION - Make the above test in shortest time possible and do not exceed 2900 engine RPM.* If unable to obtain maximum output it may be due to a fully charged battery. If so, make the following test: Turn Generator Field Control to OPEN position, then rotate tester control knob to LOAD position. Maintain 2900 engine RPM. Adjust Generator Field Control and LOAD control, maintaining a 15 volt maximum reading on voltmeter, until Generator Field Control is at its maximum clockwise position. Readjust LOAD control until voltmeter reads exactly 15 volts. Note ammeter reading and add 5 amps to this reading to obtain total alternator output. *NOTE - An output of 2-5 amps below specifications indicates an open rectifier diode.*

Diodes

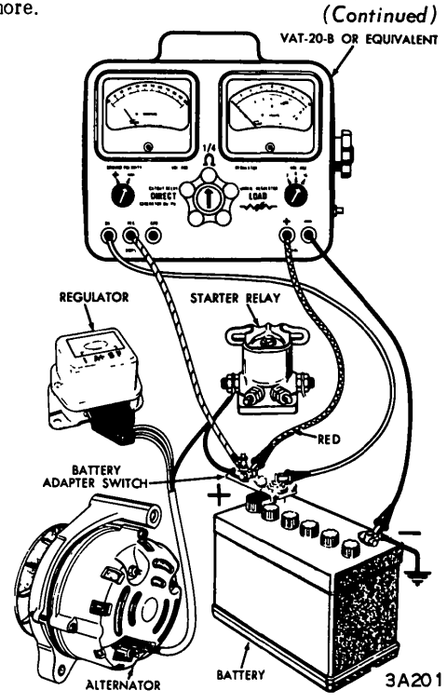


Positive Diodes - Using a Sun Rectifier Diode Tester, connect clip to alternator output terminal, then contact each diode lead with tester probe, making sure that probe penetrates varnish at diode terminal. Ammeter reading should be 2 amps or more.

Negative Diodes - Connect clip of tester to alternator frame, then check each negative diode in same manner as for positive diodes. Ammeter reading should be 2 amps or more.



(Continued)



ALTERNATOR OUTPUT TEST

FIELD OPEN OR SHORT CIRCUIT TEST

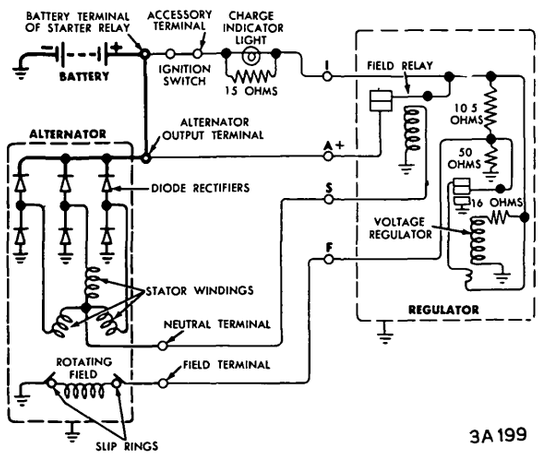
FIELD RELAY TEST

VOLTAGE LIMITER TEST

FORD MOTOR CO. ALTERNATORS & REGULATORS (C ntinued)

Field Open or Short Circuit

Connect tester as shown in "Field Open or Short" diagram. Normal current flow should be 2.9-3.1 amps (40 amp alternator); 2.3-2.6 amps (30 amp alternator). Little or no current flow indicates high resistance or an open circuit; or brushes may not be making proper contact with slip rings. A high current flow indicates shorted or grounded turns in windings. If brushes are not at fault, entire rotor must be replaced.



Field Relay Supply

NOTE - This test indicates that sufficient voltage is available and that wiring is in good condition. Remove connector plug from regulator, then remove regulator cover and reinstall connector plug. Connect negative voltmeter lead to ground, then start engine and operate it at 400-500 RPM. Connect positive voltmeter lead to a small screwdriver and touch screwdriver to the center rivet at front of regulator. *CAUTION - Be careful to touch only the rivet or rivet terminal so as not to short this point to ground or to other terminals.* Voltmeter should indicate at least 6 volts, and field relay contacts should be closed.

TESTING REGULATOR

Field Relay

Remove regulator cover, then connect tester as indicated in "Field Relay Test" Diagram. Slowly rotate field resistance control clockwise from the OFF position until field relay contacts close. Note voltmeter reading at the moment contacts close (this is relay closing voltage and should be 3-4 volts). If relay closes immediately, even with field resistance close to OFF position, use a 6 volt battery for this test. If field relay closing voltage is not within limits, bend spring arm (at lower end of spring) down to increase voltage and upward to decrease closing voltage.

ALTERNATOR & REGULATOR CIRCUIT DIAGRAM

Voltage Limiter

NOTE - For testing, lower stage (armature vibrating on lower contact) regulation is used. Calibration tests must be made with regulator cover in place and with regulator at normal operating temperature (temperature after 20 minutes operation on car with a 10 ampere load). Connect tester as indicated in "Voltage Limiter Test" diagram, then turn off all accessories and lights. Close battery adapter switch, start engine, then open adapter switch. Attach a suitable thermometer to regulator cover and operate engine at 2000 RPM for 5 minutes. Turn master control on tester to DIRECT position. If ammeter indicates more than 10 amps, stop engine and charge battery. With battery fully charged and regulator stabilized, rotate control on tester to VOLTAGE REG. position. The ammeter should indicate less than 2 amps. Cycle the regulator as follows: Stop engine, close adapter switch start engine, and open adapter switch. Allow battery to normalize for a short time, then check voltmeter reading and temperature. Voltage should be within limits indicated in table below for the specified temperature. If regulator is not within limits, make adjustments as outlined in "Voltage Limiter Adjustment" below. *NOTE - After each adjustment, be sure to cycle regulator before each reading. Reading must be made with cover in place .*

Voltage Specifications (Ambient Temperature)

Voltage	Temp. °F	Voltage	Temp. °F
14.3-15.1	50°	13.8-14.6	125°
14.1-14.9	75°	13.6-14.4	150°
13.9-14.7	100°	13.5-14.3	175°

Field Relay

Cut-in (Closing Voltage) - 3.0-4.0 volts. To adjust, bend spring arm (at lower end of coil spring) down to increase voltage and upward to decrease voltage.

Point Gap - .015-.022". Loosen lockscrew ¼ turn and insert a screwdriver in adjustment slot above screw to move stop up or down.

Air Gap - .022-.030". Loosen center lockscrew ¼ turn and insert a screwdriver in adjustment slot below screw to move contact bracket up or down.

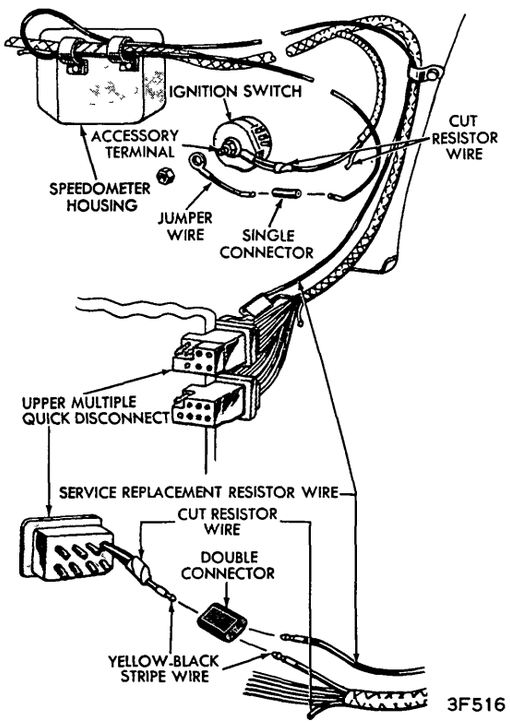
ADJUSTMENT

Voltage Limiter

Voltage Setting - Adjust by bending spring arm (at lower end of spring) downward to increase voltage, upward to decrease voltage.

Point Gap (Lower Contacts) - .010-.015" with upper contacts closed. To adjust, loosen lockscrew ¼ turn and insert a screwdriver in adjustment slot above screw to move stop up or down.

Air Gap - .045-.052" with upper contacts closed. To adjust, loosen center lockscrew ¼ turn and insert a screwdriver in adjustment slot below screw to move contact bracket up or down.



OVERHAUL (ALTERNATOR)

1963 FORD GALAXIE & MERCURY MONTEREY CHARGING SYSTEM RESISTOR WIRE REPLACEMENT - Use Service Replacement Resistor Wire, Part No. C3AZ-10A665-C (Ford Galaxie); C3MY-10A665-A (Mercury Monterey). Disconnect battery ground cable, then fabricate a jumper wire from No. 14 gauge wire (approximately 3" long) with a bullet terminal on one end and an eyelet terminal at the other. Solder terminals securely and proceed as follows:

1) At accessory terminal on ignition switch where black resistor wire and black with green stripe wire are attached to same eyelet terminal, cut the black resistor wire close to terminal and tape the cut end next to terminal. Shorten the defective black resistor wire by cutting it where it emerges from wiring harness under instrument panel.

2) Connect eyelet terminal of jumper wire to ignition switch accessory terminal. At the upper multiple quick disconnect at dash panel where black resistor wire and yellow with black stripe wire terminate together, cut black resistor wire close to disconnect and tape the cut end next to disconnect Cut black resistor wire where it emerges from harness near disconnect, then cut yellow with black stripe wire midway between disconnect and where it emerges from harness. Solder a bullet connector to each cut end of yellow with black wire

(Continued)

REPLACEMENT RESISTOR WIRE INSTALLATION

FORD MOTOR CO. ALTERNATORS & REGULATORS (C ntinued)

3) Use a double connector and connect one end of yellow with black stripe wire to one end of double connector. Connect the other end of yellow with black stripe wire and one end of service replacement resistor wire to other end of the double connector. Use a single connector and connect other end of service replacement resistor wire to jumper wire at ignition switch.

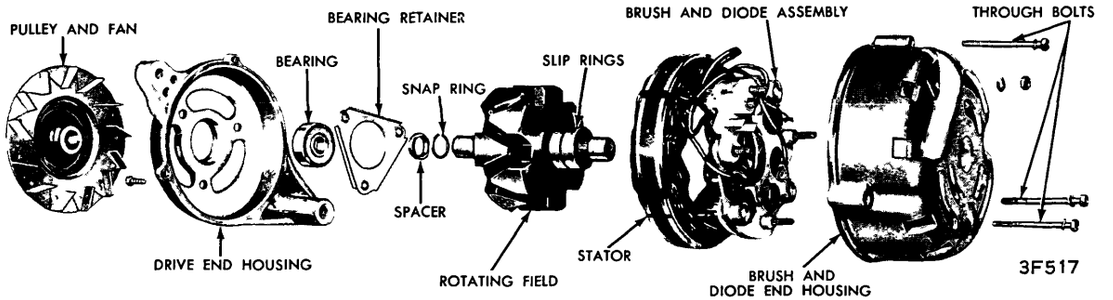
4) Route and tape tie service replacement resistor wire to wiring harness, then connect battery cable to battery.

► *CAUTION - DO NOT splice or replace resistor wire with any other wire other than service replacement resistor wire. DO NOT coil or fold surplus resistor wire as excessive heat will be generated.*

Disassembly

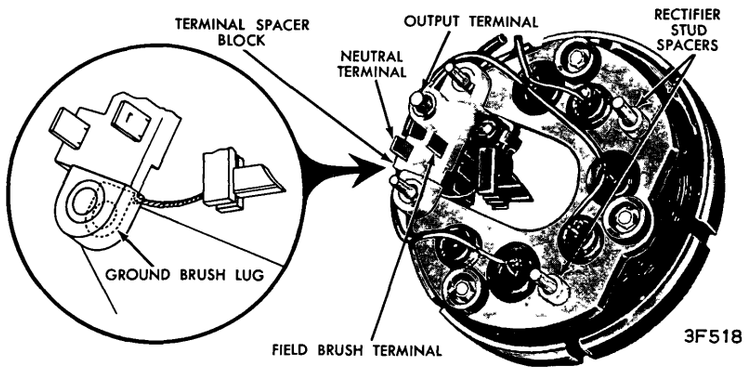
1) Mark both end housings for reference at reassembly, then reach through ventilation slot, raise both brushes off slip rings, and install a short length of 1/8" rod through hole in rear end housing to hold brushes off slip rings.

2) Remove housing through bolts and separate front housing and rotor from stator and rear housing. *NOTE - Make sure brushes do not contact greasy rotor shaft.* Remove nuts from rear housing-to-rectifier mounting studs, and remove rear housing. Remove two spacer sleeves from rectifier plate studs.



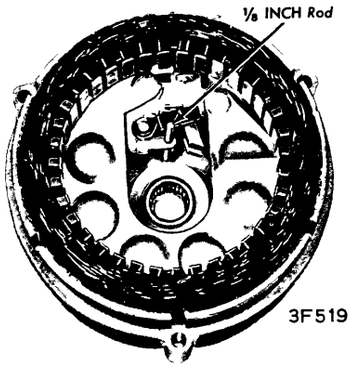
3) Press bearing from rear housing using an arbor press and a suitable tool. Remove terminal spacer block assembly from studs and unsolder neutral wire from spacer block neutral terminal. If brushes are being replaced, straighten field brush terminal blade locking tabs with pliers and remove blade from spacer block. Remove brushes and holder from the assembly.

4) If either diode plate is being replaced, carefully unsolder leads from diodes (use a 100 watt soldering iron only) and leave soldering iron in contact with diode terminals only long enough to remove wires. *NOTE - Attach needle nose pliers to diode leads adjacent to soldering point, using rubber bands around plier handles. Pliers will act as a temporary heat sink to prevent damage to diodes .* Remove three insulated diode plate screws and insulators, and separate diode plates.



5) Remove drive pulley using a suitable puller, then remove the three screws holding front bearing retainer, and remove front housing. If bearing is being replaced, use a bearing puller and pull bearing from rotor shaft. Remove bearing retainer and spacer. *NOTE - It will not be necessary to remove stop ring unless it has been damaged.*

Cleaning & Inspection



Use a clean cloth and wipe rotor, stator, diode rectifier assemblies, and bearings. DO NOT clean these parts in solvent. Wash all other parts in solvent and blow dry with air. Check bearings for wear, roughness and for noisy operation. Replace as necessary. Check housings for cracks and stripped threads. Replace pulley if more than ¼" of shaft will enter bore with light pressure. Check all wire leads and solder connections. Check slip rings for damaged insulation. Check slip rings for runout. If slip rings have more than .0005" runout, take a light cut (minimum diameter limit is 1.2") from face of rings to true them up. Replace any parts that are burned or cracked. Replace brushes that are worn to less than .350" in length. If brush springs do not have 7-12 ounces tension, replace springs.

FORD MOTOR CO. ALTERNATOR ASSEMBLY

TERMINAL SPACER BLOCK INSTALLATION

RETRACTING BRUSHES FOR DISASSEMBLY

Reassembly

1) If stop ring on drive shaft was broken, install a new stop ring (push ring on shaft and into groove. DO NOT open ring with snap ring pliers). Position front bearing spacer on drive shaft against stop ring, and position bearing retainer on shaft with flat surface of retainer outward. Exert pressure on bearing inner race and press bearing on shaft until it contacts spacer.

2) Place front housing over shaft, with bearing positioned in front housing cavity, then install bearing retainer mounting screws. Press pulley on shaft until hub touches inner race of front bearing.

3) If a new diode plate is being installed, mount the two plates together so they are insulated from each other (insulating spacer between plates and cupped insulator under screw head). Solder wire leads to diodes using same method used for unsoldering (see "Disassembly" above).

4) Insert new field brush terminal blade into slot in terminal spacer block with the brush pig-tail extending toward brush holder pivots. Install brush holders and brush spring to terminal block, then position brushes in brush holder. Solder neutral wire to neutral terminal, then position terminal spacer block assembly on rectifier plate mounting studs, with ground brush lug over mounting stud farthest from output terminal. Place spacers on rectifier mounting studs farthest from terminal block.

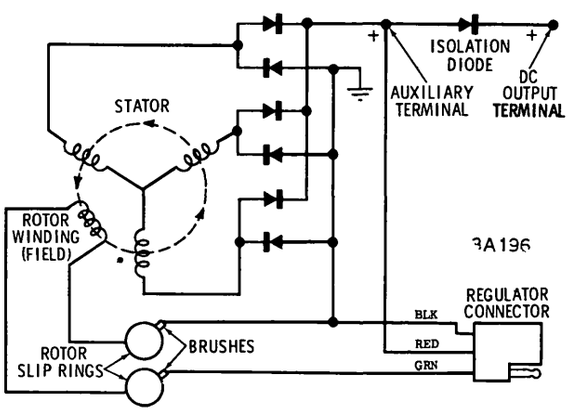
5) Place rear end housing over rectifier plate and stator assembly and mount rectifier plate to housing. Retract brushes and insert a short length of 1/8" rod through hole in rear housing to hold brushes in retracted position. Wipe rear bearing surface of rotor shaft clean, then position rear housing and stator assembly over rotor and align marks made at disassembly. Install housing through bolts and remove brush retracting rod.

MOTOROLA ALTERNATORS & REGULATORS

ALTERNATOR

DESCRIPTION

Three phase, self-rectifying type, using six diodes for rectification and a single isolation diode for operation of charge indicator lamp and to automatically connect voltage regulator to alternator and battery when alternator is operating. This isolation diode also eliminates electrical leakage over alternator insulators so that maximum leakage is less than one milliampere when car is not in use. Initial field excitation is supplied to alternator through the indicator light when ignition switch is turned on. When alternator charge equals battery voltage, voltage potential across isolation diode is low and lamp does not light indicating that alternator is charging In case of indicator light failure, defective light, socket, or wire, a 75 ohm resistor in parallel with light supplies initial field excitation current.

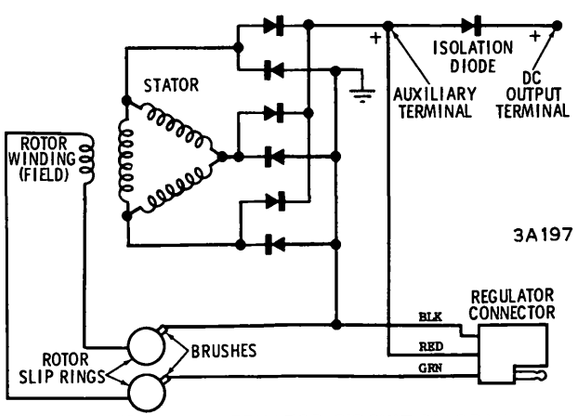


SERVICE CAUTIONS - To prevent damage to alternator and regulator, note the following: Do not short "Field" terminal of alternator to ground; disconnect voltage regulator when alternator is operating; or disconnect load (output lead) from alternator while alternator is operating. Do not remove alternator from car without first disconnecting negative battery terminal. If battery must be removed, disconnect negative cable first. If a battery is being installed, negative terminal must be connected to ground. **Reverse polarity will destroy alternator diodes.**

BATTERY CHARGING CAUTION - When charging battery in car, disconnect POSITIVE battery terminal.

TESTING (ON CAR)

Output



With engine off, disconnect output cable from alternator and connect an ammeter (0-60 amperes) in series with output terminal and cable (positive terminal of ammeter connected to output terminal of alternator). Connect a carbon pile load to negative side of ammeter and negative battery terminal, then connect a voltmeter to alternator output terminal and negative battery terminal (positive terminal of voltmeter connected to output terminal of alternator). Start engine and run for 15 minutes to stabilize temperature, then slowly increase load with carbon pile and increase engine speed until rated current output is reached. Output voltage should be 13 volts minimum, 15 volts maximum at rated output current. If voltage exceeds 15 volts, replace or check voltage regulator (see "Motorola Transistorized Alternator Regulator"). If rated output cannot be reached at high engine speeds, check fan belt tension. *NOTE - Remove carbon pile load immediately after engine is stopped.* If current output is below normal and output terminal voltage exceeds 13 volts, replace isolation diode with a known good diode. If rated output cannot be reached, or output terminal voltage is below 13 volts, test alternator (see below).

30 & 40 AMP ALTERNATOR CIRCUIT DIAGRAM

Alternator Test

CAUTION - Do not disconnect alternator field terminal wire while alternator is operating. With engine off, connect ammeter, voltmeter and carbon pile as for "Output Test" (see above), then disconnect field terminal wire and connect a 40 ohm, 3 amp. rheostat from output terminal to field terminal. Set field resistor at maximum resistance, then start engine and note voltage at output terminal. **This voltage must not exceed 15 volts. Increase load with carbon pile to reduce voltage if necessary.** Increase load with carbon pile and decrease field resistance with rheostat while maintaining less than 15 volts at output terminal. Continue to decrease field resistance while increasing output load until there is no resistance in field circuit. *NOTE - With no resistance in field circuit, maximum field current is being applied to field coil.* If rated current output is obtained with at least 13 volts but less than 15 volts at output terminal, alternator is operating properly. *CAUTION - Do not exceed rated current output of alternator by increasing load on alternator.* If rated output cannot be obtained, check brush assembly for poor connections, broken, excessively worn, or sticky brushes. *NOTE - If alternator operates properly with field rheostat connected in circuit but would not operate with field rheostat out of the circuit (with field terminal wire connected), check 75 ohm resistance wire for continuity or replace with a known good resistor. If resistor wir was open and indicator lamp burned out, alternator would not operate.*

45 AMP ALTERNATOR CIRCUIT DIAGRAM

Isolation Diode

NOTE - If battery is being discharged with ignition switch and all accessories off, isolation diode may be shorted.

With regulator connected to alternator, measure voltage appearing at auxiliary terminal. This voltage should not exceed .1 volt with ignition switch and all accessories turned off. If voltage exceeds .1 volt, excessive leakage through isolation diode is indicated and diode should be replaced.

Specifications

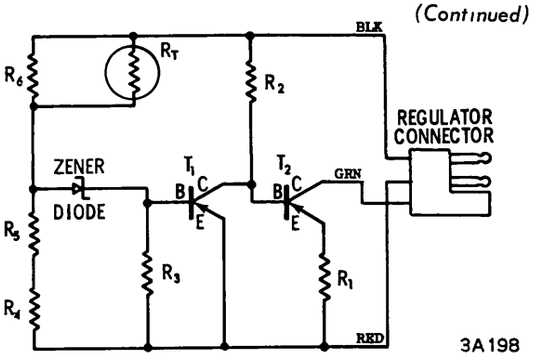
Alternator No. ①	② Rated Output
A12NX451	30 amps
A12NX550	40 amps
A12NX600	45 amps

① - Alternators used as original equipment may have a slightly different model number, however, the three suffix digits will be the same as indicated in table.
② - At 15 volts Acceptable minimum output at 75°F alternator temperature should not exceed 5 amps less than rated output

Charging Circuit

Voltage drop should not exceed .3 volt between output terminal of alternator and positive battery terminal with a 10 ampere load on alternator .

TESTING (ON BENCH)



Rotor (Field Coil) Test

Connect a test lead to ground terminal of alternator and to negative post of a fully charged battery, then connect negative lead of test ammeter to alternator field terminal Connect positive lead of test ammeter to a 40 ohm, 3 amp rheostat and set rheostat at maximum resistance Connect a test lead between positive post of battery and remaining open terminal of rheostat Test rotor as follows:

1) Slowly reduce resistance of rheostat to zero With fully charged battery applied to field coil, the field current should be as indicated in table Turn rotor by hand while making the test *NOTE - A slight fluctuation of current meter (.2 amps) is normal.*

2) If field current is not within limits, inspect brushes and slip rings for excessive dirt, sticky or broken

(Continued)

REGULATOR CIRCUIT DIAGRAM

MOTOROLA ALTERNATORS & REGULATORS (C ntinu d)

brushes and bad connections Check brush assemblies for shorts and continuity (see below).

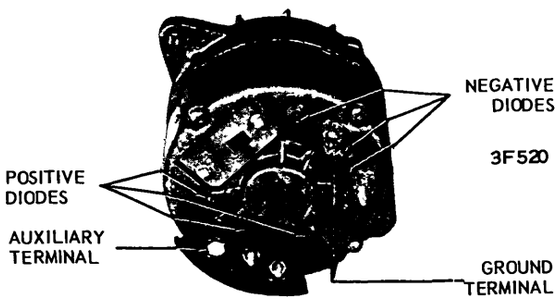
3) Re-install repaired or a known good brush assembly and repeat the test If field current is above maximum shown in table, it indicates that field coil is either shorted to rotor or field coil has shorted turns.

4) If field current is zero, it indicates that the field coil or coil to slip ring connection is open. If field current is considerably less than specifications, it indicates a poor coil to slip ring connection (high resistance) or poor brush to slip ring connection.

Field Current Draw

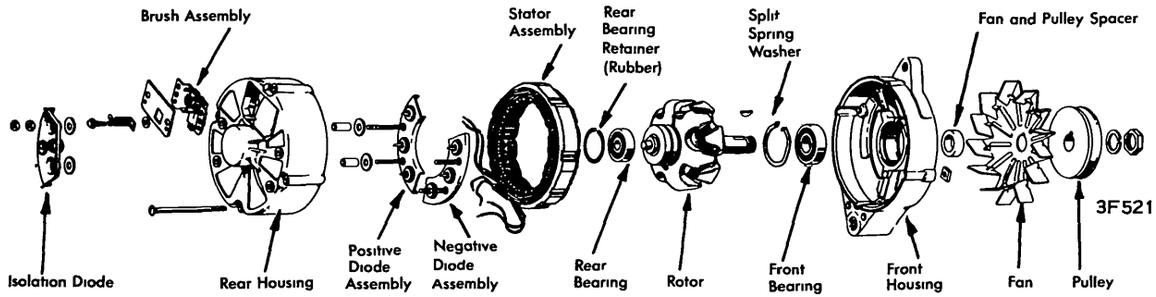
Alternator Model	Field Current
A12NX415	1.2-1.7 amps
A12NX550	1.8-2.4 amps
A12NX600	1.8-2.4 amps

Brush Assembly Insulation Test



Insulation Test - Connect an ohmmeter or a test lamp (12 or 120 volt) to field terminal and to bracket. Resistance should be high (infinite) or test lamp should not light. If resistance is low or test lamp lights, brush assembly is shorted and must be replaced

Continuity Test - Connect an ohmmeter to field terminal and brush (use an alligator clip for good contact to brush). Resistance reading should be zero. Move brush and lead wire to make sure that brush lead wire connections are not intermittent. Resistance reading should not vary when brush and lead wire are moved around. Connect ohmmeter to bracket and grounded brush. Resistance reading should be zero. Repeat same test on brush lead wire as indicated above.



Rectifier Diode Test (With Test Lamp)

NOTE - A test lamp will not indicate an open condition unless all three diodes of either assembly are open. A shorted diode can be detected with test lamp method. If available, an "in-circuit" diode tester should be used, following instructions of the manufacturer.

Connect a 12 volt D.C. test lamp probe (do not use a 120 volt test lamp) to negative diode terminals and to ground terminal, then reverse the test probes. The lamp should light in one direction and not in other direction. If test lamp lights in both directions, one or more of the rectifier diodes of the assembly being tested is

DIODE TEST POINTS

MOTOROLA ALTERNATOR ASSEMBLY

shorted. If test lamp does not light in either direction, all three diodes in the assembly are open Recheck diodes individually after disassembly *NOTE - A shorted stator coil to core would appear as a shorted rectifier diode assembly. Also check stator for shorts after disassembly.* To check positive diodes, repeat the above test (for negative diodes) at positive diode terminals, except that ground lead of test lamp should be connected to "auxiliary terminal" (see illustration).

OVERHAUL

Disassembly

1) Remove pulley from rotor shaft *NOTE* - If pulley is a "friction fit" use a suitable puller. If pulley is a "slip fit" with a woodruff key and threaded shaft, support alternator and strike end of shaft with a wooden mallet

2) Remove two self tapping screws and brush holder cover, then pull brush assembly straight out, sufficiently to clear locating pins, then remove brush assembly Remove isolation diode assembly and remove the four through bolts and nuts. Insert a small screwdriver in stator slots between stator and front housing *NOTE - Do not insert screwdriver blade deeper than 1/16" to avoid damaging stator winding.* Pry at several points around stator and remove rotor and front housing as an assembly.

3) Remove rear bearing with a suitable puller. Use long nose pliers and compress ears of split ring washer which retains front bearing, and lift washer to free it from its seated position (do not remove washer until after front housing has been removed)

4) With split ring washer out of retaining groove, tap front end of rotor shaft on a block of wood to remove front cover. If necessary, use a suitable puller to remove front housing from rotor shaft. Remove front bearing from rotor shaft with a suitable puller.

5) Remove remaining locknuts and insulating washers from rear housing and remove stator and diodes as an assembly. *NOTE - Do not unsolder stator-to-diode wire junctions. Avoid bending stator wires at junction.*

Rectifier Diode Assembly Replacement

In soldering and unsoldering leads from diodes, grasp diode lead with pliers between the diode and stator lead to be removed (this will give better heat dissipation and protect the diode). Do not exert excessive stress on diode lead. Make a note of diode assembly to stator connections and make certain that replacement diode assembly connections are the same *NOTE - Positive diode assembly has red printing and the negative has black printing. DO NOT INTERCHANGE.*

Reassembly

1) Install diode assembly and stator in rear housing and secure in position with locknuts and washers. *NOTE* - The positive diode assembly must be insulated from rear housing Be sure that all insulating washers and sleeves are installed in their proper position. Dress diode wires against rear housing.

2) Clean bearing and inside of bearing hub of front housing, then support front housing and use a suitable tool to drive or press front bearing into position in housing Insert split ring washer into hub of front housing and use a suitable tool to seat washer into groove in housing. *NOTE - Split ring washer must be installed before installing rotor assembly.*

3) If rotor shaft is equipped with a keyed pulley, install pulley and woodruff key, then install nut and tighten securely. If shaft has a "friction fit" pulley, support slip ring end of rotor with suitable tool that fits shoulder of rotor shaft (do not apply pressure to end of rotor shaft), then use a press and press pulley into position until it is properly seated on pulley spacer .

4) Support front housing assembly in an arbor press with pulley downward, then use a suitable tool that fits inner race of bearing and press bearing on until it is seated against shoulder of rotor shaft

5) Make certain that rear bearing retainer is properly seated in rear housing hub and that diode wires are properly dressed so that rotor will not rub on wires. Assemble front and rear housing assemblies (hand pressure should seat rear bearing into rear housing) Align stator slots with rear housing through bolt holes, then align front housing through bolt holes with rear housing bolt holes. Install through bolts and tighten evenly to 25-30 ft. lbs.

6) Before mounting isolation diode, make sure that positive rectifier diode plate has been properly insulated from housing *NOTE - On 40 and 45 amp. alternators, the isolation diode is mounted to one of the positiv rectifi r diod studs, and one f the negativ r ctifi r diod studs. The isolation diod must b insulated from negative diode stud.*

(Continued)

MOTOROLA ALTERNATORS & REGULATORS (C ntinu d)

REGULATOR

DESCRIPTION

Transistorized type voltage regulator which requires no adjustment This unit is sealed at the factory and should be replaced if defective

Voltage Regulat r

NOTE - Make sure alternator is operating properly before testing voltage regulator.

Connect ammeter, voltmeter and carbon pile in same manner as for alternator test (see "Motorola Alternator"), then start engine and increase load with carbon pile, and increase speed, if necessary, to obtain 10 amp output current Operate engine for 15 minutes to stabilize temperature, then check ambient temperature of regulator by placing a thermometer 1" away from regulator case Output terminal voltage must be within limits indicated in table, at specified ambient temperature If voltage is not within limits, replace regulator and repeat test Increase load with carbon pile and engine speed until rated current output is reached Voltage at terminal should be at least 13 volts but should not exceed maximum limits indicated in table.

Voltage Sp cifications
(Ambient Temperature)

Ambient Temp ratur °F	Output Voltage ℄ Minimum	Maximum
0°	14 60	15 40
20°	14 45	15 25
40°	14 26	15 08
60°	14. 13	14 92
75°	14 00	14.80
80°	13 95	14 75
100°	13 80	14.60
120°	13 65	14.45
140°	13 60	14. 28
160°	13 30	14 13

℄ - With 10 amp load.

PRESTOLITE ALTERNATORS & REGULATORS

►CHANGES, CAUTIONS, CORRECTIONS

►*BATTERY INSTALLATION, BATTERY CHARGING, OR USING A BOOSTER BATTERY TO START ENGINE CAUTION: Reversed polarity or excessive voltage will result in extensive damage to alternator system. NOTE THE FOLLOWING TO PREVENT DAMAGE.*

Battery Installati n - Alternator polarity (see above) determines which battery terminal is grounded. For negative polarity alternators, **negative** battery terminal must be grounded. *DO NOT REVERSE BATTERY LEADS or rectifi rs will be damaged.*

Charging Battery - If a "Fast Charger" is used, both of the car's battery cables must be disconnected from battery. *DO NOT use a "Fast Charger" to provide starting voltage.*

B st r Batt ry (Used To Start Engine) - Booster battery **must** be connected with negative lead to negative terminal of battery and positive lead to positive terminal of battery. *DO NOT REVERSE BATTERY LEADS.*

ALTERNATOR

DESCRIPTION: Main alternator components are the stator, rotor, slip ring end housing, drive end housing and rectifiers (diodes). Alternator voltage is controlled by varying the field current through a double contact voltage regulator unit. Because the rectifiers permit current flow in only one direction, no current can flow from battery to alternator and no circuit breaker (cutout relay) is needed. The self-limiting current characteristics of the alternator eliminate the need for a current regulator.

Stator - Consists of a laminated iron core with three phase windings electrically 120° apart wound in slots around inside circumference. A pair of leads are connected to each of the three points of the windings and one of each pair of leads connects to a negative rectifier and one to a positive rectifier.

Rotor - Consists of a single field coil encased between two four-fingered overlapping iron sections assembled on a shaft. The two ends of field coil are connected to two slip rings insulated from each other and the shaft. Battery is connected to field coil through brushes and the slip rings.

R ctifiers - Six silicone diode rectifiers are pressed into heat sinks in slip ring end housing. Three rectifiers have negative polarity and their heat sink is grounded to end housing. The other three rectifiers have positive polarity and their heat sink is insulated from end housing and connected to alternator output terminal.

Field Coil Draw - 2 38-2 63 amps (ALB); 2 32-2 43 amps (ALC); 2 34-2 42 amps (ALD), 2 33-2 44 amps (ALE), 2 23-2 43 amps (ALK) All at 10 0 volts and 70°F

TROUBLE SHOOTING & DIAGNOSIS

ALTERNATOR DOES NOT CHARGE: Drive belt loose. Brushes or slip rings worn. Brushes sticking. Field or charging circuits open. Rectifiers open. Stator windings open.

LOW OR UNSTEADY CHARGING RATE: Drive belt loose. High resistance in charging circuit, battery terminals or engine-to-body ground strap. Stator windings open.

LOW OUTPUT & LOW BATTERY: High resistance in charging circuit. Regulator setting too low. Rectifier shorted or open. Stator winding grounded.

EXCESSIVE CHARGING RATE: Regulator setting too high or contacts stuck. Regulator base not grounded. Regulator winding open. Rectifier open.

REGULATOR CONTACTS OXIDIZED: Regulator setting too high or air gap incorrect. Rotor field coil winding shorted.

REGULATOR CONTACTS BURNED: Regulator setting too high. Rotor field coil winding shorted.

REGULATOR COIL WINDING BURNED: Regulator setting too high.

ALTERNATOR NOISY: Alternator mountings loose. Bearings worn. Drive belt worn. Interference between rotor fan and stator leads or rectifiers. Rotor or rotor fan damaged. Rectifier open or shorted. Stator winding open or shorted.

TESTING

►*CAUTION: 1) Do not ground field circuit between alt r nator and voltage regulator as regulator will be damaged.*

2) Do not ground alternator output terminal or alternator and circuit will be damaged (no circuit break r used and battery applied to output terminal at all times).

3) Do not operate alternator on open circuit with field winding energized.

4) Do not polarize alternator as it is not required and doing so will damage entire system.

5) Before making test connections, ignition switch must be off and battery ground cable disconnected.

ALTERNATOR IN CAR: With battery fully charged and engine at normal operating temperature, test circuits as follows:

Charging Circuit Resistance: 1) Connect an ammeter in series between alternator output terminal and charging circuit lead with lead disconnected from terminal. Connect a voltmeter across charging circuit (negative lead of voltmeter to positive terminal of battery and positive lead of voltmeter to alternator output terminal lead). Disconnect lead from regulator field terminal and from alternator field terminal. Connect a jumper wire between alternator field and output terminals. Connect battery ground cable and adjust engine speed and electrical load to obtain 10 amperes in charging circuit. Voltmeter reading should not exceed .3 volt. If more, inspect, clean, and tighten all connections.

2) With same conditions as above, connect voltmeter from negative (grounded) battery terminal to alternator frame, and then from alternator frame to regulator base.

(Continued)

PRESTOLITE ALTERNATORS & REGULATORS (C ntinu d)

With 10 amperes in charging circuit, voltage reading in either case should not exceed .04 volt. If more, correct high resistance ground connections.

Current Output: Leave ammeter and jumper wire connected as in "Charging Circuit Resistance" above. Connect voltmeter with negative lead to ground at alternator frame and positive lead to alternator output terminal. Connect a carbon pile rheostat across battery and a tachometer to engine. Adjust engine speed so alternator is turning at specified RPM (see "Performance Data" above), and rheostat to obtain 14 2 volts on voltmeter Current output shown on test ammeter should be within specifications (see "Performance Data" above) A slightly low reading may mean an open rectifier and a considerably lower reading may mean a shorted rectifier

ALTERNATOR OFF CAR: Field Coil Draw (Te sting For Shorted Rotor) - Connect an ammeter and a rheostat in series between outer slip ring and battery. Connect other battery terminal to inner slip ring. Connect a voltmeter lead to each slip ring. With rheostat, adjust voltage to 10 volts and read field current draw on ammeter. If higher than specifications (see above) rotor field coil winding is shorted.

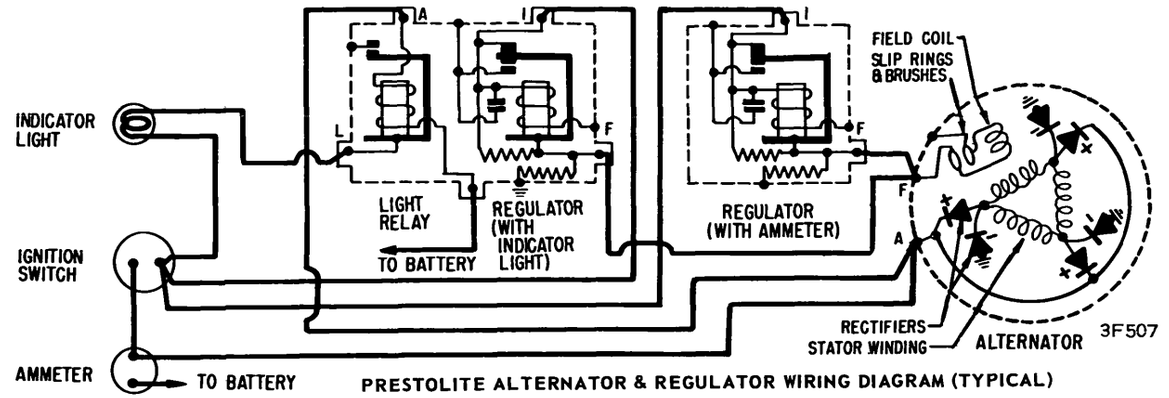
R tor Test (For Grounds): Make test with a 110-volt test bulb with one probe on a slip ring and other probe on rotor core. If bulb lights, rotor winding is grounded.

Stat r Test: Test for shorted windings with an internal-external growler. Test for grounds with a 110-volt test bulb and test probes. *Make both tests with stator leads disconnected from rectifiers.*

R ctifier (Diode) Test: *Make initial test without disconnecting stator leads from rectifiers. This will eliminate need for complete disassembly. To find which rectifier is bad, stator leads must be disconnected and each rectifier tested individually.* Use a No. 57 test bulb in series with a 12-volt battery and test probes. Touch one test probe to rectifier heat sink and other probe to a rectifier lead in same heat sink. Reverse the probes. If lamp lights in **one** direction, rectifier is good. If lamp **does not** light in either direction, rectifier is open. If lamp lights in **both** directions, rectifier is shorted.

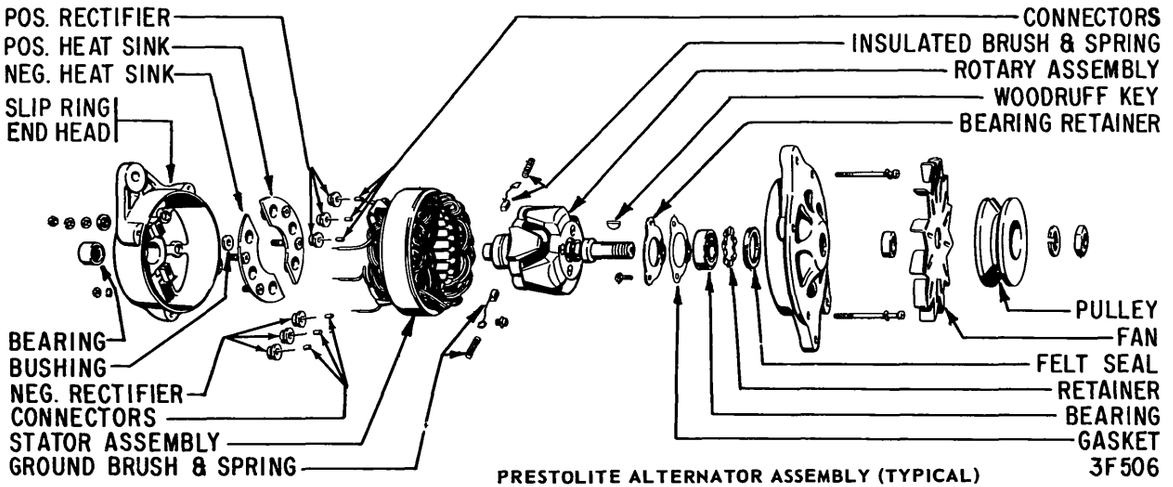
►*RECTIFIER TESTING TOOL NOTE: Diode Testing Tool C-3829 is available for testing rectifiers without disconnecting stator leads.*

OVERHAUL



See "Autolite Alternator & Regulator" on Page 273 of the 1961 Final Data.

REGULATOR



("VBS", "VBT" & "VBV")

DESCRIPTION: Regulator - Field control type. Temperature compensated, vibrating type voltage regulator with two sets of contacts using a common armature. Regulator operates on either upper or lower contacts (both sets never in operation at same time) depending on load and battery requirements as follows:

Upper Contact Operati n (Low Speed & High L ad) - Armature travel opens and closes upper contacts, cutting regulator resistance in and out of field circuit, and limiting alternator field current.

PRESTOLITE ALTERNATOR & REGULATOR WIRING DIAGRAM (TYPICAL)

PRESTOLITE ALTERNATOR ASSEMBLY (TYPICAL)

Lower Contact Operation (High Speed & Low Load) - Armature travel opens and closes lower contacts, grounding the regulator field terminal and bypassing alternator field coil (contacts closed), or cutting resistance in field (contacts open).

Circuit Breaker (VBV Regulators): This unit which is located at battery terminal end of regulator assembly, has a built in polarity sensing feature that prevents damage to alternator, circuit wiring and components of charging system should a battery of incorrect ground polarity be installed. The circuit breaker provides a means of energizing alternator rotor windings (upper contacts closed) as well as completing a circuit between alternator and battery (lower contacts closed)

VBV REGULATOR NOTE - On some model regulators, a condenser is connected between "A" terminal and frame of circuit breaker Condenser capacity .1 mfd

Indicator Light Relay: On cars with a charge indicator light in place of an ammeter a relay is used to operate the light Relay has a single heavy winding in series with charging circuit with a movable contact on an armature and a grounded stationary contact Relay contacts are in series with indicator light which is connected to battery through ignition switch. With ignition switch on, light is grounded through contacts and lights up When alternator is charging, current flow through relay winding pulls armature down, opening the contacts so that light goes out.

CHECKING & ADJUSTING (ON CAR): Regulat r - *See "Autolite Alternator & Regulator" on Page 273 of 1961 Final Data, and note the following:*

Ⓒ Voltage Setting - Ambient Temp.

Temp. (°F)	Voltage	Temp. (°F)	V ltag
50°	14.3	110°	13 9
70°	14.2	130°	13 8
90°	14.05	150°	13.65

Ⓒ - Applies to all regulators except VBV-6201AX, -1, -3; VBV-6201CX, -3, EX; VBV-6211AX, 1; VBV-6221AX, -1 These regulators are special, low setting regulators for engines having a constant speed. The voltage setting should be 13 7 volts at 70°F

Circuit Breaker (VBV Regulat rs)

Contact Gap - .017- 022" **Armature Gap** - .025- 027"

Pull-in Voltage - 8.0-9.0 volts.

NOTE - Circuit breaker releases at 13.0-13.5 volts after 14.0 volts on "A" terminal.

CORVETTE RETRACTABLE HEADLIGHTS

C rv tt (1963)

DESCRIPTION

Headlights are mounted on retractable panels operated by a reversible motor and reduction gear for each side. Control is by a manual control switch on instrument panel just below main lighting switch. A warning light on instrument panel grounded to two micro-switches at headlight linkage flashes whenever headlights are on but not fully opened and locked into position.

OPERATION

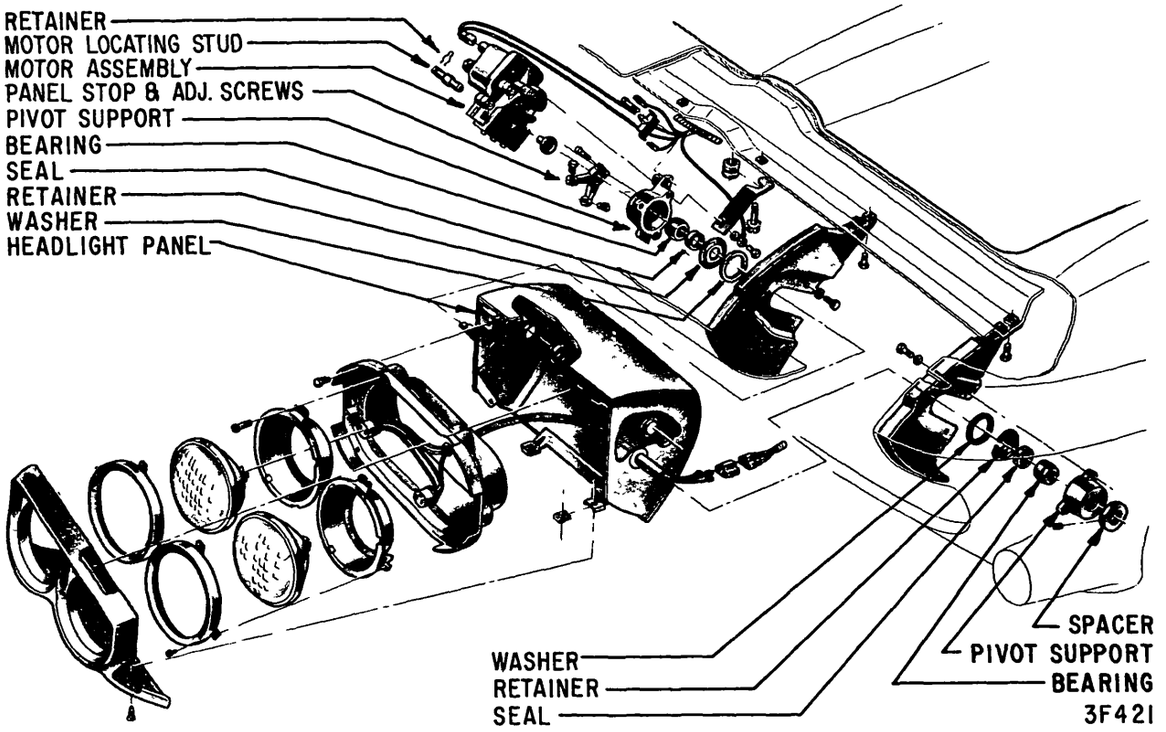
Headlights and other exterior lights are turned on and off in the usual manner from the main lighting switch. When headlight motor switch on instrument panel is actuated, motor and reduction gear assemblies turn headlight panels up or down as required. If headlights turned on before panels are opened, warning light flashes, then when up cycle is completed, linkage opens micro-switches (normally grounded) to open circuit to warning light and light goes out, indicating that headlights are up and locked. *For electrical circuits, see Wiring Diagram on Chevrolet V8 & Car- v tte Car Mod l Pag s.*

EMERGENCY OPERATION

If motor or wiring damaged, headlights may be raised manually by raising hood, reaching under body panel, and turning hand wheel attached to armature shaft of each motor. Wheel is located on same side of motor as electrical wiring connector.

TROUBLE SHOOTING & DIAGNOSIS

The following list is for headlight panel and motor circuit only. Us c nv ntional diagnosis procedures for other headlight troubles.



B th Headlights Will Not Operate in One Direction - Control switch faulty; Wiring connections loose at switch or motors; Open circuit between switch and motors.

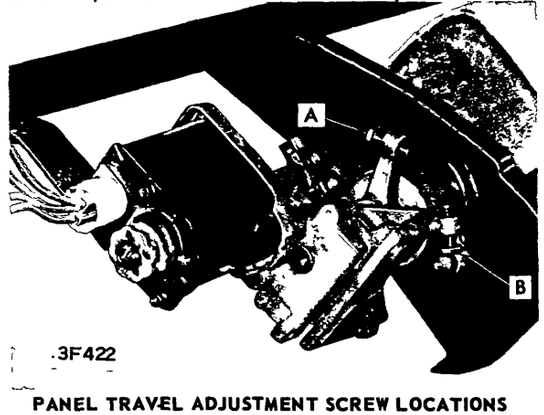
B th H adlights Completely Inoperative - Control switch faulty or not grounded; Circuit breaker open; Loose connections at circuit breaker or control switch.

One H adlight Op rat s in One Direction Only - Motor faulty or not grounded; Mechanical binding condition.

B th H adlights Op rat Slowly - Low battery; Control switch has high resistance; High resistance in circuit or loose connections.

On H adlight Op rates Slowly - Control switch faulty; Wiring connections loose; Mechanical binding condition.

CORVETTE HEADLIGHT, PANEL, AND MOTOR ASSEMBLY (EXPLODED)



Both Headlights Operate Intermittently - Circuit breaker trips repeatedly because of short; Wiring connections loose at switch, circuit breaker, or ground.

One Headlight Operates Intermittently - Motor circuit breaker faulty; Wiring connections loose.

ADJUSTMENT

Panel Travel Adjustment

NOTE - Each panel operates independently of the other. Adjustment must be made at each panel.

PANEL TRAVEL ADJUSTMENT SCREW LOCATIONS

Open Position - Turn adjusting screw "A" (see illustration) so mounting face of panel is within 2° of vertical with panel fully opened. Tighten locknut.

Closed Position - Turn adjusting screw "B" (see illustration) so headlight panel is flush with upper body panel in fully closed position. Tighten locknut.

Headlight Alignment

Headlights are aimed and adjusted in the usual manner.

REMOVAL & INSTALLATION

Sealed Beam Replacement

Bulb units are replaced in the usual manner. Retaining ring has a retaining spring which is removed and replaced with long-nosed pliers.

Headlight Panel

Removal - Remove hood, open headlights, and disconnect battery. Remove headlight bezel and remove sealed beam housing unit as an assembly. Remove motor from panel pivot shaft (see below). Remove panel stop from panel inboard pivot shaft, then disconnect micro-switch wires. Remove panel retaining bolt access hole plugs from inside of panel, then rotate panel and remove retaining bolts. Slide supports from end of panel

(C ntinued)

CORVETTE RETRACTABLE HEADLIGHTS (Continued)

pivot shaft. Remove bearing, felt seal, retainer, and and washer from inboard pivot shaft. Remove panel by alternately disengaging pivots from retaining slots and pulling unit forward through body opening. Loosen Allen screw in spacer and remove spacer, bearing, felt seal, retainer, and washer.

Installation - 1) On outboard pivot shaft, install washer, retainer, felt seal, bearing, and spacer (do not tighten spacer). Install panel in body opening and index panel pivot shafts in retaining slots, then install support retaining bolts loosely. Install washer, retainer, felt seal, bearing, and support on inboard pivot shaft, and install support retaining bolts loosely. Check panel horizontal alignment, making sure there is no panel-to-body contact, position spacer snugly against bearing, and tighten spacer screw to 30-50 inch-lbs. Install stop on panel inboard shaft so stop rests against bearing, making sure index mark on stop is aligned with flat on pivot shaft. Install stop lock bolt and tighten to 45-60 inch-lbs. *NOTE - Do not over-tighten lock bolt, and do not change panel horizontal alignment.*

2) Tighten pivot support bolts snugly (but loose enough so panel can be moved by hand), close panel, and align with body so all surfaces are flush. With panel in closed position, tighten forward outboard support bolt to 100-140 inch-lbs. (access through opening between hood and body), then rotate panel for access to remaining support bolts and tighten to 100-140 inch-lbs. Connect wiring to micro-switch, install sealed beam housing unit and connect wiring. Install motor (see below) connect battery, adjust panel travel (see above), and aim headlights. Install headlight bezel and hood.

Motor Replacement

Removal - Disconnect battery and motor wiring. Turn motor hand wheel until gear seems to turn freely (turn wheel in one direction until definite drag is felt, then turn wheel in opposite direction 6 complete turns). *NOTE - Wheel must be turned as indicated so drive gear is not loaded and so motor can be separated from panel pivot shaft.* Remove retainer from groove in motor locating stud, remove motor-to-support retaining screw, and remove motor.

Installation - Rotate motor and headlight panel as necessary to align motor slot with headlight panel pivot shaft, and install motor on shaft so bracket is aligned with locating stud. *NOTE - If necessary, turn motor hand wheel for alignment of motor with shaft.* Slide motor on shaft until motor seats against shaft shoulder, then install retainer in groove on locating stud. Install motor-to-support retaining screw (make sure ground wire is installed between screw head and bracket), connect motor wiring and battery.

DELCO-REMY TRANSISTORIZED IGNITION

Pontiac (1963)

►*TRANSISTORIZED IGNITION CAUTION:* To prevent damage to output transistor in control unit, be sure that not more than 4 secondary leads (at spark plugs or distributor cap) are disconnected while cranking the engine. Do not disconnect coil secondary cable (between distributor cap and coil). *NOTE* - When performing a compression test or any test where the engine is to be cranked without starting engine, ALWAYS DISCONNECT COIL PRIMARY LEAD.

DESCRIPTION

This ignition system consists of a specially designed distributor, control unit, and a special coil. Other units in system are conventional design. In the distributor, an iron timer core, which replaces the conventional breaker cam, rotates inside a magnetic pickup assembly, which replaces the conventional breaker plate, contact point set, and condenser assembly. To provide vacuum and centrifugal advance, the magnetic pickup assembly is rotated by a vacuum control unit, while the timer core is made to rotate about the distributor shaft by conventional advance weights.

OPERATION

With ignition switch turned on, engine not running, current from battery flows through ballast resistor to control unit. Current then flows through transistors TR-1 and TR-2, resistors R-1, R-2, and R-3, and the coil primary winding and ballast resistor to ground. *NOTE - Full current flows through coil primary winding, and condenser C-1 is charged with positive voltage towards transistor TR-2.* When engine is running, vanes on rotating iron core in distributor line up with internal teeth on pole piece, establishing a magnetic path through center of pickup coil, and inducing a voltage in pickup coil. This voltage causes transistor TR-3 to conduct, resulting in current flow as follows: Charged condenser C-1 causes transistor TR-2 to turn off which causes transistor TR-1 to turn off, interrupting the circuit to ignition coil primary winding. The high voltage required to fire spark plug is induced in coil secondary winding.

PERIODIC SERVICE

None required. At time of engine overhaul, lubricate upper distributor bushing by removing plastic seal and adding SAE 20 engine oil to packing in cavity. Install a new plastic seal.

TESTING & TROUBLE SHOOTING

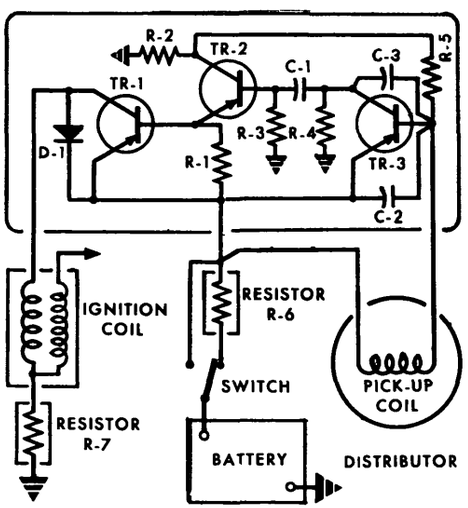
Distributor

Pick-Up Coil - Separate harness connector and connect an ohmmeter across the coil. Resistance of coil should be 550-650 ohms. If reading is infinite, coil is open, and if reading is low, coil is shorted. To check coil for grounds, connect ohmmeter from either coil lead to distributor housing. The reading should be infinite. If not, coil is grounded.

Distributor Advance Specifications - *NOTE - Distributor centrifugal and vacuum advance may be tested on a testing machine or synchroscope designed to test this type distributor as recommended by testing machine manufacturer.*

Delco-Remy 1111027

Mechanical Advance		Vacuum Advance	
Distr. Degrees	Distr. RPM	Distr. Degrees	Vacuum " of Hg
0-2	425	Start	8-10
7-9	1000	10 (Max.)	15-17
9-11	1600		



For engine RPM and degrees, multiply by 2.

Ignition Coil

Primary - Connect an ohmmeter across two primary terminals. An infinite reading indicates primary is open.

Secondary - Connect an ohmmeter from high tension center tower to either primary terminal. *NOTE - To obtain a reliable reading, a scale on the ohmmeter having the 20,000 ohm value within, or nearly within, the middle third of the scale must be used.* If reading is infinite, secondary coil winding is open.

ENGINE SURGE NOTE - This condition may be due to the two distributor leads being reversed in harness connector body, or may be due to an intermittent open circuit in distributor pick-up coil. When properly assembled, distributor white lead should be on long slot side of connector body.

PONTIAC TRANSISTORIZED IGNITION CIRCUIT

FORD TRANSISTORIZED IGNITION

F rd, 427" Eng. (1963)
M rcury, 427" Eng. (1963)

►*REMOTE STARTING SWITCH CONNECTING CAUTION* When connecting a "remote" type starting switch in order to turn engine over from under the hood, use the following procedure to prevent damage to ignition system Place jumper wire between "S" terminal of starter switch or starter solenoid and the battery, with the ignition switch "off" **and the brown coil lead disc nnect d fr m th solenoid.** *DO NOT attempt to turn the engine over by using the ignition key, when ignition coil high voltage lead is removed and the brown wire is connected to solenoid*

Description

This transistorized ignition system consists of the following components

Ignition C il - This is a specially designed coil having a primary circuit which draws a normal maximum of 12 amps to provide high plug voltage at high speeds.

Transist r - The transistor, which is connected between battery and coil, acts as a heavy duty switch to make and break the coil primary circuit A resistor, connected between distributor and transistor, limits transistor control and point current to 0 5 amps

Amplifier Assembly - This unit is located under car instrument panel to protect it from engine heat

R sist r Bl ck Ass mbly - This assembly, which is enclosed in a fibre cover, contains a ceramic ballast resistor block, a tachometer connector block, and a cold start relay This unit is mounted on a plate in engine compartment

Tach meter Bl ck - This unit is used to connect a tachometer or dwell meter into the ignition circuit *CAUTION - Do not connect a tachometer or dwell meter into ignition circuit at any other point*

C ld Start Relay - The relay contacts in this unit are normally closed and are connected into the ignition circuit only during the start cycle When starter relay is closed, cold start relay is actuated and opens its contacts If during starting, the available voltage drops below 10 5 volts, relay contacts close, bypassing the 0 33 ohm resistor in ballast resistor block, applying full available voltage to system

Trouble Shooting & Diagnosis

NOTE - Do not use any other testing procedures or conventional short cuts than those listed below

Checking For Trouble Source - Remove coil high tension lead from distributor cap, then hold lead ⅛" from cylinder head With ignition switch on, crank engine and check for a spark *NOTE - To crank engine, run a jumper wire from positive terminal of battery to "S" terminal of relay (after disconnecting red and blue lead at relay)* If spark is good, trouble is in secondary (high voltage circuit) If there is no spark or a weak spark, the trouble is in primary (low voltage circuit)

Secondary Circuit - Trouble may be caused by improperly adjusted spark plugs, defective high voltage wiring, or high voltage leakage across the coil, distributor cap, or rotor

Primary Circuit - Trouble may be caused by defective primary wiring, improperly set or defective distributor points, defective amplifier, coil, or ballast resistor

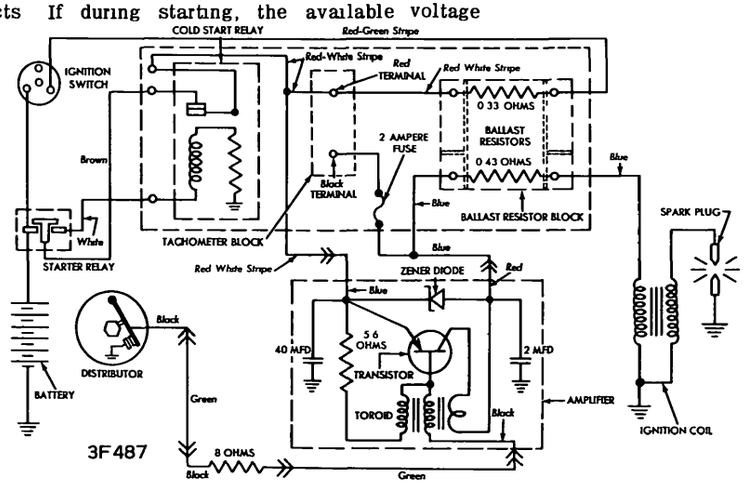
Testing

Secondary Circuits - Use the same procedures that are normally used for a conventional ignition system *DO NOT test coil on a coil tester as results will be inconclusive due to very low coil primary inductance Substitute a known good coil and perform primary cir-*

Primary Circuit - 1) *NOTE - Do not use any other testing procedures or conventional short cuts than those listed below* Remove cover from resistor block assembly **and disconnect cold start relay.** Connect a dwell meter to tachometer block so black lead of meter is connected to black terminal (blue lead), and the red lead of meter is connected to red terminal (red-white lead) Turn ignition switch on and crank engine, noting dwell meter reading If dwell is 0°, distributor points are contaminated or are not closing Wire from distributor through the 8 ohm resistor to the amplifier, is defective If dwell is 0° to 45°, transistor and the primary circuit are operating properly (trouble could be in secondary circuit)

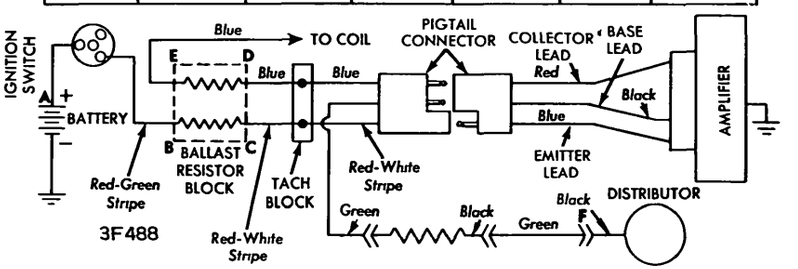
2) If dwell is 45°, there is no power from ignition switch, distributor points are not opening, or amplifier assembly is defective To determine which of these three items are causing the trouble, proceed as follows

3) Disconnect distributor lead at bullet connector, and crank the engine If dwell meter indicates 0° dwell, the distributor points are not opening If dwell is 45°, the amplifier is not operating properly or there is no power from the ignition switch



4) Use a voltmeter or test light to determine if the transistor (amplifier assembly) is at fault Connect voltmeter to red-green lead of ballast resistor, and to ground, then crank the engine If a steady indication of voltage is obtained, the trouble is in the amplifier Absence of any voltage indication on the voltmeter shows there is an open circuit, or no power between ignition switch and amplifier (ballast resistor could be defective Install new resistor and repeat test

5) If the above test indicates a defective amplifier, replace it with a known good amplifier and proceed as follows Connect distributor high tension lead at bullet connector, then with cold start relay disconnected and dwell meter connected to tach block, crank engine and note the dwell A dwell of 0° to 45° indicates satisfactory ignition (original amplifier was at fault) If the dwell is still 45°, the wiring from the amplifier through ballast resistor to the coil is defective



Operating Voltages & Currents - *NOTE - Early production amplifiers have a red "collector" lead and a blue "emitter" lead Later amplifiers have a blue "collector" lead and a red "emitter" lead The "emitter" lead is the one closest to black "base" lead* To check operating voltages and currents, disconnect brown lead from cold start relay and connect a voltmeter to test points (indicated alphabetically in "Ignition System Testing Diagram") and to ground *Do not connect a voltmeter to point "F"* Connect an ammeter in series at indicated points See "Voltage & Current Test Specifications" *Be sure battery is fully charged*

VOLTAGE & CURRENT TEST SPECIFICATIONS

TEST POINT	Cranking rpm		700 rpm		1500 rpm	
	Volts	Amperes	Volts	Amperes	Volts	Amperes

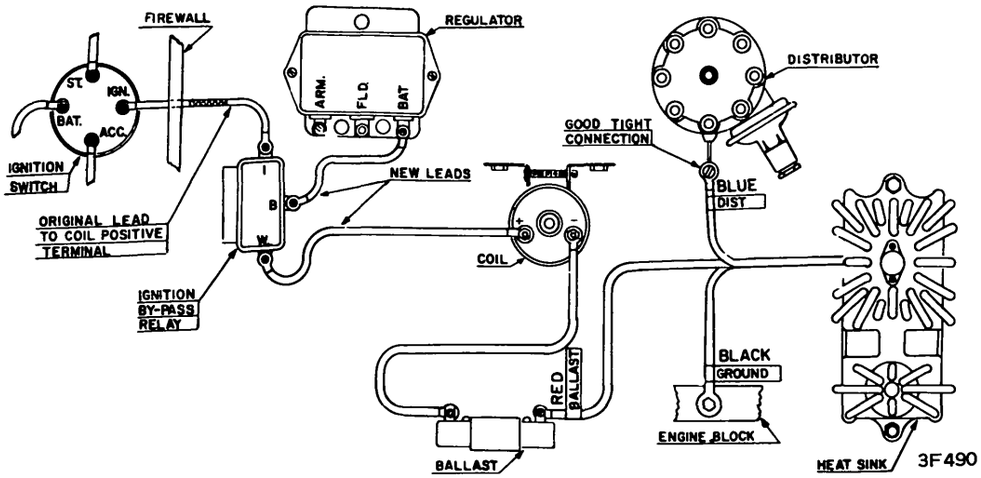
TRANSISTOR IGNITION SYSTEM DIAGRAM

IGNITION SYSTEM TESTING DIAGRAM

PRESTOLITE TRANSIGNITER IGNITION

Stud bak r, High P rformance Eng. (1963)

Description



This assembly is used on 12 volt, negative ground battery systems only, and consists of a special relay, ignition coil, a heat sink (containing all of the electrical components and transistor), and a special ballast resistor. A conventional type distributor (with condenser removed) is used.

Testing

Relay (12 Volt Systems) - Connect a voltmeter or No. 57 test light from relay "W" terminal to ground. Turn ignition switch on. Voltmeter should indicate full battery voltage, or test light should be bright. If not, check for faulty wiring or defective relay.

Voltmeter - Connect a voltmeter to heat sink terminal at ballast resistor, then turn ignition switch on. Open and close distributor contacts by hand. With the contacts closed, voltmeter should indicate approximately 2 volts. With contacts held open, voltmeter should indicate full battery voltage.

Light Bulb Test - Connect a No. 57 test light to ignition coil positive (+) terminal and to ground. Turn ignition switch on. Test light should be bright. If light is dim, check for high resistance connections. If light does not glow at all, there is an open circuit somewhere between coil and battery; or the relay is defective. Disconnect light bulb at coil positive terminal and connect it to negative terminal, then open distributor contacts. Test light should be bright; if not, coil has an open primary winding. Connect test light to heat sink terminal of ballast resistor and ground, then open distributor contacts. The test light should be bright. With contacts closed, light should be dim. *NOTE - If test light does not glow at all, the ballast is open. If light is dim with contacts open, the heat sink is defective. If light is bright with contacts closed, heat sink is defective.*

PRESTOLITE TRANSIGNITER SCHEMATIC (TYPICAL)

Trouble Shooting

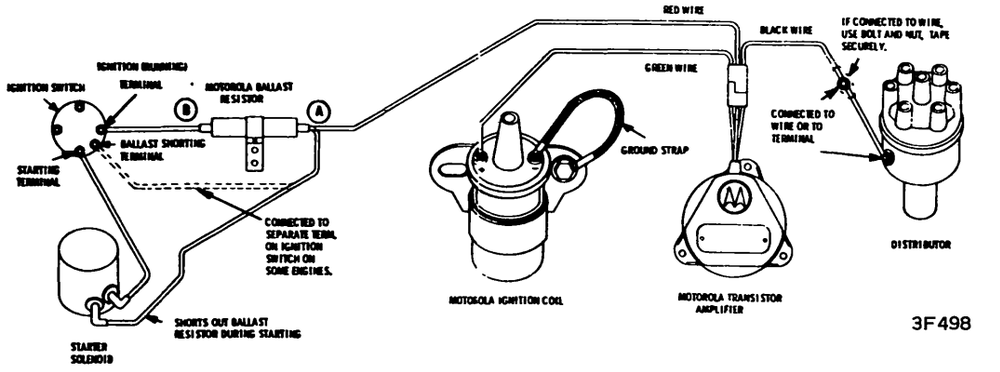
Engine Cranks But Will Not Start - Check wiring for loose or poorly connected wires. Check relay operation. Distributor contacts are dirty.

Engine Idles Rough or Stalls - Battery not fully charged. Distributor cap is carbon tracked. Distributor contacts are dirty.

High Speed or Rapid Acc lerati n Miss - Loose heat sink ground connections. Spark plugs in poor condition. High tension wires are faulty. Battery not fully charged. Distributor cap is carbon tracked.

MOTOROLA TRANSISTOR IGNITION

Description



A sealed amplifier unit containing two transistors and two Zener diodes provides a uniform high voltage at all engine speeds. Other components of the system are a special coil and a special ballast resistor. A conventional distributor (with condenser removed) is used with this system.

Testing (Negative Ground Systems)

1) Connect positive lead of voltmeter to positive (+) terminal of battery and negative voltmeter lead to ballast resistor (starter side). With all accessories turned off, turn ignition switch on. With distributor points closed, voltage should be less than 1.5 volts. A higher voltage reading indicates excessive resistance in the circuit from battery through ignition switch to ballast resistor. Isolate and correct this condition.

2) Connect negative lead of voltmeter to ground, then with ignition switch on and distributor points open, the voltage from ballast resistor (starter side) and from ballast resistor (amplifier side) should be the same. If voltage is present at starter side of resistor and there is no voltage at amplifier side (and resistor is cool), then the resistor is open and should be replaced. If the voltage is less at amplifier side than at starter side, with distributor points open, disconnect transistor ignition amplifier at the three prong molded connector. *CAUTION - Whenever disconnecting ignition amplifier plug or any other wires in circuit, turn ignition switch OFF.* Repeat the above test. If voltage is now the same at both sides of ballast resistor, replace transistor amplifier.

COIL TESTING NOTE - The special coil can be tested in a conventional manner. However, since the resistance of the primary of this special coil is less than that of a conventional coil, results obtained from test will not be the same. Compare results of commercial testing equipment reading with a known good coil. Coil resistance is .15-.35 ohms (Primary), 7800-9500 ohms (Secondary).

►CHANGES, CAUTIONS, CORRECTIONS

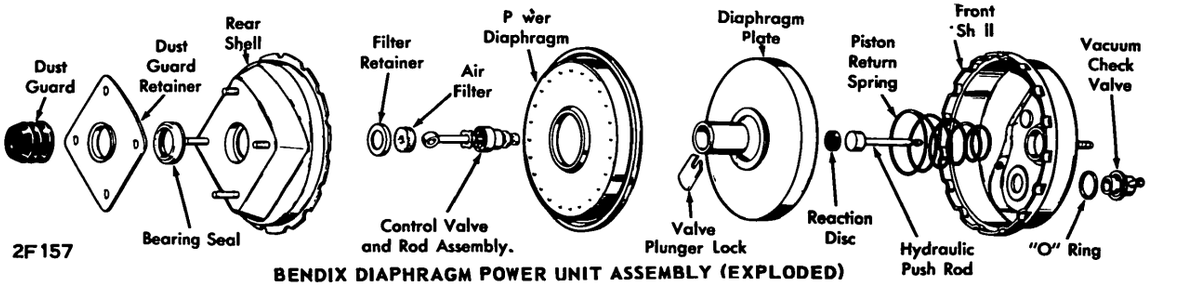
► *1963 DODGE 880 SERIES IMPROPER BRAKE PEDAL RETURN CORRECTION (EARLY CARS):* May be caused by high friction at power unit pushrod pedal pivot hole. To correct, remove any burrs from pushrod cross bolt bearing diameter, and file slightly the side faces of pushrod eye. Reassemble parts and make sure there is side movement at cross bolt. *CAUTION - D not try to corr ct condition by loosening cross bolt nut or bolt failure will result.*

DESCRIPTION

"Vacuum Suspended", disc reaction, diaphragm type power brake unit. Vacuum power chamber consists of a front and rear shell, vacuum power diaphragm, diaphragm return spring and a hydraulic pushrod. The mechanically actuated control, integral with vacuum power diaphragm, controls degree of brake application or release depending on pressure applied to valve operating rod through brake linkage. Control valve assembly consists of a single poppet valve with both atmospheric port and and vacuum port.

LUBRICATION & SERVICE

No lubrication required. At time of overhaul, clean or replace air cleaner filter as required. If filter cleaned, wash in cleaning solvent and let dry before reinstalling.



REMOVAL & INSTALLATION

Rem val

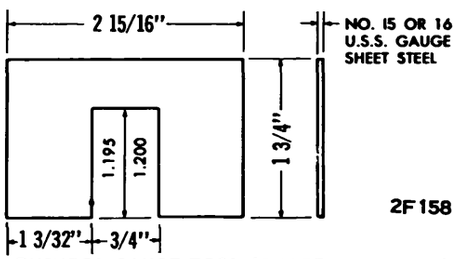
Disconnect vacuum line from power unit and hydraulic lines from master cylinder. Disconnect power unit pushrod from brake pedal assembly. Remove power unit-to-firewall attaching bolts and remove power unit and master cylinder as an assembly.

Installation

Reverse removal procedure, then adjust pedal height as follows: Adjust pedal height to specifications listed in table below. On Chevrolet Cars & Trucks, measurement is from floor carpet at toe pan to top of pedal pad. On Pontiac & Tempest, measurement is from floor mat to bottom of pedal pad.

BENDIX DIAPHRAGM POWER UNIT ASSEMBLY (EXPLODED)

Pedal Height Specifications



Car Model	Pedal Height
Chevrolet Cars	
Biscayne & Bel Air	4 7/8"
Impala	4 5/8"
Chevrolet Trucks	①8"
Pontiac (Except Tempest)	3 1/8-3 3/8"
Pontiac Tempest	3 1/16-3 5/16"

① - Total Pedal Travel.

OVERHAUL

Disassembly

1) Remove master cylinder from power unit, then remove master cylinder filter, piston seal assembly and master cylinder pushrod from front shell. Remove rubber boot and retainer plate from rear shell. If equipped, remove air valve pushrod linkage and mounting bracket. Remove filter retainer from diaphragm plate extension, then remove air filter. *CAUTION - Use extreme care when removing air filter retainer so that plastic diaphragm plate is not chipped. Pry at several places around retainer until freed.* Scribe mark both shells for mating at reassembly. Use Holding Fixture J-9576-1 and Bar Wrench J-9504 and separate shells. *CAUTION - Use care when separating shells so that diaphragm spring pressure does not cause rear shell to fly off.* Remove power piston from rear shell and remove separating tools.

PUSHROD GAUGE TOOL (EXCEPT RAMBLER) (RAMBLER SIMILAR)

2) Disassemble power piston as follows: Remove diaphragm from diaphragm hub. Hold diaphragm plate with pushrod in horizontal position, depress pushrod slightly (about 1/16"), and rotate piston so air valve lock will fall out. Remove air valve pushrod assembly. Remove reaction disc from diaphragm plate bore (use pushrod or suitable tool to push disc from seat). *D not chip diaphragm plate.*

3) Remove rear shell bearing seal with a punch or thin screwdriver. *CAUTION - Remove seal only if a new one is available. DO NOT reuse seal if it has been removed.* Remove vacuum check valve and grommet.

Cleaning & Inspection

Use "Declene" or brake fluid to clean all metal, plastic and rubber parts. Blow out all passages, orifices, and valve holes with clean, dry air, and air dry all parts. Slight rust on inside of housing can be polished with crocus cloth or fine emery cloth. There should be no cuts, nicks or distortion of any rubber part. If in doubt about the condition of a part, replace the part.

Reassembly

1) Install vacuum check valve grommet (beveled edge on inside), then install check valve. Install Holding Fixture J-9576-1 on front shell. Install new rear shell bearing seal with Installer J-9540 (tool will bottom against shell when seal properly installed).

2) Assemble power piston as follows: Lubricate outer diameter of diaphragm plate and extension, valve and plunger bearing surfaces, and outer edge of valve poppet. Install valve and rod into diaphragm plate extension. Depress pushrod slightly and install air valve lock (lock must index and retain air valve). Install rolling diaphragm in diaphragm plate hub groove. Lubricate reaction disc and install disc (use master cylinder pushrod to seat disc in diaphragm plate bore). *NOTE - If disc not fully s at d, pushrod height will be incorr ct.*

(Continu d)

BENDIX DIAPHRAGM TYPE (VACUUM SUSPENDED) POWER BRAKE UNIT (Continued)

3) Lubricate inside of bearing seal and diaphragm bead contact surface of rear shell. Install power piston return spring, and power piston, then lock shells together with Bar Wrench J-9504. Install air cleaner filter and retainer. Install boot retainer and rubber boot. If equipped, install air valve linkage and mounting bracket. *NOTE - On tempest, distance from end of air valv pushrod to face of rear shell must be 12¾". Adjust as necessary and tighten locknut to 60-120 inch-lbs.* Lubricate hydraulic pushrod lightly and install pushrod into center bore of power piston until fully seated against reaction disc. Install seal and master cylinder filter (press seal into front shell until bottomed in shell recess). Make master cylinder pushrod adjustment (see below). Install master cylinder.

Pushrod Adjustment

NOTE - No periodic adjustment of pushrod height is necessary. Check pushrod height if unit disassembled, if any major parts replaced, or if adjusting screw length is changed. Place Pushrod Gauge J-9571 (Rambler), J-7723-01 (Others) over end of pushrod with legs of gauge resting on face of power unit. Pushrod should just touch gauge at center. To adjust, hold pushrod at serrated end with pliers and turn adjusting screw. *NOTE- If gauge not available, a suitable gauge can be made according to dimensions shown in illustration.* Pushrod height should be 1.195-1.200" (General Motors Cars, and Studebaker).

BENDIX HYDRAULIC (DISC) REACTION POWER BRAKE UNIT

Lincoln Continental (1963)
Oldsmobile 88, S88, 98 (1963)©

© - "Moraine Hydraulic (Diaphragm) Reaction Power Unit" also used.

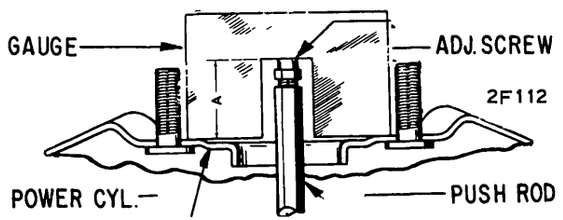
DESCRIPTION

Similar in design to units used on previous models. A plastic type piston plate is used and service procedures for this type plate are different than for die-cast plate.

OPERATION

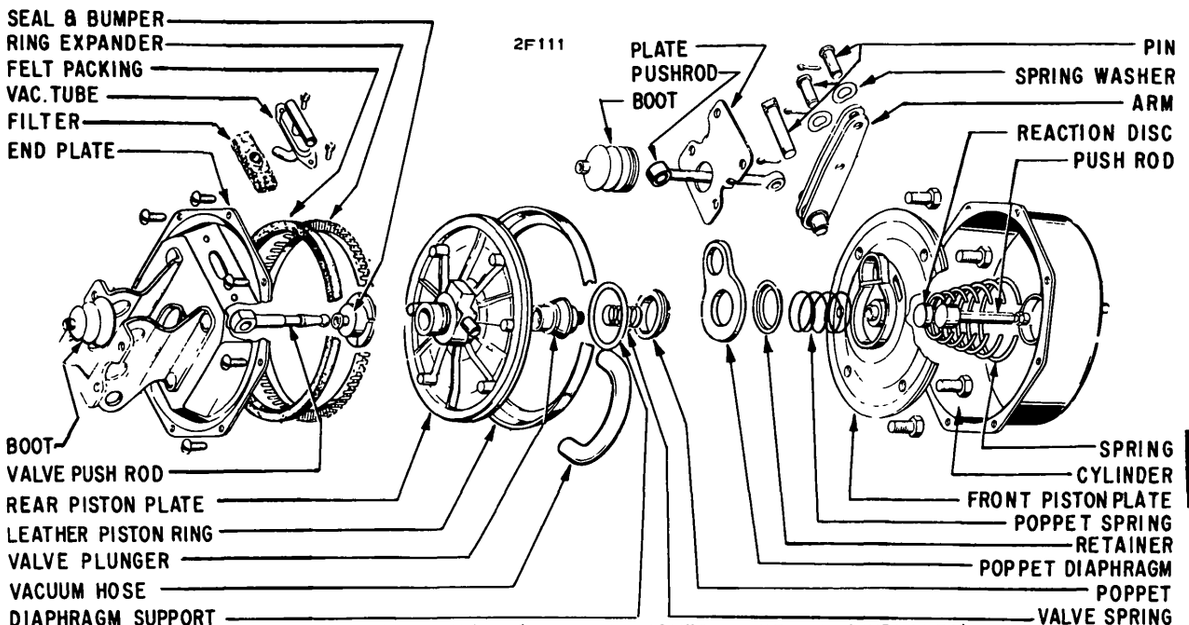
See 1959 Final Data, Page 316, or later Manual edition.

REMOVAL & INSTALLATION



Disconnect hydraulic and vacuum lines from power unit and from master cylinder. Disconnect power unit pushrod from brake pedal assembly. Remove power unit-to-cowl attaching bolts and remove power unit and master cylinder assembly. *NOTE - Master cylinder may be removed without removing power unit if desired.*

OVERHAUL



See 1959 Final Data, Page 316, or later Manual edition, and note the following:

Disassembly

Vacuum Power Piston (Plastic Type) - Remove piston felt and expander ring from piston assembly, then lift rod seal and bumper boot from rear piston plate and slide off eye end of operating rod. Remove capscrews from front piston plate, separate front and rear piston plates, and remove leather packing. Remove poppet spring, valve, return spring, retainer, poppet diaphragms, poppet, poppet spacer, and plunger and rod assembly. *NOTE - Do not separate valve operating rod from valve plunger unless replacement of valve rod or plunger is necessary.* If valve rod or plunger must be replaced, hold assembly with valve plunger down and inject alcohol into cavity around valve rod to wet rubber lock in valve plunger, then drive or pry valve plunger off valve rod. Use care not to damage plunger if it is to be reused. Remove rubber reaction disc from front piston plate if necessary. *CAUTION - When cleaning, use only alcohol on parts containing rubber or plastic.*

PUSHROD ADJUSTING GAUGE INSTALLATION

BENDIX HYDRAULIC (DISC) REACTION POWER BRAKE UNIT (EXPLODED)

Reassembly

Vacuum Power Piston (Plastic Type) - Position plunger and rod assembly into rear piston plate, and install rod seal and bumper boot. Position spacer washer into cavity inside rear piston plate, then assemble poppet through poppet diaphragm, and install poppet spring retainer on end of poppet. Position leather packing on rear piston plate, then install poppet spring and valve return spring on plunger and poppet reaction plate. Position and align front piston plate against rear piston plate, and secure in position with capscrews. Soak piston felt in shock absorber fluid, then insert felt in expander ring, and position expander and felt in groove around rear piston plate with expander teeth up.

Pushrod Adjustment

Self-locking screw on end of pushrod is set to correct height on original assembly and adjustment is not required unless adjustment is changed, or unless a major part of power unit or master cylinder is replaced. If necessary, adjust as follows:
With pushrod seated against reaction disc, measure distance from mounting face of power cylinder to end of pushrod adjusting screw. Distance should be 1.175-1.180" (Lincoln Continental), 1.195-1.200" (Oldsmobile). *NOTE - On Oldsmobile, Gauge J-7723-01 is available and may be used if desired. With gauge legs resting on face of power unit, pushrod should just touch gauge at center.* Make any adjustment, if necessary, by turning adjusting screw.

MORAINE HYDRAULIC (DIAPHRAGM) REACTION BRAKE POWER UNIT

Buick, Except Special (1963)
Oldsmobile 88, S88, 98 (1963)Ⓒ

Ⓒ - "Bendix Hydraulic (Disc) Reaction Power Brake Unit" also used

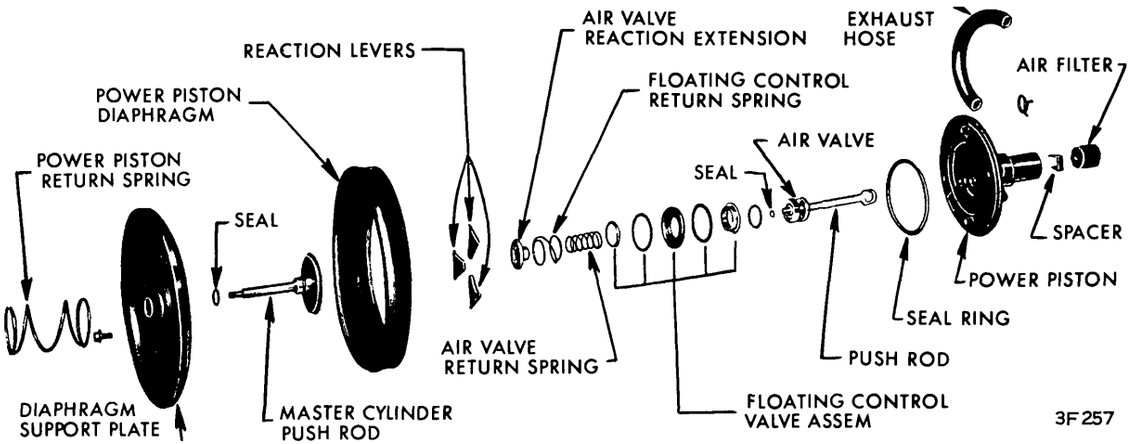
DESCRIPTION

Design is similar to previous models except that master cylinder position (pushrod length) is adjusted by means of a self-locking screw on end of pushrod On Buick models, an additional reaction disc is used between master cylinder piston reaction plate and reaction levers

REMOVAL & INSTALLATION

Disconnect hydraulic line (and stop light switch wires) from master cylinder and vacuum line from power unit Disconnect pushrod from brake pedal Remove nuts attaching power unit to firewall and remove unit *NOTE - If desired, master cylinder can be removed from power unit without removing power unit* To install, reverse removal procedure

OVERHAUL



Disassembly

1) With master cylinder clamped in a vise, clean outside of unit, then scribe mark front and rear housings With suitable wrenches or Separator Bar, turn rear housing counterclockwise to separate housings *NOTE - Do not apply pressure on plastic power piston tube* Remove return spring from front housing *NOTE - Unnecessary to remove master cylinder from front housing unless required* From rear housing remove vacuum hose or tube, rubber boot, silencer, air filter, rubber bearing, then separate power piston assembly from rear housing

2) Remove master cylinder pushrod, diaphragm, and support plate from power piston Separate diaphragm and support plate Remove master cylinder pushrod from support plate, and remove "O" ring from pushrod

3) Remove "O" ring and reaction levers from power piston Remove air valve and operating rod from floating valve side of power piston, then remove extension from air valve Remove air valve return spring, floating control valve return spring, and floating control valve assembly *NOTE - Air valve cannot be removed from operating rod* Remove "O" rings from air valve

4) To disassemble floating control valve, remove retainer ring from under lip of reaction diaphragm, then remove diaphragm and support plate from control valve hub *NOTE - Diaphragm support (back-up) plate may have remained in power piston*

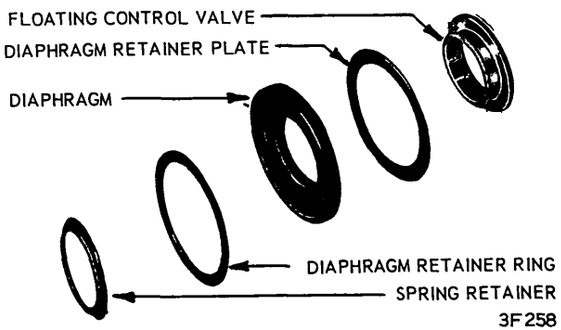
POWER PISTON ASSEMBLY (EXPLODED)

Cleaning & Inspection

Thoroughly clean all parts in diacetone alcohol or clean brake fluid Inspect all parts for nicks, damage, rust, or other deterioration Replace as necessary It is possible to smooth out small imperfections and clean light rust or abrasion with steel wool or crocus cloth Replace all rubber parts

Reassembly

Lightly lubricate all rubber parts, the reaction levers, and the part of air valve which slides in power piston with Silicone Grease, No 567196 (supplied in Overhaul Kit) before installation



1) Assemble control valve as follows Install diaphragm into groove on flange of valve with flat side toward valve face, then insert diaphragm retaining ring under lip of diaphragm

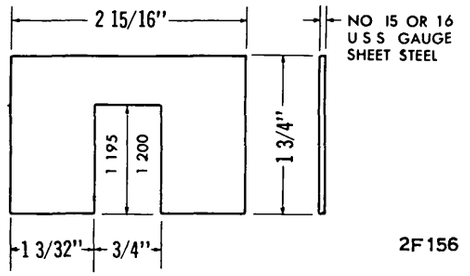
2) Install new "O" rings on air valve and air valve extension Install floating control valve over air valve so rubber face of control valve rests on seat on air valve Install control valve spring and retainer over hub of control valve, then place air valve return spring inside floating control valve spring (air valve spring should rest on air valve) Install air valve extension over spring and air valve and lock in position by turning

3) Install control valve diaphragm support (back-up) plate in power piston Install control valve-air valve assembly into piston *Make sure diaphragm is not distorted, and that air valve is firmly seated in pow r piston* Install reaction levers into power piston, then install "O" ring seal Install vacuum diaphragm over power piston with stop buttons down, diaphragm folded over into normal operating shape, and inner bead of diaphragm in outer groove of power piston Insert pushrod (adjusting screw end first) into support plate from side opposite flange Install support plate on power piston (make sure reaction levers do not jump out of seats) and install attaching screws Install vacuum hose on power piston *NOTE - Turn hose clamp outward so it nearly contacts power piston to prevent clamp striking rear housing and preventing full piston return.* Install return spring in front housing and position front housing over rear housing and power piston assembly, inserting pushrod into master cylinder Turn power piston so free end of vacuum hose is in line with master cylinder filler cap and hold piston down while fitting diaphragm bead into recess in rim of front housing

4) Install rubber bearing into rear housing Install vacuum hose on tube in rear housing and insert piston

(Continued)

FLOATING CONTROL VALVE ASSY. (EXPLODED)



MORAINE (DIAPHRAGM) REACTION POWER BRAKE UNIT (C nt.)

tube through piston bearing With exhaust pipe on rear housing slightly counterclockwise of master cylinder filler cap, install and lock rear housing to front housing, making sure scribe marks are aligned and exhaust tube is in line with filler cap *CAUTION - Make sure diaphragm remains in recess in front housing and is not pinched into housing slots.* Install air filter, silencer, and pushrod boot

Pushrod Adjustment

NOTE - This adjustment necessary only if a major part of unit, such as master cylinder or piston, either housing, power piston, or pushrod is replaced; or when unit disassembled; or if pushrod adjusting screw position is changed.

With master cylinder removed, place Gauge J-21183 (Buick), J-7723-01 (Oldsmobile) over end of pushrod with legs of gauge resting on face of power unit Pushrod should just touch gauge at center (legs of gauge are permitted to be .020" from face of power unit on Oldsmobile) To adjust, turn self-locking adjusting screw as required *NOTE - If gauges are not available, a suitable gauge can be made according to dimensions shown in illustration.* Pushrod height should be 1 195-1.200"

ℂ - "Bendix Power Brake Unit Diaphragm (Vacuum Suspended) Type" also used
ℭ - "Midland-Ross Hy-Power" and "Multi-Vac Single Diaphragm" types also used

DESCRIPTION

Vacuum suspended, folding diaphragm type consisting of a vacuum power cylinder which contains the power piston assembly and piston return spring Control and reaction valve assemblies are located in the power piston assembly Control valve assembly consists of an air valve and floating control valve assembly. Reaction assembly consists of a hydraulic piston reaction plate and a series of reaction levers. Power unit hydraulic pushrod is provided with an adjusting screw to insure correct relationship between vacuum piston and master cylinder hydraulic piston

LUBRICATION & SERVICE

No lubrication required At time of overhaul, clean or replace air cleaner filter as required If filter cleaned, wash in cleaning solvent and let dry before reinstalling

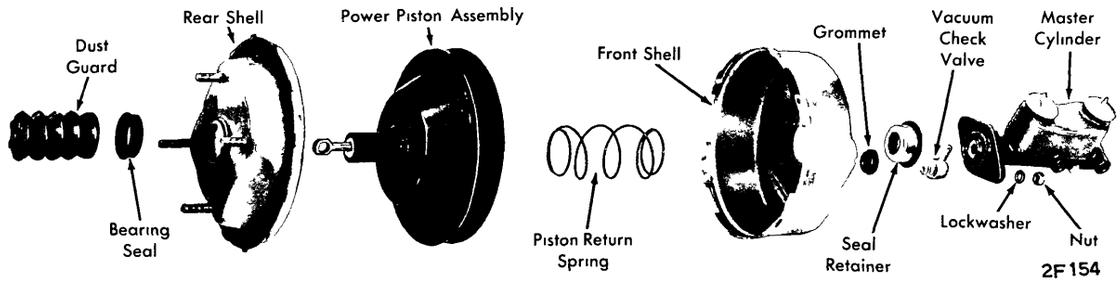
REMOVAL & INSTALLATION

Removal

Disconnect vacuum line from power unit and hydraulic lines from master cylinder Disconnect power unit pushrod from brake pedal assembly. Remove power unit-to-firewall attaching bolts and remove power unit and master cylinder as an assembly.

Installation

Reverse removal procedure, then adjust pedal height as follows: Adjust pedal height to specifications listed in table below On Chevrolet Cars & Trucks, and Corvette, measurement is from floor carpet at toe pan to top of pedal pad On Pontiac, measurement is from floor mat to bottom of pedal pad



OVERHAUL

See 1962 Final Data, Page 313 for Disassembly, Cleaning & Inspection, Reassembly, and Pushrod Adjustment procedures.

DELCO-MORAINE POWER UNIT ASSEMBLY (EXPLODED)

DELCO-MORAINE POWER PISTON ASSEMBLY (EXPLODED)

MIDLAND-ROSS HY-POWER CHEVROLET TRUCK POWER BRAKE

Ch vr l t Truck (1963)©

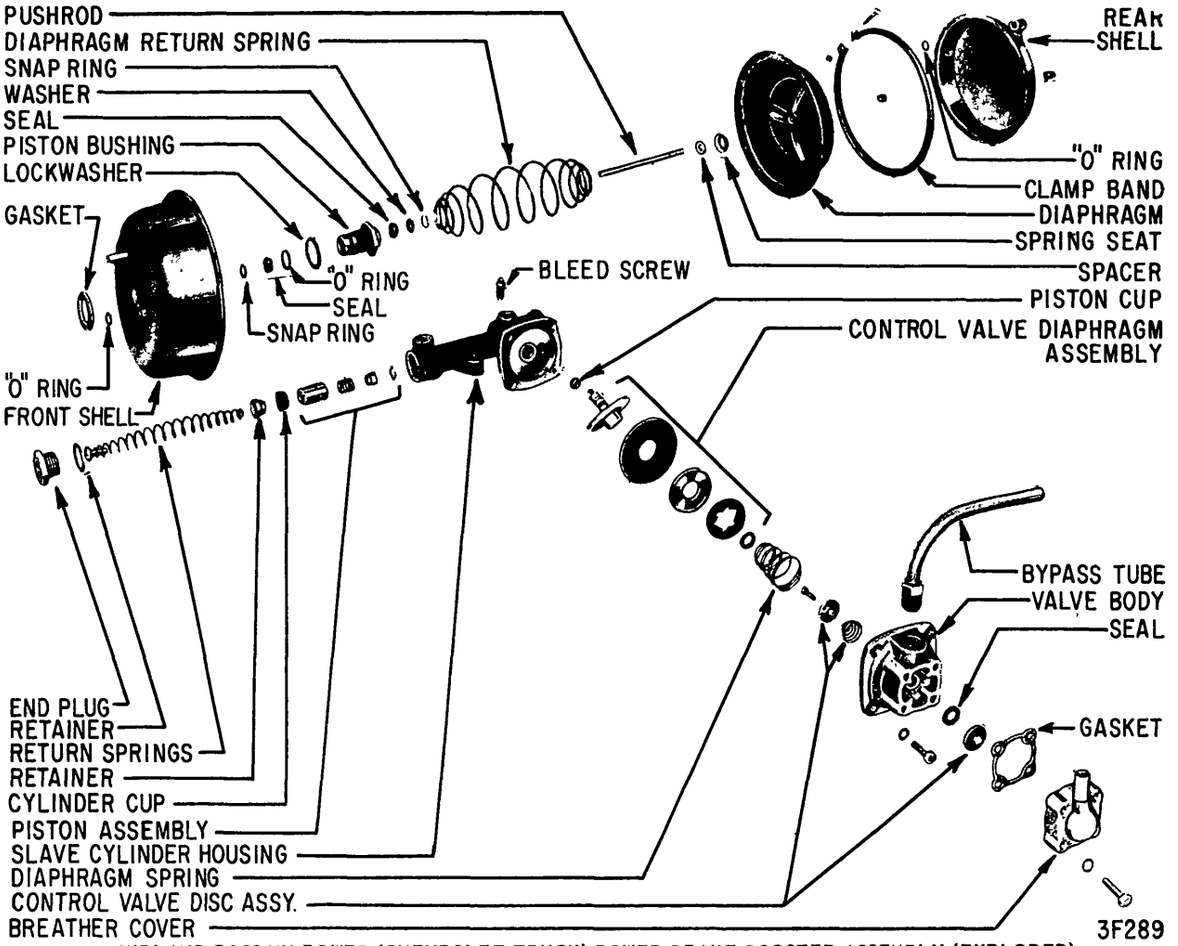
© - "Bendix Power Brake Unit Diaphragm (Vacuum Suspended)", "Delco-Moraine Vacuum Suspended Power Unit", and "Multi-Vac Power Unit" types also used.

DESCRIPTION

Remote type vacuum power brake booster unit containing a vacuum power chamber, hydraulic slave cylinder, and vacuum control valve.

OVERHAUL

Disassembly



1) Remove slave cylinder end plug, copper gasket, piston springs, and retainer. Scribe mark vacuum chamber shells and control valve body and slave cylinder housing. Remove bypass tube and seal, then remove clamp band, rear shell, diaphragm and pressure plate assembly, and diaphragm return spring. Remove pushrod bushing to disconnect front shell from slave cylinder, then remove gasket and seals.
2) Remove control valve cover and body, then disassemble valve disc and spring. Remove control valve diaphragm return spring, control valve plunger and diaphragm assembly from slave cylinder housing. Push slave cylinder piston and piston cup from front end of slave cylinder housing.

Cleaning & Inspection

1) Clean and inspect all parts thoroughly. If either vacuum chamber shell dented, they should be replaced. Replace all worn or damaged parts. Replace pushrod if rough or damaged (must be perfectly smooth - do not grind end). Replace control valve disc assembly if any part damaged.
2) Disassemble slave cylinder piston assembly for cleaning and to insure proper operation of check valve. Assembly need not be replaced unless definite hydraulic leak evident before overhaul. If leak present, replace entire piston assembly, rubber cup, and control piston cup.
3) Later type slave cylinder housings have control valve bore straight through with an end plug for cleaning purposes. Early type front shells have piston guide bushing welded to shell with no tube for slave cylinder vacuum port connection. Only later type parts furnished for service and both slave cylinder housing and front shell must be used together.

Reassembly

1) Reassemble control valve diaphragm assembly (use new diaphragm). *Diaphragm bead must face away from piston cup.* Install seal in valve body, then install control valve disc assembly into valve body with small end of spring resting on lower half of disc assembly. Install diaphragm spring into valve body with small coil of spring resting on diaphragm assembly. Install control valve body on slave cylinder housing (align scribe marks), make sure spring and diaphragm are seated properly, then tighten screws securely and install breather cover.
2) Install "O" ring, tube, and gasket on slave cylinder housing. Install seals on pushrod guide bushing (lip of seal toward slave cylinder end), then install "O" ring and lockwasher on bushing. Coat seals with brake fluid, install pushrod bushing from inside of vacuum chamber front shell and install front shell to slave cylinder housing, tightening pushrod bushing to 60-80 ft. lbs. torque.
3) Put sealing compound on pushrod threads, install diaphragm and plate on pushrod, then install pushrod-diaphragm assembly and diaphragm return spring into pushrod guide bushing, install seal and tighten locknut. Loosely install bypass tube in control valve cover, then install rear shell to front shell and diaphragm, guiding into position with bypass tube. Install clamp band and tighten securely. Secure bypass tube to valve body and rear shell.
4) Insert slave cylinder piston assembly into housing with open end of piston facing toward vacuum chamber. Install slave cylinder cup with lip facing open end of housing, then install spring retainer. Insert return spring retainer over end of return springs, install springs and retainer into housing, install gasket on end plug, and install end plug and tighten securely.

MIDLAND-ROSS HY-POWER (CHEVROLET TRUCK) POWER BRAKE BOOSTER ASSEMBLY (EXPLODED)

MIDLAND ROSS DIAPHRAGM TYPE BRAKE POWER UNIT

Chrysler & Imperial (1963) ℂ
Dodge & Dart (1963) ℂ
Ford Fairlane & Galaxie (1963)
Ford Trucks (1963) ℭ
Mercury Meteor & Monterey (1963)
Plymouth (1963) ℂ
Thunderbird (1963)
Valiant (1963) ℂ

ℂ - "Bendix Diaphragm Type (Vacuum Suspended)" also used. On Chrysler 300J, Midland-Ross Remote type used.
ℭ - "Hydrovac (Piston Type)", "Hydrovac (Diaphragm Type)", and "Midland (Remote Type)" also used.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 DODGE 880 SERIES IMPROPER BRAKE PEDAL RETURN CORRECTION (EARLY CARS):* May be caused by high friction at power unit pushrod pedal pivot hole. To correct, remove any burrs from pushrod cross bolt bearing diameter, and file slightly the side faces of pushrod eye. Reassemble parts and make sure there is side movement at cross bolt. *CAUTION - Do not try to correct condition by loosening cross bolt nut or bolt failure will result.*

DESCRIPTION

Self-contained vacuum suspended, diaphragm type brake power booster unit mounted on firewall, with hydraulic master cylinder mounted on forward end of booster unit. Actuating control piston is mechanically linked to brake pedal linkage by an actuating rod. Unit is of same basic design and operation as previous models except that on Ford Motor Co. models an atmospheric valve return spring has been added between atmospheric valve and reaction load ring. On Ford Trucks, there is a diaphragm return spring in front shell between front shell and diaphragm assembly.

REMOVAL & INSTALLATION

NOTE - To avoid bleeding brake system at installation, master cylinder may be disconnected from booster unit without removing hydraulic line (support master cylinder properly). With engine stopped, apply brakes several times to balance booster internal pressure. Disconnect vacuum hoses from unit, then disconnect pedal linkage from booster pushrod. Disconnect booster from firewall and remove. To install, reverse removal procedure and adjust brake pedal height or freeplay as indicated below.

Brake Pedal Adjustment

Fairlane & Meteor - Turn eccentric bolt at brake pedal pushrod so brake pedal is 1 7/16" above accelerator pedal.

Ford Trucks - Turn eccentric bolt at power unit pushrod so there is 3/16-3/8" brake pedal free travel.

OVERHAUL

Disassembly

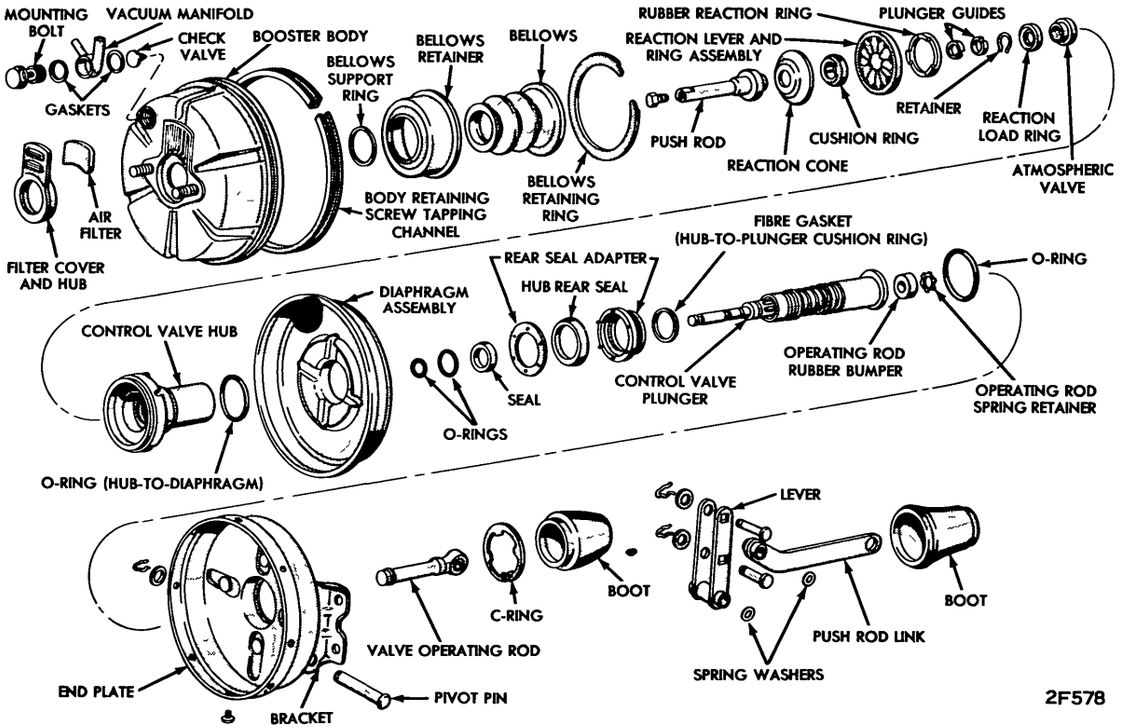
1) Remove master cylinder (if removed with power unit), air filter cover and hub, and air filter from booster body. Remove vacuum manifold, gaskets, and vacuum check valve from booster body. Disconnect valve operating rod from lever (remove retaining clip and pivot pin). Remove brackets from end plate, and rubber boot from valve operating rod.

2) Remove "C" ring holding rear seal adapter assembly to end plate. Scribe mark booster body and end plate for reassembly, then remove retaining screws or clamp band, rap end plate with a soft hammer, and separate end plate and booster body. Remove diaphragm return spring if equipped. Push lip of bellows into vacuum chamber, then remove bellows, control valve, and diaphragm as an assembly. Remove outer "O" ring from control valve hub.

3) Remove large bellows retaining ring, bellows, bellows retainer, and support ring from diaphragm and from bellows. Remove pushrod assembly, reaction lever and ring assembly, and rubber reaction ring from control valve hub. Remove both plastic plunger guides from control valve plunger, then remove retainer holding reaction load ring and atmospheric valve on control valve hub. Slide reaction load ring, return spring, and atmospheric valve from control valve hub. Slide plunger and rear seal adapter from rear of control valve hub, then remove hub outer "O" ring from front side of diaphragm.

4) Remove hub rear seal adapter from valve plunger and remove seal from adapter. Remove "O" rings, seal, and fibre gaskets from plunger. *NOTE - On Chrysler Corp. models, plunger and valve operating rod assembly serviced as a complete unit and should not be disassembled further. On Ford Motor Co. models, pull valve operating rod from valve plunger only if valve or plunger is to be replaced. If parts are separated, new rubber bumper and spring washer must be installed on operating rod to retain it properly in the valve.*

Cleaning & Inspection



Clean all metal parts in solvent. Clean rubber parts in alcohol only. Just before reassembly, re-wash all metal parts coming in contact with hydraulic brake fluid in clean alcohol. Blow dirt and cleaning solvent from recesses and passages with compressed air. Use all parts furnished in repair kit and discard all old rubber parts. Replace any parts that are worn or damaged. If inside of booster body is rusted or corroded, polish with steel wool or emery cloth. If booster body scored, it should be replaced.

Reassembly

1) If operating rod and plunger were separated, install new rubber bumper and spring retainer on rod, then push rod firmly into plunger until rod bottoms. Install fibre gaskets, plunger seal and "O" rings on plunger assembly. Install valve hub rear seal in adapter with sealing lip of seal toward rear of valve. Slide adapter assembly onto plunger with small diameter end of hub to rear.

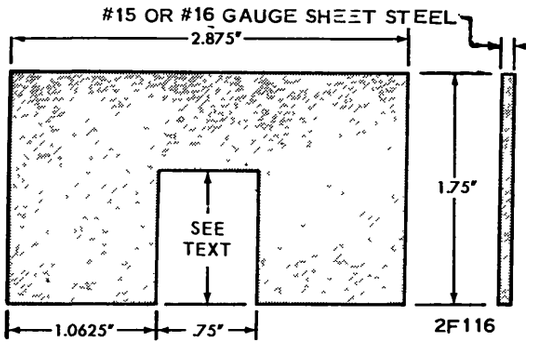
2) Install control valve hub outer "O" ring, then install

(Continued)

MIDLAND-ROSS DIAPHRAGM TYPE POWER BRAKE UNIT (EXPLODED)

(FORD MOTOR CO. CARS SHOWN - FORD TRUCK & CHRYSLER CORP. SIMILAR)

MIDLAND ROSS DIAPHRAGM TYPE POWER BRAKE UNIT (C nt.)



plunger and seal adapter and hub on diaphragm (hold hub on front side of diaphragm, insert plunger assembly into hub from rear side of diaphragm). Install atmospheric valve, return spring, and reaction load ring on plunger and hub, compress valve spring, and install load ring retainer in groove of plunger. Install both plastic plunger guides in plunger grooves. Install rubber reaction ring in valve hub so ring locating knob indexes in notch in hub with ring tips toward front. Assemble reaction lever and ring and install assembly in valve hub. Install reaction cone and cushion ring on pushrod and secure with retainer, then install pushrod assembly on valve hub so plunger indexes in rod. Assemble bellows, retainer, and support ring (ring should be on middle fold of bellows). Place bellows assembly on diaphragm and secure with retaining ring (ring must be fully seated).

3) If unit equipped with self-tapping screws to hold assembly together, move booster body retaining screw tapping channel just enough for a new surface for self-tapping screws. Install diaphragm return spring (if equipped), diaphragm, control valve parts, and bellows as an assembly in booster body. *CAUTION - Lip of diaphragm must be evenly positioned on retaining radius of booster body.* Pull front lip of bellows through body and place lip around outer groove of body. Install "O" ring in front of endplate and install plate on body. Align scribe marks, compress assemblies, and fasten together. Install large "C" ring on rear seal adapter at rear of end plate. *NOTE - Make pushrod adjustment (see below) next.*

4) Install valve operating rod rubber boot, air filter parts, and other external linkage and brackets. Install master cylinder if removed with booster assembly. Install vacuum manifold and check valve (if equipped).

Pushrod Adjustment

Place a gauge made to the dimensions shown in illustration against master cylinder mounting surface of booster body. Pushrod adjusting screw should just touch inner edge of slot in gauge. If gauge not used, distance from master cylinder mounting surface on booster body to end of pushrod adjusting screw should be .995-1.005" (Ford & Mercury Cars & Thunderbird), .700-.710" (Ford Trucks).

PUSHROD GAUGE TOOL

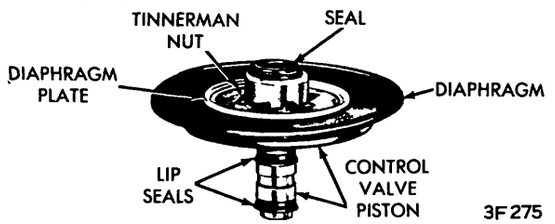
MIDLAND ROSS (CHRYSLER 300J) POWER BRAKE UNIT

Chrysl r 300J (1963)

DESCRIPTION

Remote type vacuum suspended power brake booster, slave cylinder, and control valve assembly mounted under left front fender behind headlight housing. Residual pressure check valve is integral with booster slave cylinder. An in-line check valve is used in the vacuum line.

REMOVAL & INSTALLATION



Disconnect hydraulic, vacuum, and air lines from booster unit. Disconnect slave cylinder-to-bracket attaching screws and remove booster unit. Remove filter assembly from inner side of fender side shield. To install, reverse removal procedure and bleed brakes.

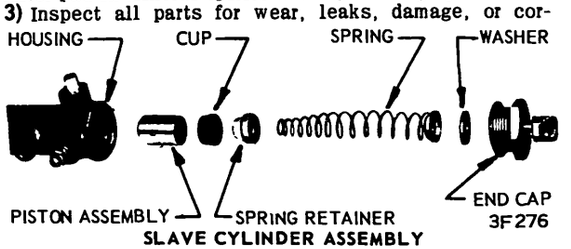
OVERHAUL

Disassembly

1) Remove bypass tube, scribe mark front and rear housings and clamp band, then remove clamp band and front housing from rear housing. Remove power piston assembly from front housing. Remove diaphragm return spring by bending tabs back. Remove pushrod locknut and remove pushrod from diaphragm hub.

2) Scribe mark control valve cover and slave cylinder housing, remove snap ring and breather cap assembly from cover, then remove control valve cover. Compress air check valve spring, remove "O" ring from check valve poppet, and remove poppet and spring. Remove control valve assembly from housing by grasping hub and rotating. Remove Tinnerman nut, diaphragm plate, and diaphragm from piston assembly. Remove rubber seal from piston hub, then remove outer lip seal on spool part of piston- *NOTE - The other seal cannot be removed and is serviced as an assembly with spool and flange sections of piston.*

CONTROL VALVE ASSEMBLY



3) Remove end cap and copper washer from slave cylinder, then remove rubber washer inside end cap. Remove piston return spring and residual check valve. Remove pushrod guide bushing and separate front housing and slave cylinder housing. Remove thick spacer washer and lockwasher. Remove "O" ring from rolled tube protruding from back of control valve housing, and remove gasket sealing housing and vacuum chamber front housing. Remove ."O" ring from guide bushing, then remove snap ring, flat washer, and lip seal from front of guide bushing, and snap ring and lip seal from rear of bushing. Remove slave cylinder piston, cup, and spring retainer from slave cylinder housing. Remove bleeder screws. Disassemble air cleaner unit.

Cleaning & Inspection

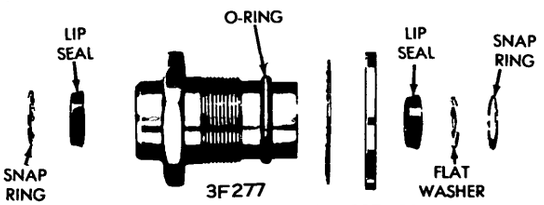
1) *The following parts are serviced as an assembly only:* Spool and flange sections of control valve piston. Residual check valve. Slave cylinder piston assembly. *NOTE - Slave cylinder piston body has a loose fitting plug, return spring and snap ring, and may be disassembled for cleaning only (remove snap ring).*

2) Wash all parts in alcohol and dry thoroughly. Replace all rubber parts and gaskets, and copper washer between end cap and slave cylinder housing. Clean air filter pad in mineral spirits and dry thoroughly.

3) Inspect all parts for wear, leaks, damage, or corrosion and replace as necessary. Test check valve in vacuum line and replace as necessary.

SLAVE CYLINDER ASSEMBLY

Reassembly



1) Reassemble piston guide nut assembly. Lip seal on small (front) end must have lip facing out, and lip seal on large (rear) end must have lip facing in. Insert new rubber seal in end cap and install end cap and copper washer on slave cylinder housing. Install tube elbow in end cap and bleeder screws in slave cylinder housing.

2) Install new seal in outer groove of control valve piston spool. Install control valve diaphragm over hub of piston flange (welt at I.D. of diaphragm next to piston flange). Install diaphragm plate and Tinnerman nut. Install new seal in hub of piston flange.

3) Install control valve assembly into housing using a rotating motion, then install air check valve spring and poppet (use new "O" ring on poppet). Install control valve cover, breather cap and retaining ring.

4) Install diaphragm assembly on pushrod and tighten locknut. Install diaphragm return spring under clips on diaphragm plate (large loop of spring next to plate). Use new bypass tube grommet in rear housing, then install diaphragm and pushrod assembly into rear housing. Install free end of pushrod in guide bushing bore, then use a rotating motion and slide pushrod in until end of pushrod bottoms against slave cylinder piston plug and small end coil of return spring seats around hub of guide bushing. Close both housing halves together until scribe marks are aligned, then install clamp band. Install bypass tube.

5) Reassemble air cleaner unit.

PISTON GUIDE NUT ASSEMBLY

STUDEBAKER HYDROVAC POWER BRAKE UNIT

Studebaker Hawk (1963) ℂ

ℂ - With Disc Brakes

DESCRIPTION

Vacuum-hydraulic power brake booster with single piston and having a control valve with a single poppet Control valve operated by a double cup hydraulic piston through the diaphragm assembly

MAINTENANCE

Air Cleaner

Integral type in end of control valve housing Clean every 1000 miles or sooner under severe dust conditions After washing element in cleaning solvent, dry thoroughly, and saturate with light engine oil

Lubrication

Every 20,000 miles (or yearly) inject 1 oz of Power Brake Cylinder Oil into unit through plug in end of vacuum cylinder shell *CAUTION - Lubricate unit only after permanently installed on car or handling of unit will cause oil to flow into hydraulic cylinder and cause damage*

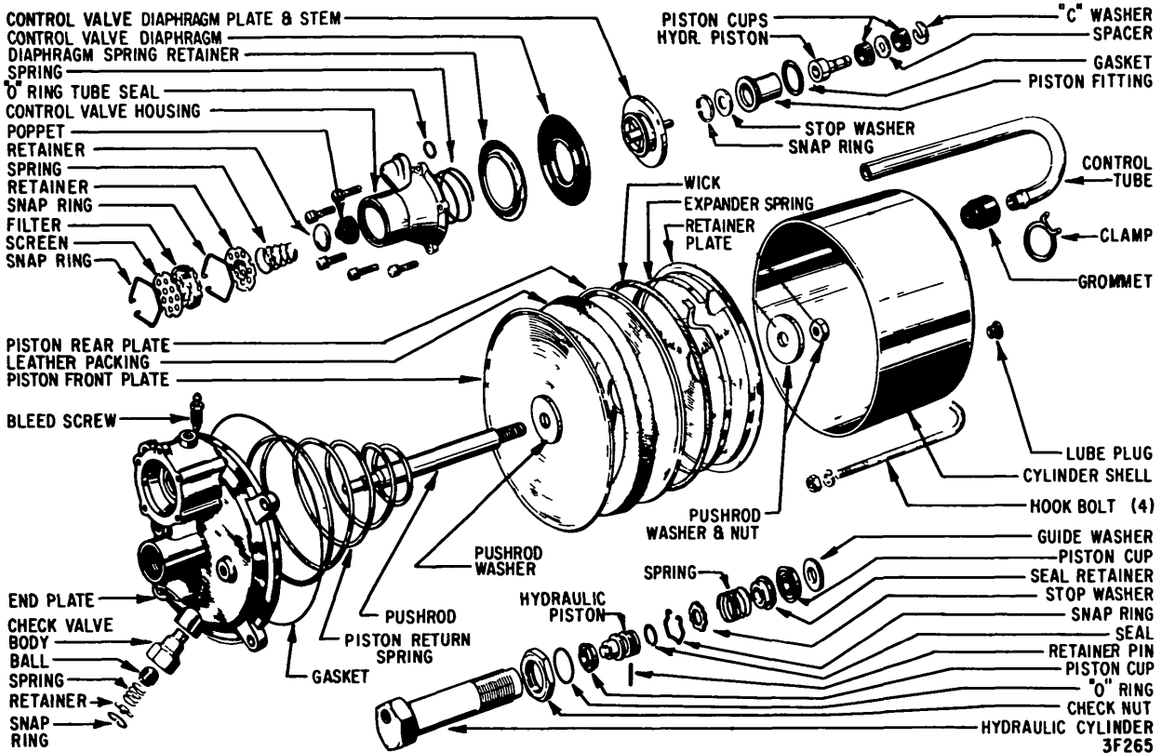
REMOVAL & INSTALLATION

Disconnect hydraulic and vacuum lines and stop light switch wires from unit Remove power unit-to-bracket attaching bolts and remove unit To install, reverse removal procedure

OVERHAUL

Disassembly

1) Scribe mark control valve housing and end plate, and end plate and vacuum cylinder shell Loosen hydraulic cylinder check nut, then remove vacuum tube and grommet Remove control valve assembly, spring, and diaphragm from end plate Disassemble and remove check valve from end plate



2) Remove air cleaner and poppet parts from control valve housing by removing snap ring From other side of housing remove control tube seal "O" ring Remove spring retainer and diaphragm from diaphragm plate and stem

3) Remove hook bolts holding end plate and vacuum cylinder shell together, and separate the parts Remove hydraulic cylinder from end plate, hold piston return spring compressed, and remove hydraulic piston from pushrod by removing retainer ring and pin Release spring and separate the parts Remove control valve hydraulic piston parts from end plate after removing snap ring Remove piston cups from hydraulic pistons Remove stationary seal parts from end plate after removing snap ring Remove pushrod "O" ring seal and bleed screw

4) Disassemble vacuum piston by removing pushrod retaining nut and lifting all parts from pushrod

Cleaning & Inspection

Clean air cleaner with solvent, metal parts in suitable parts cleaner, and rubber parts in alcohol Vacuum cylinder bore may be polished with steel wool or crocus cloth Replace any worn damaged, or pitted parts If control valve poppet seat is damaged, replace control valve body Special Hydrovac Repair Kit should be used when overhauling unit Use **all** the parts furnished in kit

STUDEBAKER HYDROVAC POWER BRAKE UNIT (EXPLODED)

Reassembly

1) Inside Assembly Ring 73664 placed flat on work bench install front piston plate (concave side down), leather packing, and rear piston plate (concave edge down) Cut wick to required length, saturate in Vacuum Cylinder Oil, and coil the wick against inside lip of leather packing Install expander spring with barbs up and engage notched end of spring with hook near opposite end of spring Install retainer plate on piston parts with cutout on plate over loop of spring Install washer on threaded end of pushrod, then install piston parts on pushrod (assembly ring still in place), install washer and nut and tighten securely *Do not remove assembly ring until piston and end plate are installed into vacuum cylinder*

2) Install pushrod "O" ring in end plate groove, then install stationary seal parts as follows Install guide washer (chamfered side against end plate), seal cup with lip toward hydraulic cylinder, seal retainer (shoulder end next to cup), and seal retainer spring Install stop washer against spring and install snap ring in inner groove Install "O" ring seal in outer groove Install bleed screw

3) Reassemble control valve hydraulic piston parts Dip piston cups in brake fluid before installing on piston and install cups with lips toward inside of end plate Install piston assembly and stop washer into end plate and secure with snap ring

4) Install hydraulic piston cup on piston with lip of cup toward small diameter end of piston Install vacuum piston return spring over pushrod with small end of spring next to piston Install end plate over pushrod, compress spring, and install hydraulic piston on pushrod and secure with pin and snap ring Install hydraulic cylinder into end plate hand tight

5) Install gasket in end plate groove, dip vacuum cylinder packing in Vacuum Cylinder Oil (allow time for excess to drain), wipe inside of cylinder shell lightly with same oil, and install vacuum piston and end plate assembly into cylinder shell and install and tighten hook bolts alternately until tight

6) Assemble control valve diaphragm over flange of plate and stem, then install retainer plate over shoulder diaphragm Install poppet bearing ring in groove of poppet, install poppet valve spring and retainer Install snap ring in housing inner groove Install air cleaner element parts, then install control tube "O" ring in control valve housing

7) Install diaphragm assembly into end plate, then install valve spring Align scribe marks and install control valve housing to end plate and tighten attaching screws Reassemble check valve and install into end plate Install control tube and lubrication plug Align hydraulic cylinder so outlet in tube is at top and aligned with bleed screw Tighten cylinder check nut

MULTI-VAC POWER BRAKE UNIT

Ch vr l t Trucks (1963)©

© - "Bendix Power Brake Unit Diaphragm (Vacuum Suspended)", "Delco-Moraine Vacuum Suspended Power Unit", and "Midland-Ross Hy-Power" types also used.

DESCRIPTION

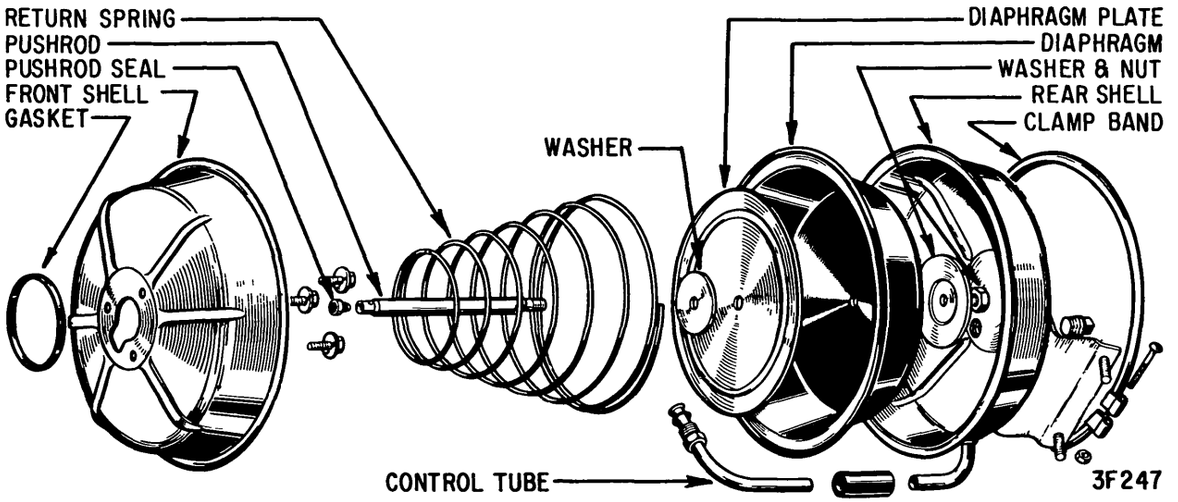
Self-contained vacuum-hydraulic power brake unit consisting of a vacuum power chamber, hydraulic slave cylinder, and vacuum control valve. 11" and 12¾" types used. 11" type has no residual pressure check valve and must be used with a master cylinder having a residual pressure check valve with a .030" orifice. Both 11" and 12¾" types are similar in design and any differences will be noted under "Overhaul" as necessary.

OVERHAUL

Disassembly

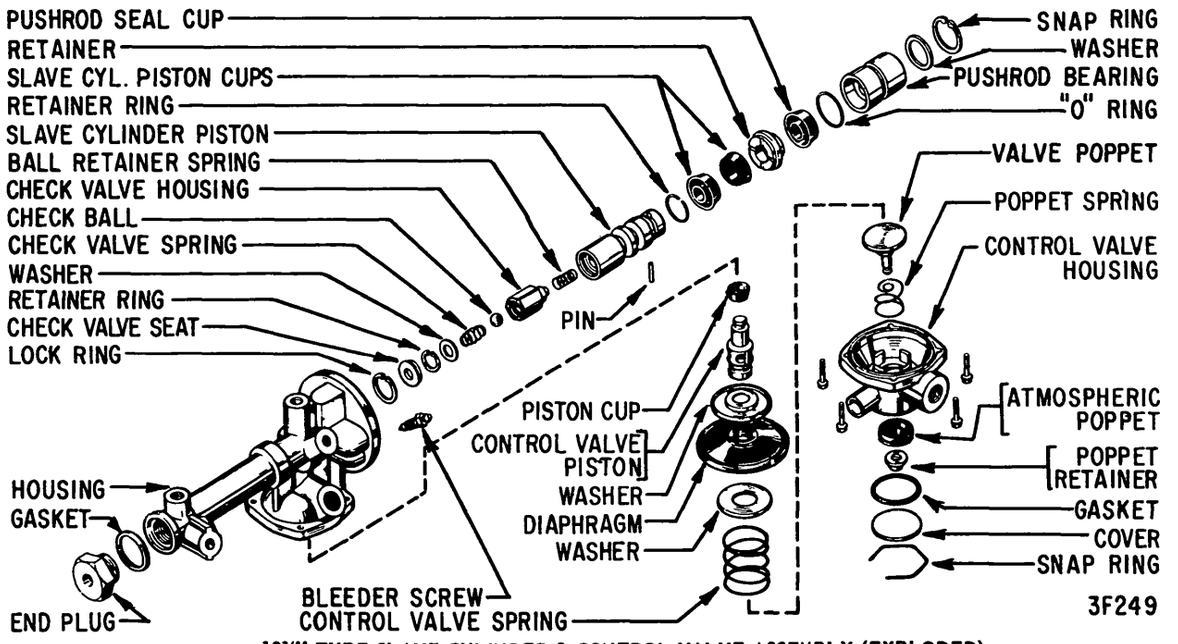
1) Scribe mark front and rear shells, clamp slave cylinder in vise, and remove control tube and hose from control valve housing. Remove clamp ring holding front and rear shells and remove rear shell. Turn back outer rim of diaphragm (to expose wrench flats on pushrod) and loosen pushrod retaining nut on outside of diaphragm. Remove nut, washer, diaphragm, plate, washer, and return spring from front shell. Remove front shell from slave cylinder, then remove gasket.
2) Scribe mark control valve and slave cylinder housing, then remove control valve housing and spring. Remove washer, diaphragm, and washer from valve piston. Remove cups (one cup only on 12¾" type) from valve piston. From control valve housing remove retaining ring, plate and gasket; and pry off poppet retainer, remove poppet and stem, and poppet spring from housing.
3) Push slave cylinder pushrod to end of its stroke and remove snap ring and washer, then remove pushrod and piston and remove "O" ring, pushrod bearing, cup, and retainer from pushrod assembly. Remove end plug, gasket (and bleed screw if equipped) from slave cylinder housing.
4) Disassemble slave cylinder piston as follows: Remove snap ring from groove in piston and remove retainer pin to separate piston and pushrod. Remove cup (2 cups on 12¾" type) from piston. Pull seal from end of pushrod. On 12¾" type, remove lock ring, check valve seat, check valve, and ball retainer spring. Disassemble check valve by removing retaining ring, washer, spring, and ball.

Cleaning & Inspection



Thoroughly clean and inspect all parts. Replace as necessary. If control valve housing valve seat is damaged, replace housing. Multi-Vac Repair Kits are available and are recommended when overhauling these units.

Reassembly

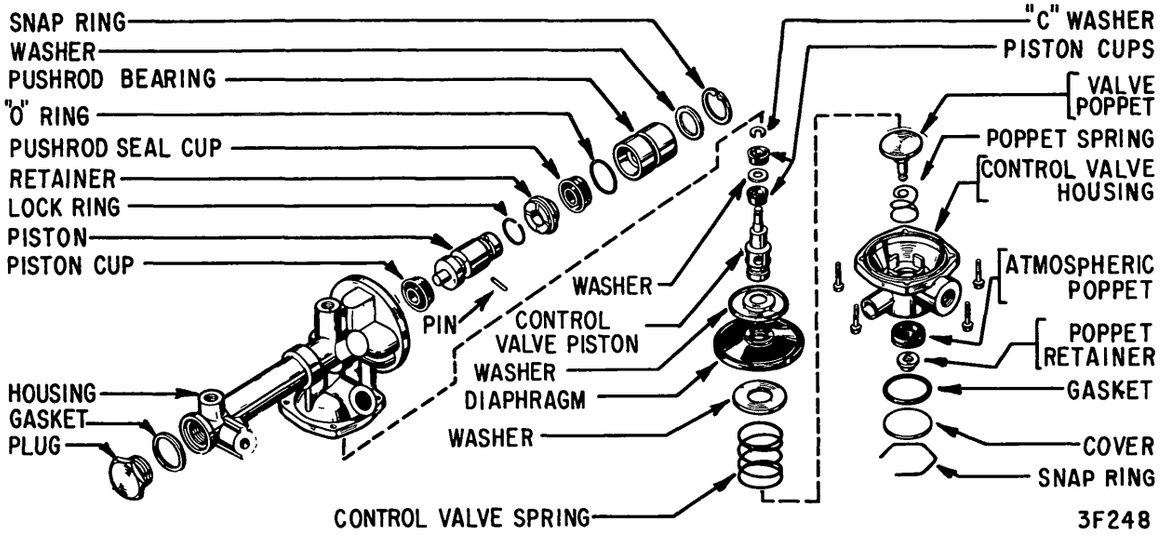


1) Install new seal in pushrod as follows: Place new seal with rubber faced side down on a clean wood block. With pushrod directly above seal and held vertically (threaded end up), strike end of pushrod with soft hammer to seat seal in pushrod.
2) Dip piston cups in brake fluid. On 11" type, install cup on piston with lip toward end plug end of housing. On 12¾" type, install cups back-to-back. On 12¾" type, assemble check valve ball, spring, washer, and snap ring in check valve body, then assemble check valve, check valve seat into piston and secure with lock ring. On both types, insert seal end of pushrod in piston, install retainer pin and secure with lock ring (ring must be seated in piston groove).
3) Install seal retainer, pushrod seal cup, and pushrod bearing on pushrod, install "O" ring seal in outer groove of bearing, and install piston and pushrod assembly into slave cylinder housing. Install support washer and lock ring. Install housing end plug and gasket (and bleed screw if equipped).

4) Reassemble control valve housing by installing poppet return spring, valve poppet and stem, and valve seal into valve housing, snap poppet retainer over valve stem, and install cover gasket, cover, and snap ring.

(Continued)

VACUUM POWER CHAMBER ASSEMBLY (EXPLODED)



12¾" TYPE SLAVE CYLINDER & CONTROL VALVE ASSEMBLY (EXPLODED)

MULTI-VAC POWER BRAKE UNIT (Continu d)

5) Install cups on control valve piston with lips of cups toward small diameter end of piston, then hold cups in place with "C" washer. Install diaphragm retainer and diaphragm, seating diaphragm in piston groove. Install control valve piston into bore of housing and install spring retainer, spring, and housing cover and tighten screws securely.

6) Install front shell to slave cylinder housing, making sure cutout in shell is aligned with porting on housing. Tighten screws securely. Pull pushrod out to end of its travel and temporarily plug slave cylinder outlet with a 5/16" (Inverted Flange) tube seat plug. With small diameter end of return spring on front shell, install washer on pushrod, diaphragm plate on spring (concave side down), diaphragm on plate (lip down), and washer. Compress parts and install retaining nut on pushrod end, tighten securely, and remove tube seat plug. Install rear shell, aligning scribe marks made at disassembly, and make sure bead of diaphragm is seated in outer flanges of front and rear shells. Install clamp band with band opening 45° to left of vertical centerline of unit. Tap band lightly with soft hammer when tightening bolt to seat band. Install tube and hose on valve housing and connect to rear shell tube.

11" TYPE SLAVE CYLINDER & CONTROL VALVE ASSEMBLY (EXPLODED)

BENDIX TANDEM DIAPHRAGM POWER BRAKE UNIT

Studebaker Avanti, Lark & Cruiser ℂ
ℂ - With Disc Brakes.

DESCRIPTION

Vacuum-hydraulic power brake assembly with tandem vacuum diaphragms. This unit is a "vacuum suspended" type and does not require a vacuum reservoir. The vacuum power chamber consists of a front and rear shell, center plate, front and rear diaphragm, hydraulic pushrod and a vacuum diaphragm return spring. The hydraulic master cylinder is connected directly to vacuum chamber.

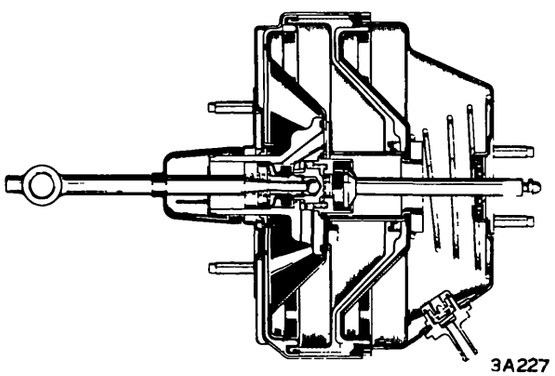
REMOVAL & INSTALLATION

Removal

Procedure below is for removal of power unit, master cylinder, mounting brackets, and power levers as an assembly. Disconnect pushrod from brake pedal by removing shoulder bolt, then remove nylon bushings from pushrod. Disconnect hydraulic and vacuum lines, and stop light switch wires. Remove bolts holding unit to firewall and to suspended pedal bracket and remove complete assembly.

Installation

1) Attach assembly to firewall and suspend pedal bracket with capscrews and lockwashers. Connect hydraulic and vacuum lines, and stop light switch wires. Install nylon bushings in eye of pushrod and connect pushrod to brake pedal with the special eccentric shoulder bolt.

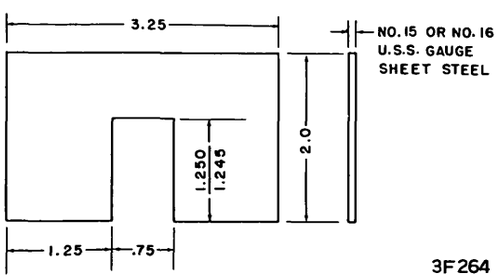


2) Adjust pedal height as follows: On Synchro-mesh cars, rotate shoulder bolt until brake pedal is at same height as clutch pedal (released position). On Auto. Trans. cars, rotate shoulder bolt so there is 7/8-1" clearance between brake pedal arm and tab on suspended pedal bracket. Hold bolt head and tighten locknut securely.

ADJUSTMENT

Pushrod Adjustment

NOTE - No adjustment required under normal service conditions. Check and reset adjustment pushrod replaced or transferred from one unit to another.



With master cylinder removed and pushrod firmly bottomed in diaphragm plate, measure distance from end of pushrod adjusting screw to master cylinder mounting face of power unit. Distance should be 1.245-1.250". Use micrometer or height gauge made locally as shown in illustration. To adjust, turn adjusting screw in or out as required.

BENDIX TANDEM DIAPHRAGM POWER BRAKE UNIT (SECTIONAL VIEW)

OVERHAUL

Power unit is serviced as a complete assembly only.

PUSHROD ADJUSTMENT GAUGE TOOL

BENDIX HYDRAULIC SINGLE ANCHOR HYDRAULIC TYPE

D dg Dart (1963) ℂ
Valiant (1963) ℂ
J ep With Dual R ar Wheels (1963) ℂ

ℂ - Early Cars Later Cars use "Bendix Automatic Adjuster Hydraulic Type"
ℂ - Other models use "Bendix (Lockheed) Self-Centering" type

DESCRIPTION

Single anchor, without eccentric, hydraulic type Fixed anchor pins are used on all models and are not adjustable

ADJUSTMENT

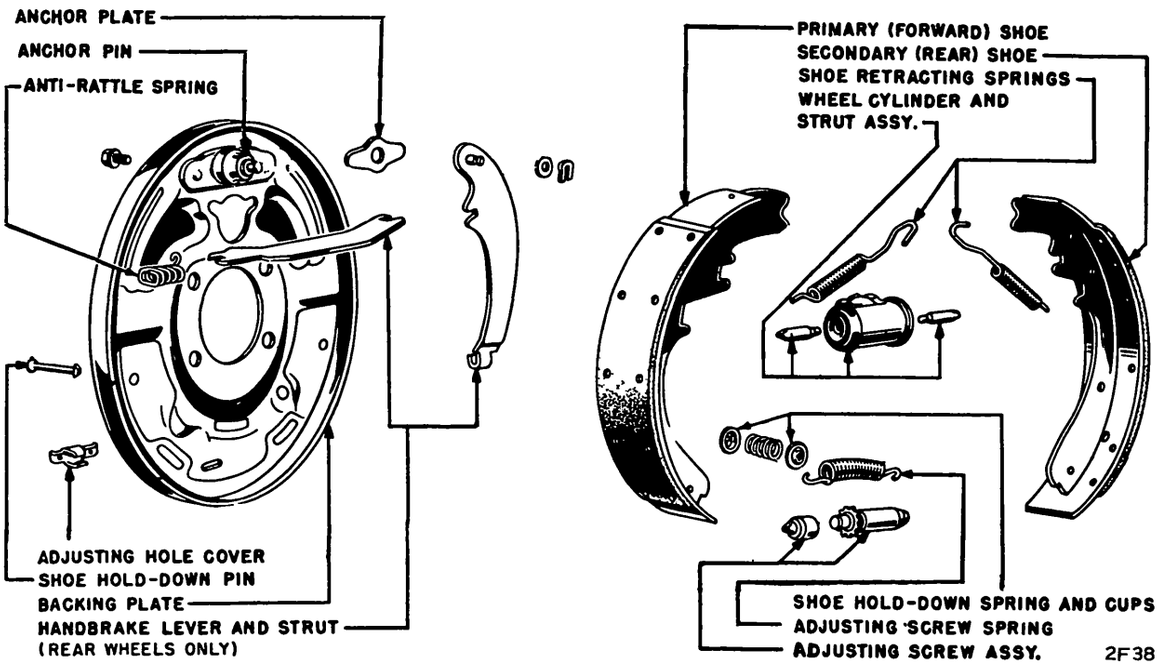
Minor Wear Adjustment

Remove adjusting hole cover on backing plate and turn adjusting star wheel to expand shoes until shoes have a slight drag on brake drum (Dart & Valiant), until shoes are tight against drum (Jeep) Now back off adjusting star wheel 10-12 notches (Dart & Valiant), until drum turns freely (Jeep)

Parking Brake Adjustment

Dart & Valiant - With parking brake lever fully released, loosen cable adjusting nut so cables are slack, then tighten adjusting nut so there is a slight drag at each rear wheel Loosen nut until both wheels are free, then back off nut **2 full turns.** Apply parking brake several times, then release and check that there is no drag

Jeep - Fully release hand brake lever, check linkage for freedom from bind Rotate brake drum so one pair of three sets of holes are over adjusting screws Use tool or screwdriver to rotate each adjusting screw away from drive shaft until shoes are snug against drum, then back off each screw 7 notches for running clearance



Brake Pedal Adjustment

Dart & Plym uth - No adjustment Freeplay controlled by stop built into master cylinder

Jeep - Pedal free travel should be ½" Adjust by turning master cylinder pushrod in or out as necessary

MASTER CYLINDER

Jeep - On Forward Control models, master cylinder is located under instrument panel in front of steering column and is accessible through hole on panel to right of speedometer

BENDIX HYDRAULIC SINGLE ANCHOR BRAKE ASSEMBLY (EXPLODED)

See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual

CHEVROLET-BENDIX HYDRAULIC

Chevrolet Trucks, Series 10,20,30 (1963) Front & Rear
Chevrolet Trucks, Series 50,60 (1963) Front Only ℂ

ℂ - For Rear Brakes, see "Chevrolet Truck Twinplex" in this section

DESCRIPTION

Duo-Servo, single anchor, hydraulic type without eccentric adjustment

ADJUSTMENT

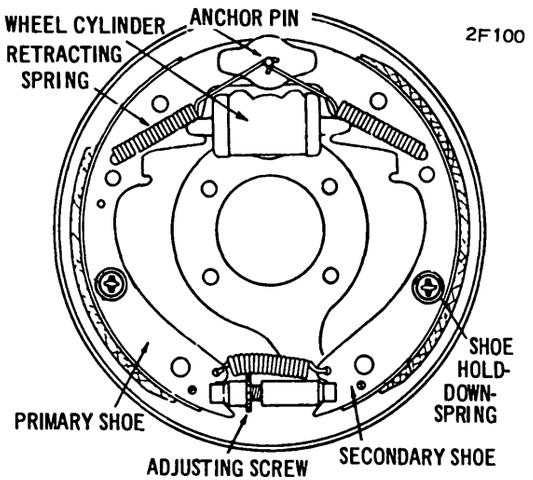
Minor Wear Adjustment

With wheels clear of floor, relieve tension on parking brake cables Remove adjusting hole covers from brake backing plates and expand shoes by turning adjusting screw with Tool J-4707 or J-9485 or screwdriver until a light uniform drag is felt on brake drum (move outer end of tool toward center of wheel to expand shoes) Now turn adjusting screw in opposite direction 12 notches (Series 10), not more than 7 notches (Series 20,30,50,60) to relieve brake drag Replace adjusting hole covers, reconnect and adjust parking brake

Anchor Pin Adjustment

NOTE - This adjustment required on rear brakes of P & C 30 Series only when reassembling brake mechanism All other anchor pins are "fixed" type

With brakes assembled and drums installed, loosen anchor pin nut and then retighten nut ¼-turn beyond "finger tight" position Insert adjusting tool into backing plate slot and expand shoes against drum while tapping backing plate with a soft hammer When adjusting screw is tight and hard to turn, tap backing plate a few more times to position anchor pin, and tighten anchor pin nut to 150-175 ft lbs Adjust brakes



Parking Brake Adjustment

Rear Wheel Type - With parking brake fully released, adjust front cable clevis at equalizer lever so there is 1 38" ± 06" from end of cable threaded rod to center of clevis pin hole With equalizer pull-back spring installed, adjust front cable at clevis so there is ¼" clearance between rear of equalizer lever and rear of slot in frame Tighten locknuts Now pull hand brake lever 4 notches from fully released position and pull rear brake cables as far as possible out of their conduits Adjust clevis at each cable so there is 1/75" ± 06" (C Series) 2 44" ± 06" (K Series) from end of threaded rod to center of clevis pin hole, then tighten locknuts Fully apply parking brakes and adjust cables as necessary so there is an equal heavy drag at both rear wheels

Propeller Shaft (Band) Type - Adjust clevis on brake pull rod so distance from end of rod to center line of clevis pin hole is 1 7/16" Place the hand brake lever in fully released notch of ratchet sector Loosen locknut on brake pull rod to brake cam (leave loose) Set brake cam rest flat on upper brake band bracket Back off adjusting nuts at lower end of spring, and adjusting nut at top of adjusting bolt (bolt joins lower part of band to bracket) *CAUTION - Do not remove nuts, loosen only* Remove lock wire from anchor screw Adjust anchor screw until there is 010- 015" clearance between lining and drum at anchor screw Tighten adjusting bolt (bolt without spring) until there is 020" clearance between drum and lower end of brake band Tighten locknut Tighten adjusting nut at lower end of spring until there is 020" clearance between drum and upper end of brake band Tighten locknut Adjust brake pull rod so clevis pin can be installed while brake cam rests flat on upper brake band bracket Install cotter pin in clevis pin of brake pull rod and tighten locknut on brake pull rod Install lock wire on anchor screw Recheck all points of lining for correct clearances

CHEVROLET-BENDIX FRONT BRAKE ASSEMBLY

Propeller Shaft (Shoe) Type - *See "Chevrolet Twinplex Brakes" in this section*

Brake Pedal Adjustm nt

With Eccentric Bolt Type Adjustm nt - Rotate eccentric bolt located where master cylinder pushrod connects to brake pedal to obtain a free pedal travel of 1/8" measured at center of brake pedal pad Tighten eccentric bolt nut to 40-50 ft lbs *NOTE - Adjust stop light switch so there is electrical contact at approximately 13/16" pedal travel*

With Threaded Rod Type Adjustment - Adjust pushrod so that pedal free travel measured at center of pedal pad is 1/8" Tighten pushrod locknut to 17-23 ft lbs *NOTE - Adjust stop light switch so there is electrical contact at approximately 13/16" pedal travel*

SERVICING

For bleeding system and overhauling wheel and master cylinders, see "Hydraulic Brake Servicing" in Brake Section of Manual

TROUBLE SHOOTING

See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual

WAGNER AUTOMATIC ADJUSTER (PRIMARY SHOE ACTUATION)

Stud bak r, Exc pt Avanti (1963)

►CHANGES, CAUTIONS, CORRECTIONS

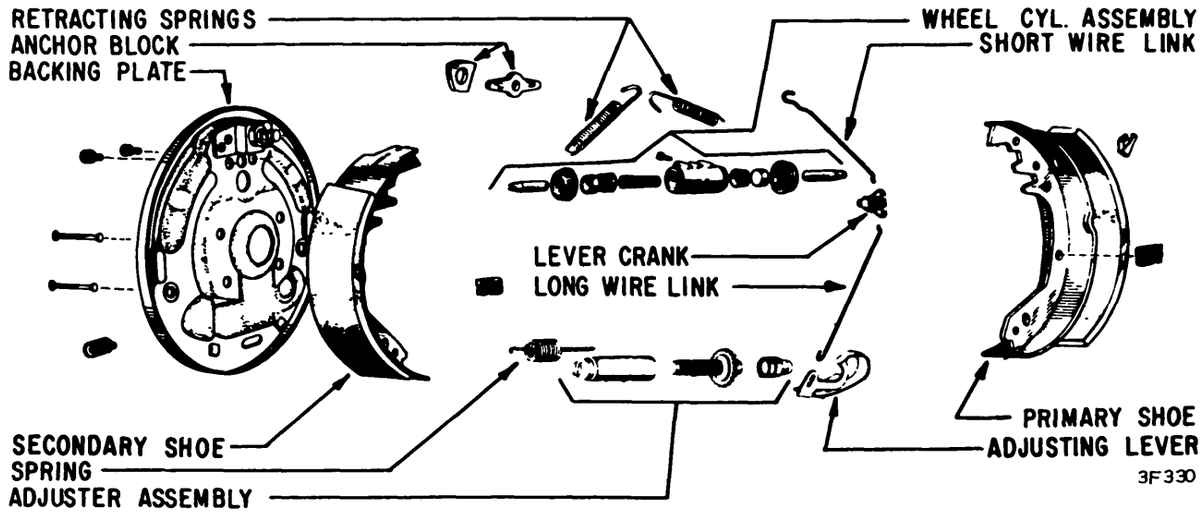
►*1963 EXCESSIVE PEDAL TRAVEL & HIGH PEDAL EFFORT CORRECTION:* On cars without power brakes, this condition may be improved by removing brake pedal return spring and installing longer brake pedal-to-master cylinder pushrod, No. 1561592; then adjust brake pedal stopscrew for 1/4-3/8" clearance from pedal with pedal in released position. *NOTE - Pedal return spring liminated in production during March, 1963; and l nger pushr d used in production beginning Serial No. 63S-34067 & 63V-33581.*

DESCRIPTION

Hydraulic, self-centering and self-energizing type with Bendix type brake shoe assemblies similar in design to Wagner (Lockheed) Self-Centering Brakes and incorporating an automatic adjuster to maintain proper lining-to-drum clearance. The automatic adjuster uses movement of the front (primary) shoe during brake applications in forward direction to turn brake adjusting star wheel a small amount as determined by lining wear. The automatic adjuster consists of an adjusting lever, a lever crank on primary shoe, and two adjusting wire links.

ADJUSTMENT

Brake Shoe Adjustment



Adjustment not normally required, but if a manual adjustment is necessary (after installation of new lining or shoes), proceed as follows: Remove adjusting hole cover from backing plate and rotate adjusting star wheel with screwdriver until there is a heavy drag on brake while rotating wheel and tire. Now insert a small bent screwdriver or similar tool by star wheel and carefully disengage actuating lever from star wheel. *CAUTION - Move lev r only amount necessary to disengage from contact with star wheel.* While holding actuating lever disengaged, back off star wheel until there is no drag and wheel turns freely. Release adjusting lever. Lever tang must reengage star wheel (check by trying to rotate star wheel). Replace adjusting hole cover, then apply brakes several times while car is moving forward.

Parking Brake Adjustment

With rear wheels off ground and parking brake handle set 4 notches from fully released position, loosen locknut at rear cable equalizer under transmission and tighten adjusting nut so there is no slack in cables and there is a heavy drag at rear wheels. Tighten nuts securely, release the handle and check that no drag exists.

Brake Pedal Adjustment

Turn adjustable pedal stop on pedal bracket so pedal free travel is 1/4-3/8" measured at pedal pad before pressure stroke starts.

WAGNER AUTOMATIC ADJUSTER BRAKE ASSEMBLY (PRIMARY SHOE ACTUATION)
RIGHT FRONT SHOWN - OTHERS SIMILAR

OVERHAUL

Brake Shoe Replacement

Reassembly - 1) Apply lubriplate to wear surface of backing plate. Install anchor block on anchor pin with curved side of block and arrow toward primary shoe side. Install parking brake lever and retaining clip to secondary shoe, then attach cable to lever. Place shoes on backing plate, aligning shoes with wheel cylinder pushrod slots. Install parking brake link, then install anti-rattle spring on primary shoe side of parking brake link. Install shoe hold-down pins and retaining clips. **2)** Install adjuster lever on primary shoe web (slot in lever must engage completely with slot in shoe web).

NOTE - Adjuster levers are painted blue for right side, red for left side. DO NOT INTERCHANGE. Install star wheel and adjust so approximately 3/16" of threads are exposed between star wheel and star wheel nut. *CAUTION - If star wheels are interchanged between sides of car, brake shoes will retract instead of expand. Right hand threads go on right brakes, left left threads on left brakes. Make sure star wheel is installed over adjusting hole in backing plate.* Install blue spring at lower end of shoe webs (long hook end in small hole of primary shoe **under** shoe web; and short hook end in small hole of secondary shoe web). Spring should not interfere with either adjusting lever or star wheel.

WAGNER AUTOMATIC ADJUSTER (PRIMARY SHOE ACTUATION) (Continued)

3) Install wing plate on anchor pin (over anchor block). Install shoe return springs (green for 10" & 11" brakes, black for 9" brakes) with long hook end flat against wing plate. Install lever crank into primary shoe web (in small hole **below** cross link slot). *NOTE - Cranks are marked "L" and "R" for identification. Lever must rotate freely on hexagon head screw.* Install short (upper) wire link as follows: Insert "S" shaped offset end into lever crank hole closest to hexagon head, then snap hook end of link in top groove of anchor pin. Install long (lower) wire link as follows: Insert "S" shaped end into lever crank, then lift adjusting lever up to hook link into slot of adjusting lever. Adjusting lever should now engage star wheel teeth at centerline of star wheel assembly ±1/16". *NOTE - Green wire links used on 11" brakes, red links on 10" brakes, and black links on 9" brakes.* Install wheel and drum, then make brake shoe adjustment (see above)

SERVICING

For bleeding brake system and ov rhaul of master cylinder, see "Bendix & Moraine Dual Piston Brak Master Cylinders" in this section.

TROUBLE SHOOTING

See "Hydraulic Brake Troubl Shooting" in Brake Section of Manual.

WAGNER AUTOMATIC ADJUSTER (SECONDARY SHOE ACTUATION)

Rambler Classic Six, Series 6310 (1963)

DESCRIPTION

Hydraulic, self-centering, self-energizing, and self-adjusting type similar in design and operation to units used on previous models. Automatic adjuster uses movement of rear (secondary) shoe during reverse brake applications to turn brake adjusting star wheel a small amount as determined by lining wear.

ADJUSTMENT

Brake Shoe Adjustment

NOTE - Make following adjustment whenever brakes overhauled, or whenever necessary in service. This adjustment is not a normal service operation. With 3/16-1/4" of star wheel threads exposed during installation procedure, install drum and rotate star wheel toward axle until wheel is in locked position. Back off star wheel at least 15-20 notches. *CAUTION - DO NOT insert a tool past star wheel to lift or pry adjusting lever off star wheel teeth.*

Parking Brake Adjustment

Set brake lever on first notch from fully released position and tighten cable at equalizer until rear wheels are locked in forward rotation Release foot lever and make sure wheels rotate without drag.

Brake Pedal Adjustment

Rotate master cylinder eccentric attaching bolt for maximum pedal height. On cars without power brakes, there should be clearance between brake pedal and pedal bumper when pedal in released position (bend pedal bumper bracket as necessary).

OVERHAUL

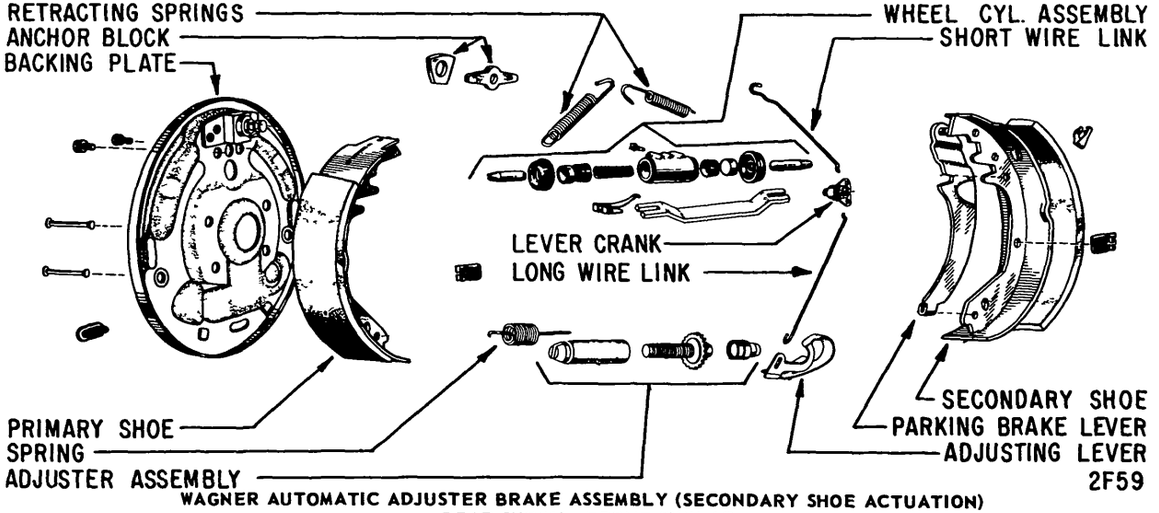
Brake Shoe Replacement

Automatic Adjuster Removal - Remove long wire link from adjuster lever and lever crank, then remove upper (short) wire link. Remove star wheel spring, star wheel, and adjusting lever. Unscrew lever crank from secondary shoe

Brake Unit Assembly - Place shoes on backing plate and secure with hold down pin and clip Install adjuster lever on secondary shoe web (slot in lever must engage completely with slot in shoe web) *NOTE - Adjuster l vers ar painted r d for right sid , blue for left side. DO NOT INTERCHANGE.* Install star wheel and adjust so approximately 3/16-1/4" of threads are exposed between star wheel and star wheel nut. *CAUTION - Make sure star wheel is installed over adjusting hole in backing plate. If star wheels are interchanged between sides of car, brake shoes will retract instead of expand.* Install spring at lower end of shoe webs (long hook end in small hole of secondary shoe **under** shoe web; short hook end in small hole of primary shoe web). Spring should not interfere with either adjusting lever or star wheel Install anchor block with arrow pointing in direction of drum forward rotation. Install guide plate over anchor pin and install shoe return spring (lock hook end flat against guide plate) Install lever crank into secondary shoe web *NOTE - Cranks are marked "L" and "R" for identification. Lever must rotate freely on hexagon head screw.* Install short (upper) wire link as follows: Insert "S" shape offset end into lever crank hole closest to hexagon head, then snap hook end of link in top groove of anchor pin Install long (lower) wire link as follows: Insert "S" shaped end into lever crank, then lift adjuster lever up to hook link into slot of adjusting lever. Adjusting lever should now engage star wheel teeth at centerline of star wheel assembly ± 1/16". Install wheel and drum, then make brake shoe adjustment (see above).

SERVICING

For bleeding brake system and overhaul of master cylinder, see "Bendix & Moraine Dual Piston Brake Master Cylinders" in this section.



TROUBLE SHOOTING

See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.

WAGNER AUTOMATIC ADJUSTER BRAKE ASSEMBLY (SECONDARY SHOE ACTUATION)
REAR SHOWN - FRONT SIMILAR

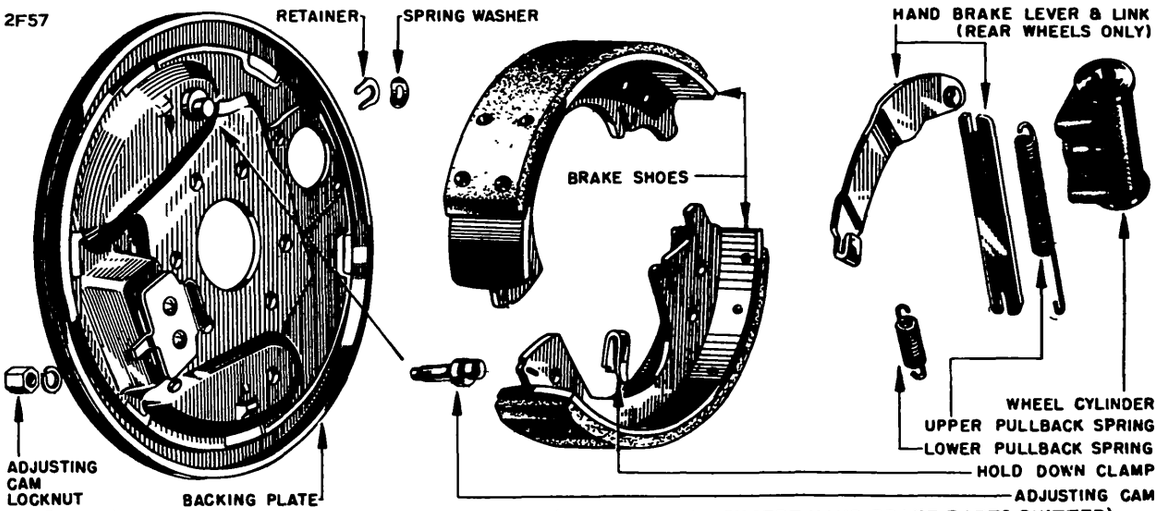
BENDIX (LOCKHEED) SELF-CENTERING

Studebak r (1963) Rear Only ℂ
Jeep, All M dels (1963) ℂ

ℂ - Front brakes are "Bendix Disc" type.
ℂ - For models with Dual Rear Wheels, see "Bendix Hydraulic Single Anchor Brakes" in this section.

DESCRIPTION

Self-Centering hydraulic type with non-adjustable anchor ramps for each shoe. An eccentric adjusting cam is used for brake shoe adjustment.
JEEP FORWARD CONTROL MASTER CYLINDER - Master cylinder mounted on inside front panel of cab, just underneath instrument panel. Access to filler plug is through hole cover on panel to right of speedometer.



ADJUSTMENT

Minor W ar & New Lining Adjustment

NOTE - Brake shoes must be "centralized" by several hard brake applications before adjusting. While rotating wheel forward for front shoe, rearward for rear shoe, adjust eccentric for each brake shoe in turn by turning eccentric up and out until brake shoe strikes drum and there is a light drag, then back eccentric off until wheel turns freely without drag

Parking Brak Adjustment

Studebaker - With rear wheels off ground and parking brake handle set 4 notches from fully released position, loosen locknut at rear cable equalizer under transmission and tighten adjusting nut so there is no slack in cables and there is a heavy drag at rear wheels. Tighten nuts securely, release the handle and check that no drag exists.
Jeep (Rear Wheel Type) - Pull hand lever out 3 notches from fully released position, loosen front nut on connecting link between intermediate lever on frame crossmember and rear cable equalizer, tighten rear nut on link until slight drag noted at each rear wheel, then tighten front nut to lock adjustment. Release hand lever and check for freedom from drag.
Je p (Prop ller Shaft Type) - Fully release hand brake lever, check linkage for freedom from bind. Rotate brake drum so one pair of three sets of holes are over adjusting screws. Use tool or screwdriver to rotate each adjusting screw away from drive shaft until shoes are snug against drum, then back off each screw 7 notches for running clearance.
Jeep (Op rator Adjustable Hand Brake Lever) - 1) Adjusting knob on hand brake lever handle compensates for lining wear or for unusual holding conditions. With lever in "off" position, turn adjusting knob clockwise while applying and releasing handle every ¼-turn of knob until definite "snap over center" action takes place *CAUTION - Over adjustment causes hard hand lever action but does not increase brake efficiency. For major adjustment, proceed as follows:*
2) With adjusting knob turned fully counterclockwise, place handle in "on" position. Tighten parking brake cables at equalizer adjusting nut until slight drag is felt at rear wheels Tighten locknut. Release control handle. Rear wheels should be free. Turn adjusting knob clockwise for desired tension

BENDIX (LOCKHEED) SELF-CENTERING REAR BRAKE (FRONT SIMILAR EXCEPT HAND BRAKE PARTS OMITTED)

Brake Pedal Adjustment

Studebaker - Lark, Cruiser, Hawk - Turn adjustable pedal stop on pedal bracket so pedal free travel is 1/4-3/8" measured at pedal pad before pressure stroke starts.
Avanti - Adjust brake pedal-to-power unit pushrod eccentric shoulder bolt so brake pedal is same height as clutch pedal (Synchro-mesh Cars), so there is 7/8-1" clearance pedal arm and tab of pedal bracket (Auto Trans Cars).
Jeep - Pedal free travel should be 1/2" Adjust by turning master cylinder pushrod in or out as necessary

SERVICING

For bleeding system and overhauling wheel and master cylinders, see "Hydraulic Brake Servicing" in Brake Section of Manual.

TROUBLE SHOOTING

See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.

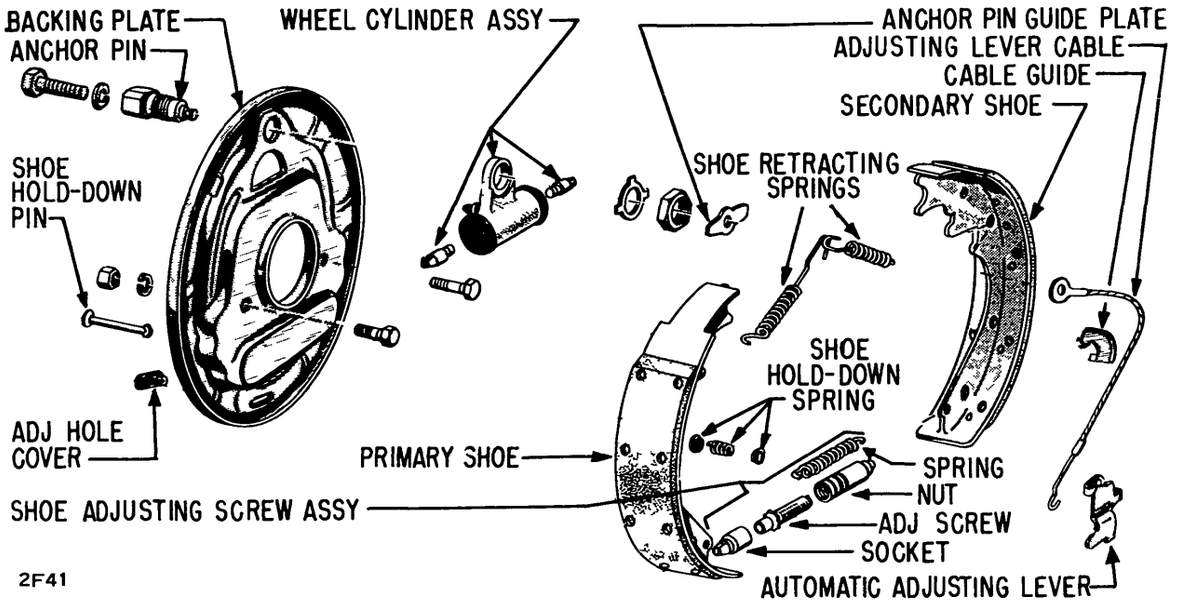
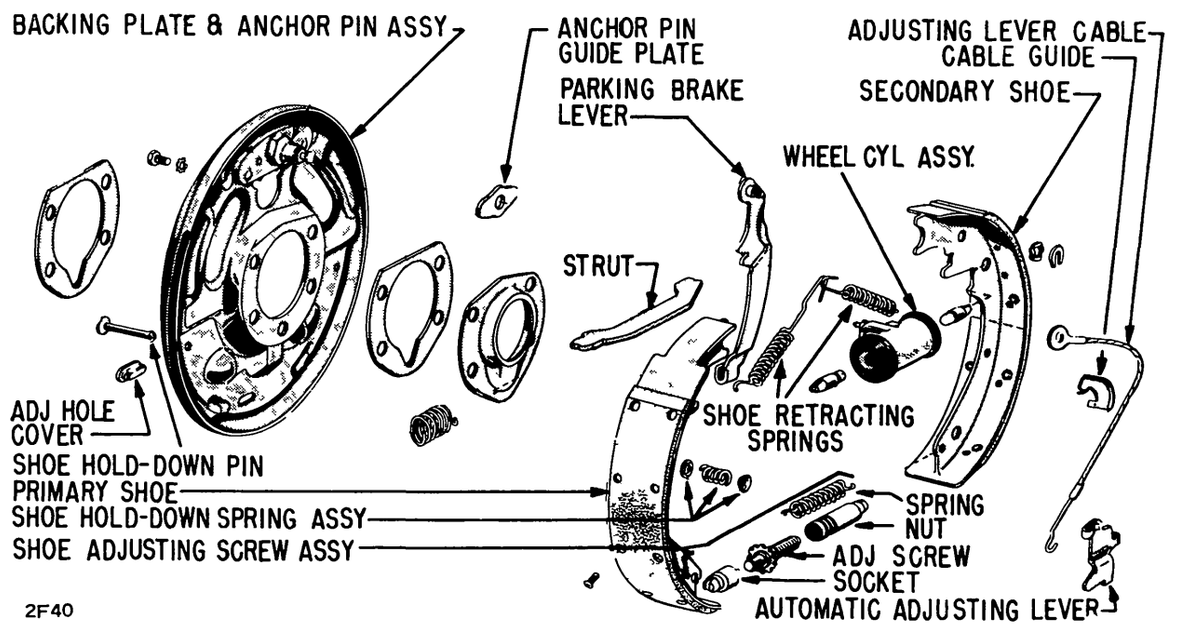
DESCRIPTION



Bendix Single Anchor (Without Eccentric) type brakes incorporating an automatic adjuster mechanism using movement of rear (secondary) shoe during reverse brake application to turn brake adjusting screw a small amount and maintain proper lining-to-drum clearance Adjuster mechanism consists of a steel cable with a hook and anchor fitting permanently attached a cable guide, adjusting lever, adjusting screw pivot nut, socket and spring Anchor pins on all brakes are fixed and not adjustable

ADJUSTMENT



Brake Shoe Adjustment

Following adjustment is made after brake shoes or lining replaced or if the number of reverse brake applications is insufficient to actuate automatic adjusters

(Continued)

FORD MOTOR CO REAR BRAKE ASSEMBLY (OTHERS SIMILAR)

FORD MOTOR CO FRONT BRAKE ASSEMBLY
(ANCHOR PIN & WHEEL CYLINDER ON OTHERS SIMILAR TO REAR BRAKE)

BENDIX AUTOMATIC ADJUSTER HYDRAULIC TYPE (Cont.)

Chrysler Corp. Models - Remove adjusting hole covers from backing plates. Insert an adjusting wrench (C-3784) into star wheel and tighten brake until wheel turns with slight drag. Hold adjusting lever away from star wheel (ice pick or other suitable tool) and back off star wheel 12 notches (provides necessary .012" clearance). Wheel should turn without drag. *Adjustment must be equal on all wheels.*

Ford Motor Co. Models - Raise car and disconnect parking brake cables. Remove access hole cover plate from backing plate and turn adjusting screw upward with Tool 2018 or screwdriver to expand shoes against drum until a slight drag is felt. Remove brake drum. Hold adjusting lever away from adjusting screw and back off adjusting screw ¾-turn with fingers. *NOTE - If screw cannot be turned with fingers, screw must be freed or adjusting lever will not turn screw.* Install wheel and drum, then back car in reverse and make 5 or 6 brake applications to complete adjustment.

Rambler - Lengthen adjusting screw to expose 3/8" of adjusting screw threads, then install drum. Drive car cautiously in reverse, making 10 brake applications before road testing. Make sure pedal height is correct (see below).

Parking Brake Adjustment

Chrysler Corp. Models - With parking brake lever fully released, loosen cable adjusting nut so there is slack in rear cables, and make sure rear brakes are properly adjusted. *NOTE - If cables are new, pull down firmly on unshrouded part of cable to seat cable fittings in brackets.* Tighten cable adjusting nut until wheels are hard to turn, then release cable until wheels rotate freely without drag, **then back nut off 2 full turns.** Apply parking brake several times then release and see that there is no drag.

Falcon, Comet, Fairlane, Meteor - Pull release handle 3 notches from fully released position. Turn front nut on equalizer several turns forward, then turn rear nut forward until cables prevent forward rotation of rear wheels. Tighten front nut against equalizer. Release the handle.

Ford Galaxie & Thunderbird - With parking brake cables fully released, loosen locknut on equalizer rod and turn adjusting nut several turns forward. Turn locknut forward against equalizer until cables are just tight enough to remove slack. *CAUTION - Excessive tightening of cables may pull brake shoes off anchors.* Tighten both nuts against equalizer. Remove all slack from cable between parking brake pedal and equalizer lever without moving equalizer lever.

Mercury Monterey - Release parking brake pedal, raise car, then loosen parking brake cable at equalizer lever. Depress parking brake pedal 1¾" from fully released position. Adjust front and rear cables until a slight drag is felt when turning rear wheels. *NOTE - The adjustment should be evenly divided between the two cables to maintain proper equalizer lever action.* Equalizer lever will be properly positioned when distance from rear cable clevis pin on equalizer bar to rear face of crossmember (to which parking brake bracket is attached) is 5½", with parking brake pedal fully released. Tighten locknut on equalizer rod, then release

⑪ - Thunderbird & Lincoln Continental.

BENDIX AUTOMATIC ADJUSTER HYDRAULIC TYPE (Cont.)

parking brake and check to make sure that shoes return to fully released position. Depress parking brake pedal 2". Under normal conditions, this should hold car satisfactorily.

Lincoln Continental - Fully release parking brake and raise car. Loosen cable at equalizer lever, then depress parking brake pedal 1¾" from normal released position. Adjust cable until there is a slight drag at rear wheels. Tighten equalizer rod locknut. Release brake and make sure brake shoes return to fully released position. Depress parking brake 2". Car should be held satisfactorily under normal conditions.

Rambler (Hand Operated Type) - Pull handle from fully released position to 5th notch and tighten cable at equalizer until rear wheels are locked in forward rotation. Release handle and make sure wheels rotate without drag.

Rambler (Foot Operated Type) - Set brake lever on first notch from fully released position and tighten cable at equalizer until rear wheels are locked in forward rotation. Release foot lever and make sure wheels rotate without drag.

Brake Pedal Adjustment

Chrysler Corp. Models - No adjustment. Pedal freeplay controlled by stop built into master cylinder,

Ford Motor Co. Models - Pedal freeplay is not adjustable.

Rambler - Rotate master cylinder eccentric attaching bolt for maximum pedal height. On cars without power brakes, there should be clearance between brake pedal and pedal bumper when pedal in released position (bend pedal bumper bracket as necessary).

OVERHAUL

Brake Shoe & Adjuster Replacement

Install brake shoes on backing plate with hold-down spring pin, springs and cups. Install parking brake link and spring. Connect parking brake cable. Install shoe guide plate on anchor pin. Place cable anchor over anchor pin with crimped side toward backing plate. Install primary and secondary shoe to anchor springs. *CAUTION - Be sure that cable end is not cocked or binding on anchor pin.* Install cable guide on secondary shoe web with flanged hole fitted in hole in web. Thread cable through guide groove, not between guide and shoe web. Turn adjusting screw in to limit of threads then back off ½-turn. *CAUTION - Adjusting screws are marked "L" and "R" and must be installed as marked.* Install adjusting socket on screw, place assembly between shoe ends with adjusting screw nearest secondary shoe. Hook cable hook into hole in adjusting lever from backing plate side. Place pivot hook into large hole in secondary shoe web. Place hooked end of adjuster spring into large hole in primary shoe web and loop end of spring to adjuster lever. Check action of adjuster by pulling cable toward secondary shoe to lift lever past tooth. Spring will pull lever to original position (when cable released) advancing screw one tooth. Lever should contact adjusting wheel 3/16"±1/32" above centerline of screw. Cable guide groove should be flat against web. Pivot hook surfaces should be square with body of lever. Adjusting screw must be seated properly in shoe web.

SERVICING

Chrysler Corp. & Ford Motor Co. Models - *For bleeding ing system and overhauling wh l and mast r cylinders, see "Hydraulic Brake Servicing" in Brak S ction f Manual.*

Rambler - *For bleeding syst m and ov rhauling mast r cylinder, see "Bendix & Morain Dual Piston Brake Master Cylinders" in this section.*

TROUBLE SHOOTING

See "Hydraulic Brake Troubl Shooting" in Brake Section of Manual.

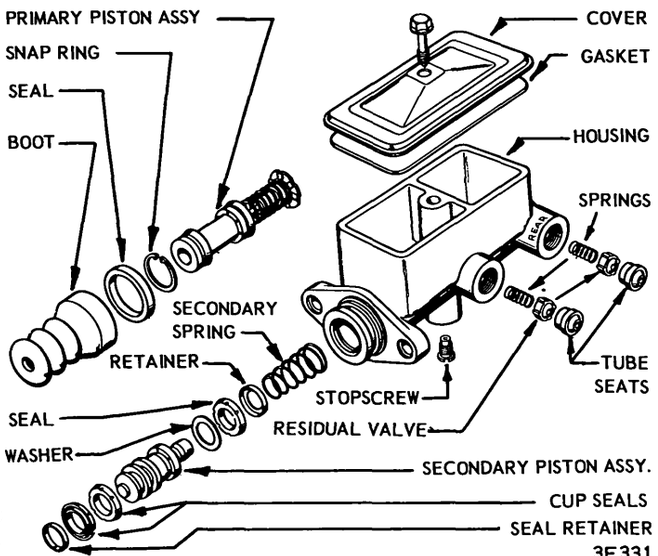
BENDIX & MORAINE DUAL PISTON BRAKE MASTER CYLINDERS

Cadillac, All Series (1963)
Corvette, Spec. Equip. (1963) ℄
Rambler, All Series (1963)
Studebaker, Except Avanti (1963)

℄ - With Heavy Duty 11.2" Drums and Metallic Lining.

DESCRIPTION

Dual piston master cylinder assemblies similar in design and operation to previous models. Bendix units used on Rambler and Studebaker models have a check valve in each outlet port on master cylinder body.



BLEEDING BRAKES

Manufacturers recommend use of pressure bleeding quipment whenever possible.

Bendix Unit

Cadillac - Bleed front wheels (front reservoir) first after installing a solid filler cap on rear reservoir, then reverse procedure.

Rambler & Stud bak r - Bleed system in usual manner using suitable adapter in place of master cylinder cap.

BENDIX (RAMBLER & STUDEBAKER) DUAL PISTON MASTER CYLINDER ASSEMBLY

(FOR CADILLAC UNITS, SEE 1962 FINAL DATA, PAGE 318)

Moraine Unit

Cadillac - Bleed front reservoir and front wheels first, then rear wheels and rear reservoir in usual manner.

OVERHAUL

Overhaul procedures are similar to singl piston typ master cylinders except the following:

Bendix (Cadillac) - If secondary piston has been disassembled during overhaul, piston must be assembled and adjusted exactly as follows: Coat piston cups with brake fluid and install cups on spring end of secondary piston with cups back-to-back. Install cup retainer on outer cup. Stand piston on end opposite cups and install spring and spring retainer. Install spring adjusting screw into retainer and start screw into piston. Tighten screw until distance from end of spring retainer to surface that protector washer seats against is 3 35/64". *CAUTION - Spring adjustm nt must be correct or too much pedal trav l b for brak s apply (piston covering inl t port) will occur if scr w adjusted too far; or piston will cover comp nsating p rt in mast r cylind r if scr w not adjust d far nough.*

B ndix (Rambl r & Stud bak r) - Primary piston serviced as an assembly only (with cups and spring). *Do not disass mble.*

BENDIX DISC BRAKES

Studebaker (1963) ©

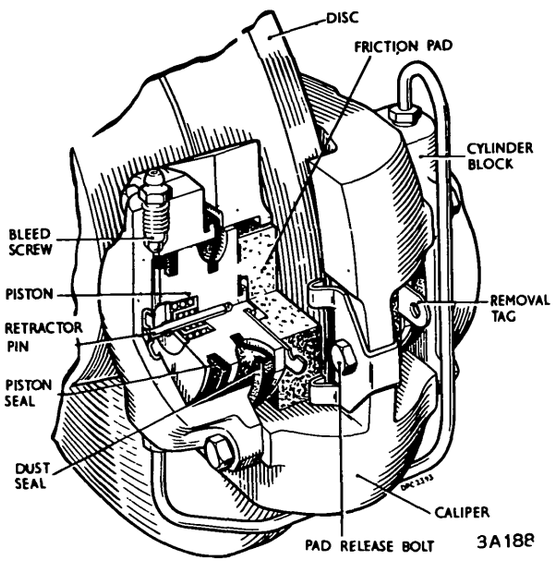
© - Front Wheels Only. Rear wheels use "Bendix (Lockheed) Self-Centering" type.

DESCRIPTION

Disc brake wheel unit consists of a rotating disc and two rectangular friction pads, actuated by hydraulic wheel cylinders which are supported by a caliper type bridge. Inner surface of rotating disc is protected by a dust shield while outer surface is protected by the wheel. The caliper type bridge containing the two wheel cylinders is secured to an adapter bracket attached to steering knuckle. Friction pads clip to wheel cylinder pistons and are held in position in caliper bridge by a retainer plate and clip. Wheel cylinders for each wheel are connected in series by a pipe assembly.

ADJUSTMENT

Adjustments in service are not required.



SERVICING

Bleeding Brak s

A bleed screw on each wheel unit allows system to be bled in a conventional manner, preferably with a pressure type bleeder.

Fricti n Pads

Cl aranc - Remove wheel and insert a feeler gauge between friction pad and rotating disc. Clearance should be .004" (minimum). *NOTE - If car was stopped by a brake application just before checking clearance, it is considered normal if there is no clearance and brakes tend to drag. Rotation of disc is a factor in causing friction pads to move away from the disc.*

BENDIX DISC BRAKE ASSEMBLY

Maximum Wear - Replace pads when pad thickness is reduced to .250". *CAUTION - All four pads (two in each wheel assembly) must be replaced whenever any pad replacement is required.*

Pad Replacement - Remove wheel, then remove bolt, nut, and lockwasher from pad retaining clip. Use a wire hook or a pair of pliers to pull on pad tab and remove pad. Clean backing plate, dust seal, and surrounding area. To install pad, slide forked end of Tool J-21172 between rotating disc and piston (flat side of tool towards face of disc and with pivot stud of tool inserted in retainer clip bolt hole). Attach a bleeder hose to bleed screw, then loosen bleed screw. Use tool pivot stud as a fulcrum and apply force on handle to slide piston into wheel cylinder, then tighten bleeder screw and remove tool. Slide new friction pad assembly into position with pad securing plate engaging button of wheel cylinder piston. Repeat operation for opposite friction pad. Replace retainer clip and secure in place. *NOTE - If brake pedal is spongy, bleed brake system.* Replace wheel and depress brake pedal several times to properly seat friction pads.

REMOVAL & INSTALLATION

Caliper Unit

Removal - Remove wheel and tire. Remove hydraulic pipe from caliper, then remove capscrews and lockwashers holding caliper unit to steering knuckle adapter bracket. Remove caliper. *CAUTION - Observe the number and EXACT LOCATION of shims between caliper and adapter bracket for installation. These shims center caliper around the disc.*

Installation - *Shims for adjusting clearance and alignment of caliper to disc are available in .010", .013", .016", .019" and .022" thicknesses.* Make sure that shims between caliper and adapter bracket are installed in exact original position, then install caliper unit on adapter bracket with hydraulic inlet facing down and slightly forward. Install capscrews and lockwashers and tighten securely. Check installation as follows: Faces of rotating disc should be centered in caliper with not more than .008" difference between sides. Machined surface inside caliper should be parallel to disc within .002". Connect hydraulic line, check master cylinder fluid level, and bleed brakes as necessary. Depress brake pedal several times to seat friction pads properly and to actuate automatic adjusters

Hub & Disc Assembly

NOTE - Hub and disc assembly serviced as a complete unit. Replace disc if scored, distorted, warped, or worn to minimum thickness of .330".

R m val - Disconnect caliper unit from disc and lift off (unnecessary to disconnect hydraulic line), noting shim pack location. Remove grease retainer cap, bearing adjusting nut, washer and outer cone and roller assembly. Pull hub and disc assembly off steering knuckle.

Instqllation - Lubricate inner hub bearing, make sure inner grease seal not damaged, and install hub and disc assembly on steering knuckle. Install outer bearing cone and roller, washers, and adjusting nut. Tighten adjusting nut until there is no freeplay, then back nut off to first slot in nut which aligns with hole i n spindle, and install cotter pin. Install grease retainer cap. Install caliper and check alignment (see above).

OVERHAUL

Caliper Unit

Disassembly - **1)** Thoroughly clean unit and clamp in vise at mounting boss. Remove hydraulic pipe, then remove nut, lockwasher, and bolt to free friction pad retainer clip. Remove friction pads with wire hook in hole of pad removal tab. Remove each piston block assembly from caliper bridge.
2) On outside piston block, remove outer lip of dust seal from block groove. Remove piston from block using hydraulic hand pump or air pressure. Remove bleed screw and bleed screw ball check.
3) On inside piston block, install bleed screw and ball into one of the hydraulic openings and use hydraulic or air pressure to remove piston .
4)On both pistons, pull seal from piston groove and discard seal Pull dust seal off over small end of piston and discard.

Cleaning & Inspection - Clean all metal parts with Bendix Metalclene or suitable solvent and use compressed air to clean and dry grooves and passages. If cylinder bore damaged or worn excessively, replace piston and cylinder assembly.

Reassembly - **1)** Lubricate all rubber parts with brake fluid Place dust seal into piston groove (both pistons) with cup side of seal facing piston side of assembly. Roll outer edge of dust seal toward piston flange. Install piston seal into piston groove
2) Coat inside surface of a piston block with brake fluid, place on arbor press bed with opening up, then place piston assembly (small end down) into block, aligning retractor pin into hole in piston and with edge of piston seal aligned with edge of block bore. Carefully press piston into block to bottom of bore, making sure piston seal is not damaged. Repeat for other cylinder. Roll and seat dust seal into groove on face of piston block
3) Install retainer plates into grooves of caliper (with tab ends out) Install piston block assemblies to caliper and tighten bolts securely. Install hydraulic pipe, making sure that pipe will not interfere with wheell Install bleed screw ball check and bleed screw. Install friction pads, retainer clips, bolts, lockwashers, and nuts.

DELCO-MORAINE AUTOMATIC ADJUSTER HYDRAULIC TYPE

Buick & Buick Special, All Series (1963)
Cadillac, All Series (1963)
Chevrolet Pass. Cars (1963)
Chevy II (1963)
Corvette (1963)
Corvair Cars & Trucks (1963)
Oldsmobile & F-85, All Series (1963)
Pontiac & Tempest, All Series (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*BRAKE DRUM REPLACEMENT NOTE:* Various smooth surface, finned, and aluminum type drums used in production on various car models. Be sure to use same type as original drum for service replacement to prevent uneven braking and other problems.

►*BRAKE ADJUSTING SCREW LUBRICANT NOTE:* Manufacturers recommend use of Special Lubricant, No. 5450032, for adjusting screw and brake backing plate to prevent gumming and freezing of parts.

►*CHEVROLET METALLIC LINING SERVICE NOTES & CAUTIONS:* Observe the following:

Brake Drums - Drums must be specially honed to 20 micro-inch finish for use with metallic linings. Do not use metallic linings for replacement with standard drums which have not been honed as specified.

Brake Lining Wear Limit - Each segment of metallic lining has top layer of metallic braking material and bottom layer is a metal backing pad. Both layers are similar in appearance. To avoid mistakes in determining actual **lining** thickness, replace brake shoes whenever **combined** thickness of lining **and** backing pad in any one area is 3/32" or less.

Seating New Linings - After brakes properly adjusted, make 6 to 8 stops from 30 MPH with moderate pedal pressure (aids seating and eliminates tendency to dive). Then make 6 to 8 complete stops from maximum legal highway speed at approximately 1 mile intervals.

►*1963 TEMPEST REAR BRAKE DRUM REMOVAL NOTE:* Rear brake drums may be difficult to remove if car raised at rear jack lift points because suspension is in full rebound and axle shaft pivots in different direction than control arm causing bind between brake shoes and drum. To remove drum easily, lift car at rear control arm.

DESCRIPTION

Hydraulic single anchor type brake (without eccentric) with Bendix type shoes. Brake shoe anchor pins are fixed in backing plate and require no adjustment (except Pontiac front wheels). Moraine automatic adjusting mechanism consists of a link, actuating lever, pawl, and pawl return spring. Adjusting mechanism is mounted on secondary shoe (except Corvette with special large high performance brakes, where actuator is on primary shoe and override spring eliminated).

OPERATION

CORVETTE NOTE - Special large high performance option brakes have adjuster mounted on primary shoe and brake adjustments take place during forward brake application. The following description of operation applies for these brakes except that for "secondary", read "primary".

All Models - The adjusters operate only when brakes are applied as car is moving in reverse. The link which holds top of actuating lever stationary, forces actuating lever to pivot on secondary shoe. This pivoting action forces pawl downward against end of a tooth on the star wheel adjusting screw. If lining-to-drum clearances are correct, the downward movement will stop before star wheel is turned. If clearances are too wide, the secondary shoe will move outward and the pawl will move downward far enough to turn star wheel one notch and take up the adjustment.

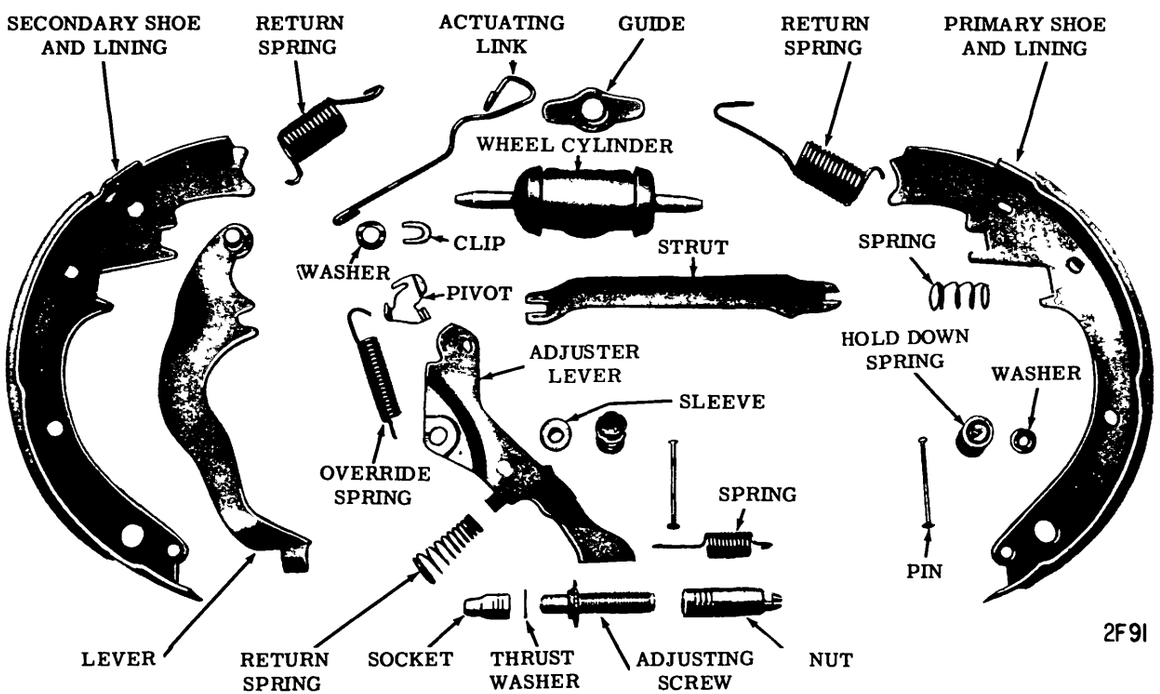
ADJUSTMENT

Brake Shoe Adjustment

Adjustment should be required only after shoe relining or replacement, or when length of star wheel has been changed.

Buick (All Models) - Remove adjusting hole cover and install a suitable tool through hole to move self-adjuster actuator lever off adjusting screw. Use a suitable tool to turn adjusting screw and expand brake shoes until wheel can just be turned by hand. Make sure drag is equal at all wheels. Back off adjusting screw at each wheel 30 notches. *NOTE - If shoes still drag slightly on drum, back off adjusting screw 1 or 2 additional notches.*

Cadillac - Tighten brake shoe adjusting star wheel until brake drum can just be rotated forward with a two-foot bar placed between wheel mounting studs. Disengage adjuster pawl from star wheel with a hooked tool and back off star wheel 40 notches using a suitable brake adjuster tool. Install wheels and lower car, then drive car alternately forward and backward, applying brakes moderately in each direction until pedal travel does not exceed 1 7/8" on an approximate 30 lbs. brake pedal application.



Chevrolet, Chevy II, Corvette, Corvair - With brake drums removed, turn star wheel until drum slides over brake shoes with a slight drag, then turn adjusting star wheel 1¼ turns to retract the shoes. Install drum and wheel, then make final adjustment by making numerous forward and reverse stops with a firm pedal effort until satisfactory brake pedal height is obtained.

Oldsmobile (All Models) - With brake drum removed, position Gauge BT-6211 (Except F-85), J-21177 (F-85) over brake linings *NOTE - On Gauge J-21177, it will first be necessary to place drum end of gauge in drum to measure inside diameter, then tighten clamp screw.* Rotate gauge slightly around shoes to insure gauge contacting linings at largest diameter, then adjust brake shoes until gauge is a snug fit on linings at point of largest diameter. *If necessary to back off brake shoe adjustment, hold adjuster lever away from star wheel.*

Pontiac (Except Tempest) - *NOTE - Adjustment procedures for front and rear wheels are different as follows:*

Front Wheels - Proper lining-to-drum gap is .015"± .005" measured with a feeler gauge inserted through slot in brake drum between secondary (long) lining

(Continued)

DELCO-MORAINE AUTOMATIC ADJUSTER BRAKE ASSEMBLY (REAR SHOWN-FRONT SIMILAR)

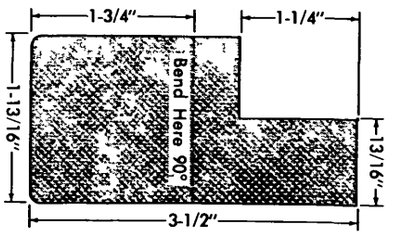
DELCO-MORAINE AUTOMATIC ADJUSTER HYDRAULIC TYPE (C nt.)

and drum while primary (short) lining is against drum. *NOTE - On integral hub and drum assemblies which have no feeler gauge slots, substitute conventional type drum of same diam ter having slots.* Proper gap is required at both ends of secondary lining. A 5-10 lbs. drag on a .015" feeler during initial withdrawal from full lining width insures holding primary shoe against drum. Change clearance at adjusting screw end of lining by turning star wheel on adjusting screw (hold adjusting lever away from star wheel). Change clearance at adjustable anchor pin end of lining by rotating anchor pin. *NOTE - Recheck adjustment after making any large change at star wheel or anchor pin* Tighten anchor pin locknut to 60-90 ft. lbs. torque.

R ar Wheels - *NOTE - Rear wheel brakes have a fix d anchor pin (not adjustable).* Turn adjusting star wheel to provide a 14-40 lbs. drag on outer diameter of drum, then back adjusting star wheel off 30 notches. Make sure brake drum is free of drag.

P ntiac T mp st - Raise car (suspension in full rebound on rear), and loosen parking brake cable or disconnect anchor from side of torque tube. Turn adjusting star wheel to provide a drag of 5-8 lbs. on outer diameter of tire. *NOTE - Insert a small screwdriver through adjusting slot in backing plate and hold automatic adjuster lever away from star wheel.* Back off star wheel 22 notches (front wheels), 26 notches (rear wheels with shock absorbers fully extended). *NOTE - If hoist supports r ar suspension near ends of control arms and prev nts rear wheels from hanging down, back brak adjusting star wheel off 30 notches instead of 26 notches.*

Parking Brake Adjustment



Buick (Exc pt Sp cial) - *Make parking brake adjustment wh n v r cabl s disconnected, or if cables are str tched, or wh nev r s rvice brake pedal has good r s rve but parking brak pedal depresses more than 8 ratchet clicks.* With parking brake assembly fully released, there should be 3/8" distance from rear face of parking brake idler lever to end of its slot in the frame. Adjust front cable clevis to correct. Depress parking brake pedal **xactly 2 ratchet clicks.** Tighten rear cable adjusting nut to obtain a heavy two-hand drag at rear wheels. Release parking brake lever and check rear wheels for free rotation in either direction.

Buick Sp cial - *Make parking brake adjustment whenver cabl s disconnected, or if cables are stretched, or wh nev r servic brak pedal has good reserve but parking brak l ver pulls out more than 15 ratchet clicks.* Pull out parking brake lever exactly 8 ratchet clicks. Hold threaded end of intermediate parking brake cable (to prevent twisting of cable) and tighten adjusting nut until left rear wheel can just be turned backward using both hands. Release parking brake lever and pull out exactly 3 ratchet clicks. Both rear wheels must turn freely in either direction.

Cadillac - *NOTE - Make a gauge tool from 3/16" flat steel stock as shown in illustration.* With service brakes properly adjusted, lubricate parking brake linkage and check for free movement of cables in conduit and equalizer. Check rear relay lever spring and replace if necessary. With parking brake mechanism in fully released position, insert 13/16" part of gauge tool in gap between relay lever and end of slot in frame. Gauge must fit in slot with clearance of less than 5/16". If necessary, adjust front cable by aligning one of the three clevis holes with one of the two relay lever holes. Back off equalizer nut so relay lever can be moved forward to insert 1 13/16" end of gauge into frame slot. *NOTE - There must be slack in rear cables when 1 13/16" end of gauge is in place.* Tighten equalizer nut to obtain a near lock-up drag on rear wheels when wheels are turned by hand in forward direction. Remove gauge. Parking brake pedal should now travel 1¾-2¾" with approximately 50 lbs. pressure on pedal.

Chevrolet Pass. Cars - With parking brake pedal depressed to 1st notch, adjust front cable so parking brake idler lever is 1"±¼" forward of rear edge of bracket on frame. Now adjust rear cable so there is a moderate drag at rear wheels. Release brake pedal and see that there is no drag.

Chevy II - With parking brake lever pulled up 1 notch from fully released position, loosen equalizer forward check nut and tighten rear nut for a moderate drag on rear wheels. Tighten check nuts and release the lever. Wheels should rotate without drag.

3F333

CADILLAC PARKING BRAKE GAUGE TOOL

Corvette - Unhook pull back spring at equalizer lever on frame side rail and loosen forward locknut at rear cable clevis. Set parking brake lever at 4 notches from fully released position, then tighten clevis rear nut so there is 16 lbs. ±2 lbs. cable strand tension on front cable. Tighten forward locknut against clevis and install pull-back spring. Release brake lever.

Corvair (All) - Raise rear of car and pull parking brake lever up 4 notches from fully released position. Loosen forward check nut on equalizer and tighten the rear nut until a heavy drag is felt at rear wheels Tighten check nuts securely. Release brake lever and check that there is no drag.

Oldsmobile (All) - With parking brake lever fully released, tighten equalizer adjusting nut until a heavy drag is felt at rear brakes, then loosen equalizer adjusting nut 10 turns (88, S88, 98), 9 turns (F-85) and tighten locknut.

Pontiac (Except Tempest) - Apply parking brake slightly and check equalization by turning rear wheels by hand. Loosen adjusting screw of tightest brake if not equal. If more than a few notches movement are required for equalization, loosen clamp screws on spreader and pull downward on the tight side of cable. This should equalize cable. Tighten spreader clamp screws while parking brake lever is still in applied position. When lever fully released, wheels should turn freely with cable pulled down by gripping cable midway between conduit and guide on frame. When adjusting rear end of front cable for close adjustment for tension, be sure to turn clevis on or off cable end but do not twist cable Coarse adjustment is secured by selecting the correct hole in spreader.

Pontiac Tempest - Parking brake cable is properly adjusted when a 30 lb. pull downward on cable 49" from front of torque tube places cable 2¼" below bottom of torque tube with parking brake lever fully released. Adjust cable at equalizer for proper tension, then tighten locknut to 5-10 ft. lbs. Make sure cable slides freely in equalizer and that rear wheels turn freely.

③ - 15/16" with Metallic (Segment) type lining.
④ - 1" with Metallic (Segment) type lining. ⑤ - 1 1/8" with Power Brakes.
⑥ - 59% Front, 41% Rear on Series 75.

DELCO-MORAINE AUTOMATIC ADJUSTER HYDRAULIC TYPE (C nt.)

Brake Pedal Adjustment

Adjustment procedures are listed below only where applicable. Cars not listed either have no adjustment or require a pedal height adjustment as part of power brake unit installation (see individual power brake unit pages for these models).

Chevrolet, Chevy II, Corvair, Corvette - Adjust pushrod or clevis at brake pedal so pedal freeplay, measured at brake pedal pad, is 1/16-1/4" (Except Corvette), 1/8-3/8" (Corvette).

Oldsmobile 88, S88, 98 - *Adjustment is for cars without power brakes.* Pedal height should be 8"±1/8" from top of pedal pad to floor pan (carpet turned back). To adjust, loosen locknut and adjust stopscrew located on underside of brake pedal support. Make pedal freeplay adjustment as follows: Push master cylinder pushrod until it contacts hydraulic piston, then turn pushrod so clevis pin can freely be installed into brake pedal. Shorten pushrod one full turn for proper freeplay. Tighten locknut and connect pushrod to brake pedal.

Oldsmobile F-85 - *Adjustment is for cars without power brakes. For power brake cars, see 1962 Final Data, Page 311.* On Synchro-mesh cars, adjust brake pedal so it is same height as clutch pedal. Pedal free travel should be 3/16" (adjustable at pushrod). On Hydra-matic cars, total pedal height should be 6 3/8-6 5/8" from top of pedal pad to floor pan (adjustable at push-rod clevis).

Pontiac & Tempest - Pedal height should be 6 1/8-6 3/8" (Pontiac), 4 1/2" + 1/4" -0" (Tempest) from top of pedal pad to floor mat. Adjust at pedal pushrod. *Pedal height may be varied for personal requirements but do not lower more than necessary (Pontiac), to less than 3 1/2" (Tempest).*

OVERHAUL

Brake Shoe Replacement

Removal - *CAUTION - Note position and color of brake assembly springs for reinstallation in exactly the same locations.* Disconnect parking brake cables at rear wheels. Disconnect primary and secondary brake shoe retracting springs, and remove shoe hold-down cups, springs, pins, and sleeve. Remove pawl return spring, pawl and actuating lever. Disengage shoes from wheel cylinder and rotate shoes until link disengages from shoe plate (front), or anchor (rear).

1963 BRAKE LINING SPECIFICATIONS (CONVENTIONAL TYPE)

Car Model	Width		Front - Length - Rear				Thickness	
	Front	Rear	Primary	Secondary	Primary	Secondary	Front	Rear
Buick	2¼"	2"	10.040"	12.959"	10.040"	12.959"	.265"	.220"

① - Special Hi Perf Option (Primary Shoe Actuation): .205" Pri., .325" Sec.

② - 12 Front, 10 Rear.

Installation - Place shoes on backing plate and install connecting spring and star wheel assemblies. *CAUTION - Do not interchange star wheel assemblies between sides of car or shoes will retract instead of expand. Right hand threads are for left side of car; left hand threads are for right side of car.* Install parking brake parts on rear brake. Install link actuating lever, pawl spring, pawl, and shoe hold-down springs and other parts. *NOTE - When installing actuator wire link, place link over anchor pin stud first, then fasten to actuator assembly by holding adjuster assembly in full down position.* Install retracting spring. Install brake drums. Make wheel bearing, service, and parking brake adjustments.

SERVICING

Cadillac - *For bleeding system and overhauling master cylinder, see "Bendix & Moraine Dual Piston Brake Master Cylinders" in this section.*

All Others - *For bleeding system and overhauling wheel and master cylinders, see "Hydraulic Brake Servicing" in Brake Section of Manual.*

TROUBLE SHOOTING

See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.

CHEVROLET TRUCK TWINPLEX

Chevrolet Trucks, Series 50, 60 (1963) Rear Only ℂ
ℂ - For Front Brakes, see "Chevrolet-Bendix Hydraulic" in this section.

DESCRIPTION

Two cylinder, four anchor type (each shoe anchored at each end and linked to wheel cylinder at each end). Brakes are radially self-centering.

ADJUSTMENT

Each shoe has one adjustment (adjusting screw at adjustable anchor end). Adjustment is same for both wear and for new or relined shoe clearance.

Brake Pedal Adjustment

See "Chevrolet-Bendix Hydraulic" for date.

Brake Shoe Adjustment

Jack up both rear wheels, remove adjusting hole covers from backing plates (two holes at each wheel - one for each shoe). Use Tool J-4707 or screwdriver inserted through rear (lower shoe) adjusting hole and turn adjusting screw up (move outer end of tool toward center of wheel) until light brake drag is felt on wheel, then back off adjusting screw 3 notches for correct running clearance. Adjust upper shoe similarly by inserting tool through front adjusting hole.

Parking (Hand Brake) Adjustment

Parking brake is independent type mounted on propeller shaft at rear of transmission.

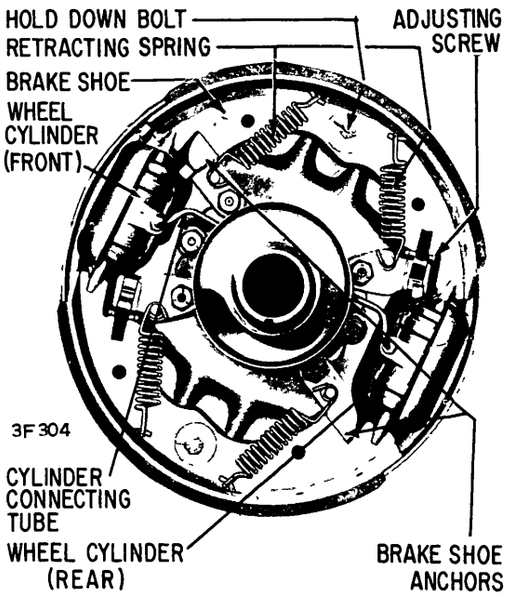
1½ & 2 Ton - Fully release brake lever. Loosen locknut on outer shoe adjusting screw then tighten to secure a clearance of .010-.015" measured at point directly above screw. Tighten locknut. Loosen locknut on link between hand brake lever and shoe actuating lever. Tighten adjusting nut on link to secure a clearance of .010-.015" between shoe and drum. Tighten locknut.

Tilt Cab Over-Center Lever Adjustment - Turn lever adjusting knob counterclockwise to bottom position. Attach brake cable to lever assembly. With lever in "brake off" position, adjust brakes for proper clearance and remove slack from cables by adjusting clevis at transmission. Pull lever to "brake on" position. If definite "snap-over-center" not felt, turn adjusting knob clockwise as necessary. Oil all moving parts.

1963 CHEVROLET TRUCK TWINPLEX BRAKE & LINING SPECIFICATIONS						
Rear Drum Diameter	Wheel Cyl. Diameter	Master Cyl. Diameter	Lining Thickness	Lining Width	% Braking Power	
					Front	Rear
14.96"	1.5"	ℂ 1.125"	.375"	4"	30	70

ℂ - 1.3" on T60 Models.

BLEEDING BRAKE SYSTEM



Back off adjusting screw all the way on upper shoes of both rear wheels. Bleed brakes in the following sequence:

a) Power booster slave cylinder.
b) Power booster control valve.
c) Right front wheel.
d) Left front wheel.
e) Right rear wheel, front cylinder.
f) Left rear wheel, front cylinder.

Adjust upper shoe on each rear wheel with pressure tank still connected. Depress brake pedal hard several times to centralize shoes.

TROUBLE SHOOTING

See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.

CHEVROLET TWINPLEX BRAKE ASSEMBLY

FORD-BENDIX HYDRAULIC

Falcon & Econoline Trucks (1963)
Ford Trucks, F & P-100 (1963) Front & Rear
Ford Trucks, F-350, P-400 (1963) Rear Only ℂ

ℂ - "Ford Truck Bendix Uni-Servo" type used on Front.

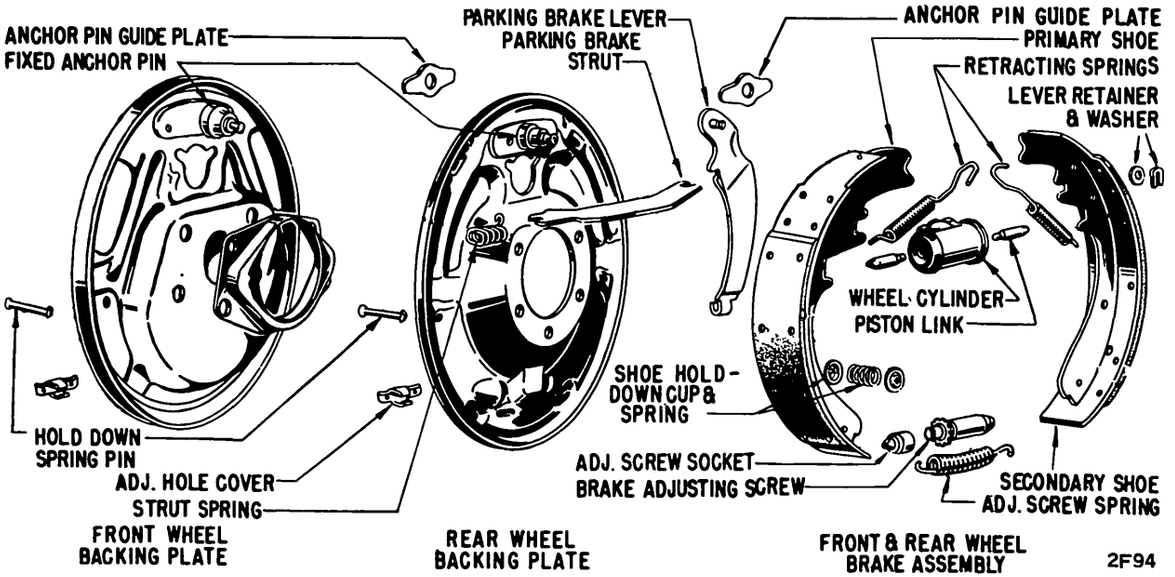
CAUTIONS

► *WHEEL CYLINDER HONING CAUTION:* Front wheel cylinders having orificed baffle **cannot** be honed. If honing required, replace cylinder. *Use care when bleeding system so no air is trapped by orificed baffle.*

DESCRIPTION

Duo-Servo, single anchor, hydraulic type without eccentric. Anchor pins are fixed and are not adjustable.

ADJUSTMENT



Minor Wear Adjustment

Remove adjusting hole cover and turn adjusting screw until the shoes drag against brake drum, then back off adjusting screw 10-12 notches so wheel turns freely.

Parking Brake Adjustment

Econoline - Pull release handle 1 notch from fully released position. Turn front nut on equalizer forward several turns, then turn rear nut forward until there

(Continued)

FORD-BENDIX HYDRAULIC BRAKE ASSEMBLY (TYPICAL) (REAR SHOWN - FRONT SIMILAR)

FORD-BENDIX HYDRAULIC (Cont.)

is a medium drag at rear wheels Tighten front nut against equalizer Release the handle

Ford Trucks - With parking brake handle fully released, turn nut on front of equalizer several turns forward Turn rear nut forward until cables are just tight enough to remove all slack Tighten front nut against equalizer *NOTE - For propeller shaft mounted parking brakes, see "Ford Truck Self-Centering Brakes" in this section*

Brake Pedal Adjustment

Total freeplay should be 1/4-7/16" (Econoline), 3/16"-3/8" (Ford Trucks) before pushrod touches master cylinder piston Adjustable at master cylinder pushrod

MASTER CYLINDER

P Series - Remove fender apron for access, and turn front wheels all the way to the left when removing

Econoline - Remove as follows: Remove forward splash shield and disconnect brake pedal return spring Remove pushrod eccentric bolt Remove snap ring from brake pedal pivot pin Remove brake pipe outlet fitting bolt and washers (outlet fitting will be disconnected from master cylinder) Remove mounting bolts and remove master cylinder (swing down and remove from brake pedal pivot pin)

SERVICING

For bleeding system and overhauling of wheel and master cylinders, see "Hydraulic Brake Servicing" in Brake Section of Manual

TROUBLE SHOOTING

See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual

BRAKE SPECIFICATIONS

ECONOLINE

Drum Diameter	10" front & rear
Wheel Cyl Diameter	1 125" front, 8125" rear
Master Cylinder Diameter	1"
Lining Width	2 50" front, 1 75" rear

FORD TRUCKS

See "Ford Truck Self-Centering Brakes" data in this section

FORD TRUCK BENDIX UNI-SERVO

Ford Trucks, F-250, P-350 (1963) Front & Rear
Ford Trucks, F-350, P-400 (1963) Front Only ℂ
Ford Trucks, F-500, 600; B-500, 600; P-500; C-550, 600; N-500, 600 (1963) Front Only ℂ

ℂ - "Ford Bendix Hydraulic" type used on Rear
ℂ - "Ford Truck Self-Centering" type used on Rear

DESCRIPTION

Bendix "Uni-Servo" single anchor, hydraulic type with single-acting wheel cylinder mounted on the backing plate and actuating the primary shoe through a strut (no direct connection to secondary shoe) Brake shoes are conventional Bendix type

ADJUSTMENT

Make adjustments with brake drums at normal temperature and with wheels either jacked up or contacting road (if wheels on road so they cannot be checked for drag, make this check by striking drum with a hammer - sound will be deadened if shoes contacting drum)

Minor Adjustment

Remove adjustment hole cover from brake carrier plate Rotate adjusting screw with a suitable tool until shoe begins to drag then back off shoe 10-12 notches until drum can be turned without drag

Major Adjustment

Rotate drum until feeler slot is at lower end of secondary (rear) shoe then insert a 010" thick feeler gauge between brake shoe and drum Rotate drum and feeler gauge up along secondary shoe until feeler is wedged between secondary shoe and drum Turn adjusting screw (star wheel) to expand shoes until a heavy drag is felt against drum, then back off adjusting screw just enough to give clearance of 010" between shoe and drum at a point 1½" from each end of secondary shoe *NOTE - This clearance will give operating clearance for both primary and secondary shoes* When this clearance cannot be obtained, anchor pin must be adjusted

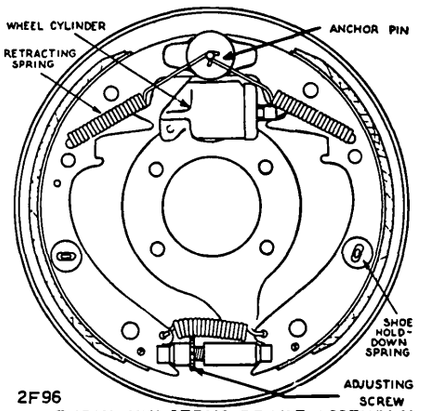
Anchor Pin Adjustment

Loosen anchor pin nut just enough so anchor pin can be moved up or down (by tapping with soft hammer) centering shoes in drum and providing the 010" clearance between secondary shoe and drum at a point 1½" from each end of secondary shoe Tighten anchor pin nut to 80-100 ft lbs Check other brake assembly

Brake Pedal Adjustment

Brake pedal free travel should not be less than 3/16 nor more than 3/8" before pushrod touches master cylinder piston Adjustable at master cylinder pushrod

Parking Brake Adjustment



Rear Wheel Type - *See "Ford Bendix Hydraulic" in this section*

Propeller Shaft Type - *See "Ford Truck Self-Centering" in this section*

MASTER CYLINDER

C Series - Access to master cylinder is under floor plate

P Series - Remove fender apron for access, and turn front wheels all the way to the left when removing

BENDIX UNI-SERVO BRAKE ASSEMBLY

BRAKE SPECIFICATIONS

See "Brake Specifications Table" in "Ford Truck Self-Centering" data in this section

SERVICING

For bleeding system and overhauling of wheel and master cylinders, see "Hydraulic Brake Servicing" in Brake Section of Manual

TROUBLE SHOOTING

See "Hydraulic Brake Trouble Shooting' in Brake Section of Manual

FORD TRUCK SELF-CENTERING

Ford Trucks F-500, 600; B-500, 600; P-500; C-550, 600; N-500, 600 (1963) Rear Only ℂ

ℂ - "Ford Bendix Uni-Servo" type used on Front

DESCRIPTION

Two cylinder two shoe four anchor type hydraulic brakes Each shoe is anchored at each end and linked to wheel cylinder at each end so that all shoes are self-energizing for both forward and reverse action All shoes are radially self-centering

ADJUSTMENT

Minor Wear Adjustment

With wheels raised, remove adjusting slot covers Turn rear (secondary shoe) adjusting screw until brake shoe drags against drum Back off adjusting screw so drum rotates freely Depress brake pedal to center the shoes then back off adjusting screw one additional notch Repeat procedure for primary (front) shoe

Brake Pedal Adjustment

Brake pedal free travel should not be less than 3/16' nor more than 3/8" before pushrod touches master cylinder piston Adjustable at master cylinder pushrod

Parking Brake Adjustment

Propeller Shaft (External Band) Type - On cable controlled type, move parking brake lever to fully released position On rod type linkage, set lever at first notch Flat part of adjusting rod cam must rest on brake band bracket If cam not flat with bracket, remove clevis pin from upper part of cam then adjust clevis rod as necessary Install clevis pin and cotter pin Remove lock wire from anchor adjusting screw, turn adjusting screw clockwise to obtain 010" clearance between brake lining and brake drum at anchor bracket Loosen locknut on adjusting screw for lower half of brake band, adjust screw to obtain 010" clearance between lining

(Continued)

FORD TRUCK SELF-CENTERING (C ntinu d)

and drum at lower half of band Tighten locknut Turn upper band adjusting nut for same 010" clearance Be sure to install lock wire in anchor adjusting screw

Prop ll r Shaft (Int rnal Shoe - 9" Diam) Type - With parking brake lever fully released, remove linkage adjusting clevis pin Lengthen adjusting link by turning clevis until shoes seat against drum with clevis pin installed Remove clevis pin and shorten linkage to obtain 010" clearance between shoes and drum measured at all points around drum with clevis pin installed Install clevis retaining cotter pin

Pr pell r Shaft (Internal Shoe - 12" Diam.) Type - Remove pin from adjusting rod clevis, loosen nut on adjusting rod, and turn clevis so there is 1/4-3/8" freeplay on brake operating lever Tighten clevis nuts and install clevis pin

OVERHAUL

Brake Shoe Replacement

Disassembly - 1) Unequal Length Retracting Springs - Clamp boots against cylinder, note location of retracting springs and remove with Tool 2035-N Remove brake shoe guide bolt lock wire, nut, washer, and bolt from both shoes, then remove shoes from carrier plate

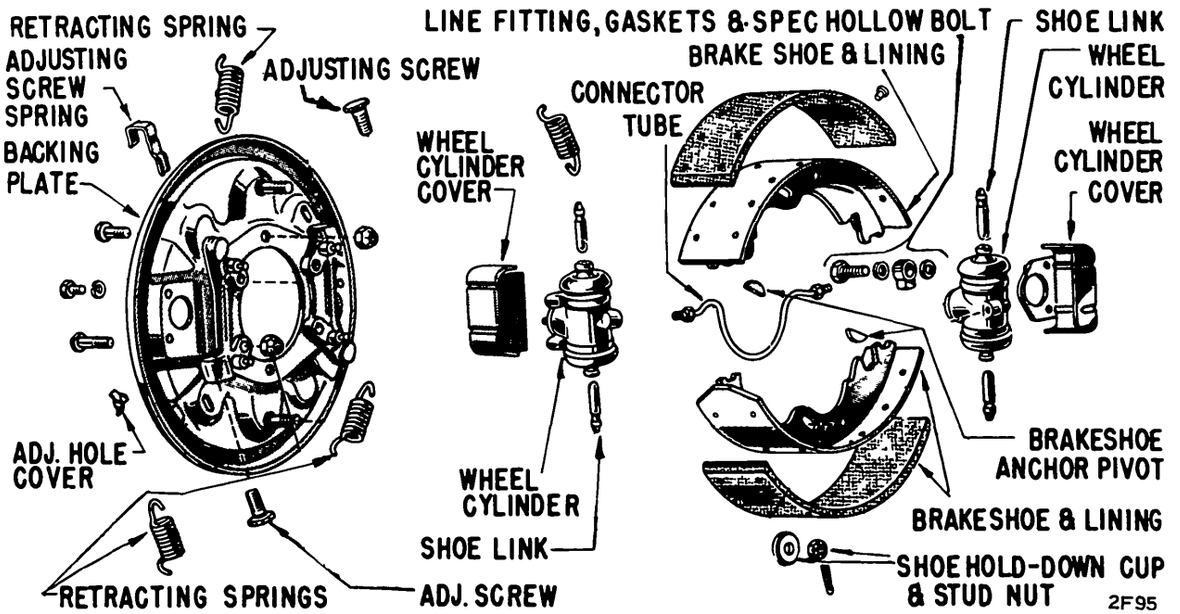
2) Equal Length Retracting Springs - Clamp boots against cylinder and remove retracting springs with Tool 2035-N Remove brake shoe guide bolt cotter pin, nut, wasner, and bolt from both shoes, then remove shoes from carrier plate

Reassembly - 1) Un qual Length Retracting Springs - Position adjusting wheel slide adjusting screw through anchor pin support and index adjusting wheel tab in slot on adjusting screw Install and tighten adjusting wheel lock Place brake shoes in anchor pin slot on support bracket and engage other end of shoe in cylinder link Install shoe guide bolt, washer, and nut Tighten nut finger tight, then back off 1 full turn and install lock wire Install retracting springs with Tool 2035-N making sure springs are installed in original locations

2) Equal Length R tracting Springs - Thread adjusting screws and wheel into anchor pin support and install adjusting wheel lock Thread adjusting wheel into support so shoe will rest against wheel end Install brake shoe over both retracting spring anchor pins, insert ends in cylinder links and install shoe guide bolt, washer and nut Tighten nut finger tight, then back off 1 full turn and install cotter pin Install retracting springs with Tool 2035-N

SERVICING

For bleeding brake system and overhauling wheel and master cylinders, see "Hydraulic Brake Servicing" in Brake Section of Manual and note the following.



Bl eding - Bleed **top** wheel cylinder first, then lower cylinder If power unit used, unit must be bled before wheel cylinders with engine off and no vacuum in power unit system

TROUBLE SHOOTING

See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual

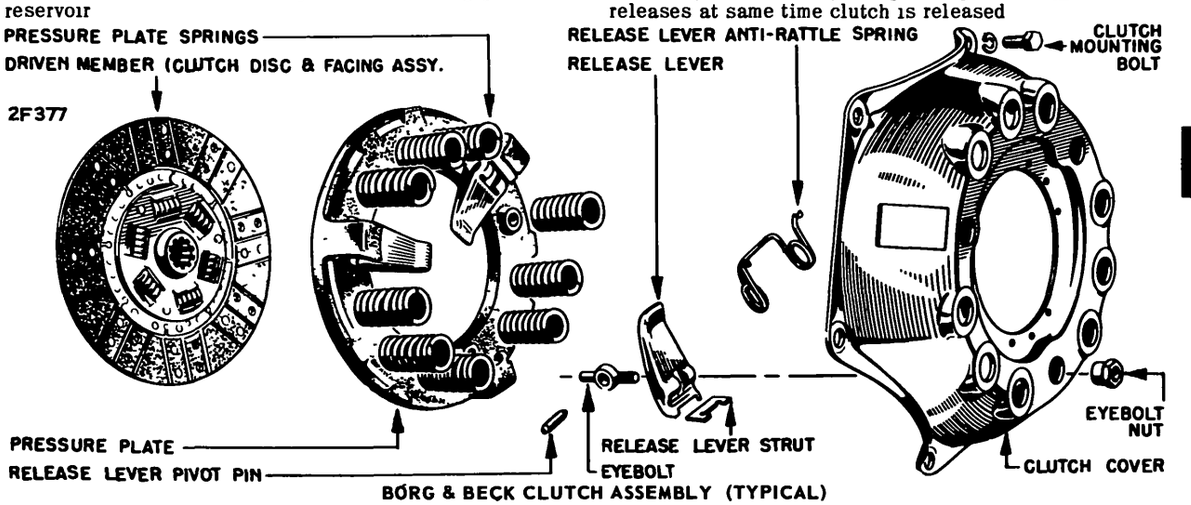
① - Std. clutch is Own Diaphragm Spring type.
② - No. 383472 (389" Eng), No. 383109 (421" Eng.).
③ - No 383291 with Overdrive.
④ - No. 383402 with 4-speed transmission.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 PONTIAC CLUTCH CHATTER WHEN PEDAL DEPRESSED TO FLOOR CORRECTION:* Caused by release bearing forcing release fingers against clutch disc. To correct, limit downward travel of clutch pedal by installing Pedal Stop, No 537929, on toe pan under pedal arm. *CAUTION - Do not try to correct condition by increasing pedal free travel.*

►*1963 RAMBLER CLASSIC & AMBASSADOR HIGH CLUTCH PEDAL CORRECTION:* Install new Clutch Pedal Stop Bracket, No. 3169442, and Pedal Stop Kit, No. 3204792. New pedal stops have elongated holes for pedal height adjustment (see "Pedal Adjustment" below for procedures and specifications). Also install Anchor, No 3145919, at right hand lower jacket tube support plate mounting bolt (angle section to bottom); and Spring, No 3123558, over pedal over-center spring and attached to anchor Spring and anchor will help retain pedal in fully released position

DESCRIPTION



Single plate, dry disc type. Release levers, mounted on bolts piloted in pressure plate and retained in clutch cover, actuate clutch struts which provide "knife-edge" action Semi-centrifugal type clutches ("W", "WW", "WH" suffix in model number) have three roller assemblies in grooves in pressure plate directly under clutch cover Centrifugal action on these rollers increases the pressure plate load as the engine speed increases

CLUTCH PEDAL ADJUSTMENT

Chevrolet Truck

Mechanical Linkage - Free travel should be ⅜-1". To adjust, remove pedal return spring and back off pedal pushrod lower locknut (at swivel end) about ½" Hold pushrod so pedal is against bumper stop, and hold cross shaft lever so throw-out bearing is against clutch fingers Adjust pushrod upper locknut so there is 3/16-1/4" clearance between this locknut and upper edge of swivel Release pushrod and cross shaft lever, tighten lower locknut to lock swivel against upper locknut, and install return spring.

Hydraulic Linkage - Free Travel - Adjust pushrod so there is free travel between master cylinder pushrod and piston This will amount to 1/8" free travel measured at centerline of pedal pad, just before pushrod contacts piston and will insure piston uncovering port in reservoir

BORG & BECK CLUTCH ASSEMBLY (TYPICAL)

Total Travel - Adjust clutch pedal bumper so clutch pedal pad (fully released) is even with brake pedal, then disconnect return spring Push slave cylinder pushrod forward as far as possible and pull clutch fork rearward until all slack is removed at throw-out bearing, then turn adjusting nut behind slave cylinder pushrod fulcrum ("V" block) to obtain 5/32" clearance between fulcrum pivot and clutch fork (use shank of 5/32" drill).

Chrysler Corp. Cars

Adjust self-locking nut on clutch fork rod to provide 5/32" free movement at fork-to-pushrod pin This will provide correct 1" pedal freeplay

Pontiac & Tempest

Pedal free travel should be about 1" Disconnect return (or anti-rattle) spring. Loosen trunnion locknuts and move pushrod and clutch fork rearward until release bearing lightly contacts release fingers Turn rear nut up to the trunnion, then shorten pushrod 7 full turns and tighten both nuts Install spring

Rambler

Pedal freeplay should be 1/2" (5/8" maximum) Adjust by changing length of throw-out lever-to-inner release idler lever assembly link Lengthen link to reduce freeplay. *NOTE - On cars with adjustable pedal stop bracket, adjust pedal height to 6" measured from bottom of clutch pedal to bare toe board at right angle.*

Studebaker

NOTE - Brake pedal must be properly adjusted before making clutch pedal adjustments. With brake pedal properly adjusted, turn clutch pedal stopscrew so that the clutch pedal is at the same height as brake pedal. *NOTE - On power brake cars, adjust so clutch pedal height is 6¼-6½" from top of pedal pad to floor mat.* Turn adjusting nut on clutch over-center spring so spring length is 10", then adjust clutch pedal-to-bellcrank rod so there is ½" clearance between top end of bellcrank and body flange on front side of firewall Now turn clutch operating rod adjusting nuts as necessary for ½-1" pedal free travel measured at pedal pad *HILL HOLDER NOTE* - Check setting whenever clutch pedal adjusted and adjust operating rod so hill holder releases at same time clutch is released

Jeep

FC-170 - ½" pedal freeplay To adjust, change cable length so pedal has ½" free movement from fully engaged position before resistance is felt

Gladiator & Wagoneer - Pedal Adjustment - Turn adjusting screw on clutch pedal support so master cylinder pushrod just contacts piston when piston is at full rear position.

(Continued)

BORG & BECK (Cont.)

Pedal Fr eplay - Disconnect clutch fork return spring, push slave cylinder pushrod forward so piston is fully forward, hold in position, and move clutch lever until release bearing touches clutch fingers Turn pushrod adjusting nut until connecting pin enters clutch lever, then back off nut 2 or 3 turns for release bearing free-play Connect return spring

CLUTCH REMOVAL

Chevrolet Trucks

Remove transmission, then disconnect slave cylinder at clutch fork and remove throw-out bearing from fork Press fork away from ball mounting (use screwdriver), or remove ball stud from rear of clutch housing. *NOTE - Pry r tainer out of fork with small screwdriver.* Install Pilot Tool J-5824 to support assembly. Loosen clutch attaching bolts gradually to release spring tension, then remove tool and remove clutch assembly After installation, bleed clutch hydraulic line at clutch slave cylinder bleed holes in same manner as for brake system bleeding.

Chrysler Corp. Cars

Remove transmission. Pull out release bearing and sleeve Mark cover and flywheel for reassembly. Loosen clutch attaching bolts in succession a few turns at a time to release spring tension, then remove clutch assembly.

Pontiac

Disconnect battery, remove transmission and propeller shaft, and clutch release bearing Disconnect clutch linkage and remove starter. Remove front flywheel housing shield and flywheel housing. Mark pressure plate and flywheel for reinstallation, loosen cover attaching bolts alternately and gradually to relieve tension, and remove clutch.

T mp st

Disconnect stabilizer bar from frame side rail, disconnect exhaust pipe, and disconnect front of torque tube from clutch housing (*s e "T mpest Propeller Shaft & Torque Tube" in R ar Axl Section*). Disconnect clutch rod from clutch fork, and linkage link from clutch housing. Remove starter Remove clutch housing assembly Mark flywheel and clutch for reassembly, then remove clutch assembly from flywheel.

Rambler

Remove transmission, disconnect linkage, and remove clutch housing and pan Mark flywheel and clutch for reassembly and take out clutch fork. Remove clutch attaching bolts and remove clutch assembly.

Studebaker

Disconnect battery On 6 Cyl , remove oil level gauge and tube, and disconnect starter and tie out of way (unnecessary to disconnect cables) On V8, remove starter completely Remove clutch operating shaft and transmission Disconnect engine rear support from crossmember and raise engine sufficiently to take weight off crossmember Remove crossmember (and clutch housing cover plate on V8 cars) Remove clutch housing Mark flywheel and clutch for reassembly, remove attaching bolts, and remove clutch assembly.

Clutch Spring Specification Table

Jeep

FC-170 - Remove transmission and transfer case. Remove flywheel housing pan from bottom of housing Mark pressure plate and flywheel for reinstallation. Loosen attaching screws evenly to release spring pressure and to prevent distortion of bracket, then remove clutch.

OVERHAUL

Mark all parts before dismantling clutch and reassemble in same position to maintain clutch balance Replace grooved, checked or warped pressure plates. Replace springs when pressure plate discolored from heat *PONTIAC & TEMPEST NOTE* - Car manufacturer does not recommend overhaul of clutch assembly.

Disassembly

Place clutch on fixture or arbor press (support pressure plate under release levers), place block across cover resting on spring bosses, compress cover slightly, remove metal staking in adjusting nuts by running hacksaw blade through slot, remove nuts Release pressure slowly and remove cover and springs. Remove release levers by grasping lever and eyebolt between thumb and forefinger, so that inner end of lever and upper end of eyebolt are pressed together, lift strut over ridge in end of lever (press lower end back against lug), lift lever and eyebolt out.

Reassembly

Place pressure plate on fixture or arbor press supporting plate under release lever lugs Install lever, eyebolt, and strut assemblies by reversing removal procedure. On semi-centrifugal models, install roller assemblies in pressure plate grooves. Install clutch springs on pressure plate Install anti-rattle springs on release levers in cover. Place cover on pressure plate. Make certain that springs are seated in cover recesses and anti-rattle springs in place on release levers Compress cover slowly and guide eyebolts through holes in cover If assembly made in fixture, use clamps to clamp cover flange to plate at mounting holes Install eyebolt nuts and turn nuts down flush with head of bolt. Compress and release clutch several times to seat all working parts, then adjust release lever heights.

Clutch Springs

Note spring color and install in same relative position (groups of two different springs used on some clutch models) Springs should check with "Clutch Spring Specification Table" Replace springs if weak or burned or if clutch has been subjected to excessive heat.

Release Lever Adjustment (Using Gauge Plate)

Install clutch on flywheel in car, or on dummy flywheel on bench, with Borg & Beck Gauge Plate installed in place of regular driven member *CAUTION - Machined lands on gauge plate should be directly und r release levers.* Depress each lever several times to seat all parts, then place straightedge or sheet metal height gauge on gauge plate boss directly above release lever and adjust lever height until lever tip contacts lower edge of height gauge ("flush" setting)

(Continued)

BORG & BECK (Cont.)

Release Lever Adjustment (With Borg-Warner Universal Fixtures UF-300 or 400)

Special lands must be installed on fixture under pressure plate lugs Set adjusting arm on adjusting sleeve so that height of lower side arm above bottom of sleeve is correct for each model (see table) Install indicating plate on levers Adjust each lever so that it just contacts indicating plate or adjusting arm, lock lever adjusting nuts by peening nut against notches in eyebolt.

Release Lever Setting (Borg-Warner Fixtures UF-300 & UF-400)

③ - 3X Indicating Plate not used.

Rambler American, Series 6301 (1963)
Rambler Classic Six, Series 6310 (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 "NO DRIVE" DURING COLD WEATHER & PREMATURE SERVO WEAR CORRECTION:* Caused by road wash entering servo body through atmospheric vent and freezing servo piston in released position. Also, mud, dirt, and dust can enter servo and cause premature wear To correct, install Servo Vent Shield, No 3171701, between rear cover of servo and servo mounting bracket with slot in shield facing downward. Hold shield in position with servo self-adjuster

►*STARTING CAR BY TOWING NOTE:* To start car by towing, proceed as follows: With "Tow Start" handle all the way in, place shift lever in 2nd gear, pull overdrive handle all the way out, and turn on ignition switch When speed reaches 10 MPH, pull "Tow Start" handle all the way out and hold in position Clutch will now be engaged As soon as engine starts, push "Tow Start" handle all the way in and move shift lever to neutral position *"Tow Start" handle must be pushed all the way in at all times when driving the car.*

►*PARKING CAR IN GEAR NOTE:* Use REVERSE gear ONLY as follows: With ignition off, place transmission in reverse gear and pull "Tow Start" handle all the way out and turn handle ¼-turn clockwise to lock in position. Clutch will now be engaged. *"Tow Start" handle must be pushed all the way in at all times when driving the car.*

►*CLUTCH DISC STICKING TO FLYWHEEL OR PRESSURE PLATE NOTE:* Higher asbestos yarn content of clutch facings may induce sticking to flywheel if clutch left in engaged condition for any length of time. If car parked for 48 hours or more, use parking brake instead of "Tow Start" handle to hold car.

►*CONTROL VALVE BODY REMOVAL NOTE & CAUTION:* If wheelhouse inner panel interferes with valve body removal, proceed as follows: Remove both lower capscrews and loosen top capscrew Pull oil pump and valve body from engine approximately ¼" and rotate pump and valve body clockwise (to front of car) until capscrew and valve body can be removed from pump *CAUTION - On "L" head engines, do not pull oil pump more than ¼" from engine or distributor shaft will disengag from drive gear and put engine out of time.* When installing valve body, torque capscrews to 13-15 ft lbs. Overtightening will distort valve body.

RAMBLER "E" STICK AUTOMATIC CLUTCH

DESCRIPTION

Fully automatic clutch operating mechanism using engine oil pressure to apply the clutch and which eliminates the need for a clutch pedal on cars with synchro-mesh transmission (with or without overdrive)

Clutch - Single plate, dry disc type of conventional design but with clutch pressure plate springs eliminated and release levers arranged to engage driven plate to flywheel instead of releasing it (clutch is disengaged at rest or in neutral) Ball type clutch throw-out bearing rotates constantly when car is moving in gear A retracting spring attached to outer end of throw-out lever holds clutch disengaged until applied by engine oil pressure

Oil Pump - Gear type with larger gears for increased oil capacity Engine oil pressure relief valve specification is increased to 55-60 lbs at 2200 RPM, and an additional minimum lube pressure relief valve is installed in control valve body to insure that engine oil pressure requirements are met before oil is diverted for clutch operation This valve opens at 10 lbs.

Control Mechanism - Consists of a control valve body mounted on engine oil pump and serving as the pump cover, a vacuum modulator diaphragm and a vacuum dump diaphragm connected in series with each other and to intake manifold, an air valve solenoid in dump diaphragm line, and a neutral safety switch on steering column.

Servo - Conventional hydraulic power cylinder with a piston and seal, and piston rod contacting clutch throw-out lever. Hydraulic pressure in servo pushes piston rod against throw-out lever to engage clutch A check valve with a metered orifice in line between servo and control valve body permits a large amount of oil under high pressure to enter servo for fast partial clutch engagement. Remaining oil needed for full engagement enters servo at a slower rate to insure smooth clutch engagement and operation

Manual Control - A "Tow Start" handle on instrument panel connected by an adjustable cable linkage to throw-out lever is provided for manual engagement of clutch

OPERATION

In Neutral At Idle Sp d - With gear shift lever in neutral, neutral safety switch contacts are closed, energizing air valve solenoid which pulls in to open vacuum line from intake manifold to dump diaphragm Combined vacuum in dump and modulating diaphragms (modulating diaphragm connected directly to intake manifold) plus atmospheric pressure on underside of modulating diaphragm pulls springs in both diaphragms up to hold pressure regulator valve open so there is no oil flow from engine oil pump to servo, and clutch is disengaged.

In Gear At Idle Speed - When transmission is placed in gear, neutral safety switch contacts open to release air valve solenoid which shuts off vacuum supply to dump diaphragm. Atmospheric pressure in dump diaphragm lets full diaphragm spring pressure close pressure regulator valve. *NOTE - Spring-loaded ball check in regulator valve maintains a 7 lb. minimum pressure in valve body and servo. This pressure is just enough to overcome slightly the clutch retracting spring tension and produce a slight drag on clutch to take up drive line backlash and to initiate coasting engagement for engine braking.* With regulator valve closed, servo pressure will be regulated by main orifice from oil pump discharge side until servo oil pressure begins to overcome dump diaphragm spring pressure (17 lbs. approximately).

In Gear At Road Load - As servo oil pressure under load increases, dump diaphragm spring pressure is not sufficient to hold regulator valve closed. But at the same time, engine manifold vacuum is dropping off because of increased engine speed. When vacuum drops, modulating diaphragm spring pressure is allowed to combine with dump diaphragm spring pressure to hold pressure regulator valve closed. This combined pressure is approximately 45 lbs. and is sufficient to keep clutch engaged.

ADJUSTMENT

Anti-Stall Dashpot

Carter Carbs. - Turn idle speed screw out so throttle valve is tightly closed, fully depress dashpot plunger, turn dashpot in or out to obtain 1/8" clearance between end of plunger and throttle lever Tighten locknut

Holley Carbs. - With engine idling at normal operating temperature, depress dashpot plunger fully, and turn adjusting screw on throttle lever to obtain a clearance of 9/64" between adjusting screw and dashpot plunger,

Neutral Safety & Actuator Cam Stop

Adjust neutral safety switch so contact roller is at a light contact against actuator cam, then move switch in

(Continued)

RAMBLER "E" STICK AUTOMATIC CLUTCH (Cont.)

mounting bracket so there is the same amount of gear shift lever movement when coming out of 2nd gear as there is when coming out of 3rd gear before neutral switch "clicks". Place gear shift lever in high gear and adjust actuator cam stop nut (upper nut at small end of spring) to take up approximately ½ of lever free movement (will center slot in 2nd and 3rd operating lever over selector key to remove any tension).

Throw-Out Lever

NOTE - Following adjustment procedure supersedes previous instructions to prevent clutch from slipping. This adjustment is n cessary only when a new clutch driven plat is install d. Under normal conditions, slack is tak n up by servo self-adjuster assembly. With parking brake firmly set, engine at 550 RPM, and transmission in Neutral, loosen locknut on throw-out lever adjusting screw. Turn adjusting nut so throw-out lever moves to rear of car, then continue to move lever until a slight transmission gear clash occurs when moving shift lever slowly toward 1st gear (do not engage in gear). Now back off adjusting screw 1½-turns and tighten locknut.

"Tow Start" Cable

After throw-out lever adjusted (see above), loosen locknut on "Tow Start" cable and turn adjusting sleeve so pivot clears throw-out lever by 1/8", then tighten locknut.

TROUBLE SHOOTING & DIAGNOSIS

TROUBLE SHOOTING NOT E - When diagnosing clutch troubles, check for the usual clutch malfunctions such as bent or distorted driven and pressure plates, worn or oil soaked facings, misalignment, etc., in addition to the following special points.

Exc ssiv Slip - Low servo oil pressure; Throw-out lever improperly adjusted or improperly installed; Engine oil level low; Air valve solenoid faulty; Diaphragm pushrod stuck in valve and diaphragm assembly; Diaphragm vent plugged; Minimum lube pressure valve stuck partially open.

Excessiv Cr p - Engine idle speed too high; Clutch retracting spring too light or broken; Servo oil pressure too high; Retractor straps broken.

N Clutch R l as - Diaphragm cover bent or damaged; Vacuum line leak; Control valve stuck in valve body; Neutral safety switch faulty or not adjusted properly; Wiring to air valve solenoid faulty; Air valve solenoid faulty; Throw-out lever or "Tow Start" cable improperly adjusted; Servo piston binding; Diaphragm pushrod sticking; Servo body air vent plugged; Diaphragm leak in diaphragm assembly.

Engin Ov rsp eds When Clutch Engages - Throw-out lever improperly adjusted; Servo piston binding; Servo air vent plugged; Oil regulator valve not seating.

N Clutch Engagem nt - Neutral safety switch faulty or improperly adjusted; Air valve solenoid or wiring faulty; Minimum lube pressure valve stuck; Servo piston binding; Dump diaphragm spring broken; Pressure regulator valve stuck open; Engine oil level low.

Exc ssiv G ar Clash On Engag m nt (1st r R vers) - Throw-out lever improperly adjusted; Engine idle speed not correct.

TESTING

Stall Test

Method 1) is preferred method, but method 2) may be used if necessary.

1) Bring engine to normal operating temperature and install an electric tachometer. Drive car on level ground in 3rd gear at 10 MPH. Move throttle to wide open position (apply brakes to hold at 10 MPH), and note tachometer reading. Engine speed should be 975-1125 RPM.

2) Bring engine to normal operating temperature and install an electric tachometer. Set parking brake and place transmission in 3rd gear. Apply brakes and open throttle fully. Engine speed should settle to 975-1125 RPM. *CAUTION - DO NOT hold throttle open for more than 2 seconds and DO NOT repeat this test until ½ hour has elapsed.*

Test Conclustions - If engine RPM is higher than specified, refer to "Excessive Slip" under TROUBLE SHOOTING above for possible causes. If engine RPM is lower than specified, engine is not developing full power or servo oil pressure is too high.

Oil Pressure Test

Bring engine to normal operating temperature and install pressure gauge at one of the pipe plugs on engine oil gallery. Place transmission in neutral and set engine speed to 550 RPM. Remove vacuum hose at intake manifold and plug **manifold** opening (do not plug loose end of hose). Install an electric tachometer. Oil pressure should be 27-32 lbs. at 1100 RPM. If not within limits, make sure pressure regulator valve cap is in place and not plugged, and that valve moves freely in valve body bore. Make sure that valve body-to-oil pump gasket thickness is within .011-.013". Replace engine oil pump or valve body and diaphragm assembly as necessary.

Air Valve Solenoid

Remove solenoid from mounting bracket, disconnect vacuum hoses, but leave wiring connected. *NOTE - If solenoid has 3 openings in "T" connection, plug center opening to make test.* Place transmission in neutral. With ignition off, solenoid is not energized, and you should not be able to blow through port "V". This checks vacuum part of solenoid in closed position. Now turn ignition on. Solenoid should be energized and you should be a ble to blow through port "V". This checks vacuum valve in open position. With ignition on, and solenoid energized, close port "D" with a finger. You should not be able to blow through port "V". This checks atmospheric end of valve for proper seating. Replace air solenoid valve if any of above conditions not met.

Servo & Check Valve

Engage clutch manually with "Tow Start" handle. Move servo pushrod back and forth to check for binding. If oil leaks at rear of servo, check servo piston seal and cylinder bore. If oil leaks at front of servo, check hose clamp and servo gasket.

CLUTCH OVERHAUL

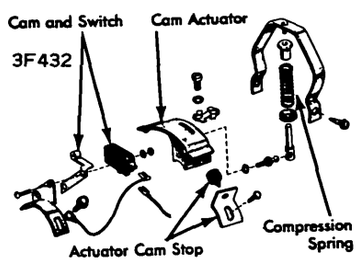
Removal

Remove transmission flywheel housing lower cover, and disconnect retracting spring and "Tow Start" cable from throw-out lever. Remove clutch. *NOTE - Mark cover, pressure plate and flywheel for reassembly in same positions.*

Disassembly

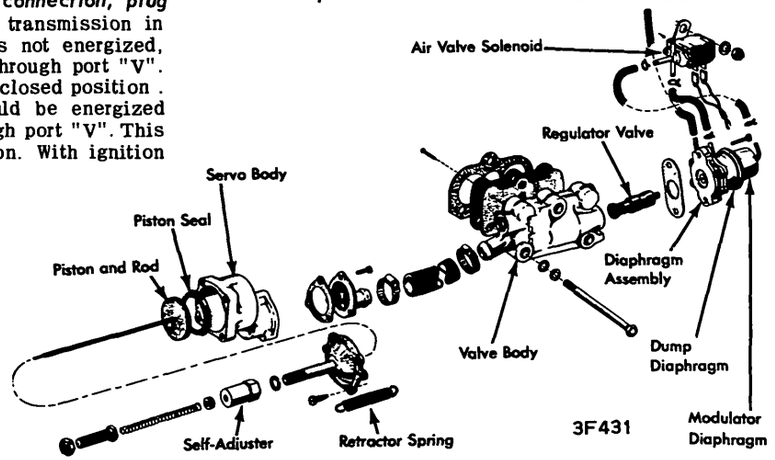
Clutch may be disassembled by removing the three pressure plate attaching screws.

Inspection



NOTE - If driven plate replaced, new servo self-adjuster must also be installed. Inspect all parts for wear, damage, distortion, etc. Replace parts as necessary. Replace cover if any drive straps are broken. *CAUTION - Do not wash release bearing in gasoline or or any solvent. Unnecessary and impossible to lubricate bearing as it is packed for life.*

Reassembly



Reverse disassembly procedure and apply small amount of lubriplate to release lever fulcrums.

Installation

Reverse removal procedure and use Aligning Tool J-1625 or J-5442 to insure correct clutch alignment. *NOTE - Before removing aligning tool, attach "T w Start" cable and pull handle all the way out to hold clutch in place to aid transmission installation.*

NEUTRAL SAFETY SWITCH & ACTUATOR CAM ASSEMBLY

"E-STICK" CONTROL MECHANISM (EXPLODED)

CHEVROLET & PONTIAC (OWN)

Chevrolet Pass. Cars (1963)
Chevy II (1963)
Corvair Cars & Trucks (1963)
Corvette (1963)
Chevrolet Trucks (1963)
Pontiac (1963)
Tempest (1963)

DESCRIPTION

Single plate dry disc type with a diaphragm spring replacing conventional clutch release springs and release levers. Diaphragm spring is shaped like a dished washer, with inner rim slotted to form many release fingers, and is pivoted on inner and outer pivot rings mounted in clutch cover. Most models have straight release fingers, however some models have 6 or all of the release fingers bent upward to provide centrifugal action for increased clutch pressure at higher speeds. Models having 6 fingers bent upwards also have weights on these 6 fingers.

CLUTCH LINKAGE ADJUSTMENT

Chevrolet Pass Cars - Free travel should be 7/8-1 1/8". To adjust, remove pedal return spring and back off pedal pushrod lower locknut (at swivel end) about 1/2". Hold pushrod so pedal is against bumper stop, and hold cross shaft lever so throw-out bearing is against clutch fingers. Adjust pushrod upper locknut so there is 3/16-1/4" clearance between this locknut and upper edge of swivel. Release pushrod and cross shaft lever, tighten lower locknut to lock swivel against upper locknut, and install return spring.

Chevy II - Free travel should be ⅜-1" measured at pedal pad. To adjust, loosen locknut on clutch fork pushrod and shorten or lengthen pushrod as necessary, then tighten locknut. Recheck pedal free travel. *NOTE - 1/8" clearance between pushrod and pushrod seat in clutch fork will give proper pedal free travel.*

Corvair Pass. Cars - **1)** Pedal free travel should be ¾". Attach return spring to clutch lever control cable cross shaft outboard lever lower hole. *NOTE - Clutch fork pull rod must be disconnected from cross shaft lever.*

2) Adjust clevis swivel until outboard lever on clutch lever control cable cross shaft has a clearance of 1/8" to 3/4".

3) Hold pull rod to remove all slack at bearing (throw-out bearing touching release fingers), and align swivel with upper hole of outboard lever, then back off swivel 3 complete turns, assemble swivel to lever, and install clip.

Corvair Trucks & Greenbrier - **1)** Pedal free travel should be ¾". Disconnect rear clutch return spring. *NOTE - Front spring must be in operation to hold pedal bumper in contact with toe-board.*

2) Remove retainer clip, clevis pin and washer from clutch control idler lever and remove rear cable clevis.

3) Let idler lever hang free to furnish guide for correct line of action of cable clevis.

4) Pull cable clevis rearward to remove all slack forward of this point, then pull clutch fork pull rod until all slack is taken up at clutch fork.

5) With cable clevis and pull rod in this position, adjust pull rod clevis to align holes in both clevises.

6) With pull rod clevis position established, unscrew clevis 3½-turns (lengthen rod 5/32"). Tighten jam nut.

7) Line up holes in cable clevis, pull rod clevis, and clutch fork pull rod idler lever and insert clevis pin and retainer clip. Install return spring.

Chevrolet Trucks - Mechanical Linkage - Free travel should be ⅜-1". Adjust in same manner as for Pass. Cars (above).

Hydraulic Linkage Free Travel - Adjust pushrod so there is free travel between master cylinder pushrod and piston. This will amount to 1/8" free travel measured at centerline of pedal pad, just before pushrod contacts piston and will insure piston uncovering port in reservoir.

Hydraulic Linkage Total Travel - Adjust clutch pedal bumper so clutch pedal pad (fully released) is even with brake pedal, then disconnect return spring. Push slave cylinder pushrod forward as far as possible and pull clutch fork rearward until all slack is removed at throwout bearing, then turn adjusting nut behind slave cylinder pushrod fulcrum ("V" block) to obtain 5/32" clearance between fulcrum pivot and clutch fork (use shank of 5/32" drill).

Corvette - Free travel should be ⅜-1" (normal pedal), 5/8-3/4" ("Fast" pedal). Adjust in same manner as for Pass. Cars (above). *NOTE - Pedal total travel should be 6½" (normal pedal), 5" ("fast" pedal); and can be increased by trimming bumper pad, and decreased by adjusting pedal free travel.*

Pontiac & Tempest - Pedal free travel should be about 1" Disconnect return (or anti-rattle) spring. Loosen trunnion locknuts and move pushrod and clutch fork rearward until release bearing lightly contacts release fingers. Turn rear nut up to the trunnion, then shorten pushrod 7 full turns and tighten both nuts. Install spring.

CLUTCH REMOVAL

Chevrolet Pass. Cars - Remove transmission. Remove clutch throw-out bearing from fork, then remove clutch fork tension spring from fork. Remove clutch fork by forcing it forward and toward center of car. Install Pilot Tool J-5824 to support clutch assembly. Loosen clutch attaching bolts one at a time until tension of spring is released, then remove pilot tool. Remove clutch assembly. When installing, align "X" mark on cover and flywheel.

Chevy II - Remove transmission. Disconnect return spring from clutch fork and remove throw-out bearing from fork. Remove clutch housing (cover plate will hang from starter gear housing). Remove clutch fork from ball stud and dust boot. Support clutch assembly with Pilot Tool J-5824, then remove clutch assembly by loosening attaching bolts a little at a time until all spring tension is relieved. *INSTALLATION NOTE - Extended end of hub with damper springs must be installed toward flywheel.*

Corvair - Engine must be removed from car and transaxle assembly separated from engine in order to remove clutch. *See Corvair Car Mod l Pages, and "Corvair Transaxle" in Transmission Section.*

Corvette - Remove transmission, disconnect pushrod and spring, and remove flywheel housing. Install Pilot Tool J-5824 to support clutch, then loosen clutch attaching bolts a little at a time until all tension is relieved. Remove clutch. When installing, align "X" mark on cover and flywheel.

Chevrolet Trucks - Remove transmission, then disconnect slave cylinder at clutch fork and remove throw-out bearing from fork. Press fork away from ball mounting (use screwdriver), or remove ball stud from rear of clutch housing. *NOTE - Pry rtainr out of frk with small screwdriver.* Install Pilot Tool J-5824 to support assembly. Loosen clutch attaching bolts gradually to release spring tension, then remove tool and remove clutch assembly. After installation, bleed clutch hydraulic line at clutch slave cylinder bleed holes in same manner as for brake system bleeding.

Pontiac - Disconnect battery, remove transmission and propeller shaft, and clutch release bearing. Disconnect clutch linkage and remove starter. Remove front flywheel housing shield and flywheel housing. Mark pressure plate and flywheel for reinstallation, loosen cover attaching bolts alternately and gradually to relieve tension, and remove clutch.

Tempest - Disconnect stabilizer bar from frame side rail, disconnect exhaust pipe, and disconnect front of torque tube from clutch housing *(see "Tmpst Propeller Shaft & Torque Tube" in Rear Axle Section).* Disconnect clutch rod from clutch fork, and linkage link from clutch housing. Remove starter. Remove clutch housing assembly. Mark flywheel and clutch for reassembly, then remove clutch assembly from flywheel.

CLUTCH OVERHAUL

1) Remove three drive strap-to-pressure plate bolts and retracting springs, then remove pressure plate from cover. *NOTE - When disassembling, not position of grooves on edge of pressure plate and cover for reassembly to maintain balance.*

2) Inspect spring, rings, and cover for excessive wear or damage. If any defect found, replace clutch assembly.

AUBURN

Dodge & Dart 6 Cyl. (1963) Ⓒ
Plymouth 6 Cyl. (1963) Ⓒ
Valiant (1963) Ⓒ
Jeep 4 & 6 Cyl. (1963) Ⓔ

Ⓒ - Borg & Beck clutch also used
Ⓔ - 3 spring and 6-spring types used Rockford and Borg & Beck clutches also used

Description

Single plate, dry disc type of same design used on corresponding previous models

Clutch Pedal Adjustment

Chrysler Corp. Cars - Adjust self-locking nut on clutch fork rod to provide 5/32" free movement at fork-to-pushrod pin This will provide correct 1" pedal freeplay.

Jeep-Universal Jeep & Dispatcher - 1½" pedal freeplay. To adjust freeplay, loosen yoke locknut on cable between throw-out lever and cross shaft lever and turn yoke as required

Utility 4 Cyl. - 1" pedal freeplay To adjust, loosen control rod locknut and screw adjusting nut (on threaded connection between clutch control lever and control tube lever) in or out Tighten locknut

Utility 6 Cyl. - 1" pedal freeplay. To adjust, loosen locknuts on pedal adjusting rod. Turn nuts forward to increase, or backward to decrease freeplay Tighten both locknuts against trunnion (without changing adjustment).

FC-150 & FC-170 - ½" pedal freeplay. To adjust, change cable length so pedal has ½" free movement from fully engaged position before resistance is felt

Gladiator & Wagoneer - Pedal Adjustment - Turn adjusting screw on clutch pedal support so master cylinder pushrod just contacts piston when piston is at full rear position

Pedal Free play - Disconnect clutch fork return spring, push slave cylinder pushrod forward so piston is fully forward, hold in position, and move clutch lever until release bearing touches clutch fingers Turn pushrod adjusting nut until connecting pin enters clutch lever, then back off nut 2 or 3 turns for release bearing freeplay. Connect return spring.

Clutch Removal

Chrysler Corp. Cars - Remove transmission. Pull out release bearing and sleeve Mark cover and flywheel for reassembly Loosen clutch attaching bolts in succession a few turns at a time to release spring tension, then remove clutch assembly

Jeep - Universal Jeep & Dispatcher - Remove transmission, transfer case, and engine (labor will be saved if engine is removed without bell housing), then remove clutch from engine

FC-150 & FC-170 - Remove transmission and transfer case On FC-150, remove bell housing from engine On FC-170, remove flywheel housing pan from bottom of housing On all models, mark pressure plate and flywheel for reinstallation Loosen attaching screws evenly to release spring pressure and prevent distortion of bracket, then remove clutch

Utility - On models with split bell housing, disconnect both front and rear propeller shafts and pull transmission to rear sufficiently to clear transmission drive shaft from clutch, then remove bottom pan from bell housing Mark both pressure plate and flywheel for reassembly, loosen pressure plate-to-flywheel screws evenly in sequence a little at a time to prevent distortion of clutch bracket, and remove clutch

Clutch Overhaul

See 1959 Final Data, Page 332, or later Manual edition and note the following:

Tools - Use Tool C-585A (Chrysler Corp.), C-585C (Jeep)

Release Lever Setting Spacer - No 43 (Chrysler Corp.), No 17 (Jeep).

Clutch Springs - Use correct springs (see table below). Replace all springs that are burned or do not meet specifications.

Clutch Spring Specifications

Car Model	No. & Color	Lbs. Pressure

Econoline Trucks (1963)
Falcon Cars & Trucks 6 Cyl. (1963)
Fairlane 6 Cyl. (1963) Ⓒ
Meteor 6 Cyl. (1963) Ⓒ

Ⓒ - Standard clutch. Heavy duty clutch is Long CF (semi-centrifugal). *See "Long CF & NC Clutches" in this section.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1962-63 FAIRLANE & METEOR CLUTCH PEDAL DOES NOT RETURN FULLY CORRECTION:* If all other adjustments are correct, pedal assist spring may not be passing over-center as required. To correct, elongate retainer hole in spring retainer bracket ½" toward bottom of bracket (on centerline of hole as positioned in car), and install an additional locknut on spring retainer

Description

Single plate, dry disc type of same design used on previous models.

Clutch Pedal Adjustment

Comet & Falcon - Assist Spring Adjustment - Adjust retainer in link so distance from inside radius of spring hook to front face of link is 1 3/16"

Total Travel - Move bumper and bracket as required to secure 6-6½" of travel Make this adjustment before making freeplay adjustment

Freeplay - Loosen pedal-to-equalizer rod nuts and move equalizer bar as required to obtain 7/8-1 1/8" movement of pedal from fully released position until release fingers contact release bearing, then tighten nuts against trunnion without altering adjustment

Econoline - Loosen nut on turnbuckle on release rod and rotate turnbuckle to obtain freeplay or travel of 7/8-1 1/8" measured from fully released position until release fingers contact release bearing Tighten nut *NOTE - When freeplay is correct, total travel will be correct (6-6½").*

Fairlane & Meteor - Disconnect interlock shift rod at interlock shift lever, then measure total travel of clutch pedal *NOTE - Measure distance from steering wheel to clutch pedal with pedal fully released, then again with pedal fully depressed.* If travel not within 6 5/8-6 7/8", move clutch pedal bumper and bracket up or down as necessary *CAUTION - Always check and adjust total travel before checking free travel.* With clutch pedal against its bumper (fully released) distance between assist spring eye centers should be 10". Adjust spring retainer hook length as necessary. With engine idling, depress clutch pedal just enough to take up free travel and note reading on tape (distance between steering wheel and clutch pedal) Difference between this reading and reading with pedal released should be 15/16-1 1/16" If not within specifications, adjust clutch pedal-to-equalizer rod To increase free travel, loosen rearward adjusting nut and tighten forward nut. To reduce free travel, loosen forward nut and tighten rearward nut. Tighten both nuts against trunnion after adjustment With transmission in neutral and interlock pawl snugly engaged, connect interlock rod As a final check, measure pedal free travel with transmission in neutral and engine running at 3000 RPM. If free travel at this speed is not ½", readjust clutch pedal-to-equalizer rod as necessary *CAUTION - Free travel must be exactly as specified.*

►*FAIRLANE & METEOR INTERLOCK LINKAGE NOTE:* If interlock shift linkage does not operate correctly, or if disturbed during clutch linkage and height adjustment, adjustment must be made on interlock linkage *See "Ford & Mercury 3-Speed Synchro-mesh Transmission" in 1962 Final Data, Page 415.*

Removal & Installation

All Models - Remove transmission, then remove starter motor and dust seal. Disconnect retracting spring, then disconnect pedal from equalizer rod at equalizer bar Remove release bearing and hub. Remove flywheel housing and inspection or dust cover. Remove clutch assembly from flywheel

Overhaul

CAUTION - Parts are not furnished and manufacturer recommends that clutch not be disassembled. Replace pressure plate and cover assembly if release levers do not operate freely or if lever heights not equal.

Release Lever Checking - Assemble pressure plate and cover assembly on flywheel with a .250" shim installed in place of regular driven member Use depth gauge or dial indicator to measure height of inner end of each release lever. All levers must be equal within 031" If lever variation greater than 031", replace pressure plate and cover assembly

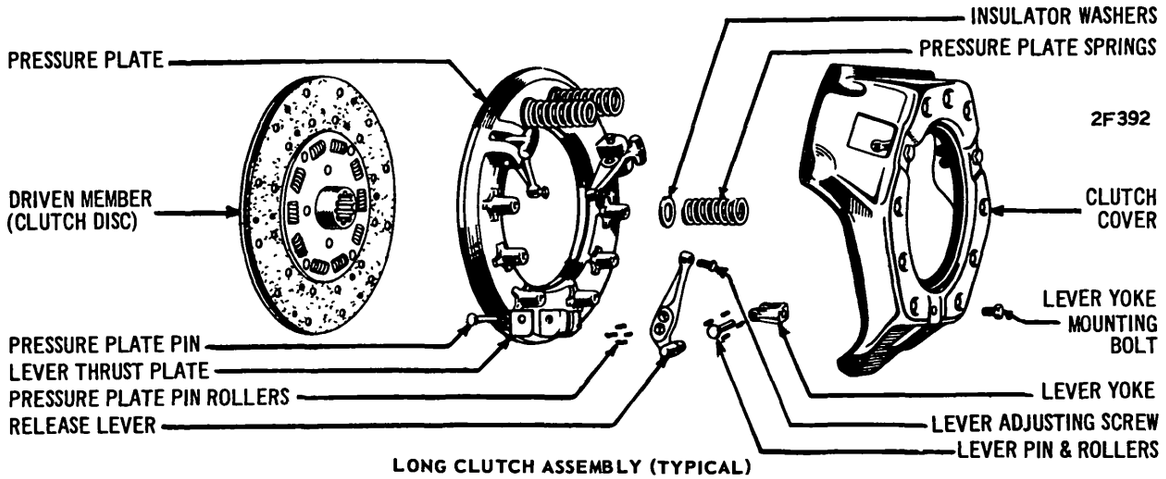
►CHANGES, CAUTIONS, CORRECTIONS



►*1963 BUICK LESABRE CLUTCH BINDING CORRECTION:* May be caused by insufficient lubrication at end of clutch release shaft opposite nylon bushings. To correct, remove clutch, disassemble, and lubricate release shaft

►*1962-63 FAIRLANE & METEOR CLUTCH PEDAL DOES NOT RETURN FULLY CORRECTION:* If all other adjustments are correct, pedal assist spring may not be passing over-center as required. To correct, elongate retainer hole in spring retainer bracket ½" toward bottom of bra cket (on centerline of hole as positioned in car), and install an additional locknut on spring retainer

►*1963 GALAXIE & MONTEREY 427" ENGINE CLUTCH RELEASE SPRING & EQUALIZER INTERFERENCE CORRECTION:* On cars before March 11, 1963, drill a ¼" hole in crossmember 2 75" from existing release spring attaching hole (toward centerline of crossmember) and install spring in the new hole.

DESCRIPTION

Single plate, dry disc type Model CF is semi-centrifugal type Model NC is not centrifugal.

LONG CLUTCH ASSEMBLY (TYPICAL)

LINKAGE & PEDAL ADJUSTMENTS

Buick & Buick Special

Pedal free travel should be 7/8-1" To adjust, pull outer end of clutch fork rearward until throw-out bearing contacts clutch release levers Free movement at outer end of clutch fork should be 3/16". Remove clevis pin from rear of clutch release rod and rotate rod as necessary for proper clutch fork free movement Install clevis pin and check pedal free travel.

Ford Motor Co. Cars

Disconnect interlock shift rod at interlock shift lever, then measure total travel of clutch pedal. *NOTE - Measure distance from steering wheel to clutch pedal with pedal fully released, then again with pedal fully depressed.* If travel not within 6 5/8-6 7/8", move clutch pedal bumper and bracket up or down as necessary *CAUTION - Always check and adjust total travel before checking free travel.* With clutch pedal against its bumper (fully released), distance between assist spring eye centers should be 10". Adjust spring retainer hook length as necessary. With engine idling, depress clutch pedal just enough to take up free travel and note reading on tape (distance between steering wheel and clutch pedal). Difference between this reading and reading with pedal released should be 15/16-1 1/16". If not within specifications, adjust clutch pedal-to-equalizer rod To increase free travel, loosen rearward adjusting nut and tighten forward nut. To reduce free travel, loosen forward nut and tighten rearward nut. Tighten both nuts against trunnion after adjustment. With transmission in neutral and interlock pawl snugly engaged, connect interlock rod. As a final check, measure pedal free travel with transmission in neutral and engine running at 3000 RPM. If free travel at this speed is not ½-1", readjust clutch pedal-to-equalizer rod as necessary *CAUTION - Free travel must be exactly as specified.*

►*INTERLOCK LINKAGE NOTE:* If interlock shift linkage does not operate correctly, or if disturbed during clutch linkage and height adjustment, adjustment must be made on interlock linkage *Se "Ford & Mercury 3-Speed Synchro-mesh Transmission" in 1962 Final Data, Page 415.*

Ford Trucks

F & B Series - Pedal total travel should be 8 1/16-8 5/16". Adjust pedal stop as necessary. Pedal free travel should be 1 3/8-1 1/2". To adjust, back off jam nut on release pushrod and turn spherical nut as necessary- There should be 1/4" clearance between spherical nut and release lever *NOTE - Mak adjustment with retracting spring in plac* . Tighten jam nut.
C Series - Initial pedal free travel before master cylinder pushrod contacts piston should be 5/32-1/4" Adjust eccentric bolt and pedal stop as necessary Disconnect retracting spring and push slave cylinder pushrod as far to front of truck as possible, then pull release lever to rear of truck until release bearing touches pressure plate release fingers. Clearance between slave cylinder pushrod spherical nut and release lever should be 1/4". Loosen jam nut and turn spherical nut as needed. Final free travel should be approximately 2".
P Series - Initial pedal free travel should be 1/16-1/4". Adjust master cylinder pushrod extension as necessary (with pedal retracting spring attached). Now disconnect retracting spring and adjust clearance between slave cylinder pushrod spherical nut and clutch release lever to 1/4" by loosening jam nut and turning spherical nut. Final free travel should be approximately 2".

Oldsmobile

F-85 - Pedal height should be approximately 6½". Pedal free travel should be 7/8-1". To adjust free travel, disconnect clutch lower control rod from release yoke and turn rod in or out of trunnion nut as necessary (bellcrank in horizontal position). Reconnect control rod and check free travel.
88, S88, 98 - Adjust clutch pedal bumper to obtain pedal height of 7 15/16" from top of pedal pad to floor pan (carpet turned back). *NOTE - There must be clearance between clutch releas b llcrank and its stop when adjusting pedal height.* Disconnect pedal bellcrank-to-release bellcrank rod at pedal bellcrank, then move spherical nut on release bellcrank rod forward until clutch release yoke is free. Move pedal

(Continued)

LONG "CF" & "NC" (C nt.)

bellcrank to raised position and adjust connecting rod until holes in clevis and bellcrank are aligned, then shorten rod 3 turns and install in pedal bellcrank Make sure there is 1/32' clearance between release bellcrank and its stop, then turn spherical nut on release bellcrank rod to obtain 1-1½" pedal free travel

CLUTCH REMOVAL

Buick

Special - Remove transmission, then remove flywheel lower housing and throw-out bearing Disconnect release rod from fork and unhook fork boot from flywheel housing opening Free release fork from ball stud (push inward on fork) and remove fork from bottom of housing Mark all clutch parts and flywheel for reassembly and remove clutch assembly *NOTE - Install metal spacers (¼" nuts) between release levers and inner dg of cover to aid removal and installation*
LeSabre, Invicta - Remove transmission and clutch equalizer shaft Disconnect return spring, then remove ball stud from release shaft Remove release lever and seal, and nylon bushing Remove socket head capscrew from release shaft, then remove other screw, and pull release shaft out about 3" Slide release yoke and throw-out bearing from release shaft and remove shaft Mark all clutch parts and flywheel for reassembly and remove clutch assembly *NOTE - Install metal spacers (¼" nuts) between release levers and inner dg of cover to aid removal and installation*

Ford Motor Cars

Remove transmission, then remove starter motor and dust seal Disconnect retracting spring, then disconnect pedal from equalizer rod at equalizer bar Remove release bearing and hub Remove flywheel housing and inspection or dust cover Remove clutch assembly.

Ford Trucks

Remove retracting spring and pushrod at release lever Remove slave cylinder attaching bolts Remove transmission Remove dust cover from clutch housing and remove release bearing and hub from lever Mark pressure plate and cover assembly and flywheel for reinstallation in same position Loosen cover bolts uniformly to relieve spring tension, then remove clutch assembly through opening in bottom of clutch housing

Oldsmobile

F-85 - Remove transmission, lower flywheel housing, and release bearing Mark flywheel and clutch cover for reassembly, then remove clutch assembly
88, S88, 98 - Remove transmission, transmission bearing retainer sleeve, and right and left lower flywheel housing bolts Disconnect adjustable rod at yoke Support rear of engine, then remove rear frame crossmember Remove clutch housing and release yoke from flywheel housing Mark flywheel and clutch cover for reassembly, then remove clutch assembly

OVERHAUL

NOTE - Car manufacturers do not recommend clutch cover and pressure plate assembly overhaul If release lever height not within specifications, or if levers not equal within 031" of each other in height, or if levers do not operate freely with out bind, and cannot be adjusted, replace the assembly Mark all parts for disassembly and reassemble in same relative positions

Disassembly

Place clutch on fixture (supporting pressure plate on special lands under lugs) or on arbor press Compress cover plate slightly, take out assembly screws (lever yoke mounting screws) on cover, release pressure on cover plate slowly, then lift off plate Note if washers are used on yokes under assembly screws (these washers must be reinstalled if old pressure plate used again) See below for replacing release levers

Reassembly

Place pressure plate on fixture or arbor press Assemble pressure springs, locator washers or insulator washers on plate Place washers on lever yokes (if used) Place cover plate in position (lining up marks made before disassembly), compress cover slowly, guiding lever weights through holes in cover and lining up yokes under cover plate holes See that pressure springs are seated, insert cover screws in yokes, using lockwasher under screw head, then tighten screws securely Compress and release clutch several times (using weight on release levers) to seat all parts Adjust release lever heights

Clutch Springs

Pressure springs should agree with specifications listed in table below

Clutch Spring Specifications

Cover Assy.	Springs (No. & Color)	Lbs. Pressure
L5222	9 - Buff (Bronze)	137-147 at 1 747"
260093	12 - Purple	140-150 at 1 677"
260154	6 - Aluminum	200-210 at 1 751"
260162	9 - Pea Green	170-180 at 1 762"
260174	9 - Aluminum	200-210 at 1 751"
260186	3 - Pea Green	170-180 at 1 762"
	6 - Brown & White	154-164 at 1 736"
260225	4 - Buff (Bronze)	137-147 at 1 747"
	5 - Pea Green	170-180 at 1 762"
260245	6 - Aluminum	200-210 at 1 751"
260251	9 - Buff (Bronze)	137-147 at 1 747"
260259	9 - Buff (Bronze)	137-147 at 1 747"
260263	12 - Pink	150-160 at 1 562"
260294	6 - Aluminum	200-210 at 1 751"
260296	9 - Pea Green	170-180 at 1 762"
266716	9 - Aluminum	200-210 at 1 751"
267371	9 - Buff (Bronze)	137-147 at 1 747"

Release Lever Installation

Mount lever yoke on release lever, fasten by inserting flat-sided lever pin (flat side out or toward cover), and roller (place roller on flat side of pin) Insert lever in pressure plate lug, use roller pin sawed off to length of lever width as a guide and insert needle bearings Insert roller pin, pushing guide pin out, lock both lever pins with cotter pins Thread release lever adjusting screws into ends of levers, turning screws down completely

Release Lever Adjustment (Using Borg-Warner Fixture UF-300 & UF-400)

Place special lands on fixture under pressure plate lugs, assemble lever adjusting arm and sleeve, setting bottom of adjusting arm the correct distance as shown in table below, above bottom of sleeve and lock the adjusting arm with the thumbscrew Swing arm over each release lever in turn, back off adjusting screw on lever tip until rounded screw head just contacts arm, lock screws by inverting clutch so screw head is supported and stake or peen lever into adjusting screw slot Do not disturb lever yoke screws when making this adjustment

Lever Height & Adjusting Tool Table

Cover Assy.	Lever Height	① Tool No.
L5222	1 13/16"	One 3D Ring
260093	2 1/8"	Three 3B Spider Post
260162	2 7/32"	None
260174	1 7/8"	None
260186	2 3/8"	One 3X Ind Plate
260225	1 13/16"	One 3D Ring
260245	2 5/16"	One 3X Ind Plate
260251	1 13/16"	One 3D Ring
260259	1 13/16"	One 3D Ring
260263	2 11/32"	None
260294	2 5/16"	One 3X Ind Plate
260344	1 13/16"	One 3D Ring
266716	2 21/32"	② Six 3K5 Height Sleeve
267371	2 1/4"	③

① - In addition to Three 3J Lands (All Models)
② - Under Cover Edge
③ - Six 3K4 Height Sleeves, 3 Pieces of ½"x4¼" Steel Bridging Slots, and One 3X Indicating Plate

Release Lever Adjustment (Without Fixture)

Buick - 1) On a spare flywheel install Adjusting Gauge J-1036 and install clutch on flywheel over gauge so release levers are directly above machined bosses of gauge *NOTE - Gauge thickness at bosses is 295", and height of gauge at hub is 2 1/16"* Install Support J-1013 on hub of adjusting gauge and a dial indicator on support, and zero the indicator With indicator stem bearing on inner end of each release lever in turn, note reading *NOTE - Indicator hand must turn on revolution and read ±.031"* If release lever heights not equal within 031" of each other, adjust as follows: 2) Make sure release lever yoke bolts are tightened to 25 ft lbs Turn each lever adjusting screw up or down as required to obtain "zero" dial indicator reading Remove clutch from flywheel, invert so adjusting screw head is supported and stake or peen lever into adjusting screw slot
Ford Motor Co. (All Models) - Assemble pressure plate and cover assembly on flywheel with a 250" shim installed in place of regular driven member Use depth gauge or dial indicator to measure height of inner end of each release lever All levers must be equal within 031" If lever variation greater than 031", replace pressure plate and cover assembly
Oldsmobile 88, S88, 98 - Install special lever setting Gauge J-1048 on flywheel in place of driven member Mount pressure plate assembly on flywheel, tightening screws one or two turns at a time to prevent distortion of cover Lay short straightedge across center boss of gauge as a guide for positioning levers Bearing surfaces of all lever adjusting screws should be from 000- 062" below level of gauge center boss, and each lever should be within 031" of the other two levers If levers more than 030" out of plane, or do not lie within 000- 062" below center boss, adjust levers as directed under Adjustment With Fixture above

CHRYSLER CORP. (EXCEPT DART & VALIANT) HYPOID

Chrysler & Imperial (1963)
Dodge, Except Dart (1963)℄
Plymouth (1963)℄

℄ - For Dart & Valiant models, see "Dart & Valiant Hypoid" in this section.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 AXLE SHAFT BEARING SEAL PRODUCTION CHANGE, USAGE, & 1962 REPLACEMENT NOTE:* Additional foam gasket, No. 2070933, installed in production on axle shaft for improved bearing sealing. Gaskets are installed one on each side of adjusting shim pack. If no shim pack used due to tolerance stack-up, use one gasket at that end of housing On 1962 & early 1963 cars, install additional 2 gaskets (one on each side) whenever axle shaft bearings removed.

DESCRIPTION

Semi-floating, hypoid gear type with Hotchkiss drive Differential case is "cage" type

AXLE RATIO & IDENTIFICATION

Identification

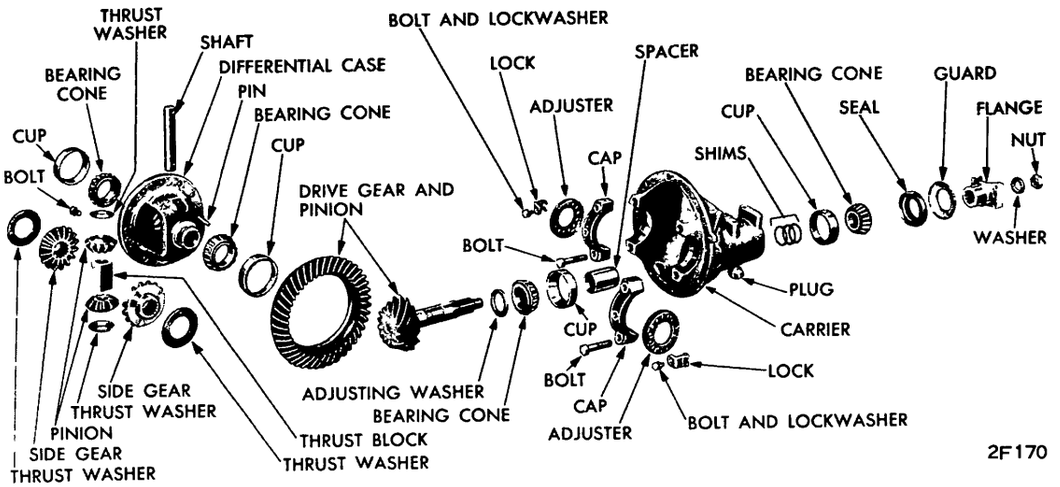
Axle ratio identification number stamped on identification pad at bottom of carrier housing. "Sure-Grip" differential identified by letter "S" stamped on this pad and by a lubrication caution tag attached to a carrier housing bolt.

Axle Ratio

Both conventional and "Sure-Grip" differentials are available with same ratios. Following ratios are available:

2 76 (47-17)	3.55 (39-11)	4.56 (41-9)
2.93 (41-14)	3.58 (43-12)	4.89 (44-9)
3 15 (41-13)	3.73 (41-11)	5.12 (41-8)
3.23 (42-13)	3 91 (43-11)	5.38 (43-8)
3.31 (43-13)	4 10 (41-10)	5 57 (39-7)
3 42 (41-12)	4.30 (43-10)	5 83 (35-6)
		6 17 (37-6)

SPECIFICATIONS



Axle Shaft Endplay	.013- 023"

℄ - Between gear and differential case.
℗ - Turning torque.

AXLE SHAFT

Replacement

Remove hub and drum with Tool C-845 *CAUTION - Do not r move drums by hammering on end of axle shaft as damage to bearings and differential thrust block will result.* Use Tool C-745 to protect axle outer seal Pull shaft with Puller C-499 *NOTE - Use of "knock-off" type remover will damage differential thrust block.* Remove axle shaft bearings with Puller C-293-13, inner oil seals with Puller C-637, and brake dust shield outer seal with Driver C-3565. To install, reverse removal procedure and use a foam gasket, No. 2070933, on each side of axle endplay shim pack. Adjust axle shaft endplay.

CHRYSLER CORP. (EXCEPT DART & VALIANT) HYPOID REAR AXLE ASSEMBLY (EXPLODED)

Endplay Adjustment

8¼" Ring Gear - Push both axle shafts in toward center as far as possible. Now push one shaft in as far as it will go Measure the distance the opposite shaft bearing cup is pushed out of axle housing If distance less than .040", no shims needed on that side If distance more than .040", subtract 040" from distance and add shims equal to this result to side just measured, then install brake support plate and a gasket on each side of shim pack. Now push opposite shaft and bearing cup in as far as possible. Add .016" to distance bearing cup is out of housing and add shims to this total to the side being measured. Install brake support plate and a gasket on each side of shim pack. Total axle shaft endplay should be as listed in "Specifications". If not within specifications, change shims as necessary **on side assembled last.**

8¾" Ring Gear - Install shims totaling 040" at one end of axle housing (shims available in 005", .0125", .015", .030" thicknesses). Install axle shaft, bearing, and cup, then, using Tool C-413, drive bearing cup into axle housing until tool bottoms on shims (not on housing flange). Install brake support plate. Install other axle shaft with bearing until inner end of shaft contacts axle shaft thrust block Lightly tap end of axle shaft with a fibre mallet to insure shaft is contacting the thrust block (opposite shaft will be forced away from thrust block to its full travel). Install bearing cup carefully until no axle shaft endplay exists without preloading the bearing (rotate shaft during bearing installation to check against preload) At this point bearing cup will protrude beyond face of axle housing flange Hold Tool C-413 firmly against bearing cup and measure the distance between end of tool and housing flange with a feeler gauge. To obtain correct endplay (see "Specifications"), add .013" shims to the above measurement *NOTE - Hold endplay to high limit rather than low limit.* Compare shim pack thickness on both sides and, if difference exceeds .020", divide the difference to center axle shafts and thrust block Install shim packs with foam gasket on each side and install cups until tool bottoms on shim pack. Install seals and brake support plates. *Axle shaft key must be flush with outboard end of hub.*

REMOVAL & INSTALLATION

Differential Carrier

Remove axle shafts and disconnect rear universal joint, then drop propeller shaft. Remove lubricant with suction gun Remove carrier attaching nuts and remove carrier

OVERHAUL

Disassembly

Before disassembly, remove any endplay in differential side bearings and check ring gear runout (back face of ring gear) through several complete revolutions If runout exceeds .005", check differential case ring gear mounting flange runout after ring gear removed by installing case with bearing cups in carrier, installing bearing caps with bolts tightened lightly, and screwing in adjusters If runout more than 003", replace differential case Note that ring gear attaching screws have left hand threads, turn clockwise to loosen. Differential shaft lock pin on 8¾" gear units can be removed and installed from back side of case only as pin hole is reamed only part way through case. Be sure to use suitable pullers and support plates when disassembling carrier and differential assemblies.

(Continued)

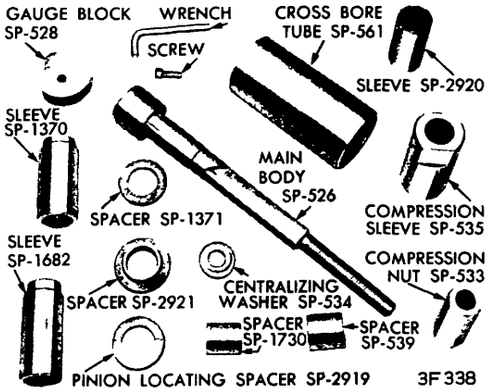
CHRYSLER CORP. (EXCEPT DART & VALIANT) HYPOID (Cont.)

Cleaning & Inspection

Clean and inspect carefully all parts for wear, distortion or damage Replace as necessary. Differential thrust block is usually damaged if "knock off" type axle shaft remover is used Ring gear and drive pinion must be replaced in matched sets only

Reassembly & Adjustments

Differ ntial Ass mbly - With thrust washer on each side gear, install gears in case, then insert each pinion and thrust washer exactly 180° opposite each other so pinion shaft holes in gears and thrust washer are aligned Now rotate side gears 90° so pinion shaft holes in case are exactly aligned with pinion and thrust washer holes Working from lock pin hole side of case, install slotted part of pinion shaft through case, conical thrust washer and just through one pinion gear Install thrust block between pinions with ground sides facing side gears Push pinion shaft in until lock pin hole in shaft is aligned with hole in case, then install lock pin Install ring gear on case flange, start bolts, tap gear on flange, and tighten bolts alternately to specifications Install side bearings on case hubs (taper away from ring gear)



Pinion B aring Preload & Mesh Adjustment - *NOTE - On units with pinion bearing spacer, make preload adjustment first, then mesh adjustment On units without pinion bearing spacer, make mesh adjustment first, then set pinion bearing preload Procedures following are with use of Tool Set C-758 (units with spacer), C-758-D-3 (units without spacer)*

With Pinion B aring Spacer - **1)** Install pinion bearing cups in carrier, then install Spacer SP-3639 (8¼" drive gear), SP-2919 (8¾" drive gear), rear bearing over Main Body SP-526, and insert into carrier Install front bearing Compression Sleeve SP-535, Centralizing Washer SP-534, and Nut SP-533 Tighten nut and rotate tool to seat bearings

2) With tool installed in carrier, remove main screw nut centralizing washer, compression sleeve, and front bearing Install pinion bearing spacer (large bore next to rear bearing) Install Sleeve SP-1730 in front bearing (sleeve flush with rear of bearing), original preload shims over sleeve, then slide sleeve, bearing, and shims over main screw until shims are against spacer Install compression sleeve (square end out), centralizing washer, and main screw nut Turn carrier so nut is up

3) Tighten tool nut to 240 ft lbs and make a complete revolution of assembly while tightening Now rotate assembly several turns in both directions to seat bearings, then recheck torque (may have lessened while bearings aligned)

4) *NOTE - Correct bearing preload reading can be obtained only with carrier nose up* Install an inch-lb torque wrench on tool nut with wrench handle floating, and read torque while wrench is moving through at least one full revolution Reading should be as specified

PINION DEPTH TOOL SET C-758
(SET C-758-D-3 SIMILAR)

(see "Specifications") and should be uniform during full rotations If preload more than specified, use thicker shim under front bearing If less than specified, use thinner shim (Shims furnished in 010", 012", 014", 016", 018" thicknesses) *Do not remove tool*

5) With carrier nose down, install Gauge Block SP-528 (or SP-3250) on end of tool main body (flat part of spacer should face differential bearing pedestals) and offset or large part of spacer toward center of carrier Install Cross Bore Tube (Arbor) SP-561 on differential bearing pedestals, install bearing caps with 002" feeler between cap and arbor and tighten cap bolts securely Choose a gauge washer which will fit between gauge block and arbor Fit must be similar to pull of a feeler gauge that is, snug but not too tight

6) To select proper pinion depth adjusting washer, note mark on end of pinion If mark is minus (-), **add** that amount to thickness of gauge washer selected above If marking is plus (+) **subtract** that amount After proper pinion depth adjusting washer selected, remove tools bearings, and shims from carrier, then make final bearing assembly

Without Pinion Bearing Spacer - **1)** Install Spacer SP-2921 on tool Main Body SP-526 followed by Spacer SP-1730 then install rear bearing over SP-1730 and against SP-2921 Install assembly into carrier, then install front bearing Install tool spacer tool thrust washer, and tool nut on tool shaft, and tighten nut to 25-50 ft lbs Turn tool several revolutions to seat bearings, then check bearing preload which should be 25-50 inch-lbs (for checking pinion depth only)

2) With carrier nose down install Gauge Block SP-528 (or SP-3250) on end of tool main body (flat part of spacer should face differential bearing pedestals) and offset, or large part, of spacer toward center of carrier Install Cross Bore Tube (Arbor) SP-561 on differential bearing pedestals, install bearing caps with 002" feeler between cap and arbor and tighten cap bolts to 10 ft lbs Choose a gauge washer which will fit between gauge block and arbor Fit must be similar to pull of a feeler gauge, that is snug but not too tight

3) To select proper pinion depth adjusting washer, note mark on end of pinion If mark is minus (-), **add** that amount to thickness of gauge washer selected above If marking is plus (+), **subtract** that amount

4) After proper pinion depth adjusting washer selected, disassemble tool from carrier and install spacer just selected between S pacer SP-2921 and rear bearing Install Spacer SP-1730 and preload shims originally used, then insert assembly into carrier Install front bearing, tool spacer, tool thrust washer, and tool nut Tighten nut to 240 ft lbs , then turn tool through several revolutions to seat bearings and recheck torque (may have lessened while bearings aligned) Turn carrier nose up *CAUTION - Correct bearing preload reading can be obtained only with carrier nose up*

5) Install an inch-lb torque wrench on tool nut with wrench handle floating, and read torque while wrench is moving through at least one full revolution Reading should be as specified (see "Specifications"), and should be uniform during full rotations If preload more than specified, use thicker shim under front bearing If less than specified, use thinner shim After proper preload shims selected remove tools bearings and shims from carrier, then make final bearing assembly

Pinion Shaft & Bearing Installation - On pinion shaft install pinion depth adjusting washer (chamfer facing pinion gear) rear bearing, bearing spacer (if equipped) and preload shim pack Lubricate bearings install front bearing in carrier, then install pinion assembly Coat seal bore in carrier with sealer then install seal (lip facing front bearing) with Tool C-3656 until tool bottoms on front bearing *Front face of seal must project 3/32" beyond front face of carrier housing* Install companion flange (Tool C-496 or DD-999) and tighten nut to specifications Rotate assembly several turns in both directions to align bearings then recheck torque (may have lessened while bearings aligned)

Carrier Assembly - Install differential side bearing cups on side bearings then place differential assembly into carrier Install bearing caps and tighten bolts finger tight Install bearing adjusters by hand *NOTE Do not apply high pressure at this time Just square bearing cups with bearings by turning adjusters in until endplay eliminated with some ring gear and pinion backlash* Face each bearing in turn and tighten **left hand** bolt on each bearing cap to specifications

Backlash & Side Bearing Preload Adjustment - **1)** Check backlash at four equally spaced points on ring gear to determine minimum clearance, then mark ring gear at point of minimum clearance *CAUTION - Do not rotate ring gear until adjustments completed* Turn both adjusters equally in same direction until backlash is 0005- 0015" *NOTE - Turn adjusters clockwise only, and do not back off* Install adjuster lock on bearing at back side of ring gear

2) Turn bearing adjuster on tooth side of ring gear inwards 1 notch at a time (a notch is a lock hole) until backlash is as specified (see "Specifications") At this point backlash and side bearing preload will be correct Tighten remaining two bearing cap bolts to specifications install remaining adjuster lock and tighten capscrew to specifications

DART & VALIANT HYPOID

Dodge Dart (1963)
Valiant (1963)

DESCRIPTION

Semi-floating, hypoid gear type with differential carrier integral with rear axle housing

AXLE RATIO & IDENTIFICATION

Identification

Axle ratio identification number stamped on identification pad at bottom of carrier housing

Axle Ratio

The following ratios are available: 2 93-1 (41-14); 3.23-1 (42-13); and 3 55-1 (39-11)

REMOVAL & INSTALLATION

Axle Shaft & Bearing

Remove wheel and drum. Disconnect brake line at wheel cylinder Work through axle shaft flange to remove retainer nuts and use Puller C-3725 to pull axle shaft and rear brake assembly Carefully remove brake assembly from axle shaft without damaging seal contact area Remove seal from housing. Use Puller C-3725 and Adapter C-3926 to remove bearing from axle shaft (when necessary to replace bearing) *NOTE - Remove bearing only if necessary. Bearing is made unfit for for reuse during removal.*

Rear Axle Assembly

Raise car and support body at front of rear springs Block brake pedal up. Remove rear wheels and disconnect hydraulic flex line Disconnect parking brake cable at transmission, and propeller shaft at yoke. Remove spring U-bolts and shock absorbers. Remove rear axle assembly

OVERHAUL

See 1960 Final Data, Page 358, or later Manual edition and note the following:

Specifications

Observ the specifications and torques listed below:

Side Bearing Preload Spread	.003- 006"
Ring Gear & Pinion Backlash	.004-.007"
Pinion Bearing Preload	ℂ 15-25 Inch-Lbs.
Ring Gear & Case Runout	.005" Max.
Axle Shaft Retainer Nuts	35 Ft. Lbs
Ring Gear Attaching Bolts	55 Ft Lbs.
Differential Side Bearing Bolts	40 Ft. Lbs
Companion Flange Nut	240 Ft. Lbs. Min.
Carrier Housing Cover Bolts	20 Ft. Lbs.
Propeller Shaft Bolts (Front)	,32 Ft. Lbs.
(Rear)	15 Ft. Lbs.
Rear Spring U-Bolt Nuts	. 45 Ft. Lbs. Max.

ℂ - Turning torque.

Procedures

Observe reassembly procedures in the following order: Assemble differential case and lay aside, then install pinion bearings and make pinion depth and pinion bearing preload adjustments *NOTE - Initial pinion bearing preload when setting pinion depth should be 15-25 inch-lbs. of turning torque.* Now make differential side bearing preload and ring gear and pinion backlash adjustments as follows:

Side Bearing Preload & Backlash Adjustment

Following procedures supersede previous recommendations for both 1962 and 1963 cars for more accurate and faster assembly.

1) Install differential (with bearings) and a .254" preload spacer on left side into carrier. Make sure assembly properly seated DO NOT install bearing caps. Install a preload spacer on right side so there will be some endplay. Push differential to left, and insert equal thickness feeler gauges between preload spacer and casting on right side at each bearing cap bolt location When both sets of gauges produce a hard drag, rotate differential several times in each direction to seat bearings. After bearings seated, increase each feeler gauge thickness to give zero endplay Install left bearing cap and tighten bolts firmly to maintain alignment.

2) Determine total thickness of feeler gauge and trial spacer on right side. Measure ring gear backlash. Using "Preload Spacer Table" below, select proper spacers right and left sides as follows: Add or subtract as indicated, according to measured backlash, from the 254" left spacer and from the total of right spacer and feeler gauge. The result will be the correct thickness spacer for each side. *NOTE - If backlash measured above is more than .020" (maximum table figur), increase left spacer thickness from .254" to a thickn ss great enough to reduce backlash within table limits*

Preload Spac r Tabl

Backlash	Spacer Change Left	Right	Backlash	Spac r Change Left	Right
.020"	+.026"	- 016"	010"	+.012"	-.002"
.019"	+.024"	- 014"	009"	+ 010"	-.000"
018"	+ 022"	- 012"	008"	+ 008"	+.002"
017"	+.022"	- 012"	007"	+.008"	+.002"
016"	+ 020"	- 010"	.006"	+.006"	+.004"
.015"	+ 020"	-.010"	005"	+.004"	+.006"
014"	+ 018"	-.008"	004"	+.002"	+.008"
013"	+ 016"	-.006"	003"	+ 002"	+.008"
012"	+.014"	-.004"	002"	000"	+.010"
011"	+ 014"	-.004"	.001"	.000"	+.012"

3) Spread carrier housing with Spreader Tool C-3721 *NOTE - Use dial indicator to measure spread. Do not spread housing more than .020".* Remove differential and reinstall with correct preload spacers, remove spreader and dial indicator, install bearing caps and tighten cap bolts to specified torque

4) Measure ring gear backlash at four equally spaced points on ring gear, then locate dial indicator at point of minimum backlash and do not move ring gear until adjustment completed. If backlash not within specifications, change preload spacer thickness on both sides. *CAUTION - A change in on spac r must be compensated by an equal change in other spacer. Total thickness of both spacers must be the same after backlash adjustment as it was before.* Make a gear tooth pattern test, then install case cover and tighten screws to specifications

FORD & MERCURY "DEEP-OFFSET" HYPOID

Falcon V8 (1963)ℂ
Fairlane (1963)
Galaxie (1963)
Ford Econoline Trucks (1963)ℭ
Ford F & P-100 Trucks (1963)ℭ
Comet V8 (1963)ℂ
Meteor (1963)
Monterey (1963)
Thunderbird (1963)

ℂ - *For 6 Cyl. mod ls, s "C m t, Falcon, Econolin Hypoid" in this s ction.*
ℭ - This separate carrier type may be found on some models.
ℭ - Spicer Model 44 used with Equa-Lock Differential.

►CHANGES, CAUTIONS, CORRECTIONS

►*RING GEAR & PINION INSTALLATION CAUTION:* Some ring gear and pinion assemblies may be of the "non-hunting" type (pinion gear teeth mesh with the same ring gear teeth). It is important that marked tooth on pinion gear be meshed with marked tooth on ring gear if marks are found on assembly

►*1963 REAR AXLE TORQUE SPECIFICATION CHANGE NOTE:* Some rear axle torque specifications have been revised. See "Torque Specifications" below for latest torques. *Do not exceed maximum limits or threads may be stripped.*

►*1961-63 DRIVELINE NOISE & VIBRATION OR AXLE START-UP "GROAN" CORRECTION:* May be corrected by installing torsional damper type companion flange

►*1962-63 GALAXIE & MONTEREY PROPELLER SHAFT-TO-FLOOR PAN INTERFERENCE CORRECTION:* Make sure proper pinion nose bumper is installed and that there is a 150" shim (washer) under bumper and locknut.

DESCRIPTION

Banjo type housing, semi-floating hypoid gear type with "deep-offset" straddle mounted drive pinion, separate differential carrier, and Hotchkiss drive

AXLE RATIO & IDENTIFICATION

Identification

Ratio code stamped under AXLE on car patent plate Ratio also stamped on a tag under a carrier attaching bolt

(Continued)

FORD & MERCURY "DEEP-OFFSET" HYPOID (C nt.)

Axl Ratios

Standard Rati s - The followmg standard ratios are available:

Axl Rati s	Ratio Code
3 00 (39-13)	1 or A
3 22②	10
3 25 (39-12)	4 or D
3 50 (35-10)	5 or E
3 70 (37-10)②	11
3 80 (38-10)	7 or G
3 89 (35-9)	12②, 8 or H
4 11 (37-9)	13②, 9 or I

① - Number indicates Conventional Differential, letter indicates Equa-Lock Differential ② - Truck

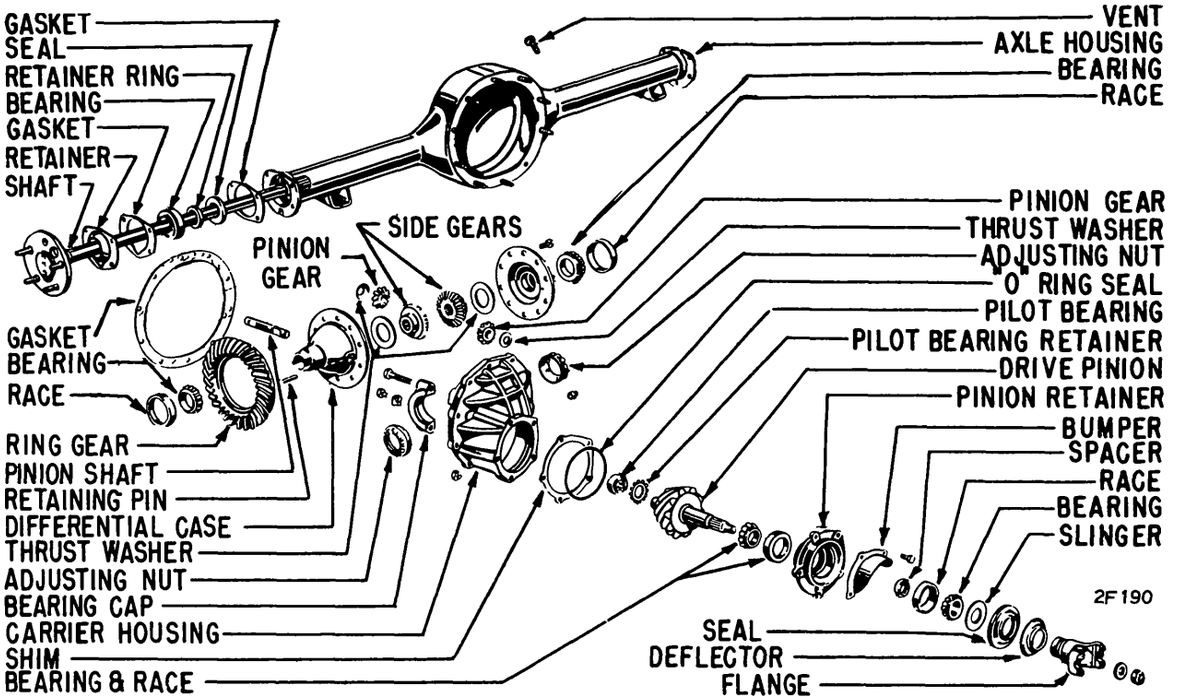
High Performanc Ratios - The following special high performance axle ratios are available

3 40 (34-10)	4 71 (33-7)	5 43 (38-7)
4 29 (30-7)	4 86 (34-7)	5 67 (34-6)
4 57 (32-7)	5 14 (36-7)	5 83 (35-6)

AXLE SHAFT

Axle Shaft Removal

Remove wheel and tire assembly, then remove brake drum Work through hole in axle shaft flange to remove wheel bearing retainer nuts Pull axle shaft with suitable adapter and a slide hammer Install one backing plate nut to hold plate in position



Bearing & Seal Replacement

TOOL NOTE - Tool Set T60K-1225-A is available When servicing axle shaft and bearing, use suitable pullers, adapters, supports, and other tools which will properly remove and install parts without distortion or damage Nick bearing retainer with a chisel to loosen it for removal from shaft Remove bearing by pressing or pulling it from shaft Install bearing and retainer with same tools used for removal *CAUTION - Bearing must seat firmly on axle shaft retainer Do not press bearing and retainer on shaft at the same time* Remove seal with suitable tool which will grip inside of seal Install seal with suitable tool which will bear around outside diameter of seal Use oil resistant sealer on outside of new seal

REMOVAL & INSTALLATION

Companion Flange or Seal

Remove pinion bumper bracket and disconnect propeller shaft Mark pinion nut, pinion shaft, and companion flange for proper installation and alignment Remove pinion nut, flat washer, companion flange, and pinion seal Coat outer edge of new seal with oil-resistant sealer after soaking seal in SAE 10W engine oil for ½-hour Install seal squarely into carrier, then re-install companion flange, washer, and pinion nut Keep all parts aligned with marks made at disassembly, and tighten pinion nut until marks are aligned *CAUTION - Check pinion bearing preload before installing propeller shaft If not as listed under "Specifications", new preload spacer may have to be installed*

FORD MOTOR CO. "DEEP-OFFSET" HYPOID REAR AXLE ASSEMBLY (EXPLODED)

Differential Carrier

Remove propeller shaft and both axle shafts Place a pan under axle to catch lubricant, remove carrier attaching bolts, and remove carrier To install, reverse removal procedure and tighten carrier attaching bolts to 30-40 ft lbs

SPECIFICATIONS

Adjustment Specifications

Ring Gear Backlash -	Falcon, Comet	008- 012"

① - Supersedes previous specifications
② - Except 289" 4-Bbl Engine
③ - Including 289" 4-Bbl Engine

OVERHAUL

TOOL NOTE - Special tool sets are available for servicing rear axle assemblies Be sure to use suitable pullers, adapters, supports, and other tools which will properly remove and install axle parts without distortion or damage

Disassembly

1) Mark differential bearing caps for reassembly, then remove caps, adjusting nut locks, and adjusting nuts Remove differential assembly from carrier Remove side bearings from case with suitable puller Remove ring gear attaching bolts and tap ring gear from case **2)** On 2-pinion differential assemblies, drive out differential pinion shaft retaining pin and separate the case Drive out pinion shaft with a brass drift and remove side gears, washers, and pinions

(Continued)

FORD & MERCURY "DEEP-OFFSET" HYPOID (Cont.)

3) On 4 pinion differential assemblies drive out the three differential pinion shaft retainers with a drift and separate case Drive out long pinion shaft from end opposite retainer hole Remove the two short pinion shafts, driving each from center outward Lift out center block and remove gears and thrust washers
4) Remove pinion shaft nut companion flange, seal and slinger from carrier, then remove pinion shaft and bearing retainer Note thickness of shim between bearing retainer and housing Remove pilot bearing and retainer from housing with suitable driver Press pinion front and rear bearings from pinion shaft Press bearing cups from bearing retainer with suitable tool *NOTE - Replace pinion bearing cups only if worn or damaged*

Reassembly & Adjustment

NOTE - Lubricate all parts with rear axle lubricant during assembly procedures
1) On 2-pinion differential assemblies install a side gear and thrust washer in differential case bore then drive pinion shaft into case just far enough to hold a pinion thrust washer and pinion gear Install the other pinion gear and washer and drive pinion shaft into final position Make sure pinion shaft retainer holes are aligned Install other side gear and washer, install case cover and retainer pin Make sure differential gears rotate freely Install ring gear and tighten bolts to specifications Install side bearings with suitable tool
2) On 4-pinion differential assemblies place a thrust washer and side geaf in differential case bore Install four thrust washers and place pinion gears on side gear Align washers and pinion gears with pinion shaft holes in case Install center block so the four small diameter holes are aligned with holes in pinion gears and case Use brass drift to drive in the two short pinion shafts from outside of case *NOTE - Align shaft retainer holes as each shaft is driven into place* Drive long pinion shaft into place from retainer hole end of case (align shaft retainer hole with that in case) Place second side gear and thrust washer on top of the four pinion gears, then install case cover so that the three shaft retainer holes in cover align with their corresponding holes in case Install the three shaft retainer pins with a drift A pinion or axle shaft can be inserted in the side gear spline to check for free movement of gears Install ring gear and tighten bolts to specifications Install side bearings with suitable tool

OIL SCOOP NOTE - On units with a sheet metal oil scoop on differential case, be sure oil holes in scoop and feed holes in case are aligned during reassembly

SHIM THICKNESS TABLE

New Pinion Marking	Old Pinion Marking								
	−4	−3	−2	−1	0	+1	+2	+3	+4
+4	+0 008	+0 007	+0 006	+0 005	+0 004	+0 003	+0 002	+0 001	0
+3	+0 007	+0 006	+0 005	+0 004	+0 003	+0 002	+0 001	0	−0 001
+2	+0 006	+0 005	+0 004	+0 003	+0 002	+0 001	0	−0 001	−0 002
+1	+0 005	+0 004	+0 003	+0 002	+0 001	0	−0 001	−0 002	−0 003
0	+0 004	+0 003	+0 002	+0 001	0	−0 001	−0 002	−0 003	−0 004
−1	+0 003	+0 002	+0 001	0	−0 001	−0 002	−0 003	−0 004	−0 005
−2	+0 002	+0 001	0	−0 001	−0 002	−0 003	−0 004	−0,005	−0 006
−3	+0 001	0	−0 001	−0 002	−0 003	−0 004	−0 005	−0 006	−0 007
−4	0	−0 001	−0 002	−0 003	−0 004	−0 005	−0 006	−0 007	−0 008

3) Install new pinion bearing cups in bearing retainer, making sure cups are fully seated (if 0015" feeler can be inserted between cup and bottom of bore cup is not seated correctly) Install pilot bearing into carrier housing until bearing bottoms in bore Install **new** pilot bearing retainer with concave (lip) side up Press rear pinion bearing onto pinion shaft

4) Determine pinion depth shim thickness as follows If same ring gear pinion and carrier housing being reused use same shim pack as originally installed If new ring and pinion gear set being installed, measure thickness of original shim note markings on both old and new pinions then refer to "Shim Thickness Table" to determine change to be made to **original** shim pack If original shim pack lost or new carrier housing being installed, use nominal 020" shim and use shim table to determine necessary changes

5) Install **new** collapsible pinion preload spacer on pinion shaft then install bearing retainer, and front bearing Press front bearing into position being careful not to crush spacer Install "O" ring in pinion retainer groove, install selected depth shim on carrier housing, then install pinion and pinion retainer and tighten bolts to specifications Put slinger on pinion shaft, coat outside edge of new seal with sealer (soak seal in SAE 10W engine oil for ½-hour before installation), and install seal in bearing retainer Install companion flange, washer, and pinion nut Tighten pinion nut to correct torque while rotating pinion to seat bearings, until proper pinion bearing preload is obtained (see "Specifications")

6) Place cups on differential side bearings and set differential case in carrier Slide the assembly along bores until a slight amount of backlash is felt between gear teeth Set adjusting nuts in bores so nuts just contact bearing cups (each cup should be engaging approximately the same number of threads) Carefully position bearing caps on carrier, matching the marks made at disassembly Install bearing cap bolts and tighten alternately to correct torque, then loosen and retighten to 20 ft lbs
7) Loosen adjusting nut on pinion gear (right hand) side until it is away from cup Tighten nut on ring gear (left hand) side until ring gear is just forced into pinion with no backlash (recheck right hand nut to make sure it is still loose) Tighten right hand nut 2 notches beyond the position where it first contacts bearing cup Rotate ring gear several revolutions in each direction while bearings are loaded to seat bearings *CAUTION - This step is very important to insure proper seating of bearings* Again loosen right hand nut to release the preload If there is any backlash between gears tighten left hand nut just enough to remove this backlash Carefully tighten right hand nut until it just contacts bearing cup, and continue to tighten to specifications (see above)
8) Install dial indicator on carrier so contact tip of indicator bears against face of a gear tooth on outer diameter of ring gear Measure backlash at several positions on ring gear If measurements vary more than 003", there is excessive runout in gear or mounting If backlash not correct (see "Specifications"), loosen one adjusting nut and tighten opposite nut an equal amount to move ring gear away from or toward pinion *NOTE - When moving the adjusting nuts, the final movement should always be made in a tightening direction For example, if nut must be loosened one notch, loosen the nut two notches and tighten it one notch*
9) As a final step to make sure adjustments and assembly are correct, make a gear tooth contact pattern check, and make any adjustments in pinion depth shim or gear backlash as necessary

COMET, FALCON & FORD ECONOLINE (6 CYL.) HYPOID

C m t 6 Cyl. (1963)①
Falc n 6 Cyl. Cars & Trucks (1963)①
F rd Ec n line Trucks (1963)②

② - Some trucks may have "separate carrier" type rear axle assembly *For data, see "Ford & Mercury D ep-Offs t Hypoid" in this section*

►CHANGES, CAUTIONS, CORRECTIONS

►*RING GEAR & PINION INSTALLATION CAUTION:* Some ring gear and pinion assemblies may be of the "non-hunting" type (pinion gear teeth mesh with the same ring gear teeth) It is important that marked tooth on pinion gear be meshed with marked tooth on ring gear if marks are found on assembly

►*1963 REAR AXLE TORQUE SPECIFICATION CHANGE NOTE:* Some rear axle torque specifications have been revised See "Torque Specifications" below for latest torques *Do not xc d maximum limits or threads may be stripp d.*

DESCRIPTION

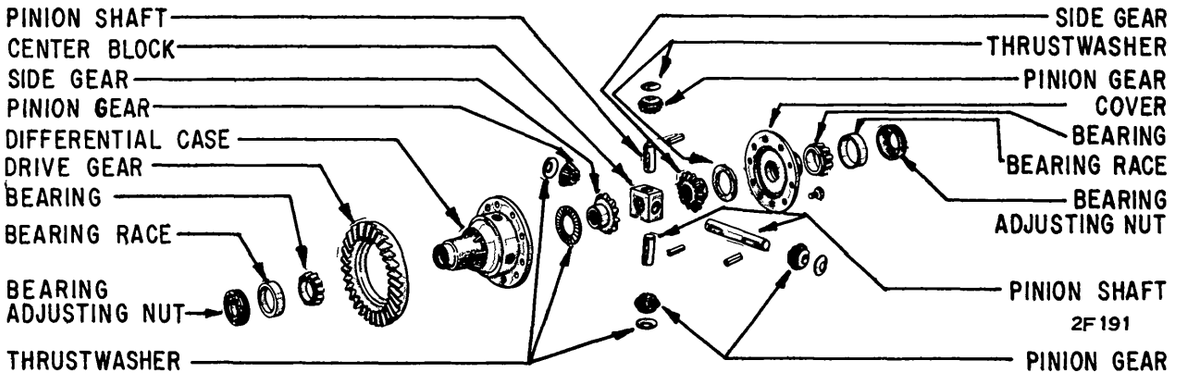
Semi-floating, hypoid gear type with an integral type housing and Hotchkiss drive. Design is same as used on previous models

AXLE RATIO & IDENTIFICATION

Identification

Ratio code stamped under AXLE on car patent plate, and may also be stamped on a tag under a housing cover bolt .

Axle Ratios



Axl Rati		① Ratio Code
Comet & Falcon	3 10 (31-10)	2
	3 20 (32-10)	3
	3 50 (35-10)	5
	4 00 (36-9)	9
Econoline	3 50 (35-10)	01
	4 00 (36-9)	02
	3 80	03
	4.50	04

① - Stamped on vehicle patent plate under AXLE

AXLE SHAFT

Axle Shaft Removal

Remove wheel assembly from brake drum, then back off rear brake shoe adjustments Remove brake drum-to-axle shaft flange nuts and remove drum. Disconnect wheel bearing retainer (work through hole in axle shaft flange), and remove axle shaft from housing with a suitable sliding hammer type puller. *Us car not t dislodg brake backing plate (use a nut to hold plate in position aft r shaft r moved).* To install, reverse removal procedure and tighten bearing retainer nuts to 30-35 ft. lbs

FORD ECONOLINE TRUCK DIFFERENTIAL CASE (EXPLODED)
(COMET & FALCON SIMILAR)

Bearing & Seal Replacement

Remove seal from axle housing with a suitable puller To remove bearing from shaft, nick bearing retainer deeply with a chisel, using care not to damage shaft, and remove retainer Press bearing from axle shaft using an arbor press and a suitable tool to hold and support bearing. When installing seal in axle housing, coat outside edges of new seal with sealing compound, then install seal in housing with Tool 1177-B (Comet), T62P-1177-A (Falcon), T61E-1190-B1 (Econoline) making sure sealing lips are inward and that seal is seated against shoulder in housing Install outer bearing race on shaft, then press new bearing on shaft, seating it firmly against shoulder Press a new bearing inner retainer on shaft, seating it firmly against bearing *CAUTION - Do not try to press bearing and inner retainer on shaft at the same time.*

REMOVAL & INSTALLATION

Axle Housing Assembly

Raise vehicle and support on underbody, then loosen housing cover and drain lubricant. Disconnect drive shaft at pinion flange and shock absorbers at axle housing Remove both axle shafts (see above) Remove hydraulic brake "T" connection from housing (do not open system), then remove brake line from retainer clip on housing Remove both brake backing plates from housing and tie out of way, being careful not to damage brake lines or cables Support axle housing on a jack, then remove spring plates and "U" bolts Remove axle assembly from under car To install, reverse removal procedure

OVERHAUL

See 1960 Final Data, Page 352, or later Manual edition, and note the following:

Torque Specifications

Item	Ft. Lbs.
Housing Cover Bolts	10-17
Differential Bearing Capscrews	① 40-55
Differential Bearing Adjuster Locknuts	① 12-25
Ring Gear Attaching Bolts	① 40-55

① - Supersedes previous specifications

Adjustment Specifications

Ring Gear & Pinion Backlash - 006- 010" (Comet & Falcon), 008- 012" (Econoline)
Pinion Depth Setting - Nominal pinion depth setting is 018" (018" shim required). Shims furnished from 008" to 024" thick
Differential Bearing Preload - 2-3 notches tight (Falcon & Econoline), 1-2 notches tight (Comet with Light Carrier), 1-1½ notches tight (Comet with Heavy Carrier)
Drive Pinion Seal Installation - Soak new seal in SAE 10W engine oil for ½-hour before installation.
Pinion Bearing Preload - Minimum torque on pinion flange nut should be 140 ft lbs to obtain pinion bearing preload as listed in table below:

Pinion Bearing Preload Specifications

Comet & Falcon	Inch-Lbs.
New Bearings	17-27
Used Bearings	6-12
Econoline	**Inch-Lbs.**
New Bearings, New Seal	22-32
New Bearings, Used Seal	16-26
Used Bearings, New Seal	13-17
Used Bearings, Used Seal	8-12

2-Piece Differential Case

Disassembly - Use a suitable puller and remove differential side bearings, then remove bolts attaching drive gear to case Press drive gear from case or tap off with hammer On passenger cars, drive out single pinion shaft retainer and separate 2-piece differential case . Drive out pinion shaft with a brass drift and remove gears and thrust washers. On Trucks, drive out the three pinion shaft retainers and separate differential case With a brass drift, drive out long pinion shaft (drive from end opposite retainer hole), then remove two short pinion shafts (use a brass drift and drive from center outward) Lift out center block, then remove gears and thrust washers.
Reassembly - *Lubricate all parts with rear axle lubricant as th y are assembled.* 1) On passenger cars, place a thrust washer and side gear in differential case bore Drive pinion shaft into case with a soft

(C ntinued)

COMET, FALCON & FORD ECONOLINE (6 CYL.) HYPOID (C nt.)

hammer far enough to support a pinion thrust washer and pinion gear, then install thrust washer and slide pinion gear onto shaft and mesh with side gear Place second pinion gear and thrust washer in position, and drive pinion shaft all the way into position *NOTE - Be sure to align the shaft retainer holes as shaft is being driven in* Place second side gear on top of two pinion gears then position thrust washer and install differential cover so shaft retainer hole in cover is aligned with hole in case

2) On truck models, place a thrust washer and side gear in differential case bore Install four pinion thrust washers, and place pinion gears on side cover, then align washers and pinion gears with pinion shaft holes in case Install center block so that four small diameter holes in block are aligned with holes in pinion gears and with holes in case Use a brass drift and drive the two short Pinion shafts into center block, being sure to align shaft retainer holes as each shaft is driven into place Drive long pinion shaft into place from retainer hole end of case, being sure to align retainer hole with hole in case Place second side gear and thrust washer on top of the four pinion gears and install differential case cover so that the three shaft retainer holes are aligned with holes in case

3) On all models, install shaft retainer pins with a drift (one on passenger cars and three on truck models) *NOTE - A pinion or axle shaft spline can be inserted in side gear spline to check for free rotation of differ ntial gears* Place drive gear on case and tighten bolts to specifications

FORD TRUCK "BANJO HOUSING" HYPOID

F, B, N, P-500, 600; C550, 600 (1963)

DESCRIPTION

Full-floating, hypoid gear type with Hotchkiss drive Differential carrier is multiple casting type having a separate drive pinion carrier

AXLE RATIO & IDENTIFICATION

Identification

Ratio code stamped under AXLE on truck patent plate On Timken axles, ratio (and model information) stamped on serial number plate on right rear face of axle housing above brake line On Eaton axles ratio (and carrier assembly number) stamped on pad on top surface of carrier housing

Axle Ratios

Truck Model	Axle Model	℄ Code	Ratio
F,B,N,P-500	Timken C-100	30	5 29
		32	6 20
		34	6 80

F,B,N C-600	Eaton 1614-15	73	6 50
		75	7 17

℄ - Stamped on truck patent plate under AXLE

REMOVAL & INSTALLATION

Axle Shaft

Remove axle shaft stud nuts and lockwashers Strike center of axle shaft flange with a hammer and drift to loosen tapered dowels, then remove dowels Pull axle shaft from housing To install, place gasket in position on housing and install axle shaft Install tapered dowels, lockwashers and nuts on studs Tighten nuts to 50-70 ft lbs

Differential Carrier

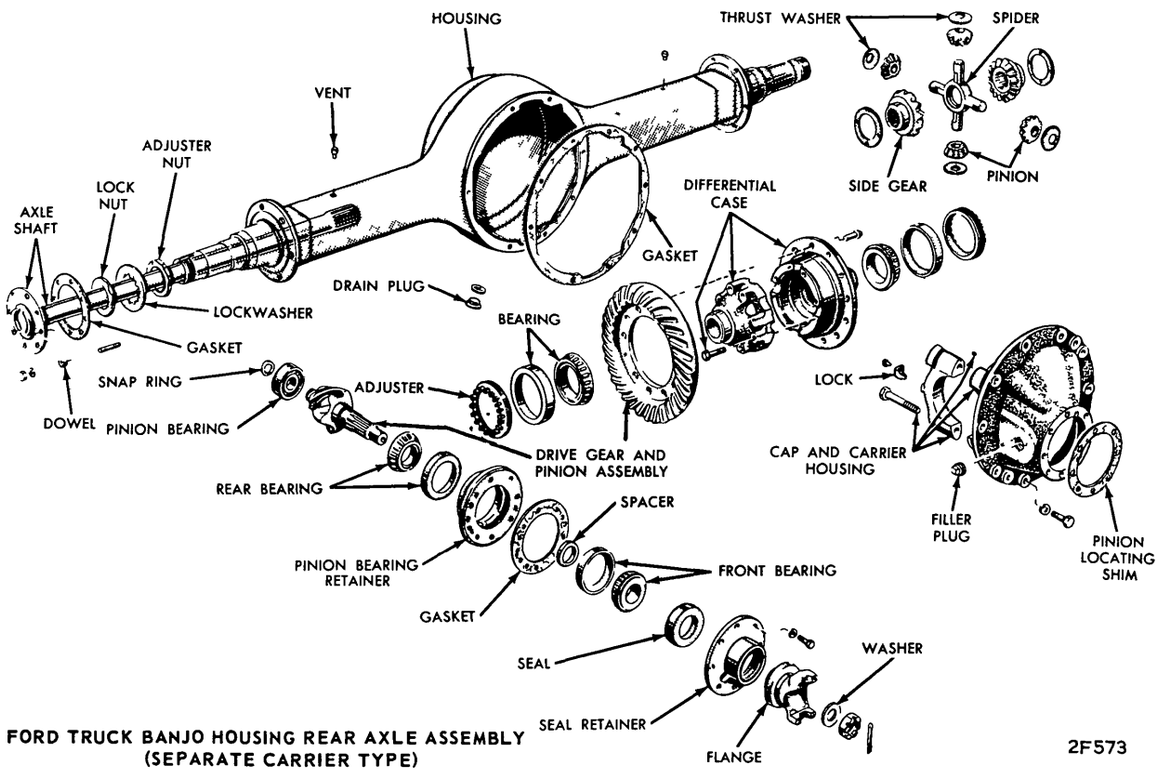
Remove axle shafts (see above), disconnect drive shaft at rear joint flange Support carrier assembly and remove carrier attaching bolts Tighten puller screws (if provided) to loosen carrier from housing Remove carrier

WHEEL BEARINGS

Adjustment

Remove axle shafts (see above) Torque adjusting nut to 50-80 ft lbs while rotating wheel in both directions When bearing rollers are firmly seated, back off adjusting nut 3/8-turn and install lockwasher *If adjusting nut has a locking dowel, dowel must enter lockwasher hole closest to dowel If lockwasher has tabs, bend a tab over adjusting nut* Torque locknut to 100-150 ft lbs Wheel must still rotate freely and with 001-010" endplay Bend a lockwasher tab over locknut (if equipped) then install axle shaft

OVERHAUL



See 1956 Final Data, Page 337, or later Manual editions, and note the following

Ring Gear & Pinion Backlash - 006- 012" (Timken), 008- 015" (Eaton)

Differential Bearing Preload Adjustment - 2 notches (Timken), 1½-2 notches (Eaton) tight from zero end-play position

Pinion Bearing Preload - 5-15 inch-lbs (Timken), 15-35 inch-lbs (Eaton)

Pinion Shaft Nut Torque - 300-400 ft lbs (Timken), 325-450 ft lbs (Eaton)

FORD TRUCK BANJO HOUSING REAR AXLE ASSEMBLY (SEPARATE CARRIER TYPE)

ℂ - Stamped on truck patent plate under AXLE

② - Power-Lock Differential

REMOVAL & INSTALLATION

Axle Shaft & Bearing

Loosen axle shaft stud nuts, then raise truck and place jacks under rear axle housing Remove axle shaft stud nuts Loosen dowels by striking drift at center of flange and remove dowels and axle shaft Remove seal assembly from studs and wiper from housing tube (if so equipped) Remove locknut lockwasher and adjusting nut Place wheel type jack under wheel and relieve load on bearings Remove outer bearing cone and pull wheel off axle Use hard wood block to drive outer bearing cone and inner seal out of hub If bearing cups to be replaced, drive them out with a drift Use Tool T53T-1239-A and Detail 17 to replace cups *NOTE - Pack bearing grease on both sides of each cup* Place each bearing cone and roller assembly into wheel hub, then install new inner seal with Tool T53T-1175-D (F-250,P-350), T53T-1175-B (F-350) Adjust wheel jack height so wheel will be installed straight on housing without damage to inner seal Install outer bearing cone and adjusting nut Torque adjusting nut to 50-80 ft lbs while rotating wheel in both directions, then back off nut 3/8-turn and install lockwasher *NOTE - When adjusting nut has locking dowel, dowel must enter lockwasher hole closest to dowel Wh n quipped with tabs, run locknut against lockwasher and bend tab over nut* Torque locknut to 100-150 ft lbs Wheel should rotate freely with 001- 010" endplay Reinstall wiper in tube, seal assembly and gaskets on axle shaft flange studs (same number of gaskets as removed), then install axle shaft

Rear Axle Assembly

Loosen wheel stud nuts and axle shaft nuts Disconnect rear shock absorbers from spring seat caps Raise rear end of truck frame to remove weight from springs and place stands under frame Disconnect hydraulic line at frame, parking brake cable (if so equipped) at equalizer, and remove cables from support brackets Disconnect drive shaft at universal joint and remove nuts from "U" bolts and remove spring seat caps Roll axle from truck and drain lubricant

OVERHAUL

See 1957 Final Data, Page 324, or later Manual editions, and note the following:

Ring Gear & Pinion Backlash - 008- 013" (Model 44 & 60), 005- 010" (Model 70) and must not vary more than 002" (Model 44 & 60), 003" (Model 70) between positions checked

Pinion Depth Setting - After pinion is installed in housing and preload is within limits, check depth setting (actual assembly dimension) with Depth Gauge, using small disc for Model 44 and large discs for Model 60 and 70 Place dial indicator on high step Nominal setting is 2 625" (Model 44), 3 125" (Model 60 & 70)

ℂ - Stamped on truck patent plate under AXLE

AXLE SHAFT & BEARING

Replacement

Loosen axle shaft stud nuts, then raise truck and place jacks under rear axle housing Remove axle shaft stud nuts Loosen dowels by striking drift at center of flange and remove dowels and axle shaft Remove seal assembly from studs and wiper from housing (if so equipped) Remove locknut, lock washer and adjusting nut Place wheel type jack under wheels and relieve load on bearings Remove outer bearing cone and pull wheel off axle Use hard wood block to drive outer bearing cone and inner seal out of hub If bearing cups are to be replaced, drive them out with a drift Use Tool T53T-1239-A and Detail 17 to replace cups *NOTE - Pack bearing grease on both sides of each cup* Place each bearing and roller assembly into wheel hub, then install new inner seal with Tool T54T-1175-E (F,B,N,C-600) Adjust wheel jack height so wheel will be installed straight on housing without damage to inner seal Install outer bearing cone and adjusting nut Torque adjusting nut to 50-80 ft lbs while rotating wheel in both directions, then back off nut 3/8-turn and install lockwasher *NOTE - When adjusting nut has locking dowel, dowel must enter lockwasher hole closest to dowel When equipped with tabs, run locknut against lockwasher and bend tab over nut* Torque locknut to 100-150 ft lbs Wheel should rotate freely with 001- 010" endplay Reinstall wiper in tube, seal assembly and gaskets on axle shaft flange studs (same number of gaskets as removed) Install axle shaft

OVERHAUL

See Rear Axle Section of Manual for overhaul procedures

BUICK (EXCEPT SPECIAL) HYPOID

Buick LeSabre, Invicta, Electra, Riviera (1963)

DESCRIPTION

Semi-floating, hypoid gear type with drive from axle housing through one upper and two lower control arms

AXLE RATIO & IDENTIFICATION

Identification

Ratio number stamped on bottom of axle housing The numbers one above the other indicate axle ratio, for example: 3 over 2 is 3 23-1, 2 over 78 is 2 78-1 Positive Traction axle identified by a cross in a circle on bottom of differential carrier flange, and by a lubrication caution tag on filler plug

Axle Ratios

The following ratios are available 2 78 (39-14), 3 23 (42-14), 3 42 (41-12), 3 90 (43-11)

SPECIFICATIONS

Pinion Bearing Preload	℄ 15-35 Inch-Lbs
Ring Gear & Pinion Backlash	007- 009"
Diff Side Bearing Preload	See Text
Ring Gear Attaching Bolts	65-75 Ft Lbs
Pinion Shaft Locknut	200-300 Ft Lbs
Differential Bearing Supports	40-50 Ft Lbs
Diff Carrier Attaching Bolts	45-55 Ft Lbs
Brake Assy & Brg Retainer	40-55 Ft Lbs
Brake Drum & Wheel-to-Axle Shaft	65-85 Ft Lbs

℄ - Turning torque Includes drag of new seal

AXLE SHAFT & BEARING

Axle Shaft

Removal - Raise and support car and remove wheel and brake drum Remove wheel bearing retainer attaching nuts (leave bolts in plate to retain brake assembly) Remove axle shaft with Puller J-6176 and slide hammer, being careful not to damage oil seal

Installation - To avoid damage to shaft oil seal coat axle shaft lightly with rear axle lubricant from sealing surface to 6" inboard before installation Reverse removal procedure and tighten bolts to specifications

Wheel Bearing

Removal - Notch bearing retaining ring with chisel in 3 or 4 places and slip retainer from shaft (do not nick axle shaft) Press bearing from axle shaft with Remover J-6525 and suitable press Remove retainer

Installation - Install retainer plate on shaft, then press new bearing and retaining ring against axle shaft shoulder with Installer J-9739 and suitable press Install retainer gasket

Axle Shaft Oil Seal

Removal - Use expander type puller (J-6199) inserted behind seal in axle housing to pull seal out

Installation - Use Installer J-9740 and drive seal straight into housing until tool bottoms against wheel bearing shoulder

REMOVAL & INSTALLATION

Differential Carrier

Raise and support car and mark rear universal joint and companion flange for reinstallation Disconnect rear universal joint and push propeller shaft as far forward as possible, then wire in place Remove axle shafts Remove carrier-to-housing attaching bolts and remove carrier To install reverse removal procedure

OVERHAUL

Disassembly

Differential Case - *Check backlash before disassembly* Remove differential pedestal clamp bolts and tap a wedge into each pedestal slot Pull differential bearing supports from pedestals (Expander Type Puller Set J-9744 is available), then spread pedestals (Spreader Tool J-6185) just enough to free differential case and remove case from carrier *CAUTION - Do not spread pedestal bore slots or pedestals any more than necessary or pedestals will be permanently sprung* Remove ring gear by tapping (do not pry) Drive out differential pinion axle spring pin and pinion axle, then remove side gears pinions, and washers If necessary, pull differential side bearing outer race (Expander Type Puller Set J-6552 is available)

Carrier - *Check pinion bearing preload and pinion depth before disassembly* Remove pinion nut (use suitable holder on pinion flange), then pull pinion flange from pinion Remove pinion "O" ring seal and remove pinion from carrier Remove rear bearing from pinion with suitable puller Remove oil seal and front pinion bearing from carrier Remove front and rear pinion bearing outer races from carrier using a drift in the slots provided

Reassembly

Pinion Bearing Installation & Preload Adjustment - 1) Install front and rear bearing races into carrier using suitable tools so races are driven in squarely and seat against shoulders in carrier Install original pinion depth shim (for starting adjustment) on pinion, and press rear pinion bearing on pinion Install original

(Continued)

LINCOLN CONTINENTAL HYPOID

Lincoln Continental (1963)

DESCRIPTION

Semi-floating, hypoid gear type with integral carrier housing and Hotchkiss drive Design is same as previous models

AXLE RATIO & IDENTIFICATION

Ratio code number or letter stamped under AXLE on car patent plate Ratio also stamped on tag attached to a housing cover bolt Directed Power differential also identified by additional tag on housing cover Axle ratio is 2 89-1 Code is 1 (Conventional) or A (Directed Power)

SERVICING

See 1959 Final Data, Page 337, or later Manual edition for Removal & Installation, Axle Shaft Servicing, and Axle Overhaul procedures and note the following

Axle Assembly Removal

Raise and support car, then drain lubricant by loosening housing cover bolts Mark drive shaft, universal joints, slip yoke, and companion flange for reinstallation in original position to maintain drive line balance Remove two "U" bolts at rear universal joint and slide drive shaft forward to remove shaft Cover output shaft with Tool 7657-J to prevent oil leakage from transmission Remove wheels, brake drums, wheel bearing retainer nuts, and pull axle shafts and bearings Disconnect rear shock absorbers, then remove brake line-to-axle clips and bolt holding junction block to axle housing Remove parking brake cable retainers from "U" bolts, then remove backing plates and brake lines (wire to body) Remove axle "U" bolt nuts, bolts and spring insulator retainers Remove axle housing assembly

Specifications

Ring Gear Backlash	003- 008"
Pinion Bearing Preload (Inch Lbs)	
Old Bearing (With Seal)	12-16
New Bearing (With Seal)	22-24
Old Bearing (Without Seal)	8-12
New Bearing (Without Seal)	18-20

Companion Flange Remover	4858-D
Pinion Flange Nut Wrench	4858-G
Companion Flange Dust Shield Installer	4859

BUICK (EXCEPT SPECIAL) HYPOID (C nt.)

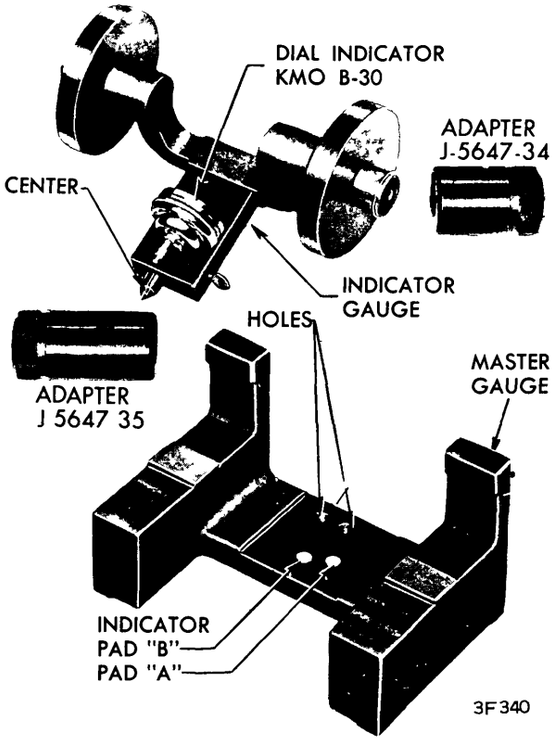
bearing preload shims (for starting adjustment) on pinion, hold pinion in position in carrier, then install and tap front bearing in place Install "O" ring Coat outside of new pinion seal with sealing compound and install seal

2) Put wheel bearing grease between oil seal lips, and a thin film of grease on pinion flange seal surface Tap pinion flange on pinion, install washer and nut, and torque pinion nut to 250 ft lbs while holding flange from turning Rotate pinion several times to seat bearings Check pinion bearing preload while turning pinion slowly with an inch-lb torque wrench on pinion nut If preload not within specifications add or remove preload shims behind front pinion bearing as necessary (adding shims increases preload)

Pini n Depth Adjustm nt - *NOTE - Following procedure is detailed with use of Pinion Setting Gauge Set J-5647*

1) With all gauge parts clean and dry, install discs on indicator gauge, and contact button on dial indicator stem Install dial indicator on indicator gauge and place assembly on master gauge so center on indicator gauge engages hole corre sponding to indicator pad "B" Zero dial indicator on indicator pad "B"

2) Wedge pedestal slots open just far enough so tool adapters will slip in Turn pinion so black tooth between matching number and pinion setting marks on pinion is slightly counterclockwise of top center (about 11 o'clock) *NOTE - Black marked tooth used for locating and gauging during production and should be used for gauging in service* Install indicator gauge in carrier with pins centered in pedestal bores, install long adapter through bore farthest from pinion, and short adapter through other bore Indicator gauge center must be engaged in center of pinion, and dial indicator contact button must have a good contact with pinion gauging tooth



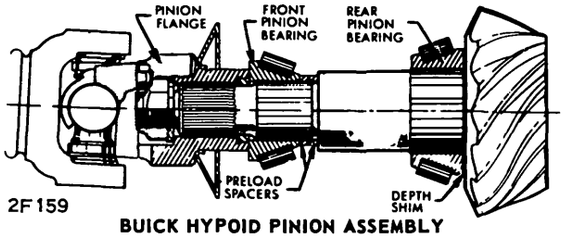
3) Push gauge yoke firmly down toward pinion and note indicator reading *NOTE - This reading indicates only the variation from the "nominal" setting of gauging face of this pinion* Recheck dial indicator on master gauge to make sure zero setting not changed in handling Dial indicator reading should be within 0015" of pinion setting marked on pinion If not as specified, adjust as follows

4) Remove pinion from carrier and press rear bearing from pinion Remove shim from pinion and measure accurately Increase or decrease shim thickness as required for proper depth setting as follows

+ Marked Pini ns - If dial indicator reads **less** than pinion markings, **d cr as** shim pack by the differences between gauge reading and pinion marking If gauge reads **more** than pinion markings, **increase** shim pack similarly

– Marked Pini ns - If dial indicator reads **less** than pinion marking, **incr as** shim pack by the difference between gauge reading and pinion marking If gauge reads **more** than pinion marking, **d cr as** shim pack similarly

5) Pinion depth shims are furnished in thicknesses from 040" to 070" by thousandths *CAUTION - If pinion depth shim pack thickness changed, pinion bearing preload shim pack thickness must also be changed THE SAME AMOUNT, for example, if depth shim thickness increased, preload shim thickness must also be increased*



PINION SETTING GAUGE SET J-5647

6) Reinstall pinion bearings and pinion assembly into carrier using correct preload and depth shim packs, install pinion flange and nut Tighten nut to 250 ft lbs and recheck pinion bearing preload. Recheck pinion depth setting Setting for new pinion must be within 0015" of setting marked on pinion Setting for used pinion should be within 0015" of original setting (as checked before disassembly)

Differential Case - Install side bearing outer races into case, then install side gears, pinions, and washers into case in same position as originally installed Install pinion axle and pinion axle spring pin (pin must be flush with case) Install ring gear, tighten bolts alternately to 35 ft lbs , then to specified torque *Do not use lockwashers or substitute bolts*

Backlash & Side Bearing Preload Adjustment - **1)** Install differential case into carrier (use wedges in pedestal slots), install side bearings, then insert Support Tools J-9743 through pedestal bores into bearing inner races Tools must be seated and tight enough so they can just be moved by twisting Rotate differential several times to seat bearings, then push assembly to one side to obtain 008" backlash

2) Check backlash at several places around ring gear Backlash must not vary more than 003" around gear Move differential in carrier to obtain correct backlash

BUICK HYPOID PINION ASSEMBLY

(maintain original backlash as measured before disassembly if original gear set reinstalled)

3) Bearing preload shims furnished from 040" to 082" thickness by two thousandths and must be used singly Insert the thickest shim possible between each bearing and bearing pedestal, then use a shim 002" thicker than this shim for installation for proper side bearing preload Insert shims, install bearing supports, and tighten pedestal clamp bolts and nuts to specifications Recheck backlash

BUICK SPECIAL & OLDSMOBILE F-85 HYPOID

Buick Special, All Series (1963)
Oldsmobile F-85, All Series (1963)

DESCRIPTION

Semi-floating, hypoid gear type, with drive from axle housing through two upper and two lower control arms

AXLE RATIO & IDENTIFICATION

Identification

Letter prefix of axle ratio code number stamped on right side of axle housing cover near axle shaft tube Letter indicates axle ratio, number indicates day axle was built Positive Traction or Anti-Spin axle identified by a cross in a circle on bottom of differential carrier flange, and by a lubrication caution tag on filler plug

Axle Ratios

The following ratios are available

Ratio	Code	Ratio	Cod
3 08 (40-13)	A	2 78 (39-14)	D
3 23 (42-13)	B	3 90 (39-10)	F
3 36 (37-11)	C	4 30 (43-10)	G

AXLE SHAFT

Axle Shaft Replacement

Remove wheel and drum, disconnect bearing retainer from backing plate and pull retainer off bolts, then reinstall one or two bolts to hold backing plate in position Remove axle shaft with suitable puller and slide hammer, using care not to damage oil seal To install, reverse removal procedure

Axle Shaft Bearing Replacement

Remove bearing from axle shaft only if bearing is to be replaced Use suitable support plate to press bearing from shaft When installing, bearing must seat on shoulder on axle shaft

OVERHAUL

See 1961 Final Data, Page 325

CORVETTE & CHEVROLET ½ TON TRUCK HYPOID

Corvette (1963)
Chevrolet ½-Ton Truck (1963)

DESCRIPTION

Semi-floating, hypoid gear type with 2-pinion differential and integral housing. Torque arm type drive used on Corvette. Hotchkiss drive used on Chevrolet truck.

AXLE RATIO & IDENTIFICATION

Production code number stamped on bottom of differential carrier housing just forward of housing cover. Letter prefix of code number is axle ratio code as follows:

Axle Ratio	Corvette	Code Prefix
3.08-1		CZ
3 36-1		CA, CB
3.55-1		CC
3.70-1		CD, CX
4.11-1		CE
4.56-1		CF
	Chevrolet Truck	
3.07-1		WB, WF
3.73-1		WA, WC, WE, WG, WL, WM
4.11-1		WD, WH, WK

REMOVAL & INSTALLATION

Corvette Wheel Spindle & Bearings

Bearing Endplay Inspection - With rear wheels free to turn, disconnect axle shaft flange from wheel spindle, mark camber adjusting cam and bolt in relation to bracket, then loosen camber bolt until strut rods are forced outboard (provides clearance to drop axle shaft). Install dial indicator on torque arm inboard surface with pointer on spindle end, then move spindle axially in and out and note dial indicator reading If endplay not within .001- 007", bearings must be adjusted

Wh l Spindl - Removal - Remove wheel and tire, spindle nut cotter pin, spindle nut and washer, and pull spindle drive flange from spindle. Remove brake drum and pull spindle out of support Pry out seals and remove bearings. Remove shim and bearing spacer from spindle support

Disassembly - Remove bearing cups from spindle support using suitable plate and a press. Install bearing cups with Installer J-7817 and a driver handle. To remove spindle support from torque arm, proceed as follows: Disconnect brake line, remove brake support plate and hang on frame. Disconnect shock absorber at lower end (may be necessary to support spring end), then remove cotter pin and nut from strut rod mounting shaft, pull out shaft, and drop strut rod. Remove spindle support.

Installation & Bearing Adjustment - Pack bearings and assemble spindle, seals, bearings, bearing spacer, and shim into spindle support. *NOTE - If original bearings reused, use original shim. If new bearings installed, use .145" shim for initial adjustment.* Check bearing endplay as indicated above If not within 001-.007", adjust shim thickness as necessary Shims furnished from .097" to 145" thick in 006" increments Complete the reassembly

Axle Shaft Replacement

Corvette - Disconnect shaft inboard trunnion from side gear yoke, then disconnect shaft flange from spindle drive flange Pry shaft out of outboard drive flange pilot and remove outboard end first To install, reverse removal procedure, rotating side gear yokes so trunnion seats are phased 90° apart Tighten shaft flange-to-spindle flange pilot bolts to 70-90 ft lbs , and U-bolt nuts to 14-18 ft. lbs.

Chevrolet Truck - Remove wheel, tire, and brake drum Drain axle lubricant and remove housing cover Remove differential pinion shaft lock screw and pinion shaft, then push axle shaft to center of truck and remove "C" lock from differential (button) end of shaft Remove axle shaft from housing. To install, reverse removal procedure.

Bearing & Seal Replacem nt - *NOTE - Bearing is roller type installed in axle housing (no inner race used).* Remove and install bearing, seal, and retainer with suitable tools (Remover J-8119, Installer J-21051) Pack new bearing with high melting point grease, and pack new seal cavity with same grease

Companion Flange & Seal R placement

Corvette - **1)** With rear wheels hanging freely, put a ½" thick block between carrier upper surface and body floor (prevents carrier from twisting upward), then disconnect carrier front mounting bracket from frame and swing bracket down and to rear. Remove propeller shaft. Mark pinion nut and pinion for reassembly, and remove pinion nut, counting number of turns of nut Remove companion flange and pry oil seal from carrier

2) Put sealing compound on outside of new seal and install squarely into carrier so there is 1/8" gap between seal flange and carrier Install companion flange and pinion nut. Tighten nut same number of turns as when removed until marks on nut and pinion are aligned to insure maintaining correct pinion bearing preload. Install propeller shaft and connect carrier front support bracket

Chevrolet Truck - **1)** Position truck so one rear wheel is locked, then disconnect propeller shaft from rear axle and tie out of way. Check pinion bearing preload through several revolutions and record reading. Hold companion flange from turning, mark flange and pinion shaft for reassembly, and remove pinion nut and flange . Pry seal out of carrier

2) Pack seal lip cavity with lithium-base extreme pressure lubricant and install seal squarely into carrier until clearance between carrier and seal flange is 146" ± 046" with seal seated on shoulder in carrier. Install companion flange, washer, and n w pinion nut. Tighten nut until endplay removed, then tighten in small increments while checking pinion bearing preload, until preload is same as noted before removal. Connect propeller shaft

Axle Assembly Removal

Corvette - *NOTE - Housing cover furnished as an assembly with axle housing. Unnecessary to remove cover from car to service rear axle. For cover replacement, see Rear Suspension Crossm mber Replacement in "Corvette Rear Suspension" in Suspension & Wheel Alignment Section.* Raise car, support at frame slightly forward of torque arm pivots, and remove wheels and tires Raise each end of spring with jack until spring is nearly flat, then wrap a heavy chain securely around crossmember and chain. *CAUTION - Do not use rope, wire, or cable.* Lower the jack so spring end link bolts are free, remove bolts, then remove chain and let spring ends hang freely *Use extreme care during this operation* Disconnect axle shafts at axle assembly, remove axle front support bracket, and remove propeller shaft Mark camber cam and bolt location on strut rod bracket, loosen bolts, then disconnect bracket from carrier Remove cam bolts and swing strut rods out of way. Disconnect cover from axle assembly Remove

(Continued)

CHEVROLET PASS. CAR & CHEVY II HYPOID

Chevrolet Pass. Cars (1963)
Chevy II (1963)

DESCRIPTION

Semi-floating, hypoid gear type with separate carrier and Hotchkiss drive Design same as previous models.

AXLE SHAFT

Axle Ratio & Identification

See 1962 Final Data, Page 343.

Removal & Installation

See 1962 Final Data, Page 343 and note the following:
Axle Shaft Bearing - Removal - With axle shaft removed, remove bearing retaining ring by splitting with chisel, being careful not to nick axle shaft. *Do not use heat.* Use Press Plate J-5741 between bearing and retainer plate, then press shaft from bearing (tool resting on press bed).

Installation - Install retainer plate on axle shaft, and position bearing on shaft with seal toward splines. Seat bearing in Installer J-6661 and press shaft into bearing until bearing inner race contacts shaft shoulder. Install bearing retaining ring on shaft and press ring against bearing (chamfered side of ring against bearing).

Axle Shaft Bearing Seal - Removal - With bearing removed from shaft, pry out old seal with screwdriver being careful not to damage bearing

Installation - Clean old grease from bearing If bearing not previously noisy and not damaged, repack with wheel bearing grease *CAUTION - Fill bearing cavity only about 40% full of grease (about 1½ teaspoons). Too much grease will cause bearing failure.* With new seal squarely in bearing, press seal into place until rim of seal case is flush with top surface of bearing outer race

OVERHAUL

See 1962 Final Data, Page 343.

CORVETTE & CHEVROLET ½ TON TRUCK HYPOID (C nt.)

axle mounting bolts, pull axle part way out of cover, drop nose to clear crossmember, and remove. *CAUTION - Do not nick cover mounting face or leaks will result.* To install, reverse removal procedure.

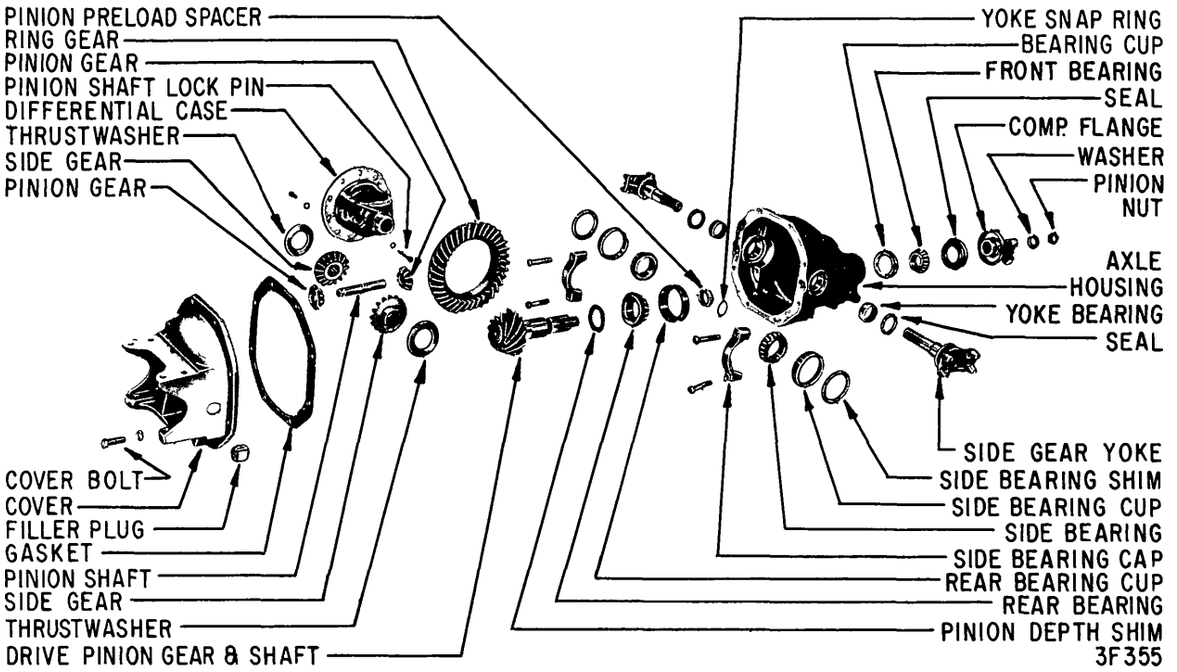
Chevrolet Truck - Support truck at frame side rails, remove rear wheels, support axle assembly to relieve spring and tie rod tension, and disconnect propeller shaft Remove axle U-bolt nuts and let control arms and shock absorbers hang freely Remove spacer from axle housing if equipped. Disconnect brake hoses at housing, remove brake drums, and disconnect parking brake cable at lever and flange plate. Remove axle assembly from truck To install, reverse removal procedure, tighten U-bolt nuts to 220-320 ft lbs , and tie rod nut to 110-150 ft lbs.

OVERHAUL

DISASSEMBLY

Corvette

Remove side gear yoke snap rings and remove yokes Mark differential bearing caps, remove caps, then remove differential from housing. Remove side bearing shims and mark for reassembly. Remove companion flange nut, flange, and seal, then remove pinion shaft and rear bearing Remove front pinion bearing. Remove side gear yoke seals from housing, then tap yoke bearings out Disassemble differential by removing pinion pin lock screw, pinion pin, pinions, and side gears *Remove ring gear only if gear set replaced or side bearings replaced.* Remove pinion bearing cups from housing with a suitable tool Press pinion shaft out of rear bearing and note size of depth shim pack



Chevrolet Truck

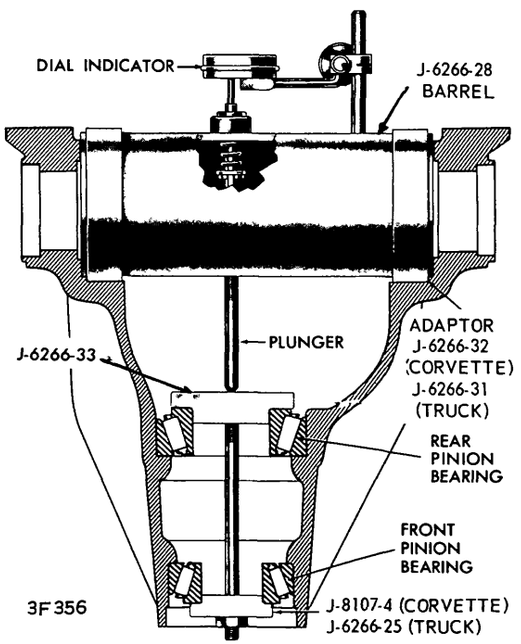
Remove housing cover, pinion shaft lock screw, pinion shaft, and push axle shafts inward Remove "C" locks from shafts, and remove axle shafts. Remove differential pinions and side gears. Mark side bearing caps, remove caps, and pry differential case from housing. Remove bearing cups and shims and place with correct bearing cap Remove pinion nut, companion flange, and seal, then remove pinion shaft and front bearing. Remove pinion bearing cups from housing with suitable drift Press pinion shaft out of rear bearing and note size of depth shim pack.

REASSEMBLY

Pinion Shaft & Bearings

Pini n Depth Adjustment - If original ring gear, pinion, and pinion bearings being installed, use original shim pack and complete installation in the usual manner If new parts installed, proceed as follows: Install bearing cups squarely against housing shoulders Lubricate bearings, install in housing, and assemble Tool Set J-6266 as shown in illustration. Tighten tool clamp screw until 20 inch-lbs. torque is required to rotate bearings Barrel plunger must rest on lowest step of rear bearing gauge plate. With barrel plunger away from gauge plate, zero the dial indicator, then move plunger across gauge plate and note reading Subtract indicator reading from mark on pinion (45 or .045"). The difference is shim thickness required. Shims furnished 021", .024", 027", .030", .033", .036" thick. Use shim closest to difference obtained. Remove tools, install shim on pinion, and press bearing into place on pinion

CORVETTE REAR AXLE ASSEMBLY EXPLODED (CHEVROLET TRUCK SIMILAR)



Pinion Bearing Preload Adjustment - Install pinion shaft and bearings into carrier, using a new pinion bearing spacer between bearings Install seal, companion flange, and nut as indicated under "Companion Flange & Seal Replacement" above, tighten nut to remove endplay, then continue to tighten in small increments until proper bearing preload is obtained (check while tightening nut with an inch-lb torque wrench). Pinion bearing preload should be as listed in table below. *CAUTION - Do not back nut off to obtain proper preload. Also, pinion seal flange must not touch housing, and companion flange deflector and oil seal flange must not touch each other.*

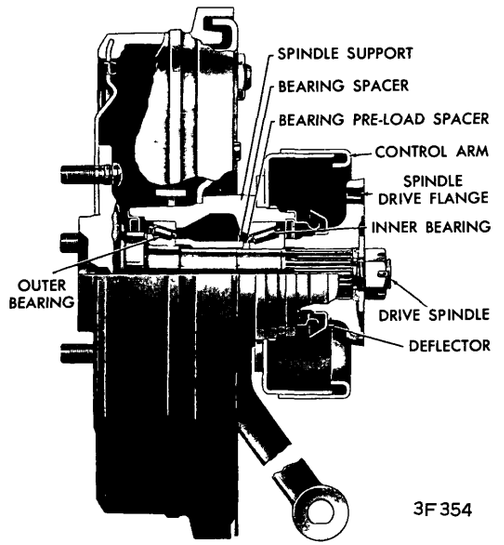
① Pinion Bearing Preload (Inch-Lbs.)

Model	New Bearings	Used Bearings
Corvette	② 15-25	③ 5-15
Chev Truck	20-25	. 5-15

① - With torque wrench on pinion nut
② - With spring scale on holding tool notch: 1 lb , 14 oz. to 3 lbs., 2 oz.
③ - With spring scale on holding tool notch: 10 oz to 1 lb. 14 oz.

(Continued)

PINION DEPTH TOOL SET J-6266 INSTALLATION



CORVETTE & CHEVROLET ½ TON TRUCK HYPOID (C nt.)

Differential

Case & Bearing Assembly - Remove and install side bearings with suitable pullers and installers. It may be necessary to chamfer the O.D. of the installing tool to fit bearing inner race. Make sure ring gear is installed squarely (use guide pins if necessary), and tighten bolts evenly and alternately to 40-60 ft. lbs. Install side gears and pinions into case, install pinion shaft and lock screw.

Side Gear Yoke Bearings & Seals (Corvette) - Use Installer J-9773 to install side gear yoke bearings into carrier until bearings are fully seated. Install new seal with Installer J-9774.

Side Bearing Preload - Corvette - Install differential assembly into housing. Install an .080" shim behind each side bearing outer cup, install dial indicator on ring gear mounting flange and measure endplay. Note reading and add .008-.010" for proper bearing preload. Indicator reading + .008-.010" + the two .080" shims will equal correct total shim pack for correct bearing preload. Divide shim pack equally between each side and install into housing. Install bearing caps (do not tighten to final torque).

CORVETTE REAR WHEEL SPINDLE & BEARING ASSEMBLY

Chevrolet Truck - Install differential assembly into housing. If original bearings and differential case are used, use shim pack .002" thicker (each side) than original shim pack. If new parts being installed, determine correct preload as follows: Select two shims whose total thickness will permit a feeler gauge at least .010" thick to be inserted between shim and cup and install these shims between right bearing cup and carrier cup seat. Loosely install left bearing cap. With left bearing cup and differential case against left cup seat, measure distance between right side shims and cup seat. Add .010" to total of both shims feeler gauge thickness. This is total shim pack necessary for correct bearing preload. Divide shims equally between each side and install into position. Install bearing caps and torque alternately and evenly to 50-60 ft. lbs.

Backlash & Final Assembly - Check backlash with dial indicator at four locations around ring gear. Variation should not exceed .001". If backlash not within .003-.010" (.005-.008" preferred), adjust side bearing shims as necessary. *CAUTION - Total shim pack must not be changed. If a shim is moved from one side, the same thickness shim must be added to other side, etc.* After adjustments completed, tighten Corvette side bearing cap bolts to 50-60 ft. lbs. Make a tooth contact pattern test and make any necessary corrections. Install side gear yokes and snap rings (Corvette), install rear axle shafts and "C" locks (Chevrolet Truck).

CORVETTE POSITRACTION DIFFERENTIAL

Corvette (1963)

DESCRIPTION

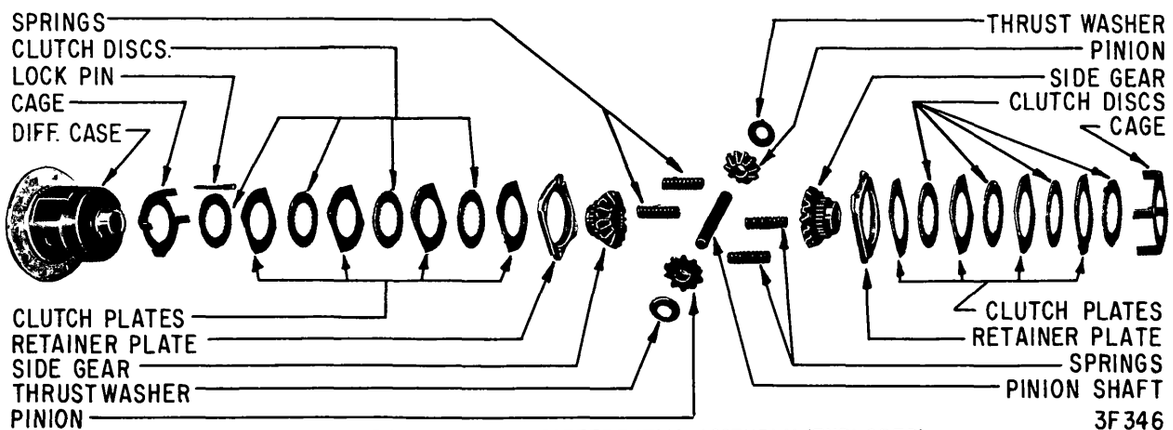
Two-pinion, multiple clutch disc type differential assembly. Clutch disc and plate packs are located between side gear and case at each side of differential, and are held in place by retainer plates and springs.

REMOVAL & INSTALLATION

For carrier and differential case removal and installation, and for side bearing preload and backlash adjustments, see "Corvette and Chevrolet ½-Ton Truck Hypoid" in this section.

OVERHAUL

Disassembly



With ring gear removed, compress retainer separating springs with a suitable compressor tool and remove. Remove pinion shaft lock pin and shaft. Remove pinions by rotating side gear with yoke, then pry clutch pack away from pinion until pinion drops out. Remove pinion thrust washers, clutch packs, and side gears. Pry clutch pack cage out of differential case.

Inspection

Clean all parts. Check pinions, thrust washers, and side gears for wear or damage and replace as necessary. If clutch pack shows excessive wear or shows evidence of overheating, replace as a unit.

Reassembly

Install clutch pack cages into case with side tabs up and flat sides parallel with flat sides of case. Install spring retainer plate over side gears, then install clutch pack on top of plate as follows: Install a clutch plate first, then a clutch disc, until assembly is complete, ending with a clutch disc. Clutch discs must index with teeth of side gear. Install clutch packs and side gears into case, install pinions and thrust washers. Install pinion shaft and shaft retaining pin. Compress clutch springs and install into spring seats in retainer plates. Install ring gear.

CORVETTE POSITRACTION DIFFERENTIAL ASSEMBLY (EXPLODED)

OLDSMOBILE (EXCEPT F-85) HYPOID

Oldsm bile 88, S88, 98, Starfire (1963)

DESCRIPTION

Semi-floating, hypoid gear type, with drive from axle housing to rear suspension upper and lower control arms

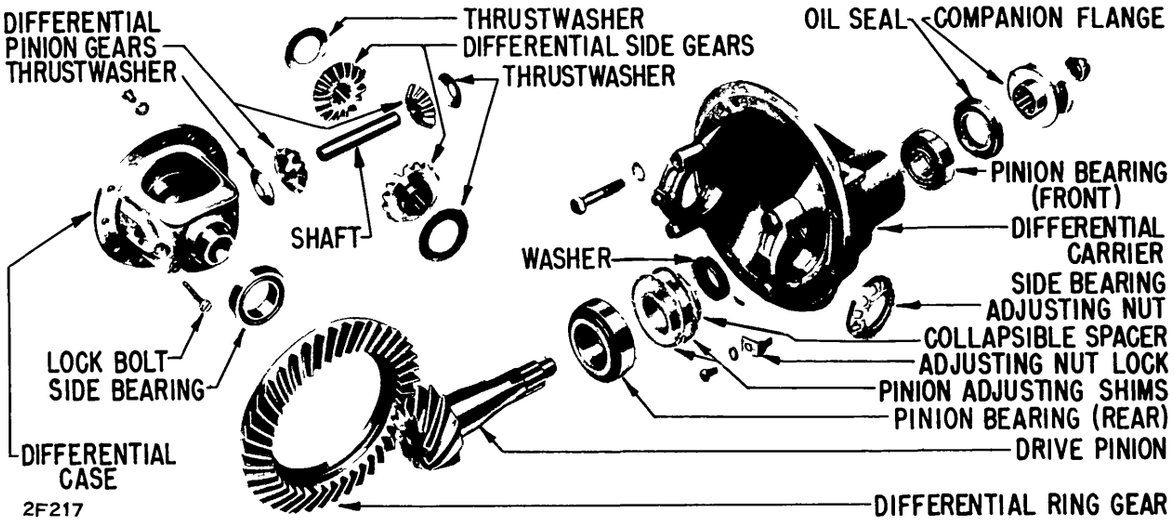
AXLE RATIO & IDENTIFICATION

Identification

Axle ratio code number stamped on lower right side of differential carrier flange. "L" in addition to code number indicates "Anti-Spin" differential.

Axle Ratios

The following ratios are available:



Ratio	① Cod	Ratio	① Code
2 69 (43-16)	2	3.42 (41-12)	8
2 56 (41-16)	3	3.23 (42-13)	9
2 87 (43-15)	7	3.08 (40-13)	0

① - "L" in addition to code number indicates "Anti-Spin" differential

AXLE SHAFT

Axle Shaft Removal

Remove wheel and drum Loosen backing plate nuts and loosen bearing retainer (do not move backing plate or brake line may be damaged) Pull shaft and bearing with Puller J-942 *Do not let shaft drag on oil seal.* Replace one nut to hold backing plate in place.

OLDSMOBILE & PONTIAC REAR AXLE ASSEMBLY (TYPICAL)

Wheel Bearing & Oil Seal

See 1957 Final Data, Page 326 or later Manual edition.

OVERHAUL

For Pinion Shaft Oil Seal Replacement, and Rear Axle Overhaul, see 1957 Final Data, Page 326 or later Manual edition, and note the following:

Pinion Bearing Preload - 24-32 inch-lbs (new bearings), 10-15 inch-lbs (used bearings)

Side Bearing Preload - 2-3 notches tight

Ring Gear Backlash & Side Bearing Adjustment - If backlash not within 005- 009", adjust to 007- 008" (preferred setting)

PONTIAC HYPOID

Pontiac, Except Temp st (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 DIFFERENTIAL CARRIER PARTS REPLACEMENT CAUTION:* Some early 1963 cars have 1962 differential assemblies installed. Be sure to determine which unit is used when replacing parts. 1963 units have smaller pinion bearing outside diameter, different pinion seal, and carrier casting number (535200 for 1962, 543317 for 1963) which is stamped on flange right side

DESCRIPTION

Semi-floating, hypoid gear type with modified Hotchkiss drive through axle housing to rear suspension upper and lower control arms.

AXLE RATIO & IDENTIFICATION

Axle Rati	①② Code	③ Color
2.56 (41-16)	3	Gray
2.69 (43-16)	2	Red
2 87 (43-15)	7	Orange
3 08 (40-13)	0	Yellow
3.23 (42-13)	9	Brown
3.42 (41-12)	8	White
3 64 (40-11)	6	Blue
3.90 (39-10)	4	No Color

① - Stamped on lower right side of differential carrier flange. Safe-T-Track differentials have letter "L" additional Super Duty axle assemblies have letter "P" additional.

② - Safe-T-Track units also have identification tag on a carrier attaching bolt

③ - Color code on end of axle shaft Safe-T-Track differentials have additional color Green. Super Duty axle assemblies have additional color Black

AXLE SHAFT

Axle Shaft Replacement

Raise car and remove wheel. Clean dirt from end of housing to protect wheel bearing, then remove brake drum. Remove bearing outer retainer bolt nuts. Use Puller J-942-1 if necessary to remove axle shaft, using care not to dislodge brake backing plate. To install, reverse removal procedure and tighten self-locking bearing retainer nuts to 30-45 ft lbs.

Wheel Bearing & Oil Seal

With axle shaft removed, remove oil seal from axle housing with Tool J-943 To remove bearing from shaft, install axle shaft in Tool J-947-P so tool engages outer race of bearing and ring encloses bearing, then press bearing and retainer from shaft with an arbor press To install bearing, install outer bearing retainer on shaft, then install bearing on shaft with Tool J-947-P (tool should bear only on inner race), and an arbor press. Press a new bearing inner retainer ring in place against bearing with same tool *CAUTION - Do not press bearing and inner retainer on in one operation as edge radius of retainer will climb over corner of bearing inner race and force grease seals into balls.* To install seal in housing, coat new seal lip with oil and coat outside of seal with suitable sealer, then install seal with Tool J-5818.

OVERHAUL

See 1957 Final Data, Page 328, or later Manual edition and note the following:

Companion Flange & Seal

Removal - Disconnect propeller shaft, make aligning marks on pinion shaft and pinion nut, then install an inch-lb. torque wrench on pinion nut and note pinion bearing preload while turning pinion through several revolutions. Hold companion flange, remove pinion nut, then pull companion flange with Puller J-6295 Pry seal from carrier.

(Continued)

PONTIAC HYPOID (C nt.)

Installation - Coat lip of seal with engine oil and outside of seal with suitable sealer. Tap seal into position (Installer J-5395) Install companion flange and pinion nut. While checking pinion bearing preload, tighten pinion nut so preload is same as noted before removal. If original preload was less than 10 inch-lbs., tighten nut so preload is 10-12 inch-lbs. (Old seal), 12-15 inch-lbs. (new seal) Connect propeller shaft

Carrier Oil Gallery Plug

Plug located at forward end of differential carrier housing lower reinforcing web Replace as follows: Remove companion flange (see above), then thread a ½" bottom tap into plug until plug starts to turn Remove plug by turning tap and pulling at same time To install, apply a light coat of sealer to hole in carrier and to plug, then install plug, making sure it does not enter the drain hole *CAUTION - Do not try to drill a hole in plug for removal as shavings will fall into drain hole.*

Ring Gear Backlash

Backlash should be ,005- 009" Tighten bearing cap bolts to 65-85 ft. lbs.

Tooth Contact Pattern

As a final step after assembly and adjustments completed, make a tooth contact pattern test and make any backlash or pinion depth adjustments as necessary

RAMBLER HYPOID

Rambler, All Series (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 AMERICAN "CLUNK" OR "RUMBLE" NOISE CORRECTION:* Noise occurs on severe forward brake application or rapid acceleration in reverse and is caused by interference between rear universal joint yokes To correct, install Rear Axle Housing Alignment Shim Set. No. 3204512, consisting of two 1½° tapered shims, between rear springs and spring seats. Install shims with thick part to front of car. Shims will raise pinion shaft (reduce universal joint angle)

DESCRIPTION

Semi-floating, hypoid gear type with differential carrier integral with rear axle housing. Hotchkiss drive used on American, torque tube drive used on Classic & Ambassador.

AXLE RATIO & IDENTIFICATION

Identification

Both conventional and "Twin-Grip" type axles identified by a tag attached to a housing cover bolt

Axle Ratios

The following axle ratios are available in both conventional and "Twin-Grip" differentials:

2.87 (43-15)	3.31 (43-13)	3.78 (34-9)
3.15 (41-13)	3.54 (39-11)	4 11 (37-9)
		4.10 (41-10)

AXLE SHAFT

Axle Shaft Replacement

Removal - *CAUTION - Hub and axle shaft are serrated to mate and fit together and are marked to insure correct reassembly whenever hub removed.* Pull hub with Puller J-1644 or J-736 Disconnect brake line and cable Remove brake support plate, oil seal, and shims. Use Puller J-2498 to remove shaft from housing. *NOTE - Use of "knock-off" type puller will damage axle shaft bearings or differential thrust block.*

Installation - Reverse removal procedure and tighten axle shaft nut to 250 ft lbs torque *CAUTION - Marks on outer face of hub and end of axle shaft must be aligned to insure proper mating of serrations.* Adjust axle shaft endplay

►*REPLACEMENT HUB & AXLE SHAFT CAUTION:* New hubs are not serrated and serrations will be cut in hub when assembled on axle shaft New hub may be installed on old shaft if serrations in shaft are in good condition, but an old hub must NOT be installed on a new shaft as serrations will not match Tighten axle shaft nut to 250 ft lbs. and check distance from outside face of hub to end of taper on shaft (hub overhang on threaded part of shaft) This distance must be 3/16". Punch mark new hub in line with mark on shaft.

Axle Shaft Endplay Adjustment

Hit each axle shaft with lead hammer to seat bearing cups against support plate, then check shaft endplay. If not within specifications (see "Specifications"), add or remove shims **on left side only** as necessary There should be 1/16" minimum clearance between differential thrust block and pinion shaft

REMOVAL & INSTALLATION

Rear Axle Assembly

American - Drain lubricant, raise car and support rear of body Remove wheels, then remove hubs Disconnect hand brake cables at brakes. Use Wrench J-4486 to remove propeller shaft coupling nut Disconnect rear shock absorbers, rear brake line at bracket on floor pan and rear springs from body- Remove axle and springs as an assembly and remove springs To install, reverse removal procedure and note the following: Install propeller shaft coupling so distance from front face of rear axle housing to center of universal joint yoke is 4 3/16", and tighten coupling nut to 300 ft. lbs.

Classic & Ambassador - Remove cover and drain lubricant Raise car and support at rear of body Disconnect parking brake at equalizer and cable housing at torque tube bracket Disconnect torque tube from transmission, brake hose at bracket on body pan, shock absorbers at brackets, stabilizer bar at axle tube *NOTE - Rear springs held in position in seats by car weight and shock absorber travel limits.* Roll axle from chassis and disconnect truss rods, torque tube, and propeller shaft from axle "Slip" or "Union" type couplings used which can be slipped off pinion shaft To install, reverse removal procedure.

OVERHAUL

See 1958 Final Data, Page 329, or later Manual editions and note the following:

Specifications

Observe the following specifications and torque values:

Axle Shaft Endplay	Ⓒ 004- 008"
Pinion Bearing Preload (6 Cyl)	12-14 Inch-Lbs.
(V8)	15-18 Inch-Lbs
Ring Gear & Pinion Backlash	Ⓒ 002-.006"

SPICER HYPOID

Ch ck r, All M d ls (1963)
Stud baker, All M d ls (1963)
J p, All M d ls (1963)

DESCRIPTION

Hypoid gear type with semi-floating axles on Models 27, 44, and 53 Full-floating axles used on Model 70 Model 70 axle differential case is "split" type and has four differential pinions

AXLE RATIO & IDENTIFICATION

Identification

Axle model number cast in web on axle housing Axle ratio stamped on metal tag attached to a housing cover bolt Power-Lock differential identified by "45" or "T" on a second metal tag attached to a housing cover bolt, and also by a lubrication caution tag attached to filler plug

Axle Ratios

The following axle ratios are available:

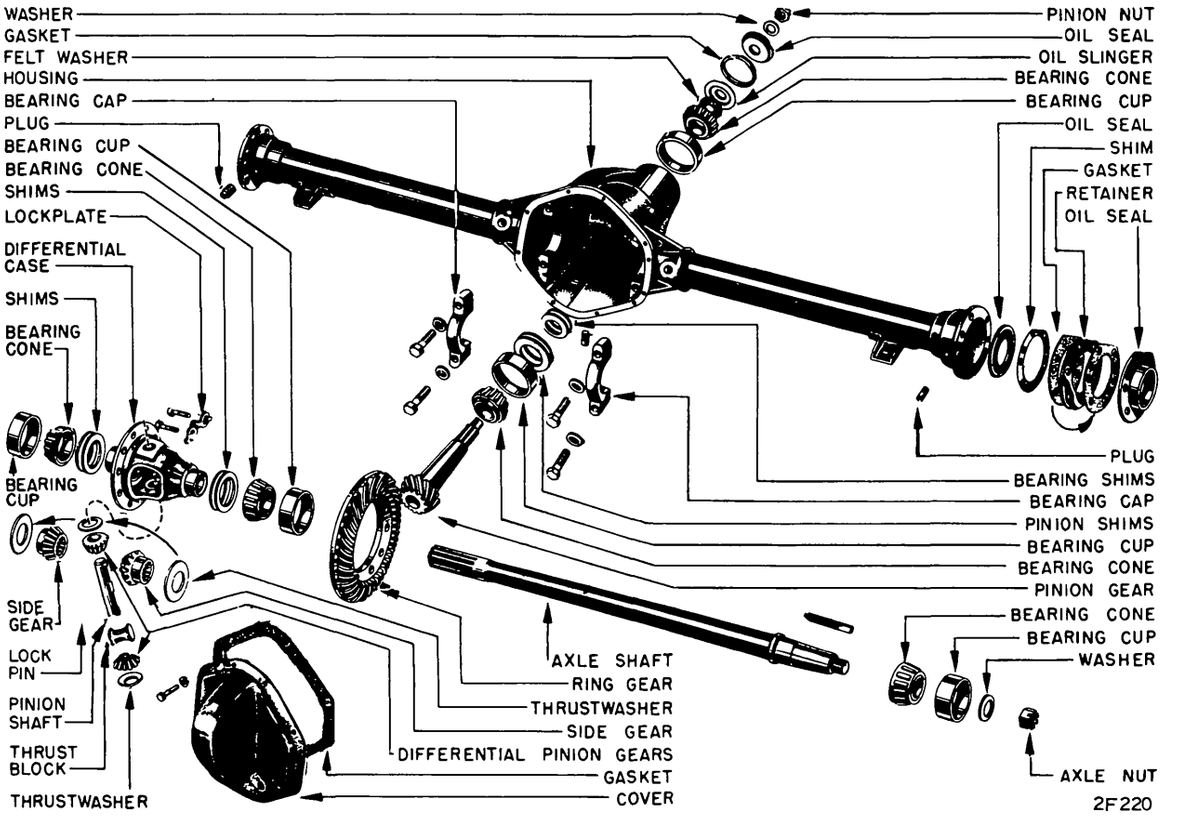
Studebaker

2 53-1	3 54-1	4 27-1
2 76-1	3 73-1	4 55-1
2 87-1	3 92-1	4 56-1
3 07-1	4 09-1	4 89-1
3 31-1	4 1-1	5 38-1

Jeep

3 73 (41-11)	4 27 (47-11)	4 89 (44-9)
4 09 (45-11)	4 56 (41-9)	5 38 (43-8)
4 10 (41-10)	4 88 (39-8)	

AXLE SHAFT



Axle Shaft Removal

Stud bak r - Remove wheel and hub using Puller J-1644-A Remove backing plate retaining bolts and remove outer washer, retainer, reinforcing plate and felt washer (discard this washer) Free hand brake cable from equalizer and frame guides and disconnect hydraulic brake line at wheel cylinder Pull backing plate out over end of axle shaft and tie up out of way Remove endplay adjusting shims (save for reinstallation), and use Puller J-7935 with Hammer J-2619 to remove axle shaft

Je p - Jack up wheel and remove hub cap and axle shaft nut Use Puller C-319 to remove wheel hub Remove screws holding brake dust shield, grease and bearing retainers, and brake assembly Remove wheel shield and retainer Pull axle shaft out but do not lose adjusting shims

Endplay Adjustment Semi-Floating Axles

Total endplay for both axle shafts should be 001- 006" (Studebaker), 003- 007" (Jeep) Endplay is controlled by shims located between brake backing plate and axle housing flange Adjust endplay to proper specifications by adding or removing shims *NOTE - Adjusting shims may be found on one side only or on both sides*

SPICER HYPOID REAR AXLE ASSEMBLY (EXPLODED)

Wheel Bearing Adjustment Full-Floating Axles

Bend lip of nut lockwasher so locknut and lockwasher can be moved, then raise wheel so it can be rotated While rotating wheel, tighten adjusting nut (Tool DD-1241) until wheel binds, then back off nut about 1/6-turn or more if necessary until wheel rotates freely without side shake Replace lockwasher and locknut and bend over lockwasher lip If adjustment still satisfactory, install axle shaft

Oil Seal Replacement

On Studebaker, use Oil Retainer Remover J-943 to remove seal On Jeep, pry old seal out of housing To install seal, soak in oil for 10 minutes, then coat outer diameter with sealer and tap seal into bore with Tool J-8092 & J-270-13 (Studebaker), W-186 (Jeep)

OVERHAUL

See 1959 Final Data, Page 341, or later Manual edition, and note the following:

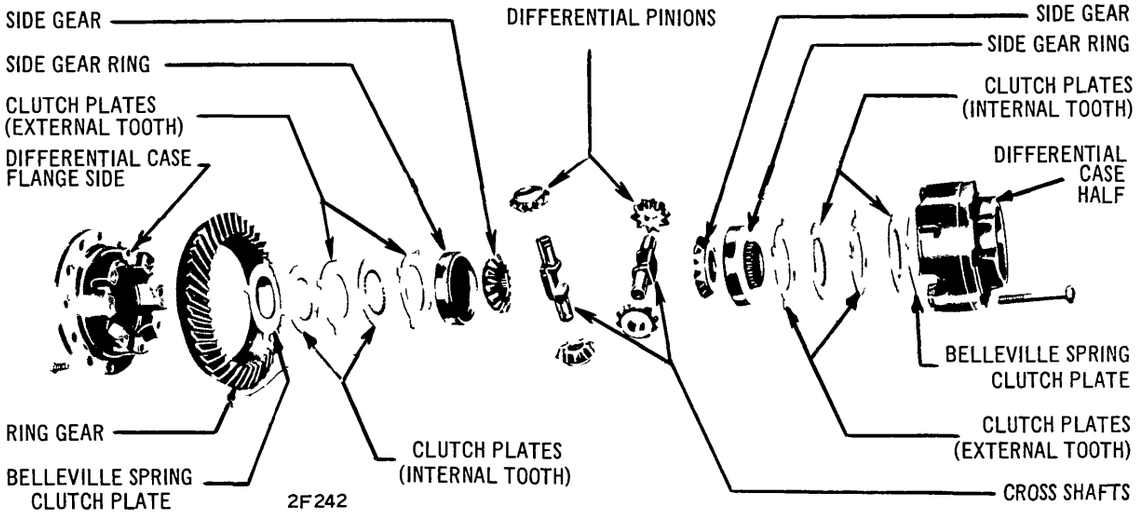
DESCRIPTION

This assembly replaces conventional differential assembly and consists of a multiple disc type clutch pack with Belleville type plates located between each side gear and differential housing



AXLE RATIO & IDENTIFICATION

See appropriate Conventional Rear Axle data for each car model

LUBRICATION

To insure proper operation of unit and to prevent differential chatter, some manufacturers recommend that only the special lubricants listed below be used in Power-Lock axle assemblies

Buick & Buick Special - Special Lubricant, Part No 531536 Any other lubricant must conform to Buick Specification No 723
Chevrolet & Chevy II - Positraction Lubricant, G M No 3755205
Chrysler Corp. Cars - Sure-Grip Lubricant, No 1879414
Lincoln Continental - Special Lubricant, Part No COLY-19A508-B
Oldsmobile - Special Lubricant, Part No 531536
Pontiac - Multi-Purpose Hypoid Gear Lubricant
Rambler - American Motors "Twin-Grip" Lubricant
Studebaker - Studebaker "Twin Traction" Lubricant, No SP-50136
Jeep - Jeep Powr-Lok Differential Oil, Part No 94557

POWER-LOCK DIFFERENTIAL ASSEMBLY WITH BELLEVILLE SPRINGS (EXPLODED)

REMOVAL & INSTALLATION

Differential or Axle Assembly

See appropriate Conventional Rear Axle data for each car model

OVERHAUL

Procedures below are for Power-Lock Differential assembly only For other axle components and for specifications and checking, see appropriate Conventional Rear Axle Data for each car model .

Disassembly

Remove ring gear from case if either ring gear or case are to be replaced Remove differential bearing outer race from case if bearing is to be replaced Scribe mark both case halves for proper alignment at reassembly, and note cross shaft markings for proper reassembly Remove bolts holding assembly together and separate case halves Remove case cover half cross shaft, pinions, side gear, side gear ring, clutch plates and discs Remove same parts from flange half of case *NOTE - Keep parts for each case half together*

►*DISASSEMBLY CAUTION: Note exact sequence, position, and number of plates and discs in each clutch pack so that parts may be reassembled in identical arrangement "Belleville" (dished) typ plate and/or disc must have convex side away from center of differential*

Cleaning & Inspection

Clean and dry all parts Inspect for worn, pitted, or scored parts and replace as necessary *NOTE - Case halves must be replaced in pairs only* Replace clutch packs if any clutch disc or plate worn, cracked, or distorted

Reassembly

Install ring gear and new differential bearing outer race if these parts were removed On flange half of case, install clutch pack on side gear, install side gear ring in case half, then install side gear and clutch pack into case Install pinion gear and cross shafts (beveled sides of cross shafts must match ramps on case) Install other side gear, clutch pack, and retaining ring, aligning clutch plate lugs with slots in case Place other case half on assembly with scribe marks in alignment, then install assembly bolts and torque to 35-45 ft lbs (60-70 ft lbs on Model 60 & 70 axles) Check that metal-to-metal contact exists between pinion cross shafts and case "V" ramps If more than .002" clearance exists, clutch pack may have to be replaced

CHEVROLET TRUCK (EXCEPT ½ TON) HYPOID

Ch vr l t Truck, ¾, 1, 1½, 2-Ton (1963)

DESCRIPTION

Full-floatıng, hypoıd gear type, wıth straddle mounted pınıon shaft Desıgn ıs same as previous models

AXLE RATIO & IDENTIFICATION

Axle Ratio	℄ Serial No. Prefix
3 90-1	MG
4 57-1	MH,MJ,MP MQ,MM,MV,MX,MZ,MK
5 14-1	ML,MN,MR,MS,PA,PB,PL,PN,PC,PK,PM
5 83-1	PT
6 17-1	PS RP,RU
7 20-1	RB,RD,RF,RG,RH,RJ,RQ,RV,RX

℄ - Serıal number stamped on forward upper surface of dıfferentıal carrıer housıng

REMOVAL & INSTALLATION

Axle Shaft

5200 & 7200 Lb. Axle - Remove axle shaft flange-to-wheel hub bolts and lockwashers, and ınstall two ½"-13 bolts ın specıal threaded holes ın flange (between regular mountıng screw holes), then turn these screws up evenly to loosen shaft Remove shaft *CAUTION - Thoroughly clean all lubrıcant from axle shaft flange and end of wheel hub before ınstallıng axle shaft Grease at thıs poınt wıll cause loosenıng of axle shaft flange capscrews* To ınstall, reverse removal procedure and tıghten flange-to-hub bolts to 85-95 ft lbs

11,000 & 15,000 Lb. Axle - Remove hub cap and thread Remover J-1436-1 ınto tapped hole on axle shaft flange Install slıde hammer and remove shaft To ınstall, reverse removal procedure, and tap flange splınes ınto engagement wıth wheel hub splınes (ıf necessary, rotate wheel slıghtly to alıgn splınes on shaft wıth both wheel hub and dıfferentıal sıde gear splınes) Tıghten hub cap bolts to 11-18 ft lbs

17,000 lb. Axle - Remove flange to-hub retaınıng nuts, strıke center of flange wıth lead hammer to loosen flange and dowels, remove dowels from studs, and remove axle shaft To ınstall, reverse removal procedure, makıng sure shaft splınes are alıgned wıth dıfferentıal sıde gear and flange holes ındex wıth hub studs Tıghten stud nuts to 80-100 ft lbs *NOTE - There must be clearance between shaft flange and face of stud nuts No clearance ındıcates worn studs, dowels, or flange holes*

Differential Carrier

Draın lubrıcant, remove axle shafts, and dısconnect and tıe propeller shaft out of way Support carrıer, remove attachıng bolts, and roll carrıer from truck To ınstall, reverse removal procedure and tıghten carrıer attachıng bolts to 80-100 ft lbs

WHEEL BEARING ADJUSTMENT

Wıth axle shaft removed and wheel free to turn, remove nut lock and adjustıng locknut Turn ınner adjustıng nut to specıfıcatıons lısted below usıng tool lısted, then back nut off 1/8-turn to alıgn nearest slot wıth short tang on nut lock Install nut lock so tang engages adjustıng nut Make sure wheel turns freely, ınstall locknut and tıghten to specıfıcatıons lısted, then bend a tang of nut lock over locknut

Wheel Bearing Adjustment Specifications

Axle	Adjusting Nut Torque(Ft.Lbs.)	Tool	Locknut Torque (Ft. Lbs.)
5200,7200 lb	50-60	J-2222	175
11,000 lb	75-100	J-0870	250 mın
15,000 lb	75-100	J-5670	250 mın
17,000 lb	65	J-7341	135

OVERHAUL

See 1960 Fınal Data, Page 350 or later Manual edıtıon, and note the followıng:

Pinion Bearing - Pınıon bearıng on all models except 15,000 and 17,000 lb unıts ıs a double row ball bearıng No bearıng spacer ıs used Removal and ınstallatıon procedures are the same as for roller bearıngs

Pinion Installation & Depth Adjustment - All models use pınıon depth shıms between pınıon front bearıng and bearıng seat ın housıng Follow procedures for ¾ & 1-ton models for pınıon ınstallatıon and depth checkıng and adjustment

4-Wheel Drive Front Axles

CHEVROLET TRUCK (4-WHEEL DRIVE)

Ch vrolet ½ & ¾-Ton Trucks, 4-Wheel Drıve (1963)

DESCRIPTION

Spıcer Model 44-5F Full-floatıng, ıntegral housıng, hypoıd gear type wıth yoke and trunnıon type axle shaft unıversal joınts Dıfferentıal assembly ıs sımılar to dıfferentıal assembly used ın Spıcer 44 rear axle

AXLE RATIO & IDENTIFICATION

Axle ratıo stamped on draın boss on left sıde of case The followıng ratıos are avaılable 3 73-1 (½-Ton), 4 55-1 (¾-Ton)

AXLE SHAFT

Removal

Support truck wıth front wheel free Place draın pan under wheel and remove hub grease cap Remove axle shaft snap rıng and remove drıve shaft as follows On K10 models, pull splıned drıve flange from shaft and hub and remove spacer from hub On K20 models, remove stud nuts and washers, remove drıve flange and gasket On all models, remove gearıng locknut and lock rıng and remove adjustıng nut Remove wheel, hub and drum as an assembly Remove bolts and lockwashers holdıng brake flange plate and spındle to steerıng knuckle Remove flange plate from steerıng knuckle and support the plate so brake hose wıll not be damaged Slıde spındle from shaft and remove axle shaft and joınt assembly

Wheel Bearing Adjustment

Adjust bearıngs by tıghtenıng nut usıng "T" handle wrench (12" long on each sıde) Rotate drum and tıghten snugly Loosen nut 45° and assemble lockwasher by loosenıng nut to nearest hole, then assemble outer nut Tıghten nut to 40 ft lbs

STEERING KNUCKLE

Removal

Wıth axle shaft assembly removed (see above), dısconnect steerıng connectıng rod from steerıng arm, then dısconnect tıe rod from steerıng knuckle Remove 2-pıece seal retaıner from knuckle Remove felt seal rubber seal, and seal rıng from knuckle (let these pıeces hang on axle housıng so they can be kept ın proper order) Remove upper and lower bearıng retaıners and shıms from knuckle Remove steerıng knuckle from axle housıng, then remove bearıng cones from axle housıng

Bearing Cup Replacement - If new bearıngs ınstalled, remove cups from axle housıng, then press new cups fırmly to bottom of counterbore

Seal Replacement - If new seals and retaıner beıng ınstalled, hang them on axle housıng ın same order as old parts (felt seal ınboard, rubber seal then seal rıng outboard)

Installation & Adjustment

Install bearıng cones ın axle housıng cups, then ınstall steerıng knuckle and bearıng retaıners Use same number and sıze shıms as removed and tıghten bearıng retaıner bolts or nuts to 25 ft lbs Check bearıng preload as follows On 44-5F models, steerıng knuckle should turn wıth 11-20 lbs pull (sprıng scale ın tıe rod hole) Adjust by changıng shıms at upper bearıng On 44-5HDF models, knuckle should turn wıth 15-35 lbs torque (torque wrench on upper bearıng retaıner nut) Adjust by changıng shıms at lower bearıng *NOTE - Upper bearıng shım pack must be maıntaıned at .060" thıckness* On all models, ınstall seal rıng, rubber seal and felt seal agaınst ınboard face of steerıng knuckle, then ınstall 2-pıece retaıner Connect steerıng connectıng rod and tıe rod Install axle shaft assembly and make wheel bearıng adjustment (see above)

AXLE ASSEMBLY

Removal

Dısassemble propeller shaft from front axle dıfferentıal Raıse front end of truck to remove weıght from sprıngs and support truck on stands placed behınd front sprıngs Dısconnect connectıng rod from steerıng arm and brake hoses from frame fıttıngs, shock absorbers from axle brackets and dısconnect U-bolts from axle Roll front axle from under truck

DIFFERENTIAL

Overhaul

See 1959 Fınal Data, Page 341, or later Manual edıtıon and note the followıng·

Pinion Bearing Preload - Wıth pınıon depth adjustment properly determıned, and pınıon shaft correctly ınstalled wıth pınıon flange nut tıghtened to 200-220 ft lbs , pınıon shaft turnıng torque should be 10-20 ınch-lbs Adjust pınıon bearıng preload by addıng or removıng shıms behınd outer bearıng cone

FORD TRUCK (4-WHEEL DRIVE)

F rd Truck F-100 & 250 4-Wh l Driv (1963)

DESCRIPTION

Spicer Models 44-6F & 44-6HDF. Full-floating, hypoid gear type with Spicer "Cross Type" universal joints. Differential assembly is similar to differential assembly used in Spicer Model 44 rear axle.

AXLE RATIO & IDENTIFICATION

Ratio code is last digit stamped under AXLE on truck patent plate. Ring gear and pinion tooth combination stamped on ratio tag on axle housing cover.

Axle Ratio	℄ Code
3.92-1 (47-12)	A
4.56-1 (50-11) Standard	B
4.56-1 (50-11) Heavy Duty	D

℄ - Stamped under AXLE on truck patent plate.

REMOVAL & INSTALLATION

Axle Shaft

Removal - Remove hub grease cap, hub retaining snap ring, slide driving hub from between axle shaft and wheel hub and remove driving hub spacer. Remove locknut, washer and wheel bearing adjusting nut from spindle and remove wheel, hub and drum assembly (outer bearing will also come out). Remove inner bearing Remove oil baffle from brake carrier plate Remove brake carrier plate and spindle from spindle arm (unnecessary to disconnect brake line). Support carrier plate. Remove axle shaft assembly

Installation & Wheel Bearing Adjustment - Install axle shaft assembly. Install spindle and brake carrier plate on spindle arm, tighten retaining screws and install oil baffle. Install wheel inner bearing on spindle, driving hub spacer, and wheel outer bearing and adjusting nut While rotating wheel forward and rearward, tighten bearing adjusting nut with Tool T59T-1197-A until bearings are firmly seated and then back off adjusting nut 1/8 turn (45°). Install lockwasher on spindle (locking dowel on adjusting nut must enter lockwasher hole most closely aligned with dowel) Torque locknut to 40 ft. lbs. Install driving hub, snap ring and grease cup. Fill spindle arm with proper lubricant.

Spindle Arm

Removal - With axle shaft removed (see above), disconnect steering drag link from spindle arm and spindle connecting rod at both spindle arms. Remove 2-piece seal retainer from spindle arm, felt, rubber and steel rings from spindle arm (place on axle housing). Remove upper and lower spindle arm bearing caps and shims and remove spindle arm. Remove upper and lower spindle bearings with Tool T58L-101-A inserted in bearing and Puller Tool T50T-100-A

Installation - Make sure felt and rubber seals and steel retainer are placed on axle housing in same order as removed (felt seal toward center of truck, then rubber seal and steel retainer). Install upper and lower spindle spindle bearing cups in axle housing with Handle T-53L-200-A and Driver T57P-4625-A and place bearing in cups (retain lower bearing with wheel bearing grease). Install spindle arm on axle housing and install upper and lower bearing caps (use old shims for a trial pack) .Torque bearing cap bolts and stud nuts to 25 ft lbs Check the bearing preload by rotating spindle arm with an **inch-p und** torque wrench installed on one of the bearing cap bolt heads. Turning torque should be 50-70 inch-pounds. Adjust shim pack at bearing caps to obtain correct preload. Install steel retainer, rubber and felt seals and 2-piece retainer. Connect spindle connecting rod and drag link.

Axle Housing Assembly

Removal - Raise truck so front axle hangs freely. Remove axles and spindle arms (see above). Disconnect shock absorbers at lower end and front drive shaft at pinion flange. Support axle and remove spring clip (U-bolt) nuts and spring seats Remove axle assembly.

OVERHAUL

Procedures and specifications are the same as for Spicer Model 44 rear axle *See "Ford Truck Int gral Housing Hypoid" in this section*

JEEP, UTILITY & FORWARD CONTROL (4-WHEEL DRIVE)

J ep, All With 4-Wheel Drive Front Axle and Leaf Springs (1963)℄

℄ - *For Rear Axle, see "Spicer Hypoid" in this section.*

DESCRIPTION

Spicer Models 25, 27AF, 44-1F, and 44F. Full-floating, integral housing, hypoid gear type with "Spicer Cardan Cross", "Bendix", or "Rzeppa" constant velocity universal joints. Differential assembly is similar to differential assembly used in rear axle.

AXLE RATIO & IDENTIFICATION

Axle model number cast into a web on axle housing. Axle ratio stamped on metal tag attached to a housing cover bolt. Power-Lock differential identified by "T" on cover ratio tag and by a lubrication caution tag on filler plug.

Axle Ratios

8.73 (41-11)	4.27 (47-11)	5.38 (43-8)
4.10 (41-10)	4.89 (44-9)	5.89 (53-9)

AXLE SHAFT

Axle Shaft & U-Joint Removal

Remove wheel, hub cap, axle shaft nut and washer. Take out drive flange capscrews and remove flange with puller. Bend lip of bearing adjusting nut lockwasher out, remove locknut, lockwasher, adjusting nut, and bearing locking washer. Remove wheel hub and bearing assembly. *CAUTION - Us care n t to damag il seal.* Disconnect brake tube, take out mounting screws on backing plate, remove backing plate and wheel spindle. Pull axle shaft and universal joint assembly out of housing. To install, reverse removal procedure and adjust front wheel bearings and bleed brakes after installation completed.

Wheel Bearing Adjustment

Tighten inner adjusting nut until there is a slight drag on the bearings as the hub is turned, then back off nut 1/6-turn and install locking washer and nut. Tighten locknut securely and bend lockwasher over the locknut.

STEERING KNUCKLE

Disassembly

First remove hub and brake drum assembly, wheel bearings, axle shaft and universal joint assembly, wheel spindle, and steering tie rod socket. Remove screws holding oil seal retainer halves, remove screws retaining upper and lower bearing caps. Withdraw bearing cap and stub shaft assemblies. *CAUTION - Do not lose bearing adjusting shims under top bearing cap.* Lift steering knuckle off axle housing. If necessary to remove bearing cups from axle housing, use special driver, Tool W-138. Wash all parts in cleaning solution and inspect bearings for wear, scores, or cracks.

Reassembly & Bearing Adjustment

Reverse disassembly procedure and note the following: Install one each .003", .005", .010", .030" shims at the top bearing only. *NOTE - A shim pack of .058" thickn ss is add d at bottom face of kingpin boss on st ring knuckl s at production. Maintain this shim pack at bottom and make adjustments at the top only.* Install bearing caps, lockwashers, and screws and tighten securely. Check preload on bearings by hooking a spring scale in hole in knuckle arm for tie rod socket. Take a reading when knuckle has just started its sweep Kingpin bearing preload should be 12-16 lbs. with seal and axle shaft removed Remove or add shims to secure this preload A washer may be added between end of cap and bearing when removal of all shims does not correct preload.

Oil Seal Assembly

Before installing oil seal felt, make a diagonal cut across top side of felt so it may be slipped over axle. Install assembly as follows: Split oil seal, backing ring assembly, oil seal felt and the two seal retainer plate halves. Install eight retaining screws.

AXLE ASSEMBLY

Removal

Support front of truck securely with a chain hoist, remove front wheels. Disconnect front shock absorbers, front brake line (at frame connection), and steering linkage at idler lever on frame front crossmember. Disconnect propeller shaft by removing universal joint "U" bolts at axle end of shaft. Place support jacks under axle housing so that springs are relieved of weight, remove nuts on spring center clip "U" bolts, remove bolts at rear end of springs and lower springs. Remove axle assembly from below.

OVERHAUL

See 1959 Final Data, Page 341, or later Manual edition.

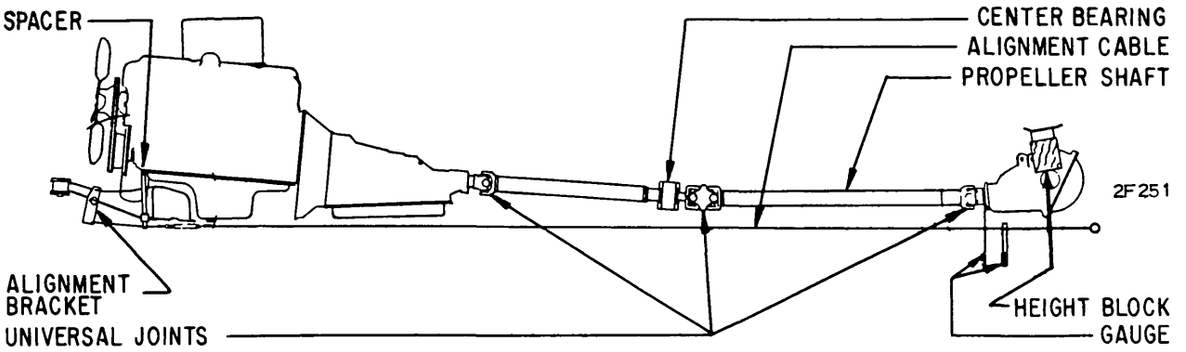
BUICK & OLDSMOBILE PROPELLER SHAFT ALIGNMENT

Buick (1963)
Buick Special (1963)
Oldsmobile (1963)
Oldsmobile F-85 (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 BUICK RIVIERA ACCELERATION SHUDDER CORRECTION* To reduce acceleration shudder, universal joint angle settings have been revised See below for latest specifications

►*PROPELLER SHAFT HANDLING CAUTIONS: To prevent damage to constant velocity universal joint center metal ball when removing shaft assembly from car or when handling the assembly after it is removed, care must be used to support shaft on both sides of constant velocity joint if shaft is moved horizontally Do not allow one end of shaft to hang free or allow universal joint to bend at a sharp angle Shaft assembly may be carried in a vertical position without damage to constant velocity universal joint*



DESCRIPTION

Measurement of rear universal joint angle for correct propeller shaft alignment is accomplished by the use of a spring-loaded steel cable stretched between front of chassis and rear axle carrier, on centerline of propeller shaft When rear universal joint angle is adjusted correctly, the steel cable will clear underside of pinion flange by a definite amount

CHECKING & ADJUSTING

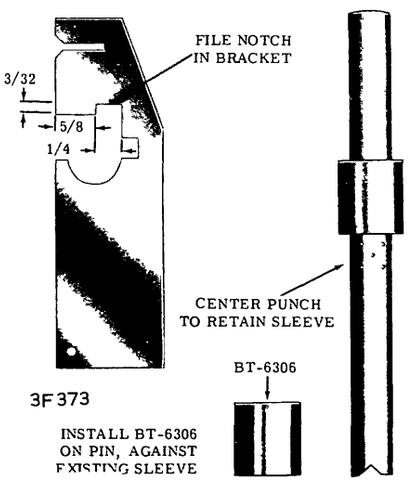
Buick (Except Special)

All (Exc pt Riviera) - Use Alignment Set, J-8973 as follows Raise rear of car body and install Rear Tubular Spacers, J-8973-19, with upper end over head of rear compression bumper mounting bolt (each side of car) and with lower ends of spacers resting on axle housing, then lower car body onto spacers (place weight in truck if necessary so body rests firmly on tubes) Remove nut from differential carrier mounting stud on each side of lowest stud Install two special flat washers over studs, then install Bracket J-8973-16 with bent edge toward front and slot to right, using original stud nuts Attach hook of Bracket J-8973-15 over center of front frame crossmember, then with shallow slot of Engine Height Plate J-8973-14 down, place wide upper end against flange of engine oil pan being certain plate rests on flat part of pan flange With cable in lower notch of height plate, pull cable tight and hook through a slot in rear bracket so one of the stops is to rear of bracket Measure perpendicular distance from machined surface immediately in front of rear pinion flange slinger to top of cable Distance should be 3 1/4" ± 1/32" on 4400 & 4600 Series, 3 3/8" ± 1/32" on 4800 Series If not within specifications, adjust length of rear upper control arm as necessary (install adjusting bolt through set of holes that most nearly coincide) Tighten bolts to 60 ft lbs and recheck measurement

PROPELLER SHAFT ALIGNMENT GAUGE TOOL INSTALLATION

Riviera - Using Alignment Set J-8973 installed as detailed above, check distance from top of tool cable to the following **three** points· 1) Machined surface immediately in front of rear pinion flange slinger Distance should be 6 5/32" ± 1/32" Adjust by changing length of rear upper control arm 2) Bottom of front propeller shaft just forward of center bearing between bearing and damper rings Distance should be 5 19/32" ± 1/32" Adjust by changing shim thickness under center bearing support 3) Lower surface of front propeller shaft yoke shaft immediately to rear of transmission rear bearing retainer Distance should be 3 1/2" ± 1/32" Adjust by adding or removing shims between transmission and rear mount

Buick Special



Use Alignment Set J-8973 as follows. Raise rear of car body and install Spacer Blocks J-8973-20 (Station Wagon), J-8973-21 (Sedans) so slots straddle rubber bumpers Hold spacer block up against bumper mounting straps and allow car to settle until axle housing tubes contact blocks Remove differential cover bolt on each side of lowest bolt, then using these two bolts, attach Rear Bracket J-8973-16 so slotted part of bracket is vertical Tighten bolts securely Engage Front Attaching Bracket J-8973-13 in front crossmember assembly using hole immediately to rear of front mount Hook slot of bracket into rear of hole Install Engine Height Plate J-8973-14 so upper end bears against oil pan between the two oil pan rear bolts Install cable in notch of height plate, pull cable tight and hook into rear bracket so one of stops on cable is to rear of bracket slot Measure perpendicular distance from top of cable to machined surface immediately in front of slinger on pinion rear flange Distance should be 3 3/16" ± 1/32" If not within specifications, add or remove shims between lower control arm forward mounting brackets and underbody side rail *Shims must be added or removed equally on both sides of car*

Oldsmobile 88, S88, 98

Use Tool BT-30-1 and BT-30-2 modified as shown in illustration Connect cable at front frame crossmember, see diagram Install rear bracket on the two lower right studs on differential carrier Hook cable in upper hole on rear bracket, then install spacer between cable and bottom of front engine mount Install wood blocks between rear axle housing and rubber bumpers Install hold-down clamps around axle housing (lower hook end should point toward front end of car) Install upper hook into 3/4" hole in frame immediately above axle housing Adjust turnbuckles on clamps until wood blocks fit snugly between axle housing and rubber bumpers Position height gauge between cable and differential (see diagram), and check alignment If cable is not within limits of gauge notch, correct nose angle by changing length of lower suspension arm

Oldsmobile F-85

Use Alignment Tool BT-30-2 and install on car in the same manner as for Buick Special (above), including special spacer block between axle housing tubes and rubber bumpers With indicator of tool set placed against differential pinion companion flange, cable must be in correct notch of gauge To adjust, add or remove shims from front of rear lower suspension arm *NOTE - The same number of shims must be added or removed on both sides of car A 1/8" shim will change differential nose angle approximately 1/16"*

OLDSMOBILE TOOL BT-30 MODIFICATION

CHRYSLER CORP. PROPELLER SHAFT ALIGNMENT

Chrysler & Imperial (1963)
Dodge & 880 (1963)
Plymouth (1963)
Valiant (1963)

ADJUSTMENT

Car weight must be on wheels (use drive-on type hoist or platform), fuel tank must be full, and there must be no extra weight in trunk

Using Spirit Level Protractor

1) Remove rebound plate and bumper from top of differential carrier housing Place spirit level protractor on machined surfaces of rebound plate bosses. Level bubble and note reading *NOTE - Carrier housing should incline downward slightly. To adjust, install a tapered shim between rear spring and seat on axle housing with thick end toward rear of car.* Recheck angle.
2) Place protractor on underside of propeller shaft near rear universal joint Center bubble and note reading **Add** this reading and pinion angle reading (above). Total should be 1-3°. Add or remove shims as above (between rear spring and seat on axle housing) to obtain this angle. Install rebound plate and bumper.

Using Gauge J-6845

NOTE - Check shaft indexing by unscrewing cap seal retainer. "O" mark on splined yoke should line up with keyway in shaft. With car level and weight of car on the wheels, remove differential carrier rebound bumper plate. Remove shims from both rear axle control strut frame brackets (Imperial only) Place Gauge J-6845 on machined pads of differential carrier and center the bubble *NOTE - Level of gauge must be on same side of propeller shaft each time gauge is used.* Place gauge on rear propeller shaft near rear universal joint Entire bubble should be within three graduations from center of gauge If edge of bubble is ahead of the third graduation, change rear axle pinion angle as follows: Install 2° tapered shims between both rear springs and axle housing pads with thick edge of shim toward **front** of car Tighten spring U-bolt nuts and install shims behind control strut brackets so space is filled (Imperial only). Tighten brackets Install differential carrier rebound bumper plate.

Center Bearing Height (Imperial)

Install Gauge Adapter part of Tool J-6845 on front propeller shaft near front universal joint Place gauge of tool on rear propeller shaft at rear universal joint and adjust gauge to center bubble Attach gauge to pins on adapter. For each graduation leading edge of bubble is **forward** of center, **add** one shim under center bearing housing bracket For each graduation trailing edge of bubble is to **rear** of center **remove** one shim from under center bearing bracket

CHEVROLET (PASS. CAR) PROPELLER SHAFT ALIGNMENT

Chevrolet Pass. Cars (1963)

CHECKING & ALIGNMENT

Front shaft angle "A", rear shaft angle "B", pinion shaft angle "C", and frame riding height "D" must be with n limits as shown in table below *NOTE* - When car driven continuously at maximum load conditions, angle "B" may be increased approximately ¼-½° (in negative direction).
Angle "A" - Is relation of engine angle to front propeller shaft angle Place protractor on rocker arm cover for engine angle, up against front propeller shaft for front shaft angle *NOTE* - DO NOT lean on front fender when taking engine angle
Angle "B" - Is relation of front and rear propeller shaft angles To determine rear propeller shaft angle, place protractor up against rear propeller shaft
Angle "C" - Is relation of rear propeller shaft angle to pinion shaft angle. To determine pinion shaft angle, rotate rear universal joint to bring machined surface down parallel with floor and place protractor on this surface
Riding Height "D" - Is distance from top of axle housing to frame kick-up. This measurement must be equal within ¼" on each side of car.
NOTE - Support car on tires, ramp, or twin post hoist (not on frame hoist) when making angle checks.

Determining Angles

Angles "A", "B", "C" are the result of subtracting rearmost of the two angles from preceding one (example - Engine angle minus front propeller shaft angle), except when second angle is "up at rear" (higher at rear of protractor than at front), the second angle should be added to first one

Correcting Angles

Std. Procedure - **1)** When angle "A" is not correct, change number of shims under transmission support Adding shims reduces angle, removing shims increases angle
2) When angle "C" is incorrect, change number of shims at upper arm attaching point. Adding shims reduces angle, removing shims increases angle *NOTE - Correcting angles "A" and "C" should automatically correct angle "B".*
Optional Procedure - For correcting angles "A" and "C", loosen or remove frame center bearing support bolts (under center section) and insert transmission shims between frame section and the support inside drive shaft tunnel. *CAUTION - Always recheck angles "A" and "B".*

VIBRATION NOTE - If objectionable vibration exists when joint angles are within specifications, readjust angle toward opposite limit (high toward low or low toward high limit)

Angles & Height Specifications

Angle "A"	**Angle "B"**
Pos 2½-3° ①	② Neg 1-1½°
Angle "C"	**H ight "D"**
Pos 2¾-3⅛° ③	6 1/4" ± 3/8"

① - Pos 2¾° desired. ② - Neg 1¼° desired
③ - Pos. 3° desired

LINCOLN CONTINENTAL PROPELLER SHAFT ALIGNMENT

Lincoln Continental (1963)

PROPELLER SHAFT ANGLE

Vibration or "shudder" upon fast acceleration, or when coasting using engine as a brake, may be caused by either rear axle being loose in springs or by excessive pr r shaft angle. Propeller shaft angle is the result of Pinion Nose Angle in relation to Riding Height with "U" bolt nuts tight

ADJUSTMENT

Pinion Nose Angle - Place vehicle on known level surface that will allow access to rear axle pinion nose Drill a small hole in common protractor at exact center of base (0°) line, and insert a line through hole with a light weight attached for bob Place base of protractor vertically against front face of pinion housing and read where line crosses scale
Riding Height - Place vehicle on smooth level floor Inflate tires to 24 lbs with full fuel tank and all loading removed from passenger and luggage compartment Push rear bumper down (at center) 1" and release slowly. Measure distance from top center of axle housing to top of frame kick-up at rear of bumper bracket Raise center of bumper 1" and release slowly and again measure distance Average of two readings is true riding height Riding height should be 7 2-8 5" with 8" normal

Riding Height	**① Pinion Nos Angle**
6 inches	4° Down
7 inches	3½° Down
8 inches	3° Down
9 inches	2½° Down

① - Tolerance ±¼°

Check Pinion Nose Angle with Riding Height as shown in table above When Nose Angle does not correspond with Riding Height, remove rear axle "U" bolt nuts and install appropriate wedges(½, 1, & 1½°) between each spring insulator upper retainer and axle housing mounting pad, with no more than one wedge to be used on a side Install "U' bolts and torque to 50-60 ft lbs *NOTE - Be sure lower insulator retainer contacts upper retainer.*

STUDEBAKER PROPELLER SHAFT ALIGNMENT

Studebaker, All Models (1963)

ALIGNMENT CHECK & ADJUSTMENT

Raise rear wheels off floor and put transmission in neutral. Clean propeller shaft with sandpaper. With dial indicator, measure runout of propeller shaft at front, center, and rear, while turning shaft slowly by hand. *NOTE - Make measurements about 1½" back from weld joint.* Maximum runout should be .010" at front or rear and .015" at center. If not within limits, check flanges of transmission and differential. Measure shaft runout at end nearest flange and mark flange at highest runout. Disconnect universal joint, rotate flange 180° and reassemble. Check runout again. If high side of runout is still on same side, flange is faulty. If rotating flanges does not correct runout, replace shaft and/or flange.

ANGLE CHECK & ADJUSTMENT

Checking

Check angles with level gauge or protractor. *NOTE - Manufacturer recommends use of Special Protractor Gauge J-7181.* Raise car on drive-on type hoist with weight on wheels and frame level. Bounce body up and down several times to normalize spring position and DO NOT DISTURB this position when taking angle checks.

Front Universal Joint Angle - Place gauge against clean surface of propeller shaft near front universal joint, so pendulum or pointer is free to swing. Move protractor scale so pointer is set at 90° mark. Remove gauge (do not disturb setting) and place it on clean bottom surface of starter housing. When pointer comes to rest, read degrees indicated from 90° mark. This reading is front universal joint angle and should be 4-5°.

Rear Universal Joint Angle - Proceed as for Front Universal Joint Angle check except in second operation, place adjusted gauge vertically against forward edge of differential housing in back of universal joint. *CAUTION - Gauge must not contact pinion bearing oil seal.* When pointer comes to rest, read degrees indicated from the 180° mark. This reading is rear universal joint angle and should be 4½-5½°. *NOTE - For best results, there should be approximately ½° greater angle at rear than at front.*

Adjustment

To change **front** universal joint angle, add or remove shims or spacer washers at engine rear support insulators. To change **rear** universal joint angle, add or remove wedge type caster shims at axle pad and rear springs.

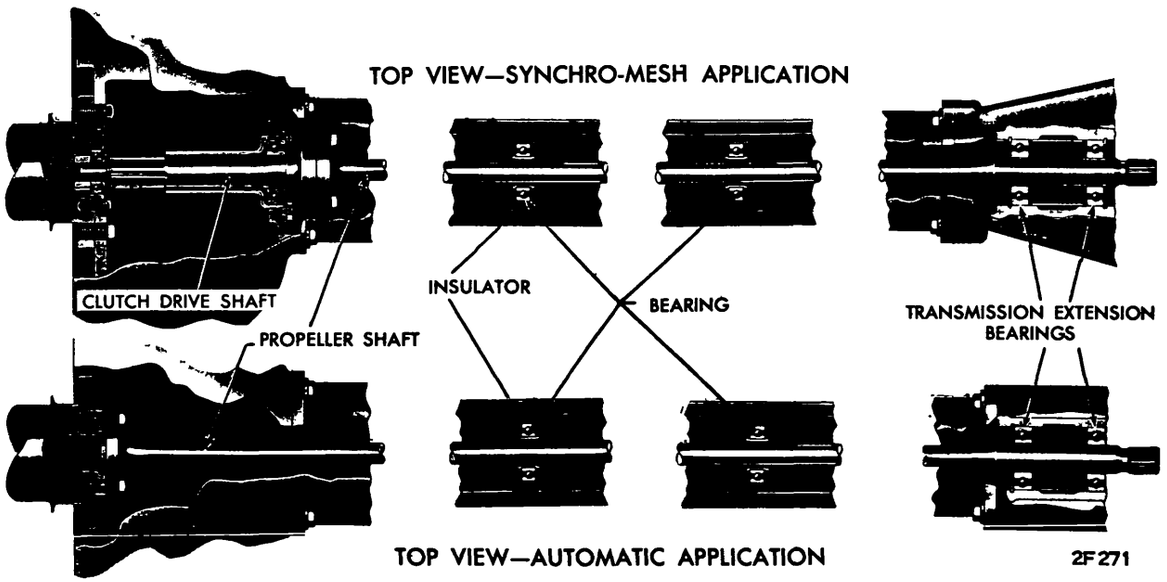
PONTIAC TEMPEST PROPELLER SHAFT & TORQUE TUBE

Pontiac Tempest (1963)

DESCRIPTION

Flexible type propeller shaft enclosed within a rigid torque tube and ball bearing assembly. Rubber insulator assemblies, pressed on ball bearings, support bearings in torque tube.

TORQUE TUBE & PROPELLER SHAFT



Removal

Synchro-mesh Trans. (All Engines) - Remove parking brake cable from torque tube, then remove complete exhaust system (break at engine and slide system off). Remove gearshift housing, and flywheel housing bottom cover. Remove torque tube access cover. Remove bolts from propeller shaft flange and place a piece of rag or rubber hose between propeller shaft and torque tube to prevent damage to coating on shaft, then disconnect torque tube from flywheel housing. Support torque tube and pry away and down from housing. Put a 2" square wood block between transmission extension and car floor to position transmission for reassembly. Remove torque tube-to-transmission bolts. *CAUTION - Torque tube and propeller shaft are now held in place only by bearings in transmission extension and must be supported to prevent bearing or shaft damage.* Remove torque tube and shaft as an assembly by pulling on propeller shaft flange. *CAUTION - Pull propeller shaft straight out of transmission so that shaft will not bind in transmission or transmission extension.* Place assembly on a bench and pull propeller shaft out of torque tube. *CAUTION - DO NOT damage coating on propeller shaft.*

Automatic Trans. (4 Cyl.) - Remove parking brake cable and vacuum line from torque tube, then remove stabilizer bar. Remove exhaust system (break at engine and slide system off). Remove flywheel bottom cover, then disconnect propeller shaft from flywheel. Back bolts holding torque tube to flywheel housing out about half-way. Place a rag or rubber hose between propeller shaft and torque tube to prevent damage to coating on shaft, then pry propeller shaft flange to rear sufficiently for pilot to clear recess in flywheel. Disconnect torque tube from flywheel housing and put a 2" square wood block between transmission extension and car floor to position transmission for reassembly. Remove torque tube-to-transmission bolts. *CAUTION - Torque tube and propeller shaft are now held in place only by bearings in transmission extension and must be supported to prevent damage to bearing or shaft.* Remove shaft and torque tube assembly by pulling on shaft flange. *CAUTION - Pull shaft straight out of transmission so shaft will not bind in transmission or extension.* Place assembly on a bench and pull propeller shaft out of torque tube. *CAUTION - DO NOT damage coating on propeller shaft.*

Automatic Trans. (V8) - With car supported under body side rails (rear wheels hanging freely), drain transmission and remove filler tube. Remove rear wheels and brake drums. Disconnect axle shaft bearing retainer from brake backing plate, and pull axle shafts outward far enough to remove universal joints from differential and carrier assembly (do not drag splines on lip of oil seal). *NOTE - Cover universal joint splines for protection.* Disconnect speedometer cable,

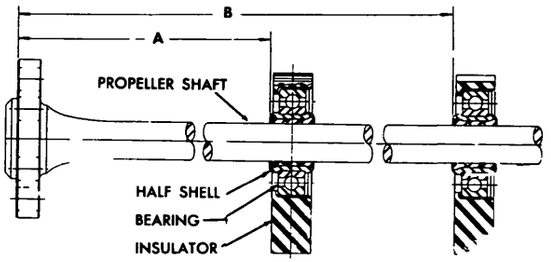
(Continued)

PONTIAC TEMPEST PROPELLER SHAFT & TORQUE TUBE ASSEMBLIES

PONTIAC TEMPEST PROPELLER SHAFT & TORQUE TUBE (C nt.)

transmission control cable, downshift electrical connector, retaining clip, vacuum modulator line, and parking lock control cable from transmission Remove parking brake cable from torque tube, and disconnect exhaust system from rear tail pipe hanger Remove flywheel bottom cover Disconnect propeller shaft flange from flywheel Place a rag or rubber hose between propeller shaft and torque tube to prevent damage to coating on shaft Support torque tube and transaxle separately, then disconnect torque tube from flywheel housing Remove axle support crossmember-to-insulator bolts and disconnect rear lower control arms from differential housing Remove axle support crossmember from transaxle by lowering transaxle slightly (for access to attaching bolts) Lower transaxle until top of torque converter clears fuel tank, then pull rearward until propeller shaft comes out of flywheel housing Remove torque tube-to-transmission bolts *CAUTION - Torque tube and propeller shaft are now held in place only by bearings in transmission extension and must be supported to prevent bearing or shaft damage* Remove shaft and torque tube assembly by pulling on shaft flange *CAUTION - Pull shaft straight out of transmission so shaft will not bind in transmission or extension* Place assembly on a bench and pull propeller shaft out of torque tube *CAUTION - DO NOT damage coating on propeller shaft*

Installation



Synchro-mesh Trans. (All Engines) - With propeller shaft installed in torque tube, place rag or rubber hose between shaft and tube to protect shaft Coat spline with axle oil and install shaft into extension seal *CAUTION DO NOT let shaft rest on seal* Engage spline into transmission and journal diameter into transmission extension bearings (do not damage journal surface) *CAUTION - Check spline alignment into transmission extension, and if absolutely necessary, tap front flange lightly with a soft rubber hammer Be sure splines are completely engaged in transmission* Tighten torque tube-to-transmission extension bolts to 30-45 ft lbs , then remove wood block from between transmission and car floor Tighten torque tube-to-flywheel housing bolts finger tight, then tighten propeller shaft-to-clutch drive shaft bolts finger tight Remove rag or rubber protector Tighten propeller shaft flange bolts and torque tube-to-flywheel bolts to 30-45 ft lbs Install torque tube access cover and tighten bolts to 40-80 inch-pounds Install gearshift housing and exhaust system

Automatic Trans. (4 Cyl.) - Installation procedure is same as for synchro-mesh cars (above) Install stabilizer bar before installing exhaust system, then install parking brake cable and vacuum line

Automatic Trans. (V8) - Place a rag or rubber hose between propeller shaft and torque tube to protect shaft coating, support torque tube, and attach to flywheel housing, tightening bolts to 30-45 ft lbs Remove rag Install propeller shaft on flywheel and tighten bolts to 30-45 ft lbs Install support crossmember on transaxle and tighten bolts to 40-55 ft lbs Coat shaft spline with axle oil and install shaft into extension seal *CAUTION - DO NOT let shaft rest on seal* Engage spline into transmission and journal diameter into transmission extension bearings (do not damage journal surface) *CAUTION - Check spline alignment into transmission extension, and if absolutely necessary, tap front flange lightly with a soft rubber hammer Be sure splines are completely engaged in transmission* Connect torque tube to transmission extension and tighten the bolts to 30-45 ft lbs Install transaxle support crossmember to rear crossmember and tighten bolts to 40-55 ft lbs Connect control arms to differential housing and tighten pivot bolts to 100-125 ft lbs Install transmission control cable, downshift electrical connector, retaining clip, speedometer cable, vacuum modulator line, and parking lock control cable Install axle shaft universal joint splines into differential (do not damage side cover oil seals) Connect parking brake cable to torque tube, and exhaust system to rear tail pipe hanger Install axle bearing retainer and tighten nuts to 30-45 ft lbs Install wheels and brake drums, flywheel housing bottom cover, fill transmission, and lower car

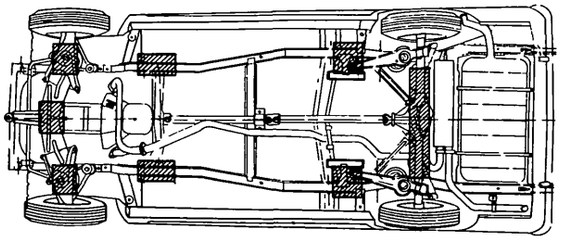
CENTER BEARING LOCATING DIMENSIONS

PROPELLER SHAFT BEARINGS

Removal

Use Tool Set J-9528, Parts 3 & 4, to pull bearing off half-shell, then remove half-shells from propeller shaft Support insulator with J-7022 or suitable tool and press bearing from insulator using a socket

Installation



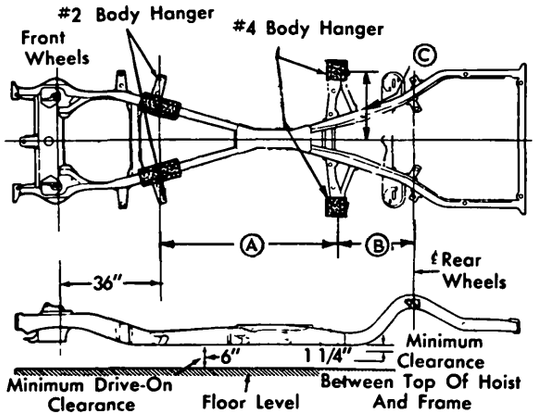
Place half-shells on shaft at dimensions indicated in illustration and clamp in position with Tool Set J-9528, Parts 1 & 2 Place bearing and insulator on shaft between arrows on tool parts 1 & 2, install tool part 4 on shaft and install bolts through tool parts 1 & 2 and into tool part 3 Tighten bolts evenly so tool does not cock and tighten until tool is completely closed (this will locate bearing on half-shell) Remove tool from shaft and inspect for centering (nibs on each side of I D) Also make sure shells are not cocked or edge damaged (will cause rubber-to-metal bond failure)

BUICK & BUICK SPECIAL

Jacking & Hoisting: All Cars - *CAUTION - When lifting at lower control arm, lifting pad must not contact steering arm or linkage or damage will result.*

Buick Special - Jack or lift car at points shown in illustration.

Buick - Jack car at spring seat on front lower control arms or center of front crossmember (front), and along entire length of rear axle housing (rear). Lift car at front frame side rails just forward of body floor pan (front), and rear of frame side rails at lower control arm front pivot (rear).



BUICK (SPECIAL) FRAME CONTACT POINTS 2A88

CADILLAC

Hoisting: Hoisting equipment that engages suspension, axle, or wheels is preferred. With this type equipment, use caution to prevent damage to shock absorber mounts, exhaust pipe and mufflers. When using a frame contact type hoist, special adapters must be used on hoist rails to assure engagement with car frame at locations indicated by shaded areas in illustration. Take care to prevent hoist adapters contacting any part of the No. 2 body hanger. Hoist contact at rear should be at outer ends of No. 4 body mounting brackets. In no case should rear contacts be less than 32½" apart. *CAUTION - Hoist should not contact rear lower control link front mounting bracket. DO NOT lift Series 75 or Commercial Chassis cars on frame contact hoist as severe stress and misalignment will result due to length of frame and car.*

Cadillac Frame Dimensions

Series	Dimension A	Dimension B	Dimension C

CHRYSLER, DODGE, DART, PLYMOUTH & VALIANT FRAME CONTACT POINTS (TYPICAL) 2A91

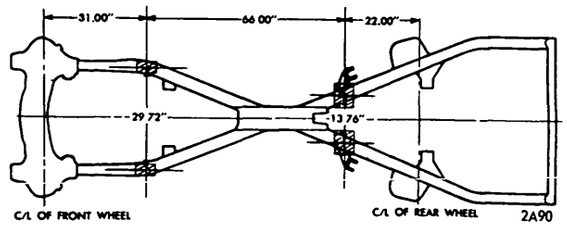
CHEVROLET TRUCKS

Jacking: Following list of jacking points will assist wheel and tire assembly changes with vertical type emergency jacks supplied with trucks.

Front

10, 20, 30 Models - Lower arm pivot or torsion bar socket.

40 Models - Frame side rail ahead of steering gear or idler support.



50, 60 Models - Frame side rail behind front crossmember. Use hardwood block between front crossmember and upper control arm to reduce jack travel.

Rear

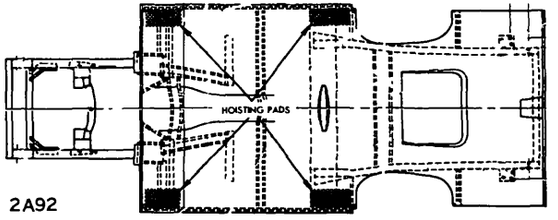
10, 20, 30 Models - Axle housing.

40 Models - Spring, ahead or behind axle.

50, 60 Models - Spring, in front of axle housing.

CHEVROLET FRAME CONTACT POINTS 2A90

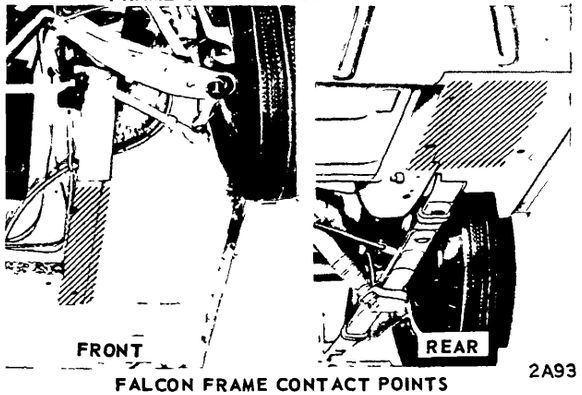
COMET, FALCON, FAIRLANE, METEOR & THUNDERBIRD



Jacking (Exc. Thunderbird): Either side of car may be raised at front by jack contact at lower control arm strut connection. Either side of car may be raised by jack contact on front crossmember, or on crossmember to which stabilizer is connected. Either side of rear end of car may be raised by jack contact on rear crossmember.

Jacking (Thunderbird): Either side of car may be raised at front by jack contact at either lower control arm. *CAUTION - Make sure jack saddle is large enough to accommodate control arm securely.* Either side of front end may be raised by jack contact on front crossmember or on crossmember to which stabilizer is connected. Either side of rear end may be raised by jack contact on rear crossmember.

Hoisting: Check all drive-on type hoists for possible interference with car underbody. Modify hoist and approach ramps as necessary to provide clearance.



Rail & Fork Lift (Twin Post) Hoists - Front adapters or hoist plates must be carefully positioned to contact lower suspension arms and must be large enough to cover entire spring seat area. Rear adapters or forks must be positioned under rear axle (forks must not contact axle at points more than 1" outboard from circumference welds near differential housing). *CAUTION* - Raise car slowly and make certain that rear shock absorbers are not damaged.

Frame Contact Hoist (All Models) - Frame contact hoist adapters are necessary to lift car. Hoist adapters should cover at least 12 square inches (Comet, Falcon, Fairlane & Meteor); 24 square inches (Thunderbird) of underbody area shown in illustration.

WHEEL ALIGNMENT SPECIFICATIONS & ADJUSTMENT

AMERICAN MOTORS

RAMBLER AMERICAN

Caster and camber adjustments are made by installing or removing shims between lower control arm mounting pivot bar and mounting bracket on under-body *NOTE - Lower control arm pivot bar brace must be loosened before making caster and camber adjustments When installing, tighten bolts to 70-80 ft lbs*

Tire Inflation (Cold)

24 lbs front and rear

Caster

Adjust caster by increasing or decreasing the thickness of shims at either front or rear mounting bolts as necessary

Camber

Adjust camber by increasing or decreasing the thickness of shims equally at both front and rear mounting bolts as necessary

RAMBLER CLASSIC & AMBASSADOR

Caster and camber adjustments are made by turning upper control arm mounting bolts which are provided with eccentric washers After adjustment, tighten eccentric bolt nuts to 50-55 ft lbs

Tire Inflation (Cold)

Tire Size	Front Pressure (Lbs.)	Rear
6 50, 6 70, 7 50	24	24
8 00	22	20
Captive Air ①	29	29
Captive Air ②	24	24

① - Inner Chamber ② - Outer Chamber

Caster

Loosen attaching bolt nut and turn either front or rear eccentric bolt as necessary for correct caster

Camber

Loosen attaching bolt nut and turn both front and rear eccentric bolts equally to obtain correct camber

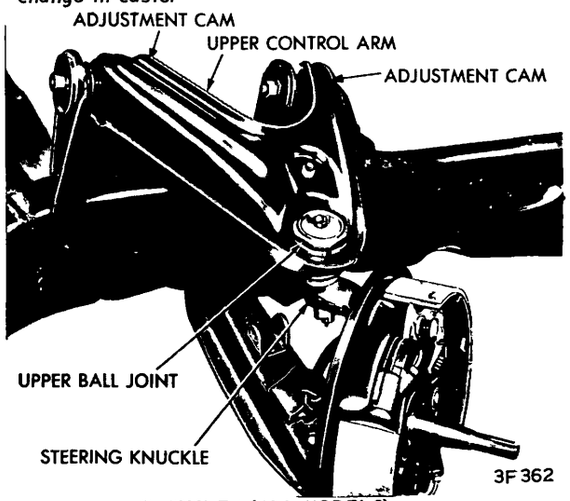
CHRYSLER CORP.

ALL MODELS

Caster and camber adjustments are made by rotating eccentric cam assemblies at inner end of upper control arm front and rear legs *NOTE - On all models, except Chrysler, access holes to lower upper control arm cam bolt nuts have been provided in fender side shields Front access hole is covered by a splash shield.*

Tire Inflation (Cold)

Car Model	Pressure (Lbs.) Front	Rear
Imperial & Chrysler 300J	24	24
Chrysler Others (Except Sta Wagon)	24	22
Chrysler Station Wagon	22	① 24
Dodge Dart 6 Cyl (Except Sta Wagon)	24	22
Dodge Dart V8 (Except Sta Wagon)	24	22
Dodge Dart Station Wagon (Except 880)	24	② 26
Dodge Custom 880 Station Wagon	22	① 24
Plymouth 6 Cyl (Except Sta Wagon)	24	22
Plymouth V8 (Except Sta Wagon)	24	22
Plymouth Station Wagon	24	② 26
Valiant	24	24



① - With station wagon fully loaded increase cold pressure to 28 lbs
② - With station wagon fully loaded, increase cold pressure to 30 lbs

Caster

Adjust by turning **one** eccentric bolt at a time as necessary to obtain correct setting *NOTE - Turning both eccentric bolts in opposite directions affects caster with a minimum amount of change in camber*

Camber

Adjust camber by turning both eccentric bolts equally in same direction as necessary to obtain correct setting. *NOTE - Turning both eccentric bolts equally in same direction affects camber with a minimum amount of change in caster*

CHRYSLER (ALL MODELS)
CASTER & CAMBER ADJUSTING CAMS

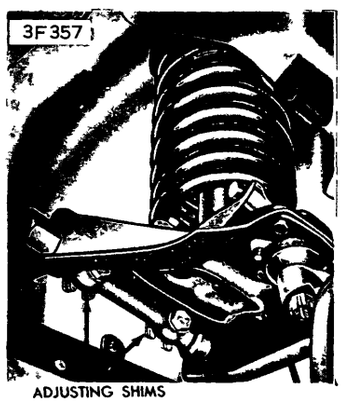
FORD MOTOR CO.

FALCON, COMET, GALAXIE & MONTEREY

Caster and camber adjustments are made by adding or removing the shims from between upper control arm inner shaft and frame member at shaft mounting bolt locations After adjustments are completed, tighten control arm inner shaft mounting bolts to 65-90 ft lbs (Falcon & Comet), 65-85 ft lbs (Galaxie & Monterey)

Tire Inflation (Cold)

Car Model	Pressure (Lbs.) ① Front	① Rear
Falcon & Comet		
Sedans	24	24
Station Wagon (Pass Load)	22	28
(Pass & Cargo)	24	28
(Snow Tires)	22	30
Ranchero	24	30
Galaxie & Monterey	24	② 24



① - Add 4 lbs for heavy loads or high speed driving
② - 28 lbs for station wagon

Caster

Remove or install shims at either front or rear mounting bolt Removal of shims at front bolt or installation of shims at rear bolt will move ball joint forward Removal of shims at rear bolt or installation of shims at front bolt will move ball joint to rear A 1/32" (Falcon & Comet), 1/16" (Galaxie & Monterey) shim change at either bolt will change caster 1/2°

Camber

Remove or install shims of equal thickness at both bolts The removal of shims will move upper ball joint inward Installation of shims will move ball joint outward A 1/16" shim change at both bolts will change camber 1/3° (Falcon & Comet), 1/4° (Galaxie & Monterey) *NOTE - Total shim pack thickness should not exceed 9/16" (Falcon & Comet), 5/8" (Galaxie & Monterey)*

FALCON & COMET
CASTER & CAMBER ADJUSTING SHIMS

FAIRLANE

► *1962-63 FAIRLANE ALIGNMENT SPECIFICATION PRODUCTION CHANGE & SERVICE NOTE· For improved handling, caster, camber, and toe-in specifications changed on later cars as indicated in Specifications Table New specifications supersede all previous specifications for all 1962 and early 1963 cars*
Caster and camber adjustments are made by moving upper control arm assembly in or out in elongated bolt holes The control of this movement **requires** use of Tool 62F-3000-A

WHEEL ALIGNMENT SPECIFICATIONS & ADJUSTMENT (Continu d)

Tire Inflation (Cold)

24 lbs. front and rear. Add 4-6 lbs. for high speed driving or heavy loads.

PRELIMINARY PROCEDURE NOTE - Before making wheel alignment, make sure lower arm assembly is forced outboard by loosening pivot bolt, and using a pry bar. With the full weight of car on suspension, torque pivot bolt to 100-120 ft. lbs. while prying arm outboard.

RECOMMENDED SPECIAL TOOLS (MADE LOCALLY) - For easier and more positive wheel alignment, the following tool fabrication and installation procedure is recommended.

1) Cut five bars from 1/4" or 5/16" stock, 1 1/4" or 1 1/2" wide, to lengths of 4 3/4", 4 7/8", 5" 5 1/8" and 5 1/4". Weld or braze a flat washer to one end of each bar.

2) Fabricate a hook from an 11" length of 3/8" diameter rod.

3) Select one fabricated bar closest to being 1/8" longer than distance measured between top of side rail sheet metal and under lip of upper control arm spring pocket.

4) Install selected bar between upper arm and side rail after raising upper arm far enough for clearance. To raise upper arm, put hook of rod on lip of body side rail, place pry bar through hook rod eye and under suspension lower arm, then pull down on bar.

TOOL 62F-3000-A INSTALLATION - Do not install tool from underneath car. For proper installation, face outside of wheel and reach behind each end of wheel under fender with each half of tool. Turn both tool adjusting screws until tool is snug **between** upper control arm and lower corners of front suspension housing. Loosen upper arm inner shaft retaining bolts several turns until bolts are 3/16-1/4" away from top face of shaft boss, then lift up on front end of car. A sharp crack will usually be heard when upper arm inner shaft serrations separate from sheet metal. *These serrations must be free in order to effect an adjustment.* If serrations not free, loosen bolts more, strike bolt heads a sharp blow, and use a long pry bar to loosen caged nut serrations. Adjust caster first and loosen or tighten tool screws not more than two complete turns alternately to avoid collapsing sheet metal. Approximately 4 complete screw turns will change a reading 1°. Allow approximately + 1/8° on caster and camber readings to compensate for torque of cross shaft retaining bolts. After adjustments are completed, tighten upper control arm attaching bolts to 125-150 ft. lbs.

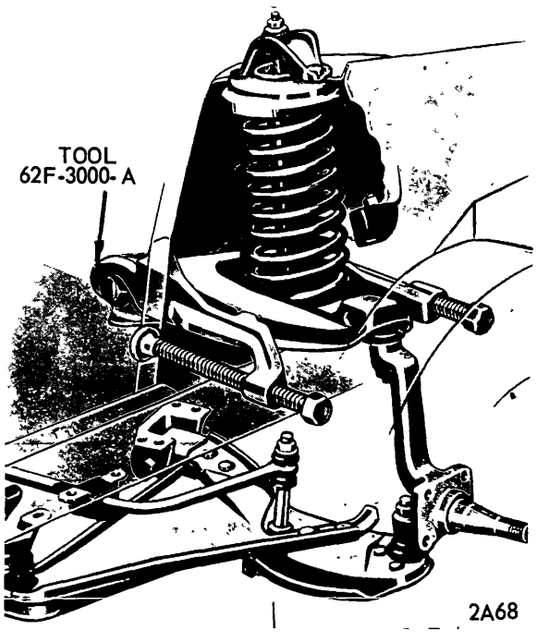
Caster

To increase positive caster or decrease negative caster, turn front screw on tool clockwise or rear screw counterclockwise. To decrease positive caster or increase negative caster, turn front screw on tool counterclockwise or rear screw clockwise. If tool tends to become loose, turn car wheels 20° outboard, then back through 0-20° inboard, then return to 0° (straight ahead). If tool is not now tight, the serrations or nuts or cross shaft are not free. Loosen cross shaft retaining bolts a little more, raise up front of car, then tap bolt heads to make sure serrations are loose.

Camber

To increase positive camber or decrease negative camber, turn front and rear screws clockwise an equal number of turns. To decrease positive camber or increase negative camber, turn front and rear screws counterclockwise an equal number of turns .

METEOR



Caster and camber adjustments are made by moving upper suspension arm shaft in or out in elongated bolt holes. The control of this movement **requires** use of Tool 62F-3000-1.

Tire Inflation (Cold)

24 lbs. front and rear. Add 4-6 lbs. for high speed driving or heavy loads.

ALIGNMENT TOOL MODIFICATION - If fender shield will not permit Tool 3000-1 to be installed properly for wheel aligning, modify tool by removing adjusting screw from tool and grinding length of threaded end of tool to 3/4" minimum.

TOOL 3000-1 INSTALLATION - Loosen upper suspension arm shaft retaining bolts several turns, then lift up on front end of car. A sharp crack will usually be heard when upper arm shaft serrations separate from sheet metal. *These serrations must be free in order to effect an adjustment.* If serrations not free, loosen bolts more, strike bolt heads a sharp blow, and use a pry bar to loosen caged nut serrations. Hook tool ends over upper suspension arm shaft bushings making sure clamp on rear tool does not make contact with brake line. *NOTE - If car raised to loosen upper arm shaft, loosen tools or remove them.* After adjustments are completed, tighten upper suspension arm shaft retaining bolts to 150-160 ft. lbs.

MERCURY METEOR WHEEL ALIGNMENT TOOL
(SIMILAR TO FORD FAIRLANE)

Caster

To increase positive caster or decrease negative caster, turn front screw on tool clockwise or rear screw counterclockwise. To decrease positive caster or increase negative caster, turn front screw on tool counterclockwise or rear screw clockwise. A movement of approximately 1/16" at either front or rear bolt location will change caster 1/2°.

Camber

To increase positive camber or decrease negative camber, turn front and rear screws of tool clockwise an equal number of turns. To decrease positive camber or increase negative camber, turn front and rear screws counterclockwise an equal number of turns . A movement of approximately 1/16" of entire shaft will change the camber 1/4°.

THUNDERBIRD

Caster adjustment is made by repositioning the strut on lower control arm. End of strut and surface on lower control arm are serrated and mounting holes in strut are elongated. Camber adjustment is made by adding or removing shims between pivot bracket of lower control arm and mounting bracket on underbody in engine compartment. After adjustments are completed, tighten strut-to-lower control arm nuts to 85-115 ft. lbs. Tighten shim retaining nut securely.

Tire Inflation (Cold)

24 lbs. front and rear.

Caster

Loosen nuts and bolts attaching strut to lower control arm and lift strut so serrations are free of serrations on lower control arm. To decrease caster, lengthen distance between strut forward mount and side of control arm. To increase caster, shorten distance between strut forward mount and side of control arm.

Camber

To move lower ball joint inward, remove shims between mounting and pivot brackets. To move ball joint outward, install shims between mounting and pivot bracket. A 1/16" change in shim thickness will change camber angle 1/3°. *NOTE - Total shim thickness should not exceed 11/16".*

LINCOLN

Caster and camber adjustments are made by moving the serrated upper control arm inner shaft assembly in elongated slots in front suspension crossmember bracket. When adjustments are completed, tighten upper control arm inner shaft-to-crossmember bracket attaching bolts to 100-125 ft. lbs.

WHEEL ALIGNMENT SPECIFICATIONS & ADJUSTMENT (C ntinu d)

Tire Inflation (Cold)

24 lbs. front and rear.

Caster

Loosen bolts securing upper control arm shaft to bracket, then with aid of a pry bar, move control arm assembly at **either of the two bolt locations** as necessary Inboard movement of front bolt or outboard movement of rear bolt will change caster in negative direction. Outboard movement of front bolt or inboard movement of rear bolt will change caster in positive direction *NOTE - A movement of 3/32" at either front or rear bolt location will change caster 1/2°.*

Camber

Inboard movement of control arm shaft **equally at front and rear bolts** will change camber in negative direction Outboard movement of upper control arm shaft equally at front and rear bolts will change camber in positive direction *NOTE - A movement of 3/64" of entire shaft will change camber 1/4°.*

GENERAL MOTORS

BUICK (EXCEPT SPECIAL)

Caster and camber adjustments are made by adding or removing shims between upper control arm inner shaft and brackets on frame

Tire Inflation (Cold)

24 lbs front and rear (28 lbs. rear on station wagons) *For temperatures below freezing, add 2 lbs.*

ALIGNMENT HEIGHT TOOL MODIFICATION - Difficulty is encountered when installing the front alignment Tool J-8973-23, so the short lip of this tool should be cut off 1/4" It is necessary to raise front of car with a jack to install this tool.

TOOL INSTALLATION - To maintain correct alignment height while checking camber and caster, install an Alignment Height Tool, J-8973-23, at each side of car between frame and front lower control arm, locating tool between coil spring and rebound bumper with long lip at upper end of tool pointing outboard Install an Alignment Height Tool, J-9873-19, at each side of car between frame and rear axle housing, locating top of tool over rear attaching bolt of rear axle housing bumper Lower end of tool must rest on axle housing Weight of car will hold tools in position

CASTER & CAMBER ADJUSTING NOTE - Do not exceed a thickness of 500" in any one shim pack After adjustments are completed, tighten upper control arm mounting bolt nuts to 90-110 ft lbs

Caster

To **increase** caster, increase amount of shims at front bolt and decrease by an equal amount at rear bolt To **decrease** caster, decrease amount of shims at front bolt and increase by an equal amount at rear bolt

Camber

To **increase** camber, remove an equal amount of shims at front and rear bolt. To **decrease** camber, add an equal amount of shims at front and rear bolt *NOTE - To increase camber and caster simultaneously, remove shims at rear bolt only. To decrease camber and caster simultaneously, add shims at rear bolt only.*

BUICK SPECIAL

Caster and camber adjustments are made by adding or removing shims between upper control arm inner shaft and brackets on frame.

Tire Inflation (Cold)

22 lbs. front and rear (26 lbs rear on station wagons). *For temperatures below freezing, add 2 lbs.*

ALIGNMENT HEIGHT TOOL INSTALLATION - Correct alignment height must be maintained while checking camber and caster. Install an Alignment Height Tool J-8973-22 at each side of car between frame and front lower control arm, locating tool between coil spring and rebound bumper with long lip at upper end of tool pointing outboard Raise rear of car slightly and place Spacer Block J-8973-20 (station wagon), or J-9873-21 (all others), at each rear wheel, positioning cutout in block over rubber bumper with bottom of block resting on axle housing Weight of car will hold tools in position.

CASTER & CAMBER ADJUSTING NOTE - Do not exceed a thickness of 380" in any one shim pack After adjustments are completed, tighten upper control arm mounting bolt nuts to 60-85 ft lbs

Caster

Adding shims at front bolt location will change caster toward negative *NOTE - This will also change camber toward negative.* Adding shims at rear location will change caster toward positive *NOTE - This will also change camber toward negative.*

Camber

Adding equal amounts of shims at both front and rear bolts will change camber toward negative *NOTE - Caster will not be changed.*

CADILLAC

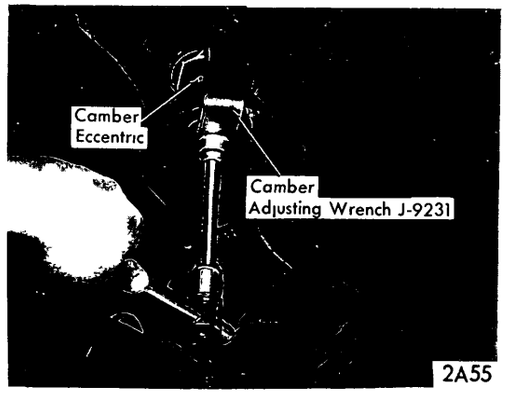
Caster adjustment is made by turning locknuts on forward ends of tie-struts at front frame crossmember *NOTE - To gain access to locknuts, it is necessary to remove air deflector at bottom of radiator* Camber adjustment is made at the camber eccentric located in steering knuckle upper support Upper spherical joint stud fits through camber eccentric and knuckle Turning the camber eccentric repositions upper spherical joint stud

Tire Inflation (Cold)

Series	Front Pressure (Lbs.)	Rear
60 & 62	24	24
75	28	28
Commercial Chassis	24	32

Caster

NOTE - Before adjusting caster, loosen tie-struts at lower suspension arms to allow tie-strut to center itself and thus prevent damage to bushings and premature wear at frame front crossmember. To provide more negative caster, lengthen tie-struts by loosening front locknuts and tightening rear locknuts. To provide more positive caster, shorten tie-struts by loosening rear locknuts and tightening front locknuts. One turn of locknuts results in approximately ½° change in caster. After proper adjustments have been made, tighten tie-strut mounting bolt nuts at lower arms to 35 ft. lbs., and front locknuts to 35 ft lbs. *NOTE - When tightening front locknut, hold rear nut securely to prevent changing caster setting.*



Camber

Loosen locknut on spherical joint stud one turn and tap bottom of stud with soft mallet to free chamber eccentric in knuckle *NOTE - If eccentric will not break free, make certain that locknut is loose, then insert a plain nut halfway on end of stud and insert a 7/16" diameter steel rod, approximately 20" long, inside plain nut and resting on stud. Tap rod with a heavy hammer to loosen eccentric.* Use Camber Adjusting Wrench, Tool J-9231, and turn camber eccentric to obtain correct setting *NOTE - Left wheel must have ¼°-½° more positive camber than right wheel to compensate for crowned roads.* Final position of ball joint should be in the rear position of camber eccentric in order to keep steering arm angle correct After adjustments are completed, tighten spherical joint stud nut to 60 ft. lbs.

TOE-IN ADJUSTMENT NOTE - Before checking toe-in make sure drag link height is correct *See "Steering Linkage" in Steering Section.*

CHEVROLET PASSENGER CARS

Camber and caster adjustments are made by adding or removing shims between upper control arm inner shaft and bracket on frame.

CADILLAC CAMBER ADJUSTING TOOL

WHEEL ALIGNMENT SPECIFICATIONS & ADJUSTMENT (C ntinu d)

Tire Inflati n (Cold)

24 lbs front and rear (28 lbs rear on station wagons)
NOTE - For improved station wagon handling under heavy loads, decrease front pressure 2 lbs. and increase rear pressure 2 lbs.

Cast r

To decrease positive caster, add shims at front attaching bolt or remove shims from rear attaching bolt. A 1/32" shim at one bolt will change caster 1/4°.

Camber

To decrease positive camber, add shims at both front and rear attaching bolts A 1/32" shim will change camber 1/6° After adjustments are completed, tighten upper control arm inner shaft attaching bolts to 45-55 ft lbs.

CHEVROLET CASTER & CAMBER ADJUSTING SHIMS

CHEVROLET TRUCKS 10, 20, 30 SERIES

On coil spring models, caster and camber adjustments are made by adding or removing shims between upper control arm shaft and mounting bracket attached to suspension crossmember Concave and convex spacers with flat opposite sides are used to allow a positive cross-shaft-to-bracket attachment regardless of the number of shims used
On "I" beam axles, camber is not adjustable, and caster is adjusted by use of tapered shims between axle spring seat and spring

Tire Inflation (Cold)

Inflation pressure for truck tires will vary according to tire size and payload Inflation of front tires should not exceed pressure or rear tires in any case.

Caster

To **incr ase** caster, increase amount of shims at front bolt and decrease by an equal amount at rear bolt To **d cr as** caster, decrease amount of shims at front bolt and increase by an equal amount at rear bolt.

Camber

To **decrease** camber, remove an equal amount of shims at front and rear bolt To **incr as** camber, add an equal amount of shims at front and rear bolt

CHEVY II

Caster adjustments are made by lengthening or shortening the lower control arm strut at front underbody connection Camber adjustments are made by rotating eccentrically mounted washers located on lower control arm inner pivot bolt

Tire Inflation (Cold)

24 lbs front and rear (28 lbs. rear on station wagons)
NOTE - For improved station wagon handling under heavy loads, decrease front pressure 2 lbs. and increase rear pressure 2 lbs.

Caster

Turn the two nuts at front end of lower control arm strut as necessary Shortening the strut rod increases caster Lengthening the rod decreases caster When adjustment is completed, tighten inside nut to 70-90 ft. lbs., and outside nut to 50-70 ft lbs.

Camber

Loosen lower control arm pivot bolts and rotate cams on pivot as necessary to move control arm in or out for correct camber When adjustment is completed, tighten pivot bolt nut to 55-70 ft lbs.

CORVAIR (FRONT WHEELS)

Caster adjustments are made by lengthening or shortening lower control arm strut in the 500, 700, and 900 series, while in the 1200 series caster adjustment is made by adding or removing shims between upper control arm inner shaft and mounting bracket at either front or rear mounting bolts. Camber adjustments on all models are made by adding or removing shims between upper control arm inner shaft and mounting bracket equally at front and rear mounting bolts.

Tire Inflation (Cold)

Car Model	Tire	Lbs. Pressure Front	Rear
Car	6.50	15	26
	7.00	15	28
Truck	4 Ply SP	24	30
	6 Ply SP	24	34
	6 Ply Ⓒ	24	45
	8 Ply Ⓒ	24	60

Ⓒ - Lt Truck Type.

Caster

Series 500, 700, 900 - Adjust caster by turning nuts at rear of strut rod Lengthening rod increases caster Shortening rod decreases caster. *NOTE - Because of manufacturing tolerances, it is possible to run out of threads on strut rod or cause front spring to be cocked in its seat and rub spring tower. Only when this happens is it permissible to shim unevenly at upper control control arm.* If shims are changed, check camber

Series 1200 - To obtain correct caster loosen upper control arm support shaft-to-crossmember bolts and add or remove shims at either front or rear bolt. *NOTE - To adjust right side, direct air heater front duct must be removed for acc ss to upp r control arm shaft attaching bolts.*

Camber

All Series - To adjust camber, loosen the upper support shaft-to-crossmember bolts, and add or remove shims **equally**, as required, at both front and rear of shaft. *NOTE - It may be necessary to remove wheel to secure these bolts.* Adding shims will decrease positive camber A 1/32" shim change will move camber 1/6°

(REAR WHEELS)

Caster

Series 500, 700, 900 - Pos 1½° - 2° at curb height.
Series 1200 - Neg. 1° ±½° at curb height
NOTE - These specifications are reference dimensions only, in that no provision for adjustment of this item is provided.

Camber

Series 500, 700, 900 - Pos ½° ± ½°at curb height
Series 1200 - Pos 1½° ± ½° at curb height
NOTE - Neither caster or camber of rear wheels is adjustable in either series, and specifications ar reference dimensions only. If camber is not within limits, either the crossmember is out of alignment, has become distorted due to collision, or control arm is bent

Toe-In

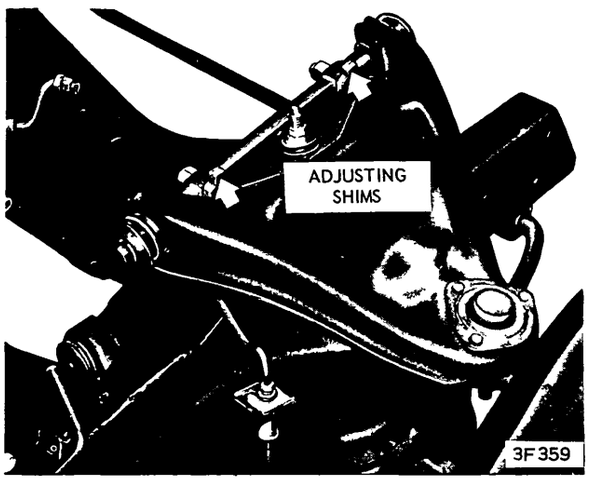
Series 500, 700, 900 - 1/8-3/8"
Series 1200 - 1/16-3/16".
NOTE - If drive-on equipment is used, reverse car and back into position. Toe-in (overall) will be read as toe-out (readings taken from rear of tires rather than front). To adjust, add or remove shims equally from each side of front edge of transmission case, with engine rear support loosened. *CAUTION - Shims must be added or removed equally, from each sid . DO NOT attempt to adjust one wheel at a time.* A shim added to each side will decrease toe-in. Removal of shim from each side will increase toe-in. *NOTE - Because of manufacturing tolerance and parts "stack-up", it is possible to have toe-out on one wheel and toe-in on opposite wheel. In this case, adjust th wheel with toe-out as close as possible to specifications, but not letting opposite wheel go out of specifications. If for example, one wheel toes-out by ¼", then opposite wheel must toe-in enough to give overall specified toe-in.*

CORVETTE (FRONT WHEELS)

Caster and camber adjustments are made by adding or removing shims between upper pivot shaft and frame side rail support bracket.

Tire Inflation (Cold)

24 lbs front and rear. *NOTE - For sustained high speed driving, inflate to 36 lbs. front and rear.*



WHEEL ALIGNMENT SPECIFICATIONS & ADJUSTMENT (C ntinu d)

Caster

To adjust caster, loosen front and rear bolts of upper control arm support shaft and add or remove shims from either bolt as required. Adding shims at the front bolt or removing shims at rear bolt will decrease positive caster. A 1/32" shim will change caster 1/4°.

Camber

To adjust camber, add or remove shims at both front and rear bolts of upper control arm support shaft A 1/32" shim will vary camber 1/6°. After adjustments are completed, tighten upper control arm support shaft bolts to 65-75 ft. lbs.

CORVETTE CASTER & CAMBER ADJUSTING SHIMS

CORVETTE (REAR WHEELS)

Camber

Camber adjustments made by turning cam type through-bolts which ride within channels on strut rod bracket. To change camber setting, loosen locknut on cam bolt, turn the cam to desired camber, then torque locknut to 55-70 ft. lbs.

Toe-In

Rear wheel toe-in angle is adjusted through use of variable thickness shims inserted between torque arm and frame side member web at forward pivoting joint. Shims are slotted to slide over bushing pivot bolt on either side. To adjust toe-in, loosen pivot bolt, shim outboard gap as necessary to obtain solid stack-up between outer end of torque arm bushing and inner wall of frame side member, and when adding shims to inner side of control arm do not use thicker shim than necessary or force insertion of shim as this may cause toe-in setting to change. After shims are securely installed, tighten pivot bolt to 40-60 ft. lbs.

OLDSMOBILE 88, SUPER 88, 98, & F-85

Camber and caster adjustments are made by removing or adding shims between upper control arm inner shaft and bracket on frame After adjustments are completed, tighten upper control arm attaching bolts to 85-110 ft. lbs. on Series 88,S88 & 98, and 60-85 ft lbs. for F-85 Series. *NOTE - To gain access to pivot shaft bolts, loosen top and rear fasteners on fender filler plate aprons.*

Tire Inflation (Cold)

Car Model	Front	Lbs. Pressure	Rear
F-85 Coupe & Sedan	① 22		① 22
Station Wagon	① 22		② 24
Convertible	24		22
Jetfire	24		22
88, S88, Starfire	② 24		22

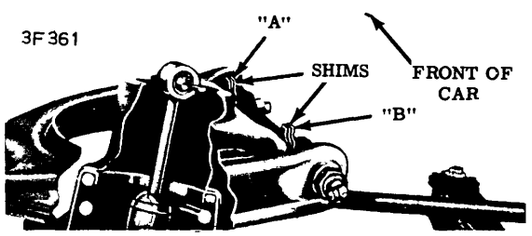
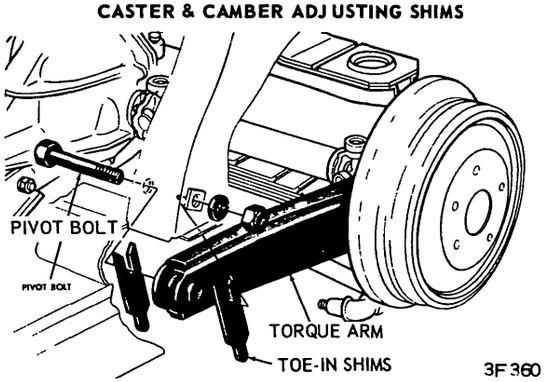
88, S88 Station Wagon	② 24		③ 24



① - 24 lbs. for air conditioned cars
② - 22 lbs for 6.50X14, 8.50X14 and 9.00X14 tires.
③ - Add 4 lbs for carrying heavy load, and to improve steering

Caster



To decrease positive caster (increase negative caster), add shims at front bolt To increase positive caster (decrease negative caster), remove shims at front bolt Removal or installation of .020" shim will change caster 5/16°.

Camber

To increase positive camber, remove shims at both front and rear bolts. To decrease positive camber, add shims at both front and rear bolts. Removal or installation of 020" shim at both bolts with change camber 1/8°.

OLDSMOBILE (ALL MODELS)
CASTER & CAMBER ADJUSTING SHIMS

CORVETTE REAR SUSPENSION TOE-IN SHIMS

PONTIAC (EXCEPT TEMPEST)

Caster and camber adjustments are made by removing or adding shims between upper control arm inner shaft and bracket on frame After adjustments are completed, tighten upper control arm attaching bolt nuts to 70-90 ft lbs.

Tire Inflation (Cold)

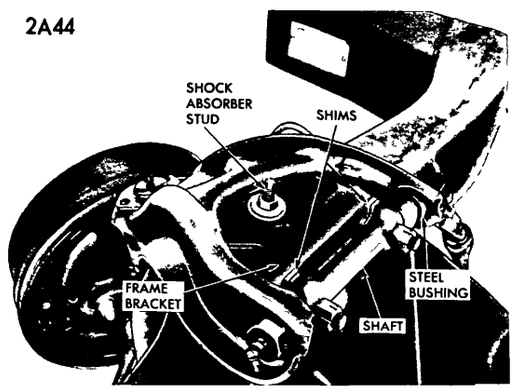
Tire & Model	① Fr nt	Lbs. Pressure	Rear
All 8.00x14	22		22
8 50x14 Station Wagon	20		24
All Others	20		20

① - Add 2 lbs for air conditioned cars.

Caster

To adjust caster, raise car to remove weight from front wheel, and loosen control arm shaft-to-frame bolts. To decrease the positive caster add shims to front bolt To increase positive caster remove shims from front bolt A .030" shim change will change caster 0°23'.

Camber



To increase camber, remove shims from both front and rear bolts. To decrease camber, add shims to both front and rear bolts A .030" shim change at both front and rear bolts will change camber approximately 1/6°

NOTE - Adding or removing an equal amount of shims at both front and rear bolts will change camber without changing caster.

PONTIAC TEMPEST (FRONT WHEELS)

Caster adjustment is made by adjusting length of strut rod Camber is adjusted by adding or removing shims equally at front and rear bolts of upper control arm inner shaft mounts. *NOTE - Shims between upper*

(Continued)

PONTIAC (EXCEPT TEMPEST)
CASTER & CAMBER SHIM LOCATION

WHEEL ALIGNMENT SPECIFICATIONS & ADJUSTMENT (Continu d)

control arm inner shaft and frame brackets at front and rear bolts must be of equal thickness After adjustments are completed, tighten bolts 55-70 ft lbs

Tire Inflation (Cold)

Tire & M d l	Front	Lbs. Pr ssure	Rear
All 6 00x15	22		22
6 50x15, 4-Cyl Eng	20		20
V8 Eng	22		20
ℂWagon, 4-Cyl Eng	22		26
Wagon, V8 Eng	22		26

ℂ - Includes Air Conditioning
NOTE - Except ℂ, add 2 lbs to front for air conditioned cars

Camber

Make camb r adjustment before adjusting caster To adjust camber, loosen upper support shaft-to-crossmember bolts, add shims equally to both front and rear attaching bolts to decrease positive camber, remove shims equally from both bolts to increase positive camber *NOTE - Shim packs at front and rear bolts must be of equal thickness Adding or removing an qual amount of shims at both front and rear bolts will change camber without changing caster* After adjustments are completed it may be necessary to remove wheel to retighten these attaching bolts

Caster

To increase caster, lengthen strut rod by loosening nut at rear of rod and turning inside nut to obtain adjustment To decrease caster, shorten strut by loosening inside nut and tightening nut at rear of rod After either adjustment, tighten other nut to 70-85 ft lbs and bend overlocking tab on two sides of nut

PONTIAC TEMPEST (REAR WHEELS)

Toe-In

Toe-in adjustment (unlike 1962 models) is made by adding or removing shims at control arm to body side rail front attaching point *NOTE - Do not add or remove shims at control arm bracket upper bolt at differential Any shims located there are for manufacturing purposes only and should not be changed* To set toe-in, loosen engine mount bolts, loosen three control arm bracket-to-body attachment bolts and adjust toe-in of each wheel to 1/16"-3/16" **by adding or r m ving shims at c ntrol arm brack t attachm nt point to body sid rail.** *NOTE - If driv -on type of equipment is used, reverse car and back it into position Toe-in (overall) will be read as toe-out when car is backwards (readings taken from rear of tires rather than front)* After adjustment is made tighten two control arm bracket-to-body bolts at front attachment points to 40-55 ft lbs *NOTE - Make sure bracket is towards center of car as far as it will go before tightening Both bracket holes are elongated for this reason* Tighten upper bracket bolt and engine mount bolts to 40-55 ft lbs

STUDEBAKER CORP.

ALL MODELS

Caster and camber adjustments are made by rotating upper control arm outer pin at steering knuckle

Tire Inflation (Cold)

STUDEBAKER CAMBER & CASTER ADJUSTMENT

NOTE - If normal loads exceed weight of four passengers, inflate 4 ply tires to 26 lbs front & rear, and 30 lbs if 6-ply tires are used
ℂ - Avanti For sustained high speed driving inflate to 30 lbs front & rear

Caster

NOTE - Adjust caster before making camber adjustment To adjust caster, loosen king pin pinch bolt, and remove lubrication fitting from rear bushing at upper control arm outer pin Insert an Allen wrench into pin (through lubrication fitting hole) and turn pin in full turns until proper caster is obtained *NOTE - A full turn of pin will change caster ½°.*

Camber

After adjusting caster, adjust camber by the same means turning the upper control arm outer pin with an Allen wrench until desired camber setting is obtained *NOTE - Entire range of adjustment is obtained by ½ turn of outer pin Additional camber change is obtained by rotating upper control arm* **inner** *shaft one-half turn, increasing or decreasing camber by approximately 1¼°*

KAISER JEEP CORP.

JEEP GLADIATOR & WAGONEER

Caster of each wheel is adjusted by turning strut tube between end of axle and frame side-member Camber is adjusted by means of slotted attaching holes in control arms

Tire Inflation (Cold)

Tire Size	Lbs. Pressure Front	Rear
6 70x15 (4 Ply)	24	26
7 10x15 (4 Ply)	24	26
7 60x15 (4 Ply)	24	28
7 50x15 (6 Ply)	30	45
7 00x15 (6 Ply)	30	45

Caster

To adjust caster, loosen locknuts at each end of strut tube, and turn (rotate) tube until specified caster is obtained After adjustment is made, tighten locknuts and recheck caster

Camber

To adjust camber, loosen control arm-to-ball joint bolts, adjust camber to specifications, and retighten bolts

WHEEL BEARING ADJUSTMENT

AMERICAN MOTORS

RAMBLER (ALL MODELS)

Rotate front hub and tighten spindle nut to 20 25 ft lbs then back off nut 1/6 turn and install cotter pin

CHRYSLER CORP.

ALL MODELS

Rotate wheel and tighten wheel bearing adjusting nut to 90 inch-lbs (Chrysler, Imperial, Dodge, Plymouth), 70 inch-lbs (Valiant) Place nut lock on nut with one pair of slots in line with cotter pin hole, then back off lock and adjusting nut to next slot Install cotter pin

FORD MOTOR CO.

ALL MODELS EXCEPT FORD & ECONOLINE TRUCKS

Rotate wheel and tighten spindle nut to torque listed in table below for each car model Install nut lock with castellations aligned with cotter pin hole, then back off spindle nut and nut lock to next castellation (next 2 castellations for Comet & Falcon), and install cotter pin

Ford Motor Co. Wheel Bearing Nut Torque

Car Model	Torque
Comet, Falcon, Meteor	12-15 ft lbs
Fairlane, Galaxie, Monterey	15-20 ft lbs
Thunderbird, Lincoln Continental	15-20 ft lbs

FORD TRUCKS (EXCEPT ECONOLINE)

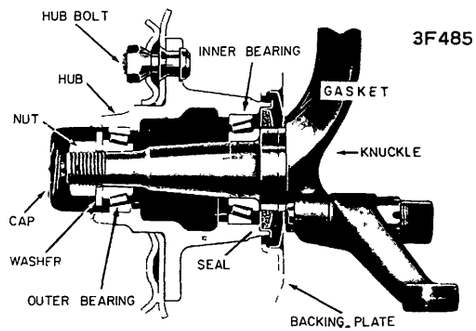
Rotate wheel and tighten adjusting nut to 50-80 ft lbs , then back off adjusting nut at least one but not more than two castellations Lock adjusting nut in this position with a cotter pin

FORD ECONOLINE TRUCKS

Rotate wheel and tighten adjusting nut to 12-15 ft lbs , then back off adjusting nut at least one castellation but not more than two castellations Loosen nut if necessary to align cotter pin hole with nearest slot in nut, and install cotter pin

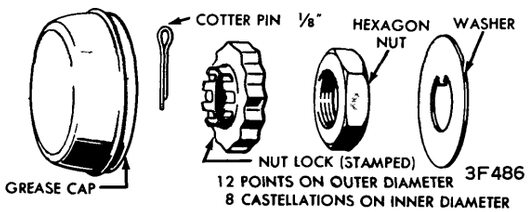
GENERAL MOTORS

BUICK AND BUICK SPECIAL



Rotate wheel and tighten spindle nut to 19 ft lbs , then back off nut and retorque to 11 ft lbs while rotating wheel If cotter pin hole in spindle does not line up with slot in nut, back off nut 1/12 turn (Buick), 1/6-3/12 turn (Special) and install cotter pin

CADILLAC



Rotate wheel and tighten adjusting nut to 30 ft lbs , then back off nut 1/4 turn and install cotter pin *NOTE - If cotter pin cannot be installed in either of the two spindle holes, loosen adjusting nut and back off as necessary*

CHEVROLET, CHEVY II, CORVAIR

Rotate wheel and tighten spindle nut to 15 ft lbs or 180 inch-lbs (Chevrolet & Corvair Trucks), and 100 inch-lbs (Chevy II & Corvair Cars), then back off adjusting nut 1 flat (1/6 turn) and install cotter pin If slot and cotter pin hole do not line up, back off nut an additional 1/2 flat or less as necessary *NOTE - Wheel bearings should have no preload and 000- 007" (000- 004" Chevy II) endplay when properly adjusted*

FRONT WHEEL BEARINGS (TYPICAL)

CHRYSLER & FORD ADJUSTING NUT LOCK

CORVETTE

Rotate wheel and tighten spindle nut to 15 ft lbs , then back off nut one flat and insert cotter pin If slot and cotter pin hole do not align, back off spindle nut 1/2 flat or less, to insert cotter pin *NOTE - Wheel bearings should have no preload and 000- 007" end movement when properly adjusted*

OLDSMOBILE 88, S88, 98

While revolving wheel at least 3 times speed of nut rotation, tighten adjusting nut to 23-25 ft lbs Back off nut 1/2 turn and retighten to 15-17 ft lbs If keyway in wheel spindle and a slot in nut line up, back off nut one notch If keyway in wheel spindle and a slot do not line up, back off nut to nearest slot, and install cotter pin

PONTIAC & TEMPEST

Rotate wheel and tighten nut to 10-12 ft lbs , then back off nut 1 flat (1/6 turn) and install cotter pin If holes do not line up, back off adjusting nut to nearest hole Final adjustment should be 1-1 1/2 flats backed off- Nut should be finger loose, with 001- 010" bearing endplay

KAISER JEEP CORP.

JEEP

Rotate wheel slowly and tighten the adjusting nut until a slight braking effect on the turning wheel is noticed Back off adjusting nut to nearest cotter pin hole and install pin

STUDEBAKER CORP.

ALL MODELS

Rotate wheel to make sure all bearing surfaces are in contact, and at the same time tighten wheel bearing nut until wheel binds on bearings Back off nut to next castellation or as necessary for wheel to turn freely, and install cotter pin

BALL JOINT CHECKING

FACTORY RECOMMENDED METHOD

Buick & Buick Special

Lower Joint - Raise car and support lower control arm as far outboard as possible to allow access to lower ball joint grease fitting. *NOTE - Support must be far enough outboard on lower control arm to raise upper control arm away from upper rubber bumper.* Clean lower ball joint and remove grease fitting, then compress Gauge F-21240 and thread captive nut on gauge into grease fitting hole. Release movable arm of gauge so pin contacts ball inside the joint. Lift or pry wheel and knuckle assembly to take up slack in lower joint. Raise and lower the wheel and knuckle assembly several times to note lower ball joint minimum and maximum endplay. Subtract minimum from maximum reading to obtain ball joint endplay in thousandths of an inch. If endplay exceeds .070" (Buick Special); .100" (Buick, Exc. Special), replace ball joint.

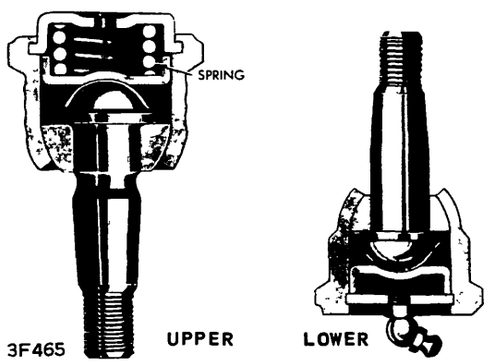
Upper Ball Joint - Support car in same manner as for lower ball joint check (see above), then hold bottom of tire stationary and push top of tire in and out. If there is any perceptible movement in the upper ball joint, replace the joint.

Cadillac

Lower Ball Joint - Check the amount of freeplay as the joint is worked vertically in its socket. If freeplay exceeds 1/16", replace the joint.

Upper Ball Joint - Use a regular joint stud nut and a second nut as a lockwasher, then turn joint in its socket with a torque wrench. Torque should be 2-4 ft. lbs. If greater, replace joint.

Chevrolet Pass. Cars & Trucks, Corvair & Corvette



Upper Ball Joint - Raise car and support on frame to allow front suspension to hang free, then remove wheel assembly. Support lower control arm on a jack stand and disconnect upper ball stud from steering knuckle. Reinstall stud nut on ball stud and check rotating torque which should be 2-6 ft. lbs. (Exc. Trucks); 5-10 ft. lbs. (Trucks). If torque is not within limits, replace ball stud. *NOTE - If excessive wear is indicated in upper ball joint, both upper and lower ball joints should be replaced.*

Lower Ball Joint - With weight of car on wheels, use a micrometer or caliper and measure distance from top of lubrication fitting to bottom of ball stud and record the dimension. Raise car and support at outer end of each support arm so that wheels are hanging free. Again measure distance from top of grease fitting to bottom and record the dimension. If difference in dimension on either side is greater than 3/32", replace both lower ball joints.

Chevy II

Upper Ball Joint - *NOTE - The upper ball joint is a loose fit when not connected to steering knuckle.* With weight of car on front wheels, install special support tool (see "Chevy II Front Suspension" in this section for tool details), then raise car and allow wheels to hang free. Measure distance from top of ball stud to top of control arm. Place adjustable jack stand under tire and raise slightly to take up ball joint looseness. Again measure distance from ball stud to top of control arm. If the difference in measurements exceeds 3/32", the ball joint should be replaced.

Lower Ball Joint - Install special support tool (see above), then disconnect lower ball stud from steering knuckle. Assemble nut to ball stud and check rotating torque with a torque wrench. If reading is not within limits of 4-6 ft. lbs. replace ball joint.

TYPICAL BALL JOINT ASSEMBLIES

(SPRING SUPPORTED ON LOWER ARM)

Chrysler, Imperial, Dodge Dart, Plymouth & Valiant

Lower Ball Joint - Raise front of car at lower control arms so wheels are hanging free. *NOTE - Lower control arms must be supported sufficiently outboard so that rebound bumper is not compressed.* Remove ball joint plug and screw the thread fitting of Tool C-3911 into ball joint plug hole until it is firmly seated. Raise and lower wheel with a pry bar and note freeplay indicated on scale of gauge. If freeplay exceeds .050" (indicated by five minor increments on gauge scale), replace ball joint.

Ford Motor Company All Models

Refer to "Alternate Method" of checking ball joints as indicated below.

Oldsmobile & Olds F-85

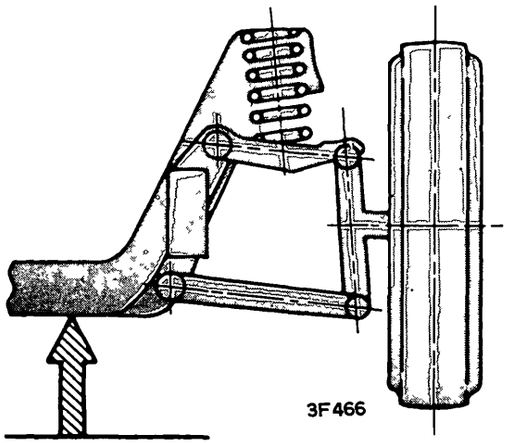
Upper Ball Joint - Disconnect upper ball joint from steering knuckle, then install a nut on ball joint stud. Use an inch pound torque wrench and rotate stud in a clockwise direction and note the torque wrench reading. If reading is not within limits of 10-60 in. pounds (Oldsmobile); 2-30 in. pounds (Olds F-85), replace ball joint.

Lower Ball Joint - Raise car and support on jackstands placed under frame side rails at each side so front wheels hang free. Place a dial indicator at lower vertical edge of wheel against rim. With one hand at top and the other at bottom of wheel assembly, moderately rock wheel at top and bottom. If movement is greater than 1/16", the lower ball joint should be replaced.

Pontiac & Pontiac Tempest

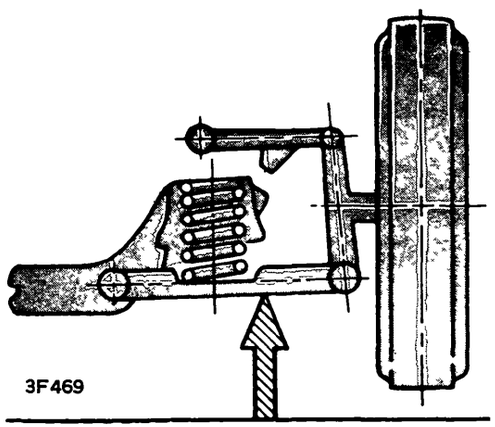
Upper Ball Joint - Disconnect upper ball stud from steering knuckle, then install nut so it is snug against ball joint and rotate stud with a torque wrench. If torque is not within limits of ½-6 ft. lbs., replace the ball joint.

Lower Ball Joint - Raise car and support with jackstands placed under lower control arm. Measure endplay of lower ball joint. Maximum endplay should be .060" (used ball joint). *NOTE* - A new ball joint should have a maximum endplay of .035" (Exc. Tempest); .020" (Tempest). Replace joint if endplay is greater than the above maximum limit.



ALTERNATE METHOD

NOTE - There are two general types of suspensions, one type with spring or torsion bar attached to lower control arm, and the other with spring attached to upper control arm. Check axial play by moving wheel up and down. Check radial play by rocking wheel at top and bottom.



Spring on Lower Control Arm

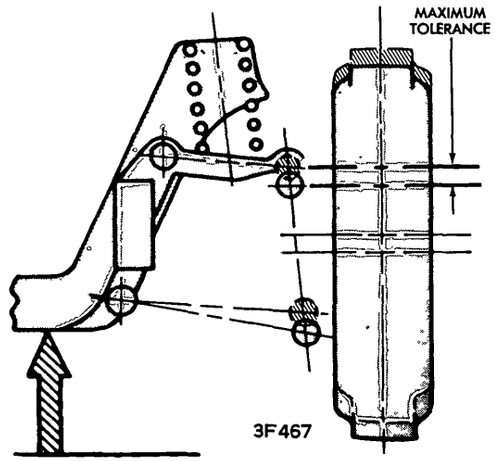
Upper Ball Joint - Replace ball joint if there is any perceptible looseness at joint.

Lower Ball Joint (Radial Play) - If radial play exceeds .250" measured at bottom of tire on side wall, replace the ball joint.

JACKING LOCATION

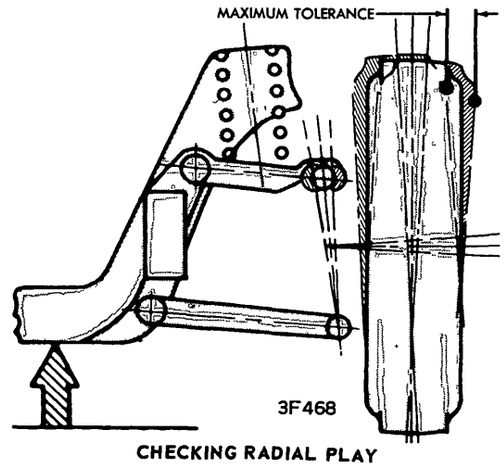
JACKING LOCATION

BALL JOINT CHECKING (C nt.)



Spring on Upper Control Arm

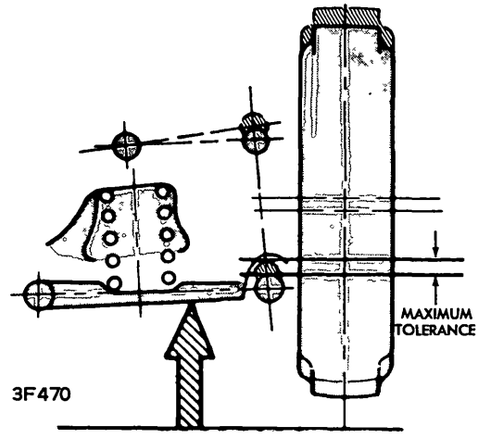
Upper Ball Joint (Radial Play) - If radial play exceeds .250" measured at top of tire on side wall, replace the ball joint.



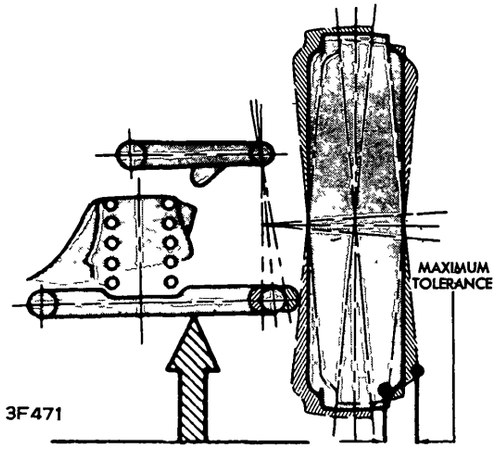
Lower Ball Joint - Replace ball joint if there is any perceptible looseness at joint.

Upper Ball Joint (Axial Play) - If axial play between upper control arm and spindle exceeds specifications (see table below), replace the upper ball joint.

SPRING SUPPORTED ON UPPER ARM



CHECKING AXIAL PLAY



CHECKING RADIAL PLAY

SPRING SUPPORTED ON LOWER ARM

CHECKING AXIAL PLAY

CHECKING RADIAL PLAY

BUICK (EXCEPT SPECIAL) FRONT SUSPENSION

Buick (Exc pt Special) 1963

DESCRIPTION

"Ball-Joint" independent type suspension similar to that used on previous models, except ball joints are pressed (were threaded) into upper and lower control arms

ADJUSTMENT

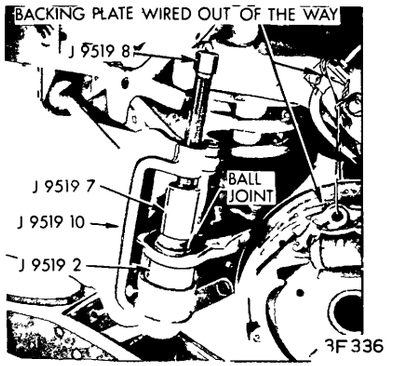
Cast r & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section*
Front Wh l Bearing - *See "Wheel Bearing Adjustment" in this section*
Riding Height - Before checking riding height, make sure that trunk is empty, fuel tank is full, and there is no bind in suspension system by bouncing both ends of car up and down several times, slowly releasing car to permit it to assume normal position At front of car riding height is measured between upper surface of lower crossmember and spring housing on crossmember (see table below for **revised** 1963 specifications) To adjust low side of car, install shim (Group 7 425) between upper end of spring and frame *NOTE - If more than two shims are required, replace spring* At rear of car, riding height is measured from axle housing to axle rebound bumper at front mounting bolt location To adjust low side of car (or to prevent "bottoming"), install spring insulators (Group 7 545) divided between upper and lower ends of spring *NOTE - If more than three insulators are required, replace spring*

1963 Buick Riding Heights

Car M del	Front Height	Rear Height
Series 4400, 4600, 4800	5 23"	℄ 7 25"
4700	4 85"	6 42"

℄ - Station Wagon rear height is 7 00"

REMOVAL & INSTALLATION



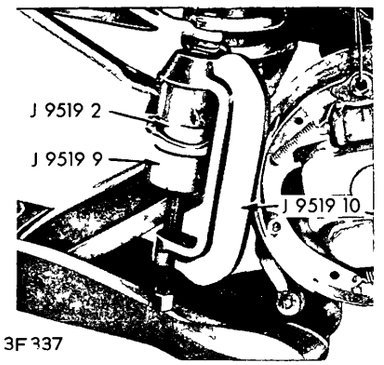
See 1962 Final Data, Page 369, and note as follows

► *UPPER & LOWER BALL JOINT REPLACEMENT NOTE* Upper ball joint and control arm are serviced as a unit, while lower ball joint may be installed or removed from the lower control arm as a separate part DO NOT ATTEMPT TO REMOVE BALL JOINT FROM UPPER CONTROL ARM

► *BALL JOINT CHECKING See Front Suspension Ball Joint Checking in this section*

Lower Ball Joint

Removal - With car raised and supported by jack stands under frame side rails, remove wheel, hub and drum assembly, and brake backing plate Wire brake backing plate out of way Place a floor jack under lower control arm as far outboard on arm as possible, leaving approximately ½' clearance between jack and control arm



REMOVING BALL JOINT

Remove ball joint cotter pin, loosen nut two turns but do not remove nut, then tap steering knuckle with a brass drift to loosen ball joint stud After stud breaks loose, use a jack to raise control arm to relieve spring tension, then remove stud nut and seal, and move knuckle away Install Lower Ball Joint Remover and Installer Tool J-9519-10 upright, and with J-9519-7 on top and J-9519-2 on bottom of lower ball joint (see illustration), tighten tool until ball joint is forced out of lower control arm *CAUTION - Ball joint may pop out suddenly*
Installation - Position ball joint, minus dust shield, in lower control arm with Tool J-9519-10 installed and J-9519-2 on top and J-9519-9 on bottom of lower ball joint (see illustration) Tighten tool until ball joint is fully seated in lower control arm With ball joint stud turned so cotter key hole is fore and aft, install dust shield, position stud in knuckle, install nut and tighten to 65 ft lbs Insert cotter pin and lubricate joint

Steering Knuckle

Removal - Loosen lower ball joint from steering knuckle (see above) but do not remove nut from ball joint stud Loosen upper ball joint stud nut two turns and with a brass drift, tap steering knuckle in area of stud on both upper and lower ball joints to separate studs from knuckle Stud nuts that were loosened still hold upper and lower control arms to knuckle *CAUTION - Be sure lower control arm is supported by a jack on its outer end to prevent downward travel of lower control arm when removing ball joint nut* If necessary, raise lower control arm slightly with jack to remove force of knuckle against nut, then remove nut raise knuckle off stud, remove nut from upper ball joint stud and remove steering knuckle

Installation - Wipe upper ball joint stud clean position it in knuckle with cotter key hole fore and aft, seat with a sharp hammer blow, torque nut to 50 ft lbs and install cotter pin Wipe lower ball joint stud clean, position it in lower end of knuckle with dust shield installed, torque nut to 65 ft lbs and install cotter pin

INSTALLING BALL JOINT

Upper Control Arm

Installation - Torque of upper control arm shaft-to-bracket nuts is 100 ft lbs

BUICK (EXCEPT SPECIAL) REAR SUSPENSION

Buick (Except Special) 1963

►CHANGES, CAUTIONS, CORRECTIONS

► *CLICKING NOISE CORRECTION* To correct for clicking noise occuring when changing direction or accelerating, tighten six rear control arm-to-frame mounting nuts and bolts to 90 ft lbs , or tighten three vernier adjustment nuts and bolts on rear upper control arm above 60 ft lbs recommended torque

DESCRIPTION

Coil spring, three link type suspension similar to that used on previous models, except that lower spring seat is no longer used as such, but is sometimes used as a shim on the left side only, when needed in production due to spring height tolerances

ADJUSTMENT

Riding Height - *See "Riding Height" under "Front Suspension" section*

REMOVAL & INSTALLATION

See 1961 Final Data, Page 349, and note the following
Coil Spring Installation - When installing rear coil spring, be sure to prevent spring end from noisily rubbing on inner edge of lower control arm by rotating it to locate bottom spring end to hang over one side or the other of lower control arm ¼-¾" *NOTE - Lower spring seat is no longer used except as a shim (on left side only) when needed in production due to spring height tolerances*

Lower Control Arm - Torque front and rear bushing bolts to 75 ft lbs

BUICK SPECIAL & OLDSMOBILE F-85 FRONT SUSPENSION

DESCRIPTION

"Ball-Joint" independent type suspension similar to that used on previous models, except ball joints are pressed (were threaded) into upper and lower control arms.

ADJUSTMENT

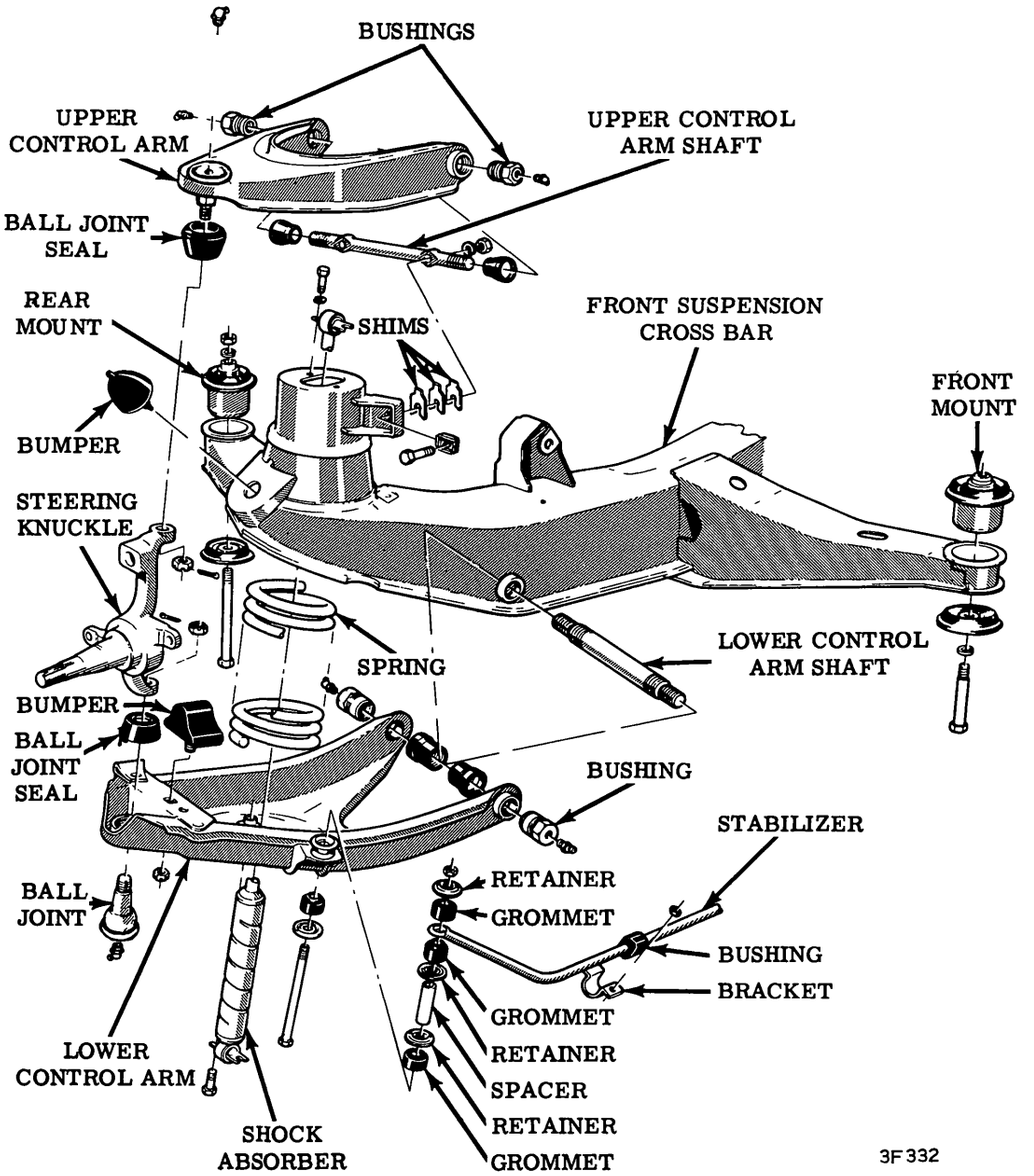
Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*

Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*

Riding Height - Before checking riding height, make sure trunk is empty and fuel tank is full. Normalize position of springs by working bumper up and down and then release it slowly. Buick Special riding height is measured from a point immediately behind front rivet of compression bumper on lower control arm to lowest point of spring housing. Oldsmobile F-85 front riding height is measured from lower side of gauge hole in lower control arm to metal surface of spring upper housing. Rear riding height is measured from top of rear axle housing tube to base (Buick), face (Oldsmobile) of rebound bumper on car underbody. *NOTE - No adjustment of riding height is provided.*

1963 Buick Special & Oldsmobile F-85 Riding Heights

Car Model	Front	Rear
Buick Special	4.40"	6.65"
Station Wagon	4.40"	5.94"
Oldsmobile F-85	6.25 ±.25"	4.75 ±.25"
Station Wagon	6.25 ±.25"	4.18 ±.25"



REMOVAL & INSTALLATION

See 1962 Final Data, Page 371, and note the following:

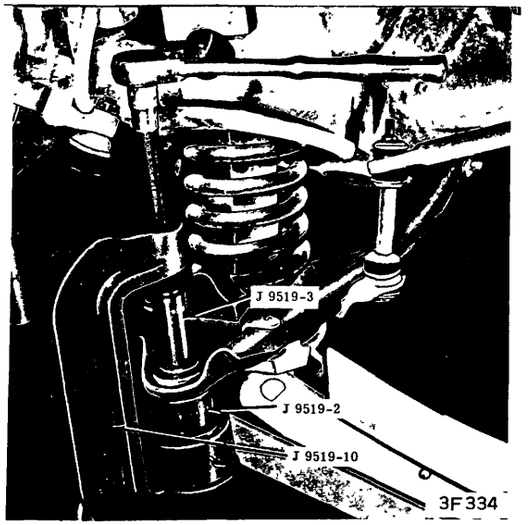
►*1963 UPPER & LOWER BALL JOINT REPLACEMENT NOTE:* Upper ball joint and control arm are serviced as a unit, while lower ball joint may be installed or removed from the lower control arm as a separate part DO NOT ATTEMPT TO REMOVE BALL JOINT FROM UPPER CONTROL ARM.

►*1961, 1962, 1963 LOWER BALL JOINT REPLACEMENT KIT:* Part No 1396309 (lower ball joint, seal, grease fitting, and ball stud nut) may be used to replace earlier "threaded" ball joints. Endplay reduced limits of .000"- 020" and a 008" oversize ball joint housing insures adequate retention and increased durability.

►*BALL JOINT CHECKING: See Front Suspension Ball Joint Checking in this section.*

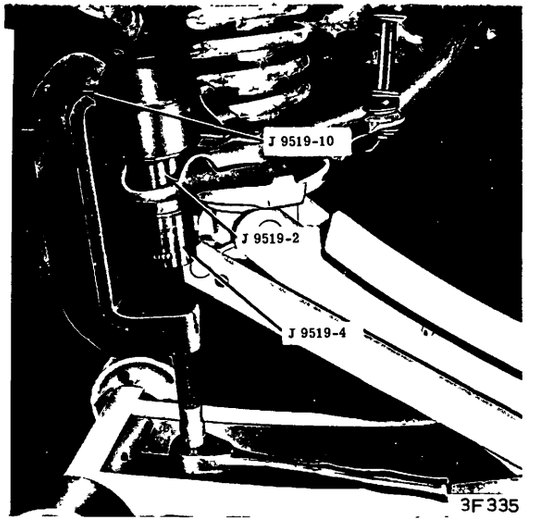
BUICK SPECIAL & OLDSMOBILE F-85 FRONT SUSPENSION ASSEMBLY

Lower Ball Joint



Removal - For both model cars, with car raised and supported by jack stands under frame side rails, remove wheel, hub and drum assembly, and brake backing plate. Wire brake backing plate out of way. Remove ball joint cotter pin, loosen nut two turns but do not

(Continued)



BUICK SPECIAL & OLDSMOBILE F-85 FRONT SUSPENSION (C nt.)

remove nut, then tap steering knuckle with a brass drift to loosen ball joint stud. After stud breaks loose, use a jack to raise control arm to relieve spring tension, then remove stud nut and seal, and move knuckle away. Install Lower Ball Joint Remover and Installer Tool J-9519-10 upright with J-9519-3 on top and J-9519-2 on bottom of lower ball joint (see illustration). Tighten tool until ball joint is forced out of lower control arm. *CAUTION - Ball joint may pop out suddenly.*

Installati n - For both model cars, position ball joint minus dust shield, in lower control arm with Tool J-9519-10 installed with J-9519-2 on top and J-9519-3 on bottom of lower ball joint (see illustration). Tighten tool until ball joint is fully seated in lower control arm. With ball joint stud turned so cotter key hole is fore and aft, install dust shield, position stud in knuckle, install nut and tighten to 50 ft. lbs. (Buick Special); 35-60 ft. lbs. (Oldsmobile F-85). Insert cotter pin and lubricate joint.

REMOVING BALL JOINT

INSTALLING BALL JOINT

BUICK SPECIAL & OLDSMOBILE F-85 REAR SUSPENSION

Buick Special (1963)
Oldsm bile F-85 (1963)

DESCRIPTION

Coil spring, four link type suspension, similar to that used on previous models, with two lower control arms mounted between outer ends of rear axle housing and car underbody, and two upper control arms mounted angularly between rear axle differential housing and car underbody.

ADJUSTMENT

Riding Height - *See "Riding Height" under "Front Suspension" section.*

Rear Universal Joint Angle - *NOTE - Whenever rear lower control arms are replaced, check and adjust rear universal joint angle. See "Propeller Shafts" in "Rear Axle" section.*

REMOVAL & INSTALLATION

See 1961 Final Data, Page 352, and note the following:

Upper Control Arm

Installation - Right and left upper control arms are interchangeable, however, best clearance is obtained when the two manufacturing tabs on side of arms are facing outboard. Torque control arm attaching bolts for both models to 45-60 ft. lbs.

Lower Control Arm

Removal - Oldsmobile F-85 bushings and lower control arm are replaced as a unit, while Buick Special bushings are replaceable as separate parts (removed and installed through one side of arm only).

Installation - Torque control arm attaching bolts for both models to 45-60 ft. lbs.

CADILLAC FRONT SUSPENSION

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 LOWER CONTROL ARM TIE-STRUT BUSHING FAILURE CORRECTION* On early model 1963 cars, excessive wear of tie-strut bushing may occur due to severe or repeated stop-and-go driving To increase service life of this bushing, weld bushing cup, Part No 1481655 to rear of number one crossmember *NOTE - Cars beginning with approximate Eng No 124300 have this bushing cup factory installed* To reduce tie-strut bushing replacement on 1961-62 cars, bushing cup may be installed

►*1963 REDUCED AXIAL MOVEMENT OF LOWER BALL JOINTS.* On all 1963 model cars, beginning with Eng No 102481, the axial movement of front suspension ball joints has been reduced from 000- 030" to 000- 020" as a means of reducing premature ball joint replacement *NOTE - Vertical freeplay in ball joint should exceed 1/16" before replacement is made* To clean ball joints, use a clean cloth, **never use solvent.**

DESCRIPTION

"Ball-Joint" type suspension similar to that used on previous models

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section*

Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section*

Riding Height - Before checking riding height, make sure that trunk is empty and fuel tank is full Normalize position of springs by working bumper up and down and release slowly, permitting car to assume normal position At the front of car, riding height is measured from top of rear flange on lower control arm to center of hole on frame side rail *NOTE - This hole (rivet in 1962), is nearly on centerline of front coil spring When measuring, hold rule vertical, seating it on lowest part of support arm flange, directly below hole* Standing height should be equal on both sides of car within 3/8" (see table below for **revised** 1963 specifications) To adjust low side of car, add one shim at top of spring seat inside frame tower *NOTE - No more than ONE shim should be used on each side* At rear of car, riding height is measured between top of rear axle housing to lower underside surface of frame Rear standing height should be equal within 1/2" on both sides of car (see table below) To adjust low side of car, add one shim at top of spring seat inside tower

1963 Cadillac Riding Heights

Car Model	Front Height	Rear Height
Series 60, 62	7 3/8"-8 1/4"	5 13/16"-6 9/16"
75	7 7/8"-8 5/8"	6 5/8"-7 3/8"
Commercial	7 7/8"-8 5/8"	4 1/4"-5"

REMOVAL & INSTALLATION

See 1962 Final Data, Page 373, except as follows

►*BALL JOINT CHECKING: See Front Suspension Ball Joint Checking in this section*

Front Stabilizer

Removal - Disconnect stabilizer at lower control arm, then remove brackets and stabilizer from frame

Installation - Reverse removal procedure and tighten bracket-to-frame bolts to 20 ft lbs Tighten link nut to end of threads

Lower Control Arm Tie-Strut

Removal - Raise front of car and place jack stands under frame side rails, then remove air deflector covering inner end of tie-strut Disconnect stabilizer link from lower arm Remove locknut, bushing retainer, and bushing from forward end of tie-strut Remove two bolts securing tie-strut to lower suspension arm and remove strut Remove rear locknut from tie-strut **if necessary.** *NOTE - If replacing only bushings, do not distrub rear locknut on tie-strut, otherwise it will be necessary to readjust caster and camber*

Installation - *NOTE - If rear locknut was previously removed, install a new locknut (¾" thick) on threaded end of tie-strut, and run nut ¾" from end of thread* Install rear bushing retainer on tie-strut with concave side against nut Insert metal spacer part way through flat side of rear bushing and install bushing and spacer on tie-strut Install threaded end of tie-strut through frame front crossmember, making certain flat side of bushing is flush with frame Position end of tie-strut on lower suspension arm and install two attaching bolts and nuts **loosely.** Install front bushing on tie-strut (ribbed face toward frame), and slide bushing against frame crossmember Place front bushing retainer on tie-strut with convex side against bushing Start new locknut (5/8" thick) on threaded end of tie-strut Connect stabilizer link to lower suspension arm, being certain grommets and retainers are properly installed Lower car, and with car weight on all four wheels, position front bushing on metal bushing on metal spacer and tighten locknut on front end of tie-strut to 35 ft lbs Tighten tie-strut to lower arm attaching bolt nuts to 35 ft lbs *NOTE - If rear locknut was disturbed during removal or installation, adjust caster and camber*

Upper Control Arm Ball Joint Seal

Removal - Raise front of car and place jack stands under lower suspension arms so that shock absorber lower mounts rest on jack stands Remove wheel and tire assembly and locknut and special flat washer from ball joint stud Scribe a mark on camber eccentric and steering knuckle to aid alignment for installation Remove joint from knuckle by installing a standard nut part way on stud, inserting a 7/16" rod (round end) inside nut, then striking rod with a heavy hammer until joint is free Remove standard nut Raise up on upper arm and remove ball joint Remove camber eccentric from joint stud, using puller J-8990 After wiping seal surface clean, remove garter spring and seal Inspect ball pivot for looseness or binding *NOTE - Joint should turn in its socket at 2-4 ft lbs If damaged or worn, replace joint and arm as an assembly* Pry out service plug from ball joint cover and discard See lubrication note below

Lubrication of Upper and Lower Ball Joints - Using Repacking Gun, J-9280 (red label), repack joint through plug hole, forcing lubricant into joint until enough comes through to flush out any moisture and foreign material Wipe off surplus, but allow sufficient lubricant to fill void around joint stud

Installation - Install new service plug in ball joint cover Using a new seal, turn seal inside out, place nylon ring inside seal just over bottom hole *NOTE - Flat nylon washer (replaced 1961 snap ring) on all 1962 front suspension upper arm ball joint seals, is being replaced by a flanged nylon retainer ring, starting with Eng No 103163 Flanged ring protects against direct contact between seal and camber eccentric* With some lubricant around hole in seal, clean groove in joint housing and install seal on joint stud, making certain large groove diameter of seal engages in recess (circular groove) around joint housing Allow air to enter seal by momentarily prying large lip of seal away from joint housing with a small screwdriver Slide small end of seal toward threaded end of stud and install new garter spring on seal using Garter Spring Installer, J-9148

CAUTION - Make sure spring secures lip of seal in recess all around joint housing Install camber eccentric and align marks on eccentric and steering knuckle Install a standard nut on ball joint stud and tighten until eccentric locks in knuckle, then remove standard nut, and install special flat washer and locknut, tightening to 60 ft lbs Check camber and adjust if necessary

CADILLAC REAR SUSPENSION

DESCRIPTION

Four link, coil spring type similar to design used on previous models

ADJUSTMENT

Riding Height - *See "Riding Height" under "Front Suspension" section*

REMOVAL & INSTALLATION

See 1961 Final Data, Page 356, and note the following:

Control Arm Attaching Bolts - With car at standing height, tighten front and rear control arm bolts to 60 ft lbs

CHEVY II FRONT SUSPENSION

Chevy II (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 UPPER CONTROL ARM BALL JOINT SEAL FAILURE:* Ball joint seal valve which releases excess grease during lubrication, may cause failure of ball joint if inoperative due to hardened grease or undersize relief valve hole Check valve openings and if necessary open with any 1/16" diameter rod.

DESCRIPTION

Ball joint independent type suspension, with shock absorbers mounted within front coil springs, similar in design to previous models.

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*
Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*
Riding Height - *See 1962 Final Data, Page 378.*

REMOVAL & INSTALLATION

See 1962 Final Data, Page 378, and note th following:

►*BALL JOINT CHECKING: See Front Suspension Ball Joint Checking in this section.*

►*1963 CONTROL ARM BALL JOINTS:* New extended lubrication interval type ball joints may be identified by large rubber boot on stud end of joint. Lubrication interval is 6,000 miles or 6 months, whichever comes first.

CHEVROLET PASS. CAR FRONT SUSPENSION

Chevrolet Pass. Car (1963)

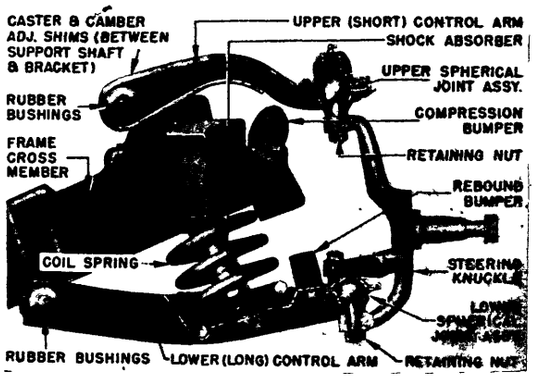
►CHANGES, CAUTIONS, CORRECTIONS

►*1963 UPPER CONTROL ARM BALL JOINT SEAL FAILURE:* Ball joint seal valve which releases excess grease during lubrication, may cause failure of ball joint if inoperative due to hardened grease or undersize relief valve hole. Check valve openings and if necessary open with any 1/16" diameter rod.

DESCRIPTION

Ball joint independent type suspension, with coil springs and direct acting shock absorbers, similar in design to previous models.

ADJUSTMENT



Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*
Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*
Riding Height - *See 1962 Final Data, Page 375.*

REMOVAL & INSTALLATION

See 1962 Final Data, Page 375, and note the following:

►*1963 CONTROL ARM BALL JOINTS:* New extended lubrication interval type ball joints may be identified by large rubber boot on stud end of joint. Lubrication interval is 6,000 miles or 6 months, whichever comes first.

►*BALL JOINT CHECKING: See Front Suspension Ball Joint Checking in this section.*

CHEVROLET FRONT SUSPENSION 2F348

CHEVROLET PASS. CAR REAR SUSPENSION

Chevrolet Pass. Car (1963)

DESCRIPTION

Rear suspension is similar in design to previous models, using a three-link, coil spring suspension. Linkage consists of two lower control arms and a single upper control arm. Forward ends of lower control arms are attached to brackets on frame side rails and rear ends are attached to brackets on rear axle housing. The upper control arm is now connected to rear axle housing at right hand side on top of axle tubes and to bracket on frame right side rail. A tie rod is attached to frame left side rail and to right hand side of rear axle housing. Rubber bushings are used at both ends of control arms for connection to frame and rear axle housing. Coil springs are mounted with lower end seated on lower control arm and upper end seated in tower bracket welded to frame side member.

ADJUSTMENT

Riding Height - *See "Riding Height" under "Front Suspension".*
Rear Universal Joint Angle - *NOTE - Whenever rear lower control arms are replaced, check and adjust rear universal joint angle. See "Propeller Shafts" in "Rear Axle" section.*

REMOVAL & INSTALLATION

Shock Absorbers

Removal - Remove lower attaching bolt, lockwasher and spacer, then remove upper two attaching nuts, bolts and washers. Pull shock absorber off of lower anchor pin.
Installation - Assemble two-piece bushing into eye on shock absorber, then install spacer, lockwasher and nut (do not tighten) Install and tighten upper bolts, flat washers, lockwashers, and nuts, then tighten lower attaching nut.

Shock Absorber Lower Anchor Pin

Removal - Remove rear coil spring (see below), or support rear suspension lower control arm. Remove shock absorber from lower mounting, then remove anchor pin nut and lockwasher. Install Tool J-7063, and sliding hammer J-2619, and drive pin out of rear suspension lower control arm. *NOTE* - It may be necessary to put a horizontal load on lower control arm rear bushing to keep it from flexing.
Installation - Use chalk and mark flat spot location on anchor pin threads and on corresponding flat on lower control arm bracket. *NOTE - It is advisabl to r mov rear wheel to aid in alignment of these two chalk marks.* Install Tool J-7063 to anchor pin and enter into lower control arm. Attach sliding hammer, Tool J-2619 and drive into place, keeping the two chalk marks aligned. Install shock absorber on lower mounting, then install anchor pin attaching lockwasher and nut.

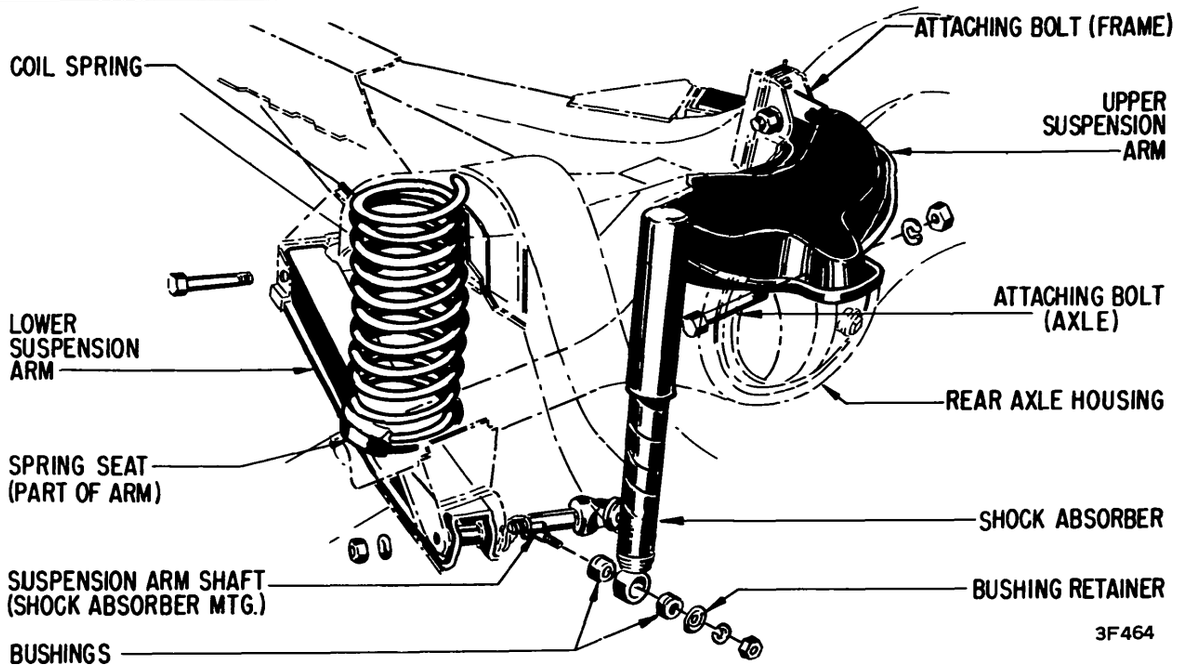
Rear Coil Springs

Removal - Place car on hoist or jack stand, and remove rear shock absorbers from lower mounting pins, remove "U" bolts from rear universal joint, and separate propeller shaft from rear axle, resting shaft on top of companion flange. Loosen pivot bolt retaining nuts at both sides of front and rear pivot of lower control arms, front and rear pivots of upper control arm, and both ends of rear axle tie rod. With car supported so that rear axle hangs free, observe position of right spring in relation to brake line, and pry spring out of lower seat, if necessary, to avoid damaging brake line while lowering rear suspension during spring removal. Remove rear spring.
Installation - Position coil springs in seats, making sure upper end of coils index with "step" in spring upper seat. *CAUTION - To avoid damag to brak lin when axle is raised, position lower end of right hand*

(Continued)

CHEVROLET (PASS. CAR) REAR SUSPENSION (C nt.)

spring slightly off bottom seat. Raise axle just enough to allow lower coil of right hand spring to clear brake line, then pry spring to proper position on lower seat. Install universal joint on rear axle. Raise axle until weight of car is supported normally. Install shock absorbers on lower anchor pins and tighten all pivot bolt retaining nuts loosened previously.



Upper Control Arm & Bushings

Removal - Raise car on a hoist that will support rear axle housing or wheels, then remove rear pivot bushing bolt at rear axle housing. *NOTE - Rear axle must be supported in such a way as to prevent axle housing from rotating about the lower control arm rear pivot, and to also relieve load on pivot bushings.* Remove bolts, lockwashers, and nuts securing upper control arm bracket to frame bracket or crossmember. *CAUTION - Note number of shims removed as these control driveline angles.* Remove arm from car.

Removal of Bushings - Remove bolt, nut and washer attaching upper control arm to bracket and separate control arm from bracket. With control arm bushing centered over Tool J-7574-4 and Tool J-7574-3 in place and with arm resting horizontally by supporting at opposite end, press or tap bushing from arm using Tool J-7574-1 and Tool J-7079-2 (Driver Handle). Repeat procedure for opposite end of control arm.

Installation of Bushings - Turn arm to opposite side (bushing can only be installed from one direction), center bushing hole over support Tool J-7574-4 and install Tool J-7574-3 between flanges at hole location. *NOTE - Tool J-7574-3 will prevent overcompression of arm during overtravel.* Fix Tool J-7574-2 on driver handle, then start bushing into hole and press or tap in place. Check to see that no interference or cocking takes place. Flange of bushing must be seated on arm. Repeat procedure for opposite end of arm.

Installation - Tap front of upper control arm into control arm bracket, then install bolt, lockwasher and nut, but do not tighten. Set control arm (with front bracket installed) on axle housing bracket and tap into place. Install bolt (head of bolt must be toward outboard side), lockwasher and locknut, but do not tighten. Align forward end of upper control arm bracket with frame bracket or crossmember, then install two lower bolts through control arm bracket and frame bracket or crossmember. *CAUTION - Make sure shims removed at disassembly are reinstalled in original locations.* Install both nuts and lockwashers. Install upper bolt and flat washer from front of bracket, then install lockwasher and nut. Tighten the three bracket bolt nuts to 60-80 ft. lbs. *NOTE - If a new control arm was installed, check driveline angles (see "Propeller Shafts" in "Rear Axle" section).* Lower car to floor, then bounce rear of car several times to settle bushings. Tighten upper control arm nuts to 80-90 ft. lbs.

CHEVROLET PASS. CAR REAR SUSPENSION ASSEMBLY

Lower Control Arm & Bushings

Removal - Place car on hoist and support frame side rails. Remove shock absorbers, then remove wheels and rear springs. Remove shock absorber lower anchor pin (see above). If both rear suspension control arms are to be removed, support rear axle housing to prevent its moving or falling from hoist or jack. Remove parking brake cable hold down clip, then remove attaching nut, bolt, and lockwasher on forward end of control arm and remove arm.

Removal of Bushings - To remove front bushing, center control arm and bushing over Tool J-7574-4 with Tool J-7574-3 in place. With arm resting horizontally and supported at opposite end, press or tap bushing from arm using Tool J-7574-5 and driver handle. *NOTE - Be sure to place the removed end of bushing with the flange.* To remove rear bushing, repeat above operation for opposite end using Tool J-7574-1 in place of Tool J-7574-5.

Installation of Bushings - To install front bushing, fix Tool J-7574-6 onto driver handle, then start bushing into hole and press or tap in place. Check to see that there is no interference or cocking. Flange of bushing must seat against arm. To install rear bushing, repeat above operation using Tool J-7574-2 in place of Tool J-7574-6.

Installation - Install forward end of control arm, but do not tighten bolt. Swing control arm into place and install shock absorber lower anchor pin *(see "Shock Absorber Lower Anchor Pin" Installation above),* but do not tighten attaching bolt. Install wheel, then install coil springs (see above). Install shock absorbers and check drive line angles *(see "Propeller Shafts" in "Rear Axle" section).* Lower car to floor and bounce it several times to settle bushings, then tighten all attaching nuts.

Rear Suspension Tie Rod & Bushings

Removal - Remove nut, washer and bolt from left hand side and washer from stud on right side that secures tie rod to brackets. Remove tie rod. To remove bushings, center tie rod over Tool J-7877-2 and with tie rod supported horizontally, press or drive bushing from rod, using Tool J-7877-1 and J-7079-2.

Installation - To install bushings, reverse above procedure, using Tool J-7877-3 in place of J-7877-1 to press or drive in bushing. *NOTE - Tool J-7877-2 should bottom on rod when bushing is fully seated.* Mount tie rod to right hand stud, then install nut and special washer but do not tighten. Install bolt, lockwasher and nut to left hand bracket but do not tighten. Lower car to floor and bounce rear end several times, then tighten nuts to 55-70 ft. lbs.

CHEVROLET TRUCK FRONT SUSPENSION

Ch vr l t Truck (1963)

DESCRIPTION

New design ball joint independent type suspension with tapered coil springs between upper and lower control arms. Double acting shock absorbers, located at rear of control arms, are stud-mounted to a frame bracket at top and clevis-mounted to lower control arm bracket at the bottom. Ball joints are pressed into control arms and arms pivot on steel threaded bushings. Caster and camber shims are located between concave-convex spacers and upper control arm bracket on frame.

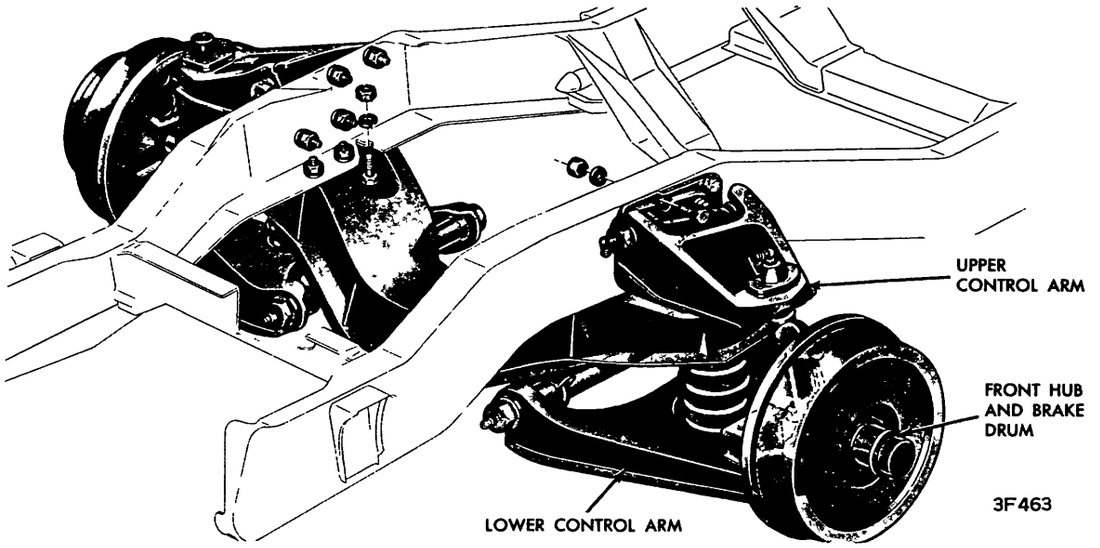
ADJUSTMENT

Cast r & Camb r - *See "Wheel Alignment Specifications and Adjustment" in this section.*
Fr nt Wh el B aring - *See "Wheel Bearing Adjustment" in this section.*

REMOVAL & INSTALLATION

► *BALL JOINT CHECKING: See "Front Suspension Ball Joint Checking" in this section.*

Sh ck Absorber



R m val - After removing upper and lower nuts and eye bolt, remove shock absorber, then remove any burrs formed by lockwashers on control arm and frame. *NOTE - If rubber bushings are defective, replace shock absorber assembly.*
Installati n - Reverse removal procedure and torque upper nut to 130-150 ft. lbs. and lower nut to 55-75 ft. lbs.

Stabilizer

R m val - With truck raised and link bolt disconnected at upper nut, withdraw upper grommet retainer and grommet, then slide link bolt, remaining grommets, and spacer out of bracket. Remove frame brackets and drop stabilizer bar from under frame.
Installati n - With stabilizer in position on frame, install frame brackets over bushings. *NOTE - Center of stabilizer must line up with centerline of vehicle within 3/8" to prevent interference with steering gear.* Install link bolts, spacer and grommets to stabilizer, then torque link bolt nut to 9-12 ft. lbs. (threads should bottom out) and tighten frame brackets to 15-24 ft. lbs

Coil Spring

R m val - Raise truck and support on frame to allow control arm to swing free. Disconnect lower end of shock absorber and loosen lower ball joint stud nut. While supporting steering knuckle boss, rap boss sharply with hammer to loosen ball stud. Use Tool J-6874 and components to compress coil spring enough to clear spring tower, then remove lower ball joint stud nut. With lower ball stud free of steering knuckle, swing lower control arm down, release spring tension and remove spring.
Installati n - *NOTE - Install c il spring with small coil end up.* Reverse removal procedure and note the following: Torque lower ball joint stud to 100-135 ft. lbs. While releasing spring tension, guide spring into seat with drift.

CHEVROLET TRUCK FRONT SUSPENSION

Lower Control Arm, Ball Joint & Bushings

Removal - With coil spring removed from arm (see above), disconnect control arm from crossmember. Make remover/installer tools of heavy pipe or tubing in dimensions of 2 1/2" diameter X4", 2" X 2 7/8", 3" X 1/2", 1 3/4" X 2 3/4". With arm off car, place arm over remover support tool and press out ball joint with appropriate remover tool.
Bushing Removal - With grease fittings removed from bushing outer end, unscrew bushings from control arm.

Bushing Installation - Slide new seal on each end of shaft and insert shaft into control arm. Start new bushings on shaft and into control arm, adjusting shaft until it is centered in arm, then turn bushings in and torque to 200-220 ft. lbs. (with spacer); 125-140 ft. lbs. (without spacer).
Installation - Invert control arm and place on installer support tool at ball joint area, then press new ball joint assembly into arm until it is fully seated and square with arm. Position arm assembly in tube type brackets located on crossmember and notice specially designed rivet in forward position has a head on bottom side which serves as a guide pin to locate pivot shaft in proper position. Install "U" bolts and torque to 30-40 ft. lbs. Install spring and complete installation as described above.

Upper Control Arm, Ball Joint & Bushings

Removal - Raise truck, and with lower control arm assembly supported by adjustable jack, remove wheel and hub assembly. Use Tool J-6874 and components to compress coil spring, then disconnect upper ball joint stud and raise upper arm to clear steering knuckle. Disconnect control arm shaft studs to crossmember bracket and withdraw control arm assembly. *NOTE - Tape shims and concave-convex spacers together just as they were removed.* With arm off truck, center punch ball joint rivet heads, then drill and punch out rivets to remove ball joint.
Bushing Removal - With grease fitting removed from ends of bushings, unscrew bushings from shaft and control arm. Remove shaft and seals.
Bushing Installation - Slide new seal on each end of shaft and insert shaft into control arm. Start new bushings on shaft and into control arm, adjusting shaft until it is centered in arm, then turn bushings in and torque to 140-160 ft. lbs. (with spacer); 80-100 ft. lbs. (without spacer). Check shaft for free rotation.
Installation - Install service ball joint assembly in arm using special hardened bolts only, torquing bolts to 40-50 ft. lbs. Place control arm in position on bracket and loosely install nuts. Before tightening nuts, insert caster-camber shims and concave-convex spacers in the same order as when removed. Torque nuts to 70-90 ft. lbs. Insert ball joint stud into steering knuckle and torque nut to 60-75 ft. lbs. Remove spring compressor tool and support from under lower control arm, then install hub and wheel assembly and lower truck.

Crossmember

Removal - With both coil springs removed (see above), support engine and remove front engine mount center bolt. Separate main brake feeder line from crossmember tee and remove bolts retaining crossmember hangers to frame side rails. Remove bolts securing crossmember to frame side rail lower flange and lower assembly from truck.
Installation - Jack crossmember into position under frame and install frame side rail lower flange mounting bolts. Install bolts securing crossmember hanger to frame and torque nuts to 60-80 ft. lbs. Position engine on front mount and install mounting bolt and torque to 40-50 ft. lbs. Install coil springs (see above) and connect front brake main feeder line. Bleed brakes and check front end alignment .

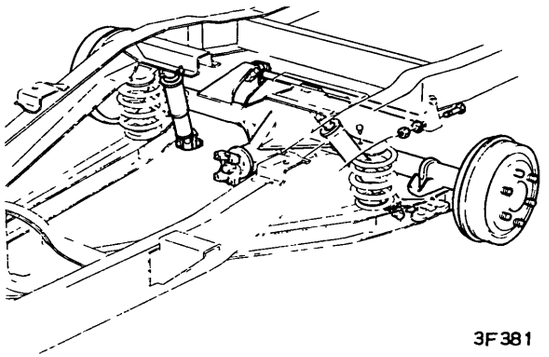
CHEVROLET TRUCK REAR SUSPENSION

Chevrolet Trucks (1963)

DESCRIPTION

New design two-link coil spring type suspension. Rear of control arms attach to axle housing tubes by a single "U" bolt, while front ends attach to rear crossmember frame brackets by a single pivot bolt. Shock Absorbers, located forward of axle housing, are attached at top to rear crossmember brackets and at bottom to brackets held to axle by control arm "U" bolts. A tie rod is mounted parallel to axle housing and bracket supported at axle housing and frame.

REMOVAL & INSTALLATION



Tie Rod & Bushings

Removal - Remove nuts and bolts from each end of rod and remove rod. *NOTE - Minor defects in rod may be corrected by bending, however, a badly bent rod should be replaced.*

Removal of Bushings - Using Tool J-7079-2, position end of rod over a suitable tube-type support and press bushing from rod.

Installation of Bushings - Reverse removal procedure, using Tool J-8518.

Installation - With rod ends aligned in mounting brackets with a drift, insert pivot bolts and install nuts finger tight, then let weight of unloaded vehicle rest on suspension and torque pivot nuts to 110-150 ft. lbs.

CHEVROLET TRUCK REAR SUSPENSION

Control Arm & Bushings

Removal - Jack up frame to remove load from spring, and remove spring clamp bolt from underside of control arm. Remove "U" bolt nuts and separate shock absorber bracket from control arm and arm from "U" bolts. Lower rear of arm, disconnect parking brake lever at clip on bracket attachment, remove pivot bolt and remove arm from truck.

Bushing Removal - With Tool J-8448-3 in fork of control arm, astride bushing, and Tool J-5888-3 underneath bushing, place Tool J-8448-2 on top (in bushing hole), and press bushing from arm with Tool J-7079-2

Bushing Installati n - Support control arm as in removing procedure, with new bushing flanged side up, then press bushing in with Tools J-8448-1 and J-7079-2.

Installation - With bushed end of control arm positioned in pivot yoke, align holes with drift, insert pivot bolt and turn nut on bolt finger tight. Position clamp inside coil spring so that it seats freely on spring end without any hang-up, then raise control arm to spring, pass bolt with flat washer installed up through arm and clamp. *NOTE - Coil end should be in-line with clamp bolt straight across arm and notch of clamp should be within 30° in from coil end.* Install lockwasher and torque nut to 40-50 ft. lbs With arm adjacent to axle, pass "U" bolt over axle and through holes in arm. Place shock absorber bracket on ends of "U" bolt, install nuts and torque to 220-320 ft. lbs. Lower truck, and with full weight of unloaded vehicle on front and rear suspension, torque control arm pivot bolts to 125-165 ft. lbs.

Coil Spring

Removal - Remove shock absorber bolt from mounting bracket at control arm, then jack up frame so spring is not under tension. Remove upper and lower clamps from spring by backing out lower bolt from underside of control arm, and upper bolt from inside spring. Lower control arm to allow removal of spring.

Installation - Position spring clamp inside coil spring (as described above) and loosely install clamp bolt, washer and nut. Position upper clamp inside spring and install bolt, washer, and torque nut to 45-55 ft. lbs. Connect and torque shock absorber-to-control arm bracket to 110-150 ft. lbs Torque spring lower clamp bolt to 40-50 ft. lbs., then remove jack.

CORVETTE FRONT SUSPENSION

Corvette (1963)

DESCRIPTION

New design "Ball joint" independent type suspension, with shock absorbers mounted within front coil springs and springs mounted between lower control arms and front suspension crossmember. Upper and lower control arm pivot shafts are bolted to a fixed suspension crossmember with shims provided between upper pivot shaft and crossmember for caster and camber adjustments. A front mounted stabilizer bar is linked to lower control arms.

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*

Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*

Riding Height - With car at curb weight, position car on a level floor, then bounce front of car several times and allow to settle. Measure distance from floor to center of front inner pivot of lower control arm and record measurement. Measure distance from floor to lower face of front steering knuckle boss for "ball joint" (on same side of car) and record measurement. Difference between these two measurements should be 3 5/8" ± 1/2". Measure opposite side. Differences should not exceed 1/2" between right and left sides of car.

REMOVAL & INSTALLATION

► *BALL JOINT CHECKING: See "Front Suspension Ball Joint Checking in this section.*

Shock Absorber

Removal - With car raised, remove nut at top and two bolts at bottom of shock absorber (hold upper stem from turning), then remove shock absorber from bottom of control arm.

Installation - Place lower cushion on stem and insert shock absorber up through lower control arm into hole in crossmember. Place upper cushion, retainer and nut on shock absorber upper stem, tightening nut to 15-25 ft. lbs. Install lower mounting bolts to control arm and tighten to 8-11 ft. lbs.

Stabilizer Bar

Removal - With car raised, at both sides of car remove nut at top of link bolt, retainer, bushing, and remove link bolt. At both sides of car, remove two nuts attaching stabilizer bracket to frame and remove stabilizer bar.

Installati n - Reverse removal procedure, lower car to floor and bounce and rock front end several times to settle bushings, then retighten stabilizer link bolts and bracket-to-frame bolts to 9-12 ft. lbs.

Coil Spring

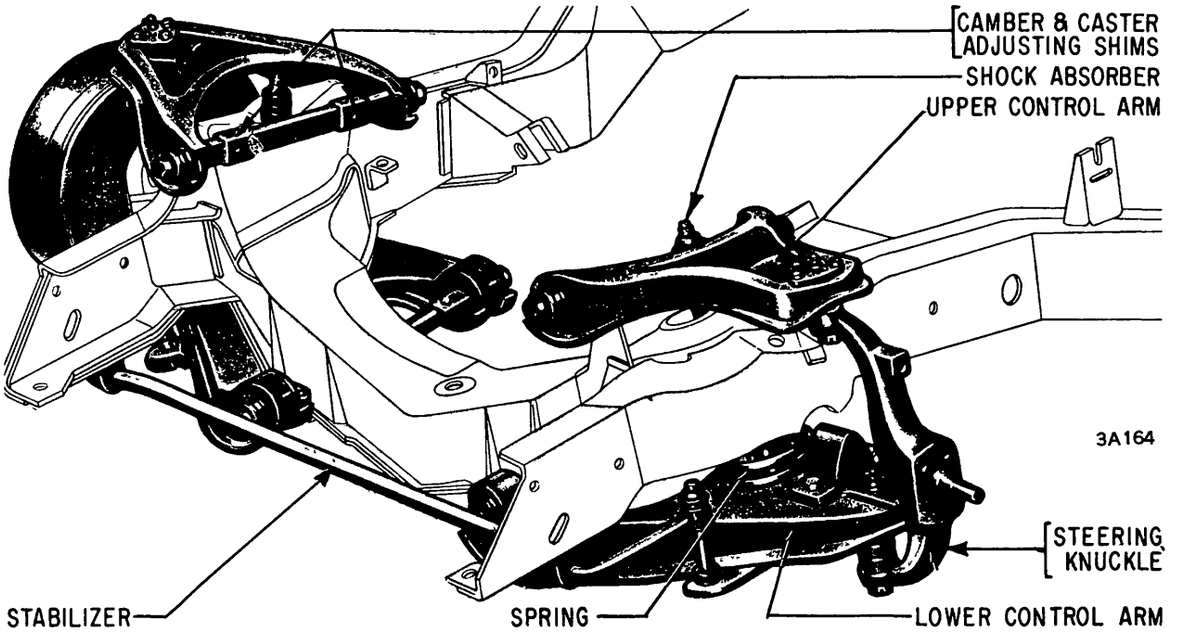
Removal - With car raised and supported by frame so control arms swing free, remove wheel and tire assembly, stabilizer bar and shock absorber (see above). Loosen lower ball joint-to-steering knuckle nut, and two lower control arm cross shaft bushing bolts. Place Tool J-6874-1 across top of sixth coil, then loosely secure Tool J-6874-2 to upper shoe with attaching capscrews and lock washers. Upper shoe "V" notch and lower shoe raised land should contact spring. Insert Tool J-6874 up through center of spring and attach to upper and lower shoe assembly. With spacers under shock absorber mounting hole and against bottom of lower control arm, install special bearing washer and Tool J-6874-5 against spacer with large washer against bearing, then feed screw up through large washer bearing and spacer and thread into Tool J-6874 and tighten snugly With shoe assembly centered on spring and screw tightened until a very slight compression is placed on spring, firmly tighten down two capscrews securing upper and lower shoes to lock these shoes to spring. Turn head of screw until spring is compressed just enough to clear spring tower, then remove lower ball joint-to-steering knuckle nut. *NOTE - If needed, assist spring out of spring tower with pry bar.* Disconnect lower ball joint from spring knuckle and lower control arm with compressed spring. Immed-

(Continued)

CORVETTE FRONT SUSPENSION (C ntinued)

iately release compression on spring by backing off long screw, release spring and tool and withdraw spring. **Installation** - Position spring with small coil end up, and place Tool J-6874-1 across top of sixth coil, then loosely secure Tool J-6874-2 to upper shoe with attaching capscrews and lockwashers. Upper shoe "V" notch and lower shoe raised land should contact spring. Insert Tool J-6874 up through center of spring and attach to upper and lower shoe assembly with bolt and nut. With spring in its seat on lower control arm, position spacers centrally under shock absorber mounting hole and against bottom of lower control arm. Install bearing, washer and Tool J-6874-5 with bearing against spacer and washer against bearing. Feed screws up through large washer, bearing and spacer and thread into yoke rod, then tighten snugly but do not draw down yet. Center shoe assembly on spring and tighten log screw until a very slight compression is on spring, then firmly tighten down two capscrews securing upper and lower shoes, locking shoes to coil spring. Turn head of screw until spring is compressed just enough to clear spring tower. *NOTE - If needed, assist spring into tower with a pry bar.* Install lower ball joint into steering knuckle and secure with attaching nut, then release compression on spring and also use a drift to guide coil spring into its proper seat. End of coils must be 3/8" from coil stops in spring seat. Tighten lower ball joint-to-steering knuckle nut and lock with cotter key. Install shock absorber, stabilizer bar, wheel and tire assembly and lower car to floor. Tighten two lower control cross shaft bushing bolts to 45-55 ft. lbs.

Upper Ball Joints



Rem val - With car raised and supported by frame so control arms swing free, disconnect stabilizer link from lower control arm and upper ball stud from steering knuckle, to allow knuckle and wheel hub assembly to hang free. Grind or cut off rivets securing ball joint assembly to control arm and remove ball joint.

Installation - Place ball joint assembly on arm and assemble with special bolts furnished in kit, tightening bolts to 15-25 ft. lbs. *NOTE - Drill out rivet holes in control arm to diameter specified in kit.* Raise lower control arm and insert upper ball stud into steering knuckle, then install ball stud nut and tighten to 42-47 ft. lbs. Insert cotter pin, then connect stabilizer link to lower control arm bracket and tighten to 9-12 ft. lbs.

Lower Ball Joints

R m val - With car raised, support lower control arm on stand and disconnect lower ball stud from steering knuckle, then raise knuckle and wheel hub assembly out of way. *NOTE - Spring removal not neeced if jackstands firmly support lower control arm after ball stud is disconn cted.* Grind or cut off rivets securing ball joint assembly to control arm and remove ball joint.

Installation - With new ball joint on arm, install special bolts and nuts furnished in service kit and tighten to 15-25 ft. lbs. *NOTE - Drill out rivet holes in control arm to diameter specified in kit.* Raise arm and insert ball stud into steering knuckle, install ball stud nut and tighten to 60-94 ft. lbs. Insert cotter pin.

CORVETTE FRONT SUSPENSION

Lower Control Arm & Bushings

Removal - With coil spring removed (see above), remove two front cross shaft-to-frame attaching bolts and rear frame attaching nut, then remove lower control arm.

Bushing Removal - Remove bolt, lockwasher and collar from each end of cross shaft, then thread a 7/16" x 20 capscrew (furnished with Tool J-5888) to bottom of threads in one end of cross shaft. With control arm in arbor press on Tool J-5888-3, press on capscrew until bushing is removed. *NOTE - Be sure bushing flange does not contact support.* Repeat for other bushing.

Bushing Installation - With cross shaft in control arm and Tool J-7052-1 in position, place control arm on Tool J-5888-3, and hand start bushing into control arm and over end of cross shaft. *NOTE - End of shaft with two bolt holes should be toward front of control arm.* Install Tool J-7052-5 over bushing, being certain three-piece spacer is not overlapping bushing holes in control arm. Press bushing into control arm until flange contacts control arm, then invert arm in press and repeat same process on other bushing. *NOTE - After installation, cross shaft should be free enough to be rotated by hand.* Install collar, lockwasher and capscrew in each end of cross shaft. DO NOT TIGHTEN.

Installation - With control arm in place, attach in place with three lockwashers and special washers under rear bolt, bolts, and anchor nuts, then install coil spring (see above), and lower car to floor. Tighten cross shaft bushing bolts to 45-55 ft. lbs.

Upper Control Arm & Bushings

Removal - With car raised and supported at outer end of lower control arm, remove wheel and tire assembly, then remove nut from upper control arm ball stud and remove ball stud from steering knuckle. Remove two nuts retaining upper control arm shaft to front crossmember, and note number of shims at each bolt, then remove control arm.

Bushing Removal - Remove capscrews, lockwashers and collars from both ends of cross shaft, then install a 3/8" x 24 capscrew (furnished with Tool J-5888) in one end of cross shaft. Support control arm in arbor press on Tool J-5888-3 and press out bushing. *NOTE - B sure flange of bushing does not contact support.* Invert control arm and repeat process on other bushing. Remove capscrew from cross shaft.

Bushing Installation - With control arm in arbor press and Tool J-7052-2 in place, press in one bushing while arm is supported by Tool J-5888-3. Install cross shaft in arm, invert in press, and press in second bushing. *NOTE - Cross shaft should be free enough to be rotat d by hand.* Install collar, lockwasher and capscrew in ends of cross shaft. DO NOT TIGHTEN.

Installation - With control arm in place and attaching studs in position, install two nuts and bolts retaining upper control arm shaft to front crossmember and install same number of shims as removed at each bolt. With new seal on joint stud, install stud through knuckle, install nut, tighten securely, and install cotter pin. Install wheel and tire assembly, lower car to floor, bounce front end several times, and tighten bushing collar bolts to 35-40 ft. lbs.

CORVETTE REAR SUSPENSION

C rv tt (1963)

DESCRIPTION

New design, with a transverse multi-leaf spring mounted on a fixed differential carrier, and each wheel mounted by a three-link independent suspension composed of a wheel drive shaft, a camber control strut rod, and a trailing wheel spindle support arm that acts like a radius arm.

ADJUSTMENT

Camber & Toe-In - *See "Wheel Alignment Specifications and Adjustment" in this section.*

REMOVAL & INSTALLATION

Shock Absorber

Removal - With car raised, disconnect shock absorber upper mounting bolt and lower nut, sliding shock upper eye out of frame bracket and pulling lower eye off strut rod mounting shaft.

Installation - Reverse above procedure, tightening upper nut to 40-60 ft. lbs. and lower nut to 50-60 ft. lbs.

Strut Rod & Bushings

Removal - With car raised, disconnect shock absorber lower eye from strut rod shaft, remove strut rod shaft nut, and withdraw shaft by pulling toward front of car. *NOTE - Mark relative position of camber adjusting cam and bracket, so they may be reassembled in same location.* Loosen camber bolt and remove four bolts securing strut rod bracket-to-carrier and lower bracket. Remove cam bolt nut and cam and bolt assembly, then pull strut down out of bracket and remove bushing caps.

Bushing Removal - With strut rod bushing centered over Tool J-7877-2 and strut rod supported horizontally, press or drive bushing from rod, using Tools J-7877-1 and J-7079-2.

Bushing Installation - With strut rod end centered over Tool J-7877-2, press or drive bushing to bottom on strut rod using Tool J-7877-3.

Installati on - With bushing caps over inboard bushing, slide rod into bracket, install cam and bolt assembly, and adjust cam to line up with mark on bracket. Tighten but do not torque nut. Raise bracket and assemble to carrier lower mounting surface, torque bolts to 15-22 ft. lbs. Raise outboard end of strut rod into spindle support fork and insert strut rod shaft into fork so that flat on shaft lines up with corresponding flat in spindle fork, then place shock absorber lower eye and bushing over strut shaft, tightening nut to 50-60 ft. lbs. Lower car to floor, torque camber nut to 55-70 ft. lbs. and strut rod shaft nut to 80 ft. lbs. Check wheel camber.

Spring

Removal - Raise car and support on frame slightly forward of torque control arm pivot points, then remove wheels. With a jack under spring at link bolt, raise spring until it is nearly flat, then wrap 1/4" or 5/16" chain with grab hook around suspension crossmember and spring. Hook chain securely with grab hook and secure chain to spring with "C" clamp to prevent slipping. *CAUTION - Do not use rope, wire, cable or anything but chain to retain spring.* Lower jack to free and remove link bolt, then raise jack and spring end and remove chain when it is loose. Lower jack until spring end tension is released, then repeat all of the above procedure for the other end of spring. Remove four bolts securing spring center clamp plate and drop spring, sliding it out from under car.

Installation - With spring on carrier cover mounting surface, index center bolt head with hole in cover, place center clamp plate in position and install four attaching bolts, tightening bolts to 55-75 ft. lbs. Raise spring outer end with jack until spring nearly flat, then secure with chain as described above. Lower jack, align torque control arm with spring end and insert link bolt, cushions and retainers. Tighten nut on link bolt until cotter pin hole is visible and insert pin. Raise spring end with jack under link bolt and remove chain and "C" clamp when loose. Lower jack, making sure cushions remain indexed in retainers, then remove jack and repeat above procedure for other spring end.

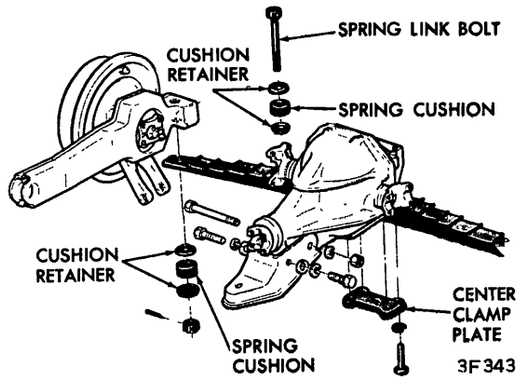
Torque Control Arm & Bushings

Removal - Disconnect spring on side that torque arm is to be removed (see Spring Removal above). With shock absorber lower eye removed from strut rod shaft, disconnect and remove strut rod shaft, swinging strut rod down, then remove four bolts securing axle drive shaft to spindle flange and disconnect drive shaft. *NOTE - It may be necessary to force torque arm outboard to provide clearance to drop drive shaft.* Disconnect brake hose from torque arm and disconnect parking brake cable. Loosen torque arm pivot bolt and remove toe-in shims. Tape shims together and identify for correct reinstallation, then withdraw pivot bolt and pull torque arm out of frame.

Bushing Removal - With torque arm off car, drill out flared end of bushing retainer, remove retainer plate and tap retainer out of bushing. Remove bushings by spreading them apart with a chisel and tap out of arm. *NOTE - If bushing diameters are severely rusted in torque arm, and arm tends to spread during removal, clamp arm in a "C" clamp to prevent spreading.*

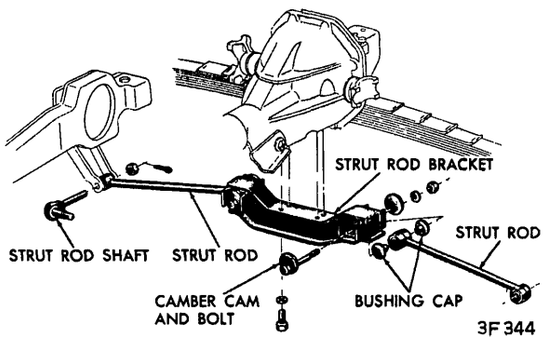
Bushing Installation - Hand start bushings in arm, then press into place using Tool J-7055-1. With special plate over flared portion of new bushing retainer, insert retainer into bushing. Place fabricated back-up plate (see illustration) on flared end of bushing retainer and assemble Tool J-8111-23 to plate with two 1/2" bolts 5" long. Be sure threaded hole in J-8111-23 is centered over unflared end of bushing retainer and that chamfered retainer plate is centered over retainer tube. Lightly oil pointed end of J-8880-5 screw and thread into J-8111-23 until pointed end contacts bushing retainer. Continue threading J-8111-23 until retainer is flared.

Installation - With torque arm in frame opening, insert pivot bolt and assemble. Place toe-in shims in original position on both sides of torque arm, then tighten pivot bolt but do not torque. Raise axle drive shaft into position and install to drive flange, then torque bolts to 25-35 ft. lbs. With strut rod in position, insert strut rod shaft so that flat lines up with flat in spindle support fork, then install and tighten nut to 80 ft. lbs. Install shock absorber lower eye, tighten nut to 50-60 ft. lbs., then connect spring (see Spring Installation above). Install wheel, lower car, and tighten torque arm



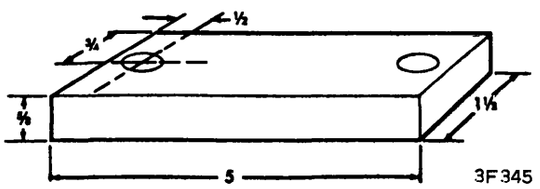
Suspension Crossmemb r & Isolation Mount

R m val - With rear spring removed (see above), remove differential Carrier *(see "Corvette & Chevrol t ½-Ton Truck Hypoid" in Rear Axle s ction),* and with crossmember supported, remove bolts securing crossmember isolation mounts to frame.



Isolation Mount Removal - With suspension crossmember off car, remove bolts securing carrier cover to crossmember, and bend back isolation mount tabs. Place crossmember on a suitable support and press mount out of arm using a piece of suitable size pipe or tubing on outer shell or inner insert.

Isolation Mount Installati n - With mount in position on crossmember, compress outer sleeve and press mount into place until it is fully and squarely seated, then bend over locking tabs.



Installa tion - Install carrier cover to crossmember and torque bolts to 25-35 ft. lbs. Raise crossmember into position and install mounting bolts to torque of 20-30 ft. lbs. Install differential carrier assembly *(see "Corvette & Chevrolet ½-Ton Truck Hyp id" in R ar Axle section),* then install wheels and lower car.

CORVETTE REAR SPRING INSTALLATION

CORVETTE STRUT ROD ASSEMBLIES

FLARING TOOL BACK-UP PLATE

CORVAIR FRONT SUSPENSION

C rvair, All Models (1963)

►*CORVAIR 95 BALL JOINT STUD REPLACEMENT*

NOTE: If upper control arm ball stud replacement unit, Part No. 3813205, has ¼" diameter attaching holes in flange, drill holes to 5/16" diameter. Special 5/16" diameter bolts furnished in unit must be used to attach ball stud assembly.

DESCRIPTION

Ball joint type independent front suspension with a ball and socket joint connecting upper and lower control arms to steering knuckles. Coil springs are mounted between lower control arm and tower in front crossmember. Shock absorbers are mounted within coil springs on lower control arm and connected at top to tower in front crossmember. On 500, 700, and 900 Series, a strut rod is connected between outer ends of lower control arms and brackets that trail back from front crossmember. On these models, caster adjustment is made with this strut rod. On 1200 Series (including Greenbriar), the lower control arm is of different design and caster is adjusted by shimming upper control arm

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*

Fr nt Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*

Riding Height - With car at curb load (full gas tank, and spare tire, no passengers), position car on a level floor, then bounce and rock car several times and allow to settle Measure heights as follows:

Front End - Measure from center of lower control arm pivot bolt to floor If distance not as shown and equal within ½" on both sides of car, replace springs

Rear End - Measure distance from bottom of rocker panel 29" ahead of rear wheel center line to floor (Pass Cars), from center of rear suspension control arm pivot bolt to floor (1200 Series). If distance not as shown and equal within ½" on both sides, replace springs.

CAUTION - Springs do not have flat ends and shims must not be used.

Riding Height

Mdl	Front	Rear
Pass Cars	12" ± ½"	9" ± ½"
Greenbrier & Trucks	12" ± ½"	14 5/16" ± ½"

REMOVAL & INSTALLATION

See 1960 Final Data, Pag 376, or later Manual edition, and n te th f llowing:

►*BALL JOINT CHECKING: See Front Suspension Ball Joint Checking in this section.*

1963 Ball J int Stud Tightening Torques

Model	Upper	Lower
Pass. Cars	30-40 ft. lbs.	30-40 ft. lbs
Greenbrier & Trucks	42-47 ft. lbs.	60-94 ft lbs

Coil Spring (Series 1200)

Removal - Take out the upper rebound bumper, then place car on a hoist, raising and supporting the car on jack stands so front control arm hangs free. *NOTE - Position stands so c ntrol arms may b raised or lowered with a floor jack.* Remove shock absorber, then position a piece of 2" x 4" lumber, 16¼" long between top of upper control arm and behind reinforcing channel above wheel. Make sure upper corner of this wood support is placed behind reinforcing channel toward inside of car. Place a floor jack under lower control arm and raise until wood support is forced firmly against channel. Disconnect lower control arm ball joint stud from steering knuckle, then raise lower control arm and free stud from knuckle boss. Swing wheel out far enough to clear lower arm, and block or wire in this position. Carefully lower jack supporting control arm until spring is decompressed and remove spring.

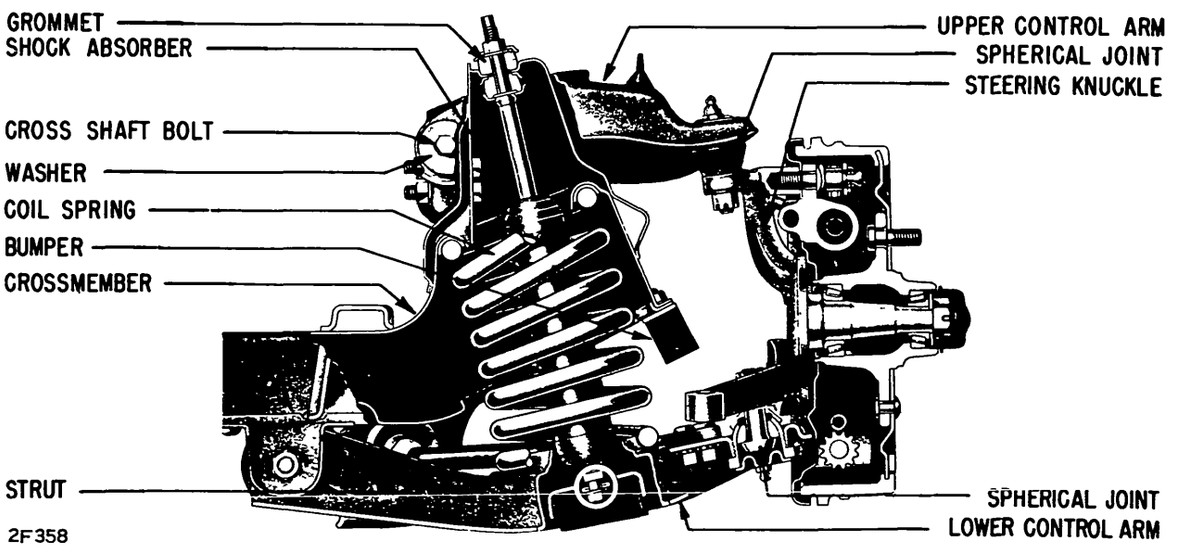
Installation - Seat coil spring in tower with its end in contact with step in spring seat, then swing lower control arm up as far as possible and seat spring in control arm. Place floor jack under lower control arm and raise until ball joint stud may be placed into steering knuckle boss (make sure dust cap is in position on ball stud). When stud will enter hole in knuckle, lower jack and install stud nut. Tighten to 60-94 ft. lbs. and continue to tighten until cotter pin holes are lined up and install cotter pin. Raise lower control arm and install upper rebound bumper in proper hole, then to seat it in position, slowly lower the control arm until upper arm presses point of bumper through hole in spring tower.

Lower Control Arm (Series 1200)

Removal - Remove coil spring (see above), and disconnect lower control arm inner shaft from crossmember

Disassembly - Remove bolt, lockwasher and collar from each end of cross shaft, then thread a 7/16" - 20 capscrew (furnished with Tool J-5888) to bottom of the threads in one end of cross shaft. Support control arm in an arbor press on Tool J-5888-3, being careful not to allow bushing flange to contact support, then press on capscrew until bushing is free of control arm. Repeat this operation to remove bushing from opposite end of shaft.

Reassembly - Install cross shaft in control arm and position Tool J-7052-1, then support control arm with Tool J-5888-3 and hand start bushing into control arm and over end of cross shaft *NOTE - End of cross shaft with two bolt holes must be toward front of control arm.* Install Tool J-7052-5 so three-piece spacer does not overlap bushing holes in control arm, then press bushing into control arm until flange contacts arm. Repeat procedure for bushing at opposite end of cross shaft. Install collar, lockwasher and capscrew in each end of shaft but DO NOT TIGHTEN.



Installation - Install control arm on crossmember and attach with lockwashers, bolts and anchor nuts. Install coil spring, then with car weight on wheels, tighten cross shaft bushing bolts to 45-55 ft lbs.

Upper Control Arm (Series 1200)

Removal - Raise and support car under outer end of lower control arm, then remove wheel assembly. Disconnect and remove ball joint stud from steering knuckle with Tool J-6627 (pitman arm puller), then wire hub, drum and steering knuckle in position to prevent damage to brake hose Remove nuts retaining upper control arm to crossmember, noting number and thickness of shims found at each bolt, and remove control arm.

Disassembly - Remove capscrews, lockwashers and collars from both ends of cross shaft, then install a 3/8" - 24 capscrew (furnished with Tool J-5888) in one end of shaft Support control arm in an arbor press on Tool J-5888-3, being sure that flange of bushing does not contact support, then press bushing out of arm, repeat this procedure for opposite bushing

(Continued)

CORVAIR SERIES 500, 700, 900 FRONT SUSPENSION ASSEMBLY

CORVAIR FRONT SUSPENSION (Continu d)

Reassembly - Install control arm in press with Tool J-7052-2 in place between legs of control arm and press in bushing. Install cross shaft in arms and invert assembly in press, and press in second bushing. *NOTE - Cross shaft should be free enough to turn by hand.* Install collar, lockwasher and capscrew in each end of cross shaft, but DO NOT TIGHTEN.
Installation - Reverse removal procedure and lower car to floor. Bounce front end to centralize bushings, then with weight of car on wheels, tighten bushing capscrews to 35-40 ft. lbs.

Ball Joints (Upper & Lower)

Removal - With coil spring removed and control arms hanging free, remove lube fitting from joint, then mark center of rivet heads with a center punch and drill through head with a ¼" drill. Cut off heads with a chisel and remove balance of rivets with a punch. Remove ball joint.
Installation - On upper control arms, ream rivet holes out to 21/64". Position new ball joint assembly on control arm and install special bolts through mounting holes and tighten nuts securely. *CAUTION - Use only the bolts (specially hardened) furnished with ball joint assembly.* Complete installation by reversing removal procedure.

Front Suspension Crossmember

Removal - Remove steering relay rod from car, then remove bolts retaining idler arm to frame. Disconnect brake main cylinder line and rear brake feed line from junction block at top center of cross member. Use a suitable jack under crossmember and remove the four bolts holding crossmember to underbody, then remove crossmember.
Installation - Reverse removal procedure and note the following: Tighten crossmember mounting bolts to 100-110 ft. lbs., and idler arm-to-frame nuts to 13-22 ft. lbs.

CORVAIR REAR SUSPENSION

Corvair, All Models (1963)

DESCRIPTION

Independently sprung with individual single control arm on each side of car. Coil type rear springs are mounted between control arm and frame crossmember. Shock absorbers are mounted within coil springs.

ADJUSTMENT

Toe-In - *See "Wheel Alignment Specifications & Adjustment".*
Riding Height - *See "Riding Height" under "Front Suspension".*
Camber - *See "Camber" under "Front Suspension"*

REMOVAL & INSTALLATION

See 1960 Annual Data, Page 377, or later Manual edition.

DODGE, DART, PLYMOUTH & VALIANT FRONT SUSPENSION

Dodge & Dart (1963) ℂ
Plymouth (1963)
Valiant (1963)

ℂ - Except Dodge Custom 880. For this model, see "Chrysler, Imperial, & Dodge Custom 880" in this section.

DESCRIPTION

Ball joint independent type suspension with torsion bars, similar in design to previous models.

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*
Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*
Riding Height - With car at curb weight and positioned on a level floor, bounce front of car several times and allow to settle. *NOTE - Checking Gauge No. C-3895 or C-3914 is available for checking riding height.* Measure front riding height from height adjusting lever directly below center of lower control arm inner pivot to floor, and from lowest point of steering knuckle arm to floor on same side. The difference between these two measurements should be as listed in table below. The difference from one side of car to other should not exceed 1/8". To adjust riding height, turn adjusting bolt at front of torsion bar as necessary. After adjusting, bounce car and recheck height on both sides.

1963 Front Suspension Riding Height Limits

Car Model	ℂ Height Difference
Valiant & Dart (Std. Susp.) ②	2 1/8" 1/8"
Plymouth & Dodge (Std. Susp.) ②	1 3/4"±1/8"
Valiant & Dart (Heavy Duty Susp.)	2 3/8"±1/8"
Plymouth & Dodge (Heavy Duty Susp.)	2 1/8"±1/8"

ℂ - Maximum variation between sides of car 1/8".
② - Including all Suburban models.

REMOVAL & INSTALLATION

See 1962 Final Data, Page 385.

►*BALL JOINT CHECKING: See Front Suspension Ball Joint Checking in this section.*

CHRYSLER, IMPERIAL, DODGE 880 FRONT SUSPENSION

Chrysler & Imperial (1963)
Dodge Custom 880 (1963) ℂ

ℂ - For other Dodge & Dart models, see "Dodge, Dart, Plymouth, Valiant Torsion-Aire" in this section.

DESCRIPTION

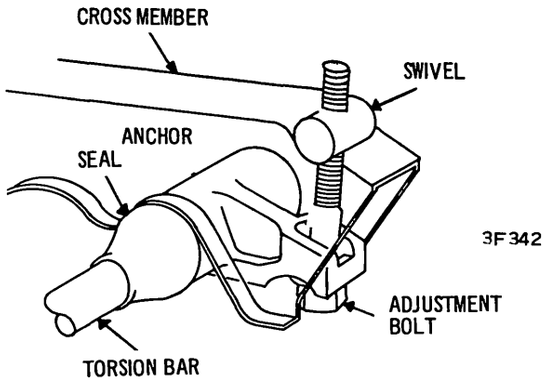
Torsion bar independent type suspension system similar in design to previous models.

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*
Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*
Riding Height - With car at curb weight and positioned on a level floor, bounce front of car several times and allow to settle. Measure the distance from lowest point of one lower control arm bushing housing to the floor, and distance from flat portion on bottom of lower ball joint (same side of car) to the floor. *NOTE - Under car weight, bushing will always be higher.* A difference between these two distances on one side of car should be as given in table below. If difference between two sides of car is less than 1/8" and is within limits specified, riding height is correct. If difference is more than 1/8", adjust riding height by turning torsion bar adjusting bolt (at rear end of torsion bar) "in" to increase height, and "out" to decrease height. *NOTE - Use a torque wrench to make this adjustment, and if torque required to turn torsion bar adjusting bolt "in" exceeds 200 ft. lbs., replace torsion bar adjusting bolt.* After adjustment, bounce car and recheck measurements on both sides. After final adjustment, check wheel alignment and headlight adjustment.

►*HEIGHT CHECKING GAUGE NOTE:* Height and Level Gauge Tools C-3608 or C-3895 are available for checking front suspension height.

Front Suspension Height Limits



Car Model	ℂ Height Difference
Imperial	2"±1/8"
Chrysler (Ex. Sta. Wgn. & 300J)	2"±1/8"
Station Wagon	2 3/8"±1/8"
300J	1 3/4"±1/8"
Dodge Custom 880 (Ex. Sta. Wgn.)	2"±1/8"
Station Wagon	2 3/8"±1/8"

ℂ - Maximum variation between sides of car 1/8"

REMOVAL & INSTALLATION

See 1957 Final Data, Page 341, or later Manual editions.

►*BALL JOINT CHECKING: See Front Suspension Ball Joint Checking in this section.*

TORSION BAR ADJUSTMENT BOLT

COMET & FALCON FRONT SUSPENSION

Ford Falcon (1963)
Mercury Comet (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 HIGH RIDING HEIGHT CORRECTION:* High riding height caused by improperly seated coil springs may be corrected by reseating springs.

►*1963 FRONT WHEEL BEARING CONTAMINATION:* Water or contaminants entering front wheel bearings due to brake backing plate not being in complete contact with spindle flange, may be corrected by applying sealer (Part No. B5A-19554-A or 8A-19554-B) around outer edges of spindle flange.

►*1963 LOWER SUSPENSION ARM STRUT ADJUSTMENTS AFFECT CASTER:* To maintain caster adjustment and prescribed strut length of 17 5/8" (1961-62), or 16 15/16" (1963 models), as measured between front face of rear adjusting nut and center of lower arm front attaching bolt, loosen both nuts securing strut to frame body member and adjust as necessary. After adjusting, tighten rear nuts to 45-60 ft. lbs., and recheck strut length.

DESCRIPTION

Ball joint independent type suspension, with shock absorbers mounted within front coil springs, similar in design to previous models.

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*

Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*

Riding Height (Comet) - **Front** - With car at curb weight and on a flat floor, push front bumper down 1" and release slowly. Measure distance from flat surface of upper control arm midway between ball joint rivets to bottom surface of spring tower on centerline of rebound bumper. Raise front bumper up 1" and take measurement again. The average of the two measurements is front riding height and should be as indicated in table below. If not within limits, proceed as follows: If less than specified by not more than ¾", install shims on top of front springs. If less than minimum specification, replace springs.

Rear - Proceed as for front height measurement (above), and measure the distance between top of axle housing tube and bottom of frame side member about ½" forward of axle bumper bracket flange. If average height is less than minimum specification (see table below) by 5/8" or more, replace springs.

NOTE - Difference between right and left sides of car must not be more than 1" (must not be less than minimum height specified).

1963 Comet Front Riding Height Specifications

Body Type	Normal	Minimum	Maximum
Sedans 6 Cyl.	6 1/2"	5 7/8"	7 11/32"
(Air Cond.)	6 13/32"	5 25/32"	7 1/4"
Sedans V8	6 11/32"	5 23/32"	7 3/16"
(Air Cond.)	6 9/32"	5 21/32"	7 1/8"
Hardtop 6 Cyl.	6 19/32"	6 1/4"	7 13/32"
(Air Cond.)	6 15/32"	6 5/32"	7 5/16"
Hardtop V8	6 13/32"	6 3/16"	7 1/4"
(Air Cond.)	6 11/32"	6"	7 5/32"
Convertible 6 Cyl.	6 7/16"	6 3/32"	7 1/4"
(Air Cond.)	6 3/8"	6 1/32"	7 3/16"
Convertible V8	6 3/8"	6 1/16"	7 7/32"
(Air Cond.)	6 13/32"	6 1/16"	7 7/32"
Wagons 6 Cyl.	6 7/32"	5 29/32"	7 1/16"
(Air Cond.)	6 5/32"	5 13/16"	7"
Wagons V8	6 3/32"	5 3/4"	6 15/16"
(Air Cond.)	6 1/32"	5 11/16"	6 7/8"

1963 Comet Rear Riding Height Specifications

Body Type	Normal	Minimum	Maximum
Sedans	6 5/16"	5 11/16"	7 1/16"
Hardtop	6 5/16"	5 11/16"	7 1/16"
Convertible	5 7/8"	5 1/4"	6 5/8"
Wagons	6 19/32"	5 31/32"	7 11/32"

REMOVAL & INSTALLATION

See 1960 Final Data, Page 374, or later Manual edition, and note the following:

►*BALL JOINT CHECKING: See "Front Suspension Ball Joint Checking" in this section.*

Coil Spring

Removal - Raise car and remove wheel assembly and shock absorber. *CAUTION - Install a safety stand under front end of underbody.* For Comet model cars, install Tool 5310-B through top of coil spring, into shock absorber lower mounting holes. Compress spring sufficiently for removal clearance, then remove spring seat retaining nuts and remove spring and tool assembly from underneath car. For Falcon model cars, install Tool T63P-5310-A through top of coil spring, while from underneath car, place tool lower plate under third spring coil from the bottom. While keeping tool and spring from turning (with wrench in tool lower plate), compress spring sufficiently for removal clearance and remove tool and spring from underneath car.

Installation - To replace dismounted spring, measure compressed spring height in tool, then place tool nut in vise and remove nut by rotating the spring by hand. Install tool in new spring, then with tool nut in a vise, rotate spring until previously measured spring height is attained. To install spring on car, reverse "Removal" procedure.

FORD FAIRLANE & MERCURY METEOR FRONT SUSPENSION

Ford Fairlan (1963)
Mercury Meteor (1963)

DESCRIPTION

Ball joint type independent suspension with shock absorbers mounted within front coil springs, similar in design to previous models.

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*
Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*
Riding Height - *See 1962 Final Data, Page 387.*

REMOVAL & INSTALLATION

See 1962 Final Data, Page 387, and note the following:

►*BALL JOINT CHECKING: See "Front Suspension Ball Joint Checking" in this section.*

Coil Spring

Removal - With car raised, remove wheel assembly and shock absorber, then install safety stand at front end of underbody and lower car until upper control arm is horizontal. Install Tool 5310-C into top of coil spring and insert lower part of tool into lowest open coil of spring. Compress coil spring with tool, raise car to allow upper arm to tilt downward, and remove tool and coil spring assembly from underneath car. For Fairlane model cars, repeat the above but install Tool T63P-5310-A into top of coil spring, while from underneath car, place tool lower plate under third spring coil from the bottom. While keeping tool and spring from turning (with wrench in tool lower plate), compress spring sufficiently for removal clearance and remove tool and spring from underneath car.

Installation - If spring is to be replaced, chalk two alignment marks on narrow side of spring upper seat. Align first mark with center line of caged nut, and second mark 3/4" from the first and in alignment with tip end of bottom coil. Reverse removal procedure and note the following: Position upper seat and insulator assembly on spring so that mark made earlier is aligned with end of bottom coil. *NOTE - If a new seat is being installed, scribe a line at centerline of caged nut on narrow side of seat. Position seat on spring so line in caged nut is aligned with bottom coil. Scribe a second line 3/4" clockwise from first line, then turns at counterclockwise until second line is aligned with tip end of bottom coil.* Install tool and compress spring. Install tool and spring assembly in spring housing with end of bottom coil bearing against punched end of recess in spring lower seat. Secure spring upper seat to top of spring housing with two bolts and washers (this will hold spring in correct position while it is being released). Release spring tension, then remove two temporary holding bolts from top of spring housing and remove tool. Install shock absorber and wheel assembly.

FORD GALAXIE & MERCURY MONTEREY FRONT SUSPENSION

Ford Galaxie (1963)
Mercury Monterey (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 "ANTI-HARSH" OVERSIZE BEARING INSTALLATION:* To eliminate stripped threads in front crossmember when reinstalling original lower control arm front bushing, an oversized bushing (Part No. C3AZ-3069-C, identified by red paint on hex head) is available. To maintain same shim thickness as prior to bushing removal, a 118" shim (Part No. C3AZ-3054-A) and a .030" shim (Part No C3AZ-3054-B) are available for inserting between bushing hex head and crossmember To reinstall an oversized bushing, it is necessary to tack arc weld bushing hex head, bonding bushing, shims, and crossmember.

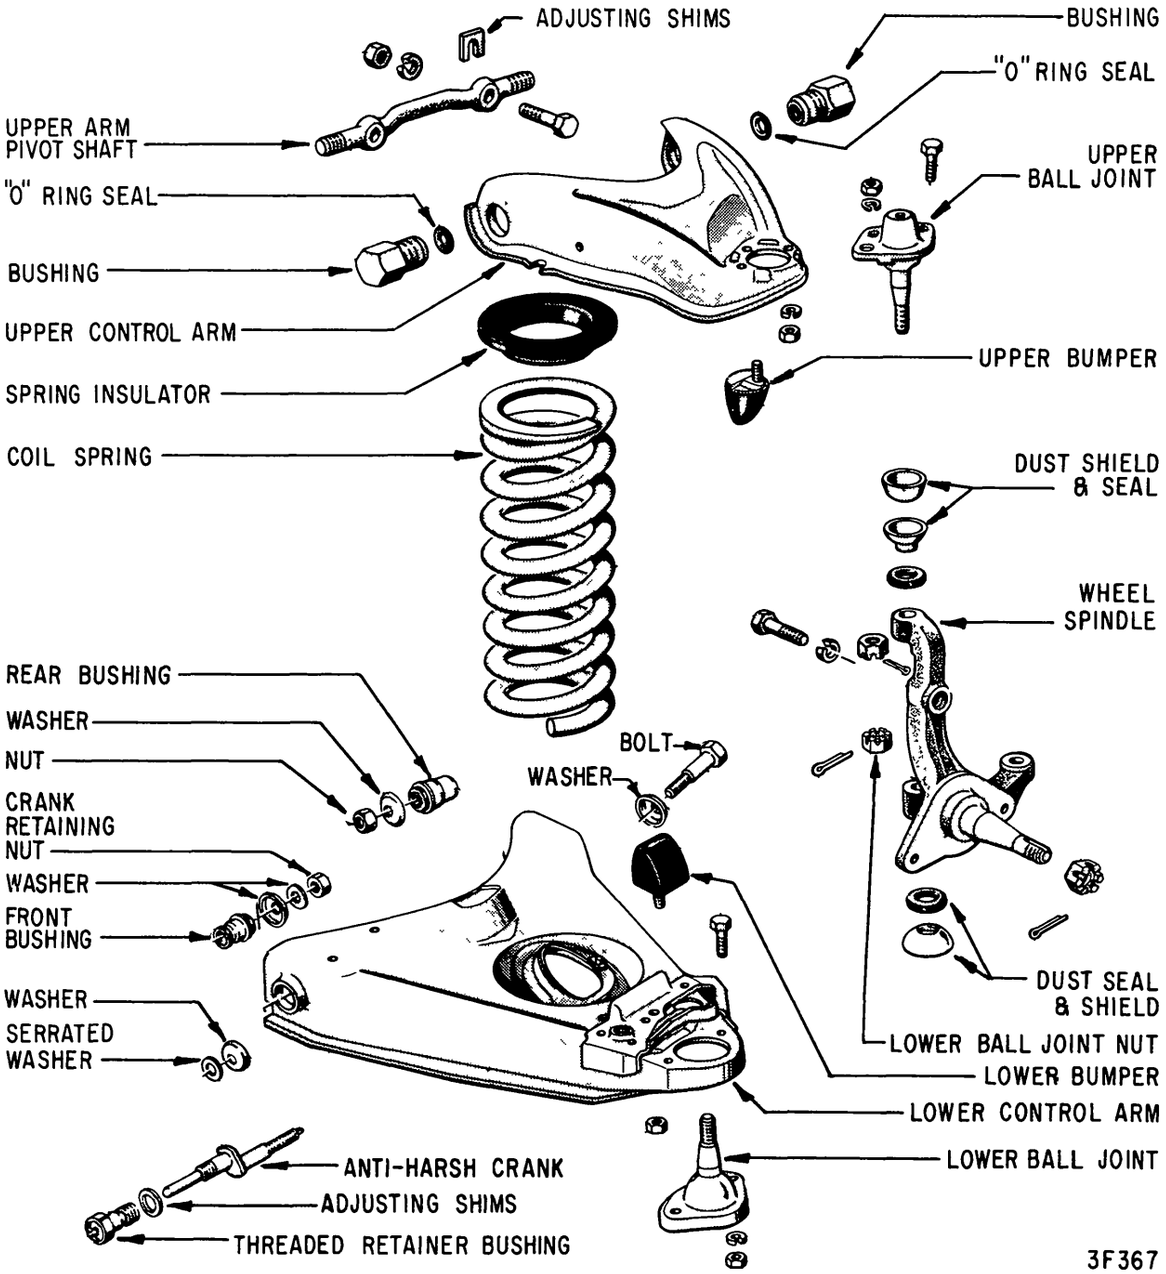
DESCRIPTION

Ball joint independent type suspension similar in design to previous models except that front lower control arms are now connected to frame crossmember at front of arm by a "anti-harsh crank" shaft.

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*
Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*

REMOVAL & INSTALLATION



►*BALL JOINT CHECKING: See "Front Suspension Ball Joint Checking" in this section.*

Shock Absorber & Bushings

Removal - Raise car and place stands under both lower control arms, making sure shock absorbers remain accessible for servicing Remove upper mounting nut, lower bolts, and remove shock absorber through hole in lower control arm
Removal of Bushings - Using an arbor press, remove bushings using Tool T57P-18201-A1 and T57P-18201-A5
Installation of Bushings - Using an arbor press, install bushings using Tools T57P-18201-A1, A4, and A5 Lubricate bushing with a vegetable soap solution and install on shock absorber with one quick drive of press ram.
Installation - Extend shock absorber shaft and install by reversing removal procedure. Torque upper nut to 15 ft. lbs. and bottom bolts to 12-20 ft lbs.

Coil Spring & Lower Control Arm

Removal - Raise car and support side rails with stands just back of lower control arms. Remove wheel, hub, drum and shock absorber Disconnect stabilizer from lower arm and remove brake backing plate With lower ball joint stud nut loosened two turns, place spreader Tool (Ford, T57P-3006-A or Mercury 3006-B) between ball joint studs and turn tool hex head while tapping side of spindle with a hammer When ball joint is popped loose against nut, remove tool and jack up outer end of lower arm until ball joint stud nut can be removed. Lower jack and remove spring. Remove rear retaining bolt and nut attaching rear of control arm to frame, then remove front threaded retainer bushing and shims from frame and anti-harsh crank shaft.

FORD GALAXIE & MERCURY MONTEREY FRONT SUSPENSION ASSEMBLY

Remove arm from car and crank retaining nut and crank from arm
Rem val of Bushings - *NOTE - Replace both front and rear lower arm bushings, if either is worn or damaged.* Using an arbor press, remove front bushings with Tool T63P-3044-A and tool parts, D-1, D-5 and D-3 To remove Galaxie rear bushings, use Tools T54P-3044-A13 and T57P-3044-A. To remove Monterey rear bushings, use Tools 3069J and 3069H
Installation of Bushings - Using an arbor press, install front bushings using Tool T63P-3044-A and tool parts

FORD GALAXIE & MERCURY MONTEREY FRONT SUSPENSION (C nt.)

D-1, D-4 and D-2 To install Galaxie rear bushings, use Tools T54P-3044-A7 and T57P-3044-A To install Monterey rear bushings, use Tools 3069E and 3069H

Installation - Place serrated washer over inner end of anti-harsh crank with serrated side of washer toward crank throw Position anti-harsh crank through rubber bushing at front end of replacement arm, install crank retaining washer and nut and torque to 40-60 ft lbs Position lower control arm and crank assembly to mounting holes in frame crossmembers, install rear retaining bolt, washers, and torque nut to 36-46 ft lbs With a piece of .140" shim between crank throw and crossmember, install threaded retainer bushing through the frame crossmember with internal threads of bushing engaging threads of crank, then turn bushing until it contacts shim The distance between head of retainer bushing and crossmember represents required shim thickness that must be installed on bushing Position bushing and shims to frame and turn internal threads of bushing onto anti-harsh crank but do not torque With insulator and/or shim taped to top of spring, position spring top in upper suspension arm spring pocket and spring bottom in lower arm spring pocket If necessary, Tool 5310-A is available for partially compressing spring With spring in position and a jack under outer end of lower arm, raise arm, connect lower ball joint to wheel spindle and torque lower arm front threaded retainer bushing to 160-240 ft lbs *NOTE - Support arm with jack and place anti-harsh crank throw in a vertical position when tightening front threaded retainer bushing* Install brake backing plate, stabilizer, shock absorber, drum, hub and wheel

Upper Control Arm

Removal - Raise car and place a stand under lower control arm Remove wheel and hub, then loosen upper ball joint stud two turns but do not remove nut Place a box wrench over lower end of ball joint remover, Tool T57P-3006-A (Ford), then install tool between upper and lower ball joints, making sure tool seats firmly against ends of both studs and not against stud nuts Turn wrench until tool places studs under tension, then tap spindle near upper stud with a hammer to loosen stud in spindle *(Do not loosen stud in spindle with tool pressure only)* If both arms are being removed, loosen lower stud in same manner as upper stud Remove nut from upper stud and remove stud from spindle Support spindle to prevent damage to brake hose Remove nuts from retaining bolts on upper arm inner inner shaft, using Tool T58P-3047-A While removing upper arm from mounting bracket, note and measure total shim thickness at each inner shaft bolt **Do not use solvent to clean ball joints .**

Removal of Bushings - With upper control arm shaft removed from car, hold shaft in a vise and turn bushing off shaft and out of control arm *NOTE - Replace both front and rear bushings if either is worn or damaged or if replacing inner shaft*

Installation of Bushings - Install a new "O" ring seal in each bushing, then coat inside of each bushing with a small amount of multi-purpose lubricant (coat outer threads also) *CAUTION - An excessive amount of lubricant inside bushing will force the "O" ring out of place when bushing is installed* Insert inner shaft in upper control arm, making sure that "bow" in shaft is upward, then install Tool T54P-3044-A (Ford), Tool 3082-A (Mercury) With tool inserted between arms of upper control arm to properly locate arms the correct distance apart, place tool in a vise and thread bushing on each end of shaft, then turn bushings in until hex heads bottom on upper arm *NOTE - New upper arms are not threaded Bushings are self-tapping type* Tighten bushing to 160-190 ft lbs Remove assembly from vise and remove tool, then check to see that shaft rotates with moderate effort If shaft binds, check for misalignment

Installation - Position upper arm on frame mounting bracket and install but do not tighten nuts and keystone-type lock washers on two inner shaft retaining bolts Install adjusting shims on both bolts between inner shaft and frame bracket, making sure shim thickness is same as removed during disassembly Using Tool T58P-3047-A, torque inner shaft retaining nuts to an indicated 50 ft lbs , making sure wrench and tool stay in line while tightening If not using this special tool, torque retaining nuts to 65-85 ft lbs Position upper ball joint stud in top of wheel spindle and torque stud nut to 28-35 ft lbs , continuing to turn nut until cotter pin may be inserted Install hub and wheel, and lower car

LINCOLN CONTINENTAL FRONT SUSPENSION

Linc ln C ntinental (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962-63 REPLACEMENT OF FRONT SHOCK ABSORBERS* When servicing front shock absorbers of Lincoln Continental Sedans and Convertibles built before Sept 17, 1962, replace each unit with heavy duty shock absorber, Part No C2VY-18124-B

DESCRIPTION

Ball joint independent type suspension similar in design to previous models

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section*

Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section*

Riding Height - With car at curb weight and positioned on a level floor, bounce front of car several times and allow to settle Measure front riding height of 5 2-6 2" between top of drag strut and inside of No 2 crossmember next to forward edge of bumper striking pad If riding height not within limits, shim or replace spring Measure rear riding height from top of axle housing to underbody at rear of rebound bumper bracket rear attaching bolt Rear riding height limits of 7 0-8 8" are corrected by replacing springs For front or rear riding height, the difference between each side of car should not be more than .5"

REMOVAL & INSTALLATION

See 1961 Final Data, Page 367

►*BALL JOINT CHECKING See "Front Suspension Ball Joint Checking" in this section.*

STUDEBAKER FRONT SUSPENSION

Stud bak r, All Models (1963)
Avanti (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*LOW FRONT END RIDING HEIGHT CORRECTION:* If front riding height too low due to accessories or optional equipment, front spring spacers may be installed at one or both ends of front spring Table below indicates amount a single spacer will raise front of car (if two spacers used, double specification)

Front End H ight Spacer Specifications

Spac r N .	Thickn ss	℄ Raises Car Approx.
526830	3/16"	5/16"
436420	3/8"	5/8"
436417	1/2"	13/16"

℄ - If one spacer only is installed

DESCRIPTION

Independent coil spring type of same design used on previous models

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*
Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section*

REMOVAL & INSTALLATION

See 1957 Final Data, Page 351, or later Manual editions, and note the following:

►*BALL JOINT CHECKING: See Front Suspension Ball Joint Checking in this section*

Upper Control Arm

Removal of Bushings (Threaded Steel Type) - With control arm in vise, turn and remove threaded steel bushings from inner shaft Shift shaft as far as possible to one side, move opposite end of shaft out of control arm end and remove shaft and seals from control arm, then remove grease seals

Installation of Bushings (Threaded Steel Type) - Place grease seals on inner shaft and insert one end of shaft into control arm, then bring other end into position and insert into control arm Spread inner ends of control arm .015" with Spreader Tool J-3957-7 & 8 at inner ends of arm Turn hexagon of tool until hand tight, then tighten an additional two flats which will spread arms desired .015" Centralize inner shaft between ends of control arm and install bushings securely Shaft must be free to turn

THUNDERBIRD FRONT SUSPENSION

Ford Thunderbird (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1962-63 LOOSE OR RATTLING FRONT SUSPENSION DRAG STRUT CORRECTION* To correct looseness or rattling of front suspension drag struts, replace attaching bolts (Part No 373880-S2) and nuts (Part No 33850-S), then recheck caster, camber and toe-in

DESCRIPTION

Ball joint independent type suspension similar in design to previous models except that new design upper control arm is grooved to seat coil spring, and lower end of shock absorber mounts to a three stud bracket on arm by a single bolt

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section*
Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section*

REMOVAL & INSTALLATION

►*BALL JOINT CHECKING See "Front Suspension Ball Joint Checking" in this section*

Shock Absorber

Removal - Raise front of car, position a safety stand under lower suspension arm, then lower car slightly From underneath car, disconnect shock absorber lower mounting bracket from upper arm by removing three nuts and washers, then open hood and remove three shock absorber upper mounting plate retaining nuts and two bolts attaching plate to dash panel brace Remove shock absorber, mounting plate and lower bracket as an assembly Remove shock absorber upper retaining nut, and lower nut and bolt
Installation - Install bumper and shield, and insulator on shock absorber upper mounting stud Assemble upper mounting plate, then outer insulator, washer and retaining nut to mounting stud Position shock absorber and upper mounting plate assembly through top of spring housing so that three lower mounting studs enter holes in upper control arm Install two bolts that attach mounting plate to dash panel brace, and install three mounting plate retaining nuts Remove safety stands and lower car

Coil Spring & Upper Control Arm

Removal - Raise front of car, position a safety stand under lower suspension arm, then lower car slightly Remove shock absorber (see above), then install spring removal tool T63P-5310-A Slide tool bearing and upper plate over shaft screw against shaft nut Insert tool assembly through upper opening in spring housing so that shaft screw goes through top of coil spring with tool under plate holes going over studs Underneath car place tool lower plate under fourth coil from bottom of spring securing plate to coil by installing tool retainer to groove in shaft screw With a flex-handle wrench in lower plate drive hole to prevent tool and spring from turning, compress spring by turning tool shaft nut clockwise Loosen upper ball joint stud nut but do not remove Place a box wrench over lower end of tool T57P-3006-A and position tool between upper and lower ball joint studs Tool should seat firmly against ends of both studs and not against lower stud nut Turn wrench until both studs are under tension, then loosen upper stud from spindle by tapping spindle near upper stud with a hammer *Do not loosen stud with tool pressure alone* Remove upper ball joint stud nut and pull upper arm free of spindle Remove two nuts that retain upper arm inner shaft to chassis and remove arm from car Remove bolt that retains clip and brake line to chassis, move brake line out of way, then fully release spring tension by turning tool shaft nut counterclockwise *NOTE - Be sure to hold lower plate of tool with 1/2" square drive flex-handle wrench so that tool will not turn or snap loose during spring release* Remove spring tool, then remove spring from car

Removal of Bushings - *NOTE - Replace both upper arm bushings if either is worn or damaged, or if replacing inner shaft* Position upper arm inner shaft in a vise, then unscrew bushings from shaft and arm Remove assembly from vise and separate inner shaft from arm

Installation of Bushings - With shaft in arm, apply grease to new bushings and install bushings loosely on shaft and arm *NOTE - Turn bushings so shaft is centered in control arm (centerline of shaft attaching bolts holes should be 1 85" ± 02" from side of arm)* Fabricate a 9½" spacer from ¾" diameter pipe or metal and (with arm and inner shaft assembly in vise) position spacer parallel with inner shaft, forcing spacer between flanges of upper arm If spacer cannot be forced between arm flanges due to excessive distortion, replace upper arm assembly With spacer positioned in arm, torque bushings to 15-25 ft lbs Move arm on shaft to be sure no binding exists, then remove spacer

Installation - Tape rubber insulators to ends of spring and install spring in its housing at underside of car Assemble spring tool T63P-5310-A to car and spring (see above) and compress spring making sure lower plate of tool does not turn Install bolt retaining brake line and clip to chassis Position upper arm to spring upper bore and install and torque upper ball joint stud nut With upper arm in position, install arm inner shaft-to-chassis retaining nuts but do not tighten Partially release coil spring tension while prying lower coil so that it will seat in groove of upper arm Prevent tool lower plate from turning Torque upper arm inner shaft-to-chassis retaining nuts and release spring completely, then remove tool *CAUTION - Prevent tool lower plate from turning during spring release* Lower car slightly to compress spring and install shock absorber (see above)

Lower Control Arm

Removal - Raise and support car under chassis then remove wheel, hub, and drum assembly Remove brake backing plate and wire up out of way Disconnect stabilizer and strut from lower control arm, then disconnect lower ball joint from spindle (see "Wheel Spindle") Remove lower control arm pivot bracket retaining nut and shim retaining nut, then remove lower control arm Place lower control arm assembly in a vise and remove pivot bolt Separate pivot bracket from lower arm
Installation - Assemble pivot bracket to lower control arm and install pivot bolt Tighten pivot bolt nut snug but do not tighten until control arm is installed on car Complete installation by reversing removal procedure, then adjust front end alignment

Wheel Spindle

Removal - Raise front of car and support under chassis, then remove wheel, hub, and drum Remove brake backing plate from spindle and wire up out of way Disconnect tie rod end from spindle and then loosen both upper and lower ball joint stud nuts, but do not remove Position a box wrench over lower end of Tool T57P-3006-A and position tool so each end contacts a ball joint stud *CAUTION - Tool should seat firmly against ends of both studs, not against stud nut* Turn wrench until tool places studs under tension, then loosen studs in spindle by tapping spindle near studs with a hammer Do not loosen studs in spindle with tool pressure alone Remove stud nuts and spindle from both studs
Installation - Position wheel spindle on upper and lower ball joints and install stud nuts and tighten to 60-80 ft lbs Continue to tighten nuts until cotter pin holes line up with slots, then install cotter pins Complete installation by reversing removal procedures

Upper & Lower Ball Joints

Removal - With control arm removed from car, remove ball joint retaining nuts and bolts, or if ball joint is riveted to arm, drill a 1/8" hole completely through each rivet Drill off rivet heads through pilot hole with a 3/8" drill Drive all rivets out of holes and remove ball joints
Installation - Clean end of arm and remove all burrs from hole edges Install ball joints on arms using only specified bolts, nuts, and washers *NOTE - Do not try to rivet ball joints to arm* Torque ball joint retaining nuts and bolts to 60-80 ft lbs and lubricate ball joints

OLDSMOBILE (EXCEPT F-85) FRONT SUSPENSION

Oldsmobile (Except F-85) (1963)

DESCRIPTION

Ball joint type suspension with shock absorbers mounted within front coil springs, similar in design to previous models, except new design lower control arm now has replaceable inner pivot shaft bushings and ball joint is pressed in arm. Upper control arm, shaft, and bushing assembly continues to be furnished only as a complete unit, and ball joint is riveted to arm.

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*

Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*

Riding Height - With car at curb weight, position car on a level floor, then bounce front of car several times and allow to settle. Measure front riding height from underside of front spring lower seat to underside of upper seat (see table below). To measure, insert a 1/8" welding rod in drain hole of lower spring seat (inboard side of spring) and push rod up to contact underside of upper spring seat. Mark rod, then remove and measure distance rod was inserted. To adjust, replace spring. Measure rear riding height from top of axle housing to frame (see below). Remove rear axle bumper for checking.

1963 Riding Heights

Model	Front	Rear
Series 36 & 39	11 11/16-12 1/8"	5 1/2-6 1/4"
Fiesta Sta.Wag	11 11/16-12 1/8"	5 1/4-6"
Others	11 7/8-12 5/16"	6-6 3/4"

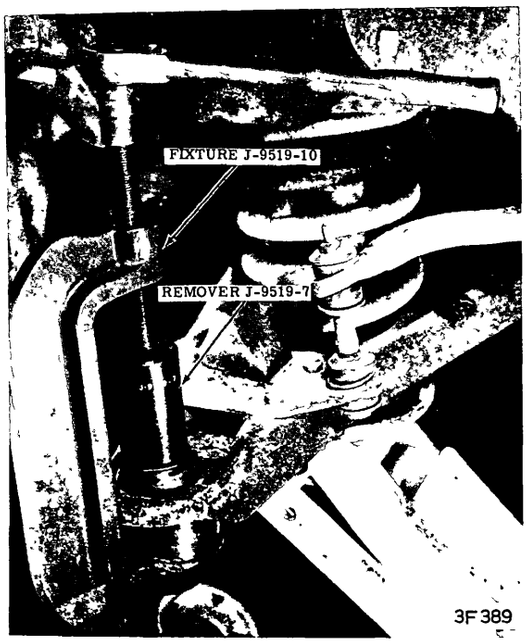
REMOVAL & INSTALLATION

See 1961 Final Data, Page 369, and note the following:

►*BALL JOINT CHECKING: See "Front Suspension Ball Joint Checking" in this section.*

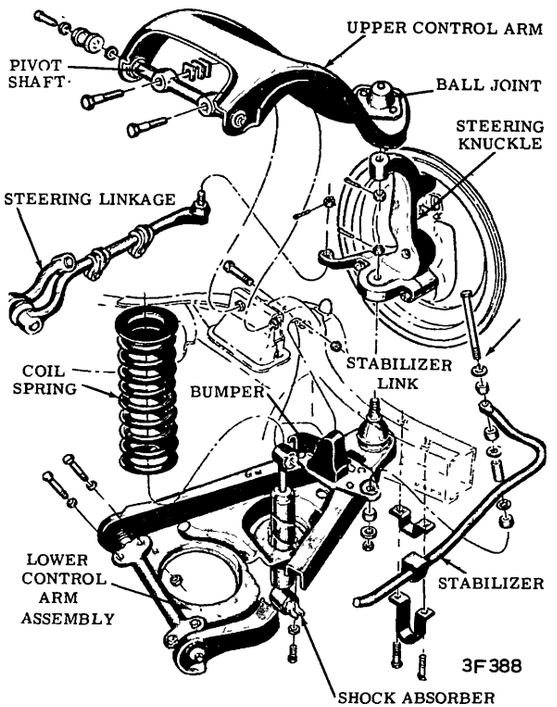
►*UPPER CONTROL ARM INNER SHAFT BUSHING NOTE:* Upper control arm bushings are not replaceable. Control arm and bushing assemblies are furnished only as a complete unit, including control arm pivot shaft. If necessary, tighten upper control arm shaft-to-bushing screws to 35-45 ft. lbs. Lower control arm shaft bushings may be replaced as indicated below.

Lower Control Arm Shaft Bushings



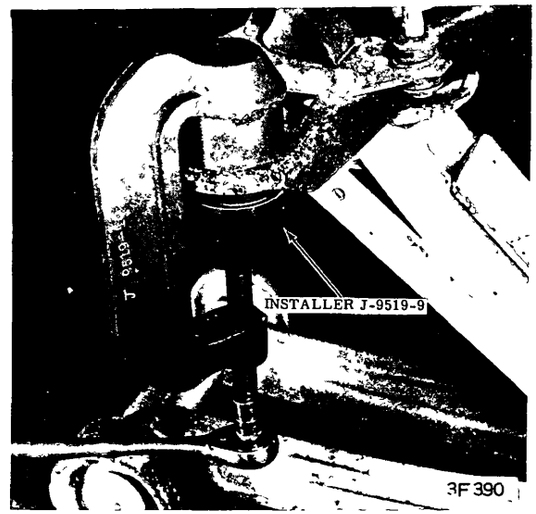
Removal of Bushings - With control arm removed from car and placed on a arbor press, use Press Plate BT-6309-1 and Bushing Remover J-9516 to press bushing out of control arm as far as possible. Repeat on other bushing. Finish pressing bushing from arm by using spacer tool BT-6309-2 on pivot shaft between ears of shaft and end of bushing, and J-9616.

Installation of Bushings - Use Tools J-9481 and BT-6309-1 to install bushings, then torque pivot shaft bolts to 50-60 ft. lbs.



Lower Control Arm Ball Joint & Seals

Removal - Raise front of car, support outboard end of lower control arm with floor stand and remove wheel assembly. Disconnect lower ball joint from steering knuckle using Tool J-8806. Block steering knuckle, backing plate and hub and drum assembly away from lower arm to obtain accessibility. For Inland joints, drive seal retaining ring from ball joint and discard seal assembly. For Saginaw joints, pry garter spring from bottom of seal, then remove and discard seal and garter spring. Press ball joint from control arm using Fixture J-9519-10 and Remover J-9519-7 (see illustration).



Installation - New ball joint is pressed in with Tools J-9519-10 and J-9519-9. Apply a thin film of grease on outside of new seal and on saw-tooth part of seal that fits around ball stud. On Saginaw joints, stretch garter spring around Tool J-6119 (stretch no more than necessary), then slide tool over seal, roll garter spring off tool and into seal groove. On Inland joints, place seal inside of Seal Installing Tool J-8761, and drive seal onto ball joint making sure seal is not cocked. Reassemble suspension and torque ball joint stud nut to 70 ft. lbs. *NOTE - A screwdriver slot is provided in lower ball joint stud as a means of preventing stud from turning when tightening ball joint nut.*

REMOVING LOWER BALL JOINT

1963 OLDSMOBILE (EXCEPT F-85) FRONT SUSPENSION

INSTALLING LOWER BALL JOINT

OLDSMOBILE (EXCEPT F-85) REAR SUSPENSION

Oldsmobile (Except F-85) (1963)

DESCRIPTION

Coil spring type with two upper and two lower control arms. Upper control arms are connected to rear axle housing adjacent to differential carrier and to bracket on frame side rail. Lower control arms are connected between outer ends of rear axle housing and bracket on frame side rail. Lower control arms are adjustable for length and control the differential nose angle.

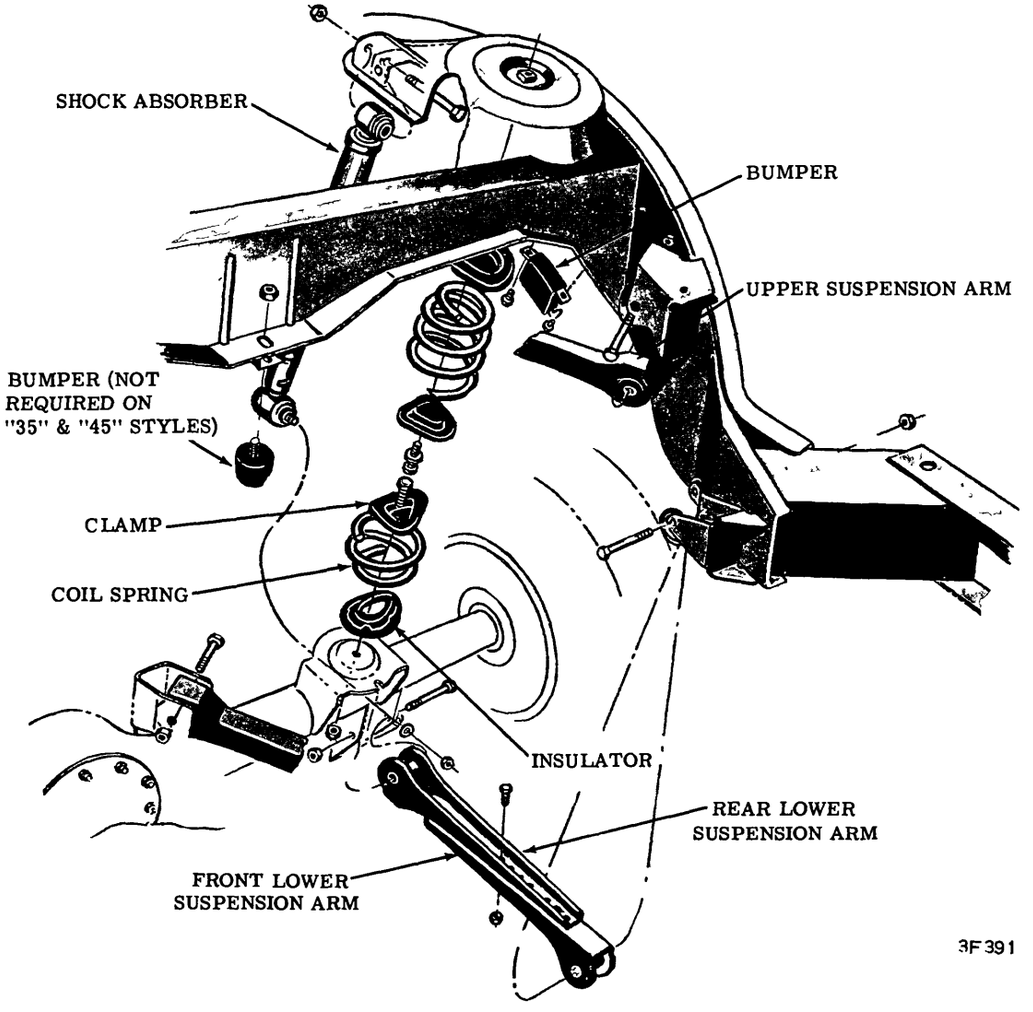
ADJUSTMENT

Riding Height - *See "Riding Height" under "Front Suspension" section.*

REMOVAL & INSTALLATION

► *SHOCK ABSORBER INSTALLATION NOTE:* Tighten upper pivot bolt and nut to 45-55 ft. lbs., and lower stud nut to 30-46 ft. lbs.

Coil Spring



Removal - Raise rear of car and disconnect shock absorber from axle housing, then disconnect parking brake cable clamp at frame and loosen suspension arms at frame and axle. Support frame, then remove upper and lower spring mounting bolts, washers, insulators and clamps. Remove coil spring and two remaining insulators. *NOTE* - Spring will be under slight compression.

Installation - Place upper insulator snugly in end of spring coil. Place spring with insulator against upper seat and install clamp but do not tighten upper attaching bolt. *NOTE* - Locate clamp so it nests in insulator (tang in notch), then torque mounting bolt to 35-45 ft. lbs. Place lower end of spring on axle housing pad, then raise axle housing to compress spring to normal carrying height. Install Spring Holding Tool BT-6102 at front of spring, then lower axle housing and place other spring insulator in spring coil. Raise axle housing and install lower clamp. With lower clamp nesting in insulator, torque lower mounting bolt to 35-45 ft lbs. Remove Tool BT-6102. Connect shock absorbers and tighten suspension arm bolts to 70-90 ft. lbs. with car weight on rear spring. Place parking brake cable at locating marks and tighten cable clamps.

Control Arms

Removal - *CAUTION - Upper and lower control arm bushings cannot be serviced or replaced in the field. Bushings and control arms are available only in complete assemblies.* Raise and support rear axle housing, then support frame at side rails. Disconnect support arms at rear axle housing and frame side rails and remove control arms.

Installation - *CAUTION - When installing a new lower control arm, the same corresponding holes should be aligned as in the riginal arm.* Install upper arm and the lower arm front section with open side of channel facing downward. Lower control arms are stamped "Front" and "Rear" for proper installation. DO NOT tighten attaching bolts until car is at normal height on floor, then tighten attaching bolts to 70-90 ft. lbs.

OLDSMOBILE (EXCEPT F-85) REAR SUSPENSION

PONTIAC (EXCEPT TEMPEST) REAR SUSPENSION

Pontiac (Except Tempest) (1963)

DESCRIPTION

Coil spring type independent suspension similar in design to previous models, except for trunnion-type upper mounting of rear shock absorber.

ADJUSTMENT

Riding Height - *See "Front Suspension" in this section.*

REMOVAL & INSTALLATION

See 1961 Final Data, Page 372, and note th following:

Control Arms

Installation - Four upper and lower control arm pivot bolts are torqued to 100-125 ft. lbs.

Shock Absorber

Removal - Remove two nuts, bolts and lockwashers at upper end of shock absorber, then remove self-locking nut from lower end and remove shock absorber.

Installation - Reverse removal procedure, tightening upper bolts to 15-25 ft. lbs., and lower self-locking nut to 70-85 ft. lbs.

PONTIAC (EXCEPT TEMPEST) FRONT SUSPENSION

P ntiac (Exc pt T mp st) (1963)

DESCRIPTION

Ball joint independent type suspension, with shock absorbers mounted within front coil springs similar in design to previous models, except pressed-in rubber bushings at inner ends of upper control arms replace threaded steel bushings

ADJUSTMENT

Cast r & Camber - *Se "Wheel Alignment Specifications and Adjustment" in this section*
Fr nt Wh l B aring - *See "Wheel Bearing Adjustment" in this s ction*
Riding H ight - With car at curb weight and positioned on a level floor, bounce front of car several times and allow to settle Front riding height of 3 5/8" ± 1/8" is measured from top of lower control arm to underside of frame directly behind centerline of spring Rear riding height of 9 3/4" ± 1/8" is measured from top of axle housing to top of spring seat at a point approximately 1 1/2" outward from rubber bumper on frame

REMOVAL & INSTALLATION

See 1962 Final Data, Pag 382, and n ote the following:
► *BALL JOINT CHECKING: See "Front Suspension Ball Joint Checking" in this s ction*

C il Spring

Installati n - Upon assembly of front coil spring, torque bolts which attach inner ends of control arm to frame front crossmembers to 70-90 ft lbs Torque steering arm-to-knuckle nut to 50-70 ft lbs

Upper Control Arm & Bushings

Removal - With jack under lower control arm raise and remove wheel, then remove ball stud from steering knuckle using Tool J-6627 Disconnect control arm shaft to frame and remove arm and shaft assembly

Bushing Removal - With nuts and retainers removed from pivot shaft enus, remove shaft from control arm by removing bushings with an arbor press and Tool J-8917 as a support

Bushing Installation - Place Tool J-7167 in position and expand until distance between outer faces of arm is 8 31/32", then place pivot shaft with insert bushings on ends of shaft, in control arm Press bushings on control arm with arbor using large sockets for installers Install retainers and nuts on ends of shaft finger tight Rotate shaft to line up frame mounting holes to approximate installation position, then torque shaft nuts to 70-90 ft lbs

Installation - Position control arm and shaft on frame crossmember and install two bolts with self-locking nuts, tightening nuts to 75-90 ft lbs Connect upper ball stud to steering knuckle, tightening stud nut to 55-70 ft lbs Lubricate ball stud (using extended interval lubricant), replace wheel, lower car, and check front wheel alignment

Lower Control Arm & Bushings

Removal - Raise and support car with jack placed under front crossmember, then remove wheel and shock absorber, and disconnect lower end of stabilizer link from lower control arm Disconnect steering linkage from knuckle Install spring compressor Tool J-7592 as follows Locate one compressor plate in one of the upper coils of spring so that ramp faces down against coil, then locate other plate in one of the lower coils with ramp facing up *NOTE - Plates must parallel centerline of spring with holes in plate properly aligned* Place retainer J-7592, cup side up, over threaded end of rod J-7592-5, followed by bearing, then start long nut, J-7592-3 on rod Insert rod, hex end first, up through both plates, then slide retainer J-7592-4, cup side down, over end of hex rod and secure with "C" clip, seating clip down in retainer While holding upper end of rod, turn nut at lower end and compress spring Press lower control arm stud from steering knuckle with Tool J-6627 Swing steering knuckle out and lower control arm, coil spring will drop from its seat in frame side member Disconnect inner ends of lower control arm by removing nuts and withdrawing two special 9/16" bolts

Bushing Removal - With control arm off car, utilize an an arbor press and rest arm on remover Tool J-7022-1, with spacer J-7022-7 around rear bushing With sleeve J-7022-3 between control arm and arbor, press rear bushing from arm To remove front bushing, rest arm on remover Tool J-9584-1, with spacer J-9584-3 around bushing, then with sleeve J-8481-2 between control arm and arbor, press bushing from arm
Bushing Installation - Press in new rear bushing using Tool J-7022-2 on outside face of control arm rear bushing location, with J-7022-7 around bushing, and J-7022-3 on inside face of control arm between arm and arbor table Press in new front bushing using Tool J-9584-4 on outside face of control arm front bushing location, with J-9584-3 around bushing, and J-8481-2 on inside face of control arm between arm and arbor table
Installation - Reverse removal procedure and tighten lower ball stud nut to 55-70 ft lbs , and control arm to frame bolts to 100-125 ft lbs

PONTIAC TEMPEST FRONT SUSPENSION

P ntiac T mpest (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 LOWER CONTROL ARM BALL JOINT & STEERING KNUCKLE REPLACEMENT NOTE:* If lower ball joint assembly is replaced because of a broken or bent stud, or loose stud nut, it is necessary to also install a new type steering knuckle in 1961-62 model cars to prevent the possibility of a repeat failure

►*1963 V-8 MODEL STRUT ROD, SLEEVE & STEERING LINKAGE SHOCK ABSORBER PRODUCTION CHANGE NOTE:* New type strut rod bushing and sleeve, factory installed on V-8 model cars with standard steering, requires a steering linkage shock absorber be installed for front end stabilization

DESCRIPTION

Ball joint independent type suspension, with shock absorbers mounted within front coil springs, similar in design to previous models.

ADJUSTMENT

Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section*

Front Wheel Bearings - *See "Wheel Bearing Adjustment" in this section*

Riding Height - *See "Riding Height" in 1962 Final Data, Page 383*

REMOVAL & INSTALLATION

See 1962 Final Data, Page 383, and note the following.
►*BALL JOINT CHECKING: See Front Suspension Ball Joint Checking in this section*

►*LOWER CONTROL ARM BALL STUD REPLACEMENT NOTE:* On 1961 model cars, replacement ball stud (5677213) assembly is press fit into lower control arm rather than self-threading as was original stud, and and it is not necessary to remove roughness or burrs resulting from threaded stud installation as these will insure tight retention of new ball joint Use ball stud installation procedure given for 1962-63 model cars

1963 Pontiac Tempest Front Suspension Torque Table

Location of Bolt or Nut	Ft. Lbs. Torque
Shock Absorber	
Lower Bolts	15-25
Upper Bolt	60-120
Ball Joint Studs	
Lower and Upper	70-85
Upper Control Arm	
Cross Shaft Nuts	40-60
Bolts	55-70
Ball Joint Nuts	10-12
Lower Control Arm	
Pivot Bolt	75-90
Strut Rod	
Front Nuts	60-75
Rear Nut	70-85
Stabilizer Bar	
Body Rail Bolts	20-35
Strut Rod Clamp Nuts	20-30
Crossmember	
Attaching Bolts	70-85
Engine Mount Bolts	30-45
Tie Rod End Nuts	55-70

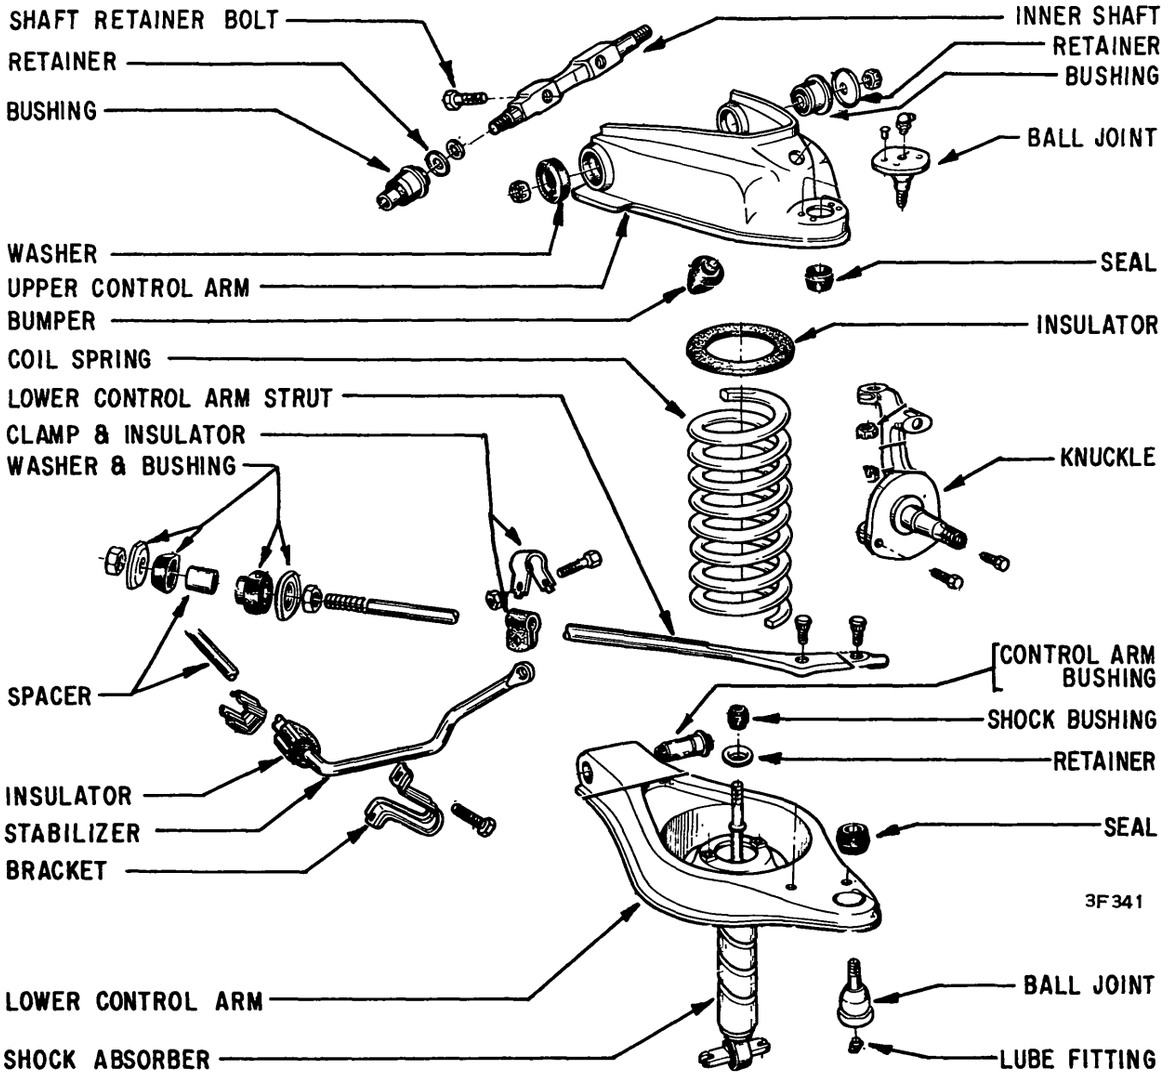
PONTIAC TEMPEST FRONT SUSPENSION (Cont.)

Strut Rod Bushing & Sleeve

Removal - A new strut rod bushing (544558) and sleeve (544559) are factory installed on all Tempest V-8 model cars starting December 3, 1962, to provide softer ride. To remove bushing and sleeve, remove nuts securing rod to lower control arm, then remove nut and bushing from rear end of strut rod. Withdraw strut rod from crossmember bracket, remove bushing, spacer and nut from rod. Studs in rod are replaceable by driving them in and out.

Installation - Install forward nut onto rod and position it about 1" from front end of threads, then install spacer and rubber bushing with three equally spaced ribs. *CAUTION - Do not interchange ribbed and smooth surfaced bushings.* Set strut rod in place in crossmember bracket and install remaining bushing and nut, then snug up rear nut. Install rod to lower control arm and tighten nuts to 60-75 ft. lbs. Lower car to floor, adjust caster, then tighten nut at rear of strut to 70-85 ft. lbs.

Steering Linkage Shock Absorber



Removal - Remove U-clamp-to-steering connecting rod nuts, and remove nut from side rail bracket end of shock absorber shaft. Remove shock absorber and U-clamp bracket from car. Stud connecting U-clamp bracket to shaft of shock absorber may be removed while the assembly is on or off the car.

Installation - Install retainer washer and bushing on threaded end of shock absorber piston rod. Install piston rod through hole in body side rail mounting bracket, then place remaining bushing and retainer on end of rod and secure with nut tightened to 60-120 in. lbs. Install stud at opposite end of shock absorber in connecting rod attachment bracket, then tighten stud nut finger tight. With shock fully extended and then moved back approximately 1/4", and wheels in full right turn position, install U-clamp bracket on steering linkage rod, tightening U-clamp nuts to 60-75 in. lbs., then tighten piston rod stud-to-bracket nut to 70-85 ft. lbs. *NOTE - U-clamp bracket should be attached to steering linkage rod at an approximate 33½° from the horizontal, with the stud side of bracket on top.* Check clearance and alignment of shock through full left and right turns, and if interference at pitman arm occurs, adjust angle of linkage bracket to provide clearance.

Steering Knuckle

Removal - With hub and drum assembly removed, and lower control arm supported, remove bolts attaching backing plate to steering knuckle and arm. Secure backing plate to bumper hanger with suitable wire. Remove upper and lower ball studs from knuckle with Tool J-6627.

Installation - *NOTE - If lower ball joints replaced due to broken or bent stud or loose stud nut, a new design steering knuckle must be used (545403 for 1961-62 cars, and 544169 for 1963 models).* Install upper and lower ball studs through steering knuckle and tighten nuts to 70 ft. lbs. *NOTE - Do not back off nut when aligning holes to install cott r pins. Turn in a tight ning direction only.* Secure backing plate to knuckle and steering arm, tightening two lower bolts to 45-65 ft. lbs. and upper bolt to 80-110 ft. lbs. Install hub and drum assembly.

PONTIAC TEMPEST FRONT SUSPENSION ASSEMBLY

PONTIAC TEMPEST REAR SUSPENSION

P ntiac T mpest (1963)

DESCRIPTION

Swing axle independent type suspension includes new "L" shaped lower arms forming lower seats for rear coil springs, and suspension crossmember forming upper seats. Angled shock absorbers operate outside spring coils and rear axle shafts are attached to differential with universal joints, having a splined yoke that extends into side gears of differential case.

ADJUSTMENT

To -In - *See "Wheel Alignment Specifications & Adjustment".*

Riding H ight - *See "Riding Height" in 1962 Final Data, Page 377.*

REMOVAL & INSTALLATION

See 1960 Final Data, Page 377, or later Manual edition, and note the following:

Shock Absorber

Rem val - With jack stands or hoist under car side rails, just forward of rear wheel openings, raise car so wheels hang free and a floor jack can be placed under tire. Raise tire, remove upper and lower attaching nuts, and remove shock absorber.

Installati n - Install shock absorber by reversing above procedure and torque attaching nuts to 70-85 ft. lbs.

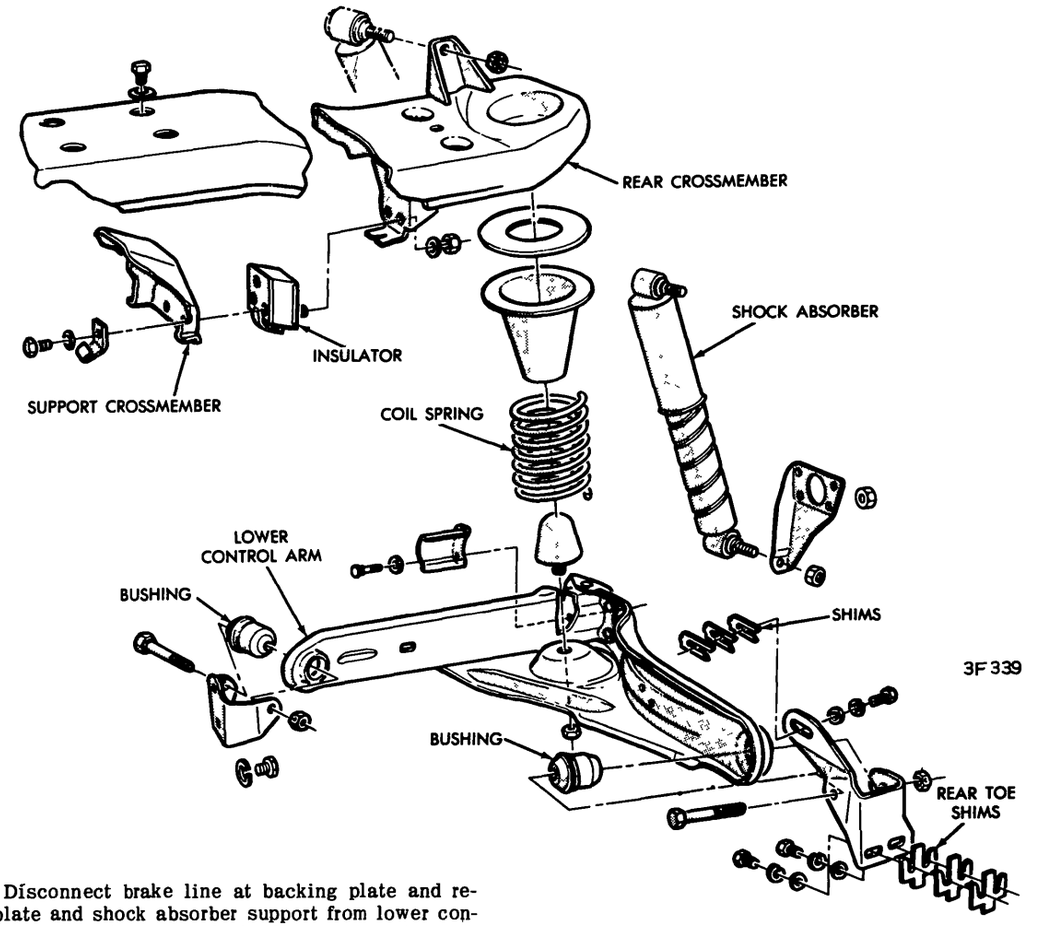
Coil Springs

R m val - Raise car with jack stands or hoist at body side rails. Support control arms to place slight load on coil springs. Disconnect shock absorber at lower support and, for right spring removal only, disconnect exhaust system. Remove wheel and brake drum. *NOTE - To eliminat xc ssiv prying of brake drum, give added support to rear control arm.* Line up hole in axle shaft flange with four nuts retaining backing plate to lower control arm and remove nuts. Remove support from control arms, remove nuts and lock tabs that secure universal joint U-bolts, and remove parking brake strut. Pull axle shaft outward to separate yoke from U-bolts. Mark each coil spring with its spring seat, and remove spring by lowering control arm.

Installati n - Place spring into crossmember spring tower and pry into place in lower control arm. If same spring is used, be sure that index marks line up. Install axle shaft through backing plate and install U-bolts. Line up holes in axle bearing flange plate with studs on end of control arm and push axle shaft inward until yoke fully engages U-bolts. Install U-bolt, nuts and lock tabs, and torque to 14-20 ft. lbs. Install brake backing plate nuts through hole in axle shaft flange and torque to 30-45 ft. lbs. Install parking brake strut. Support control arms and connect shock absorbers, torque nuts to 70-85 ft. lbs. Connect exhaust system (right spring removal only), install brake drum, and wheel.

Low r Contr l Arm & Bushings

Removal - With shock absorber and coil spring removed as outlined above, remove bolt, lockwasher and flat spacer securing yoke to axle shaft and remove universal joint yoke with Tool J-8614. Withdraw axle shaft. Disconnect brake line at backing plate and remove plate and shock absorber support from lower control arm studs. Disconnect brake line support bracket from control arm, three bolts, lockwashers and flat washers securing control arm support bracket to body side rail and remove shims. Disconnect control arm at support bracket on differential and remove control arm.



Removal of Bushing - Rest arm on support J-21027-2, and place Remover Tool J-21027-3 between control arm and arbor. Press out bushing. Remove other bushing from arm in same manner.

Installation of Bushing - Install new bushing in control arm by reversing above procedure, using Tool J-21027-2 for support and Tool J-21027-1 as installer. Press in bushing and repeat procedure for other bushing in arm.

Installation - Install control arm by reversing above procedure and bleed brakes. See table below for torques.

1963 Rear Suspension Tightening Torques

L cati n f B lts r Nuts	Ft. Lbs.
Control Arm Trans-Axle Bracket	100-125
Support Bracket to Side Rail	40-55
Yoke to Axle Shaft	20-35
Crossmember to Body	60-80

REAR COIL SPRING SUSPENSION

Rear Suspension Crossmember

Removal - Raise car, remove shock absorbers, coil springs and control arms (see above), and support transaxle with a separate jack stand. Disconnect parking brake cable at rear equalizer and speedometer cable at transaxle. Disconnect downshift electrical connector, parking lock control cable, shift control cable, and modulator vacuum line on automatic transmission cars, or shift control tube on synchro-mesh models. Remove two bolts on each side, connecting crossmember to body, and lower crossmember and transaxle away from car. *CAUTION - Be sure transaxl and crossmember ar supported prior to low ring.* Remove crossmember by removing six transaxle support crossmember to insulator bolts.

Installati n - Install by reversing above procedure and torque according to table under "Lower Control Arm Installation."

RAMBLER FRONT SUSPENSION

Rambler American (1963)
Rambler Classic Six & Eight (1963)
Rambler Ambassador Eight (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*CAR LEVELING NOTE:* Spacer (Part No. 3204474), for Series 10, 20, 80 cars (1950-55), and Series 01 cars (1958-63), and spacer (Part No. 3202359) for Series 10, 20, 80 cars (1956-63), are available to assist in leveling a car that leans at right or left front corner. Install spacer on spring seat with spring cushion and spring resting on spacer. *CAUTION - If two spacers are used, install one spacer on upper spring seat and one on lower spring seat.* Adding one spacer (Part No. 3204474) will raise affected corner 3/8"; one spacer (Part No. 3202359) will raise an affected corner approximately 1/2".

DESCRIPTION

Basic design (independent linked type) is similar to that used on previous models. Upper control arms are connected to steering knuckles by trunnion assemblies. On Rambler American, the upper trunnion assembly is integral with front spring lower support. On other models, coil spring lower support is threaded on upper trunnion. Lower control arms of Rambler American attach to steering knuckles by lower trunnion assemblies, while other models (1962-63) use a single lower control arm and strut rod, attached to steering knuckle by a ball joint stud assembly.

ADJUSTMENT

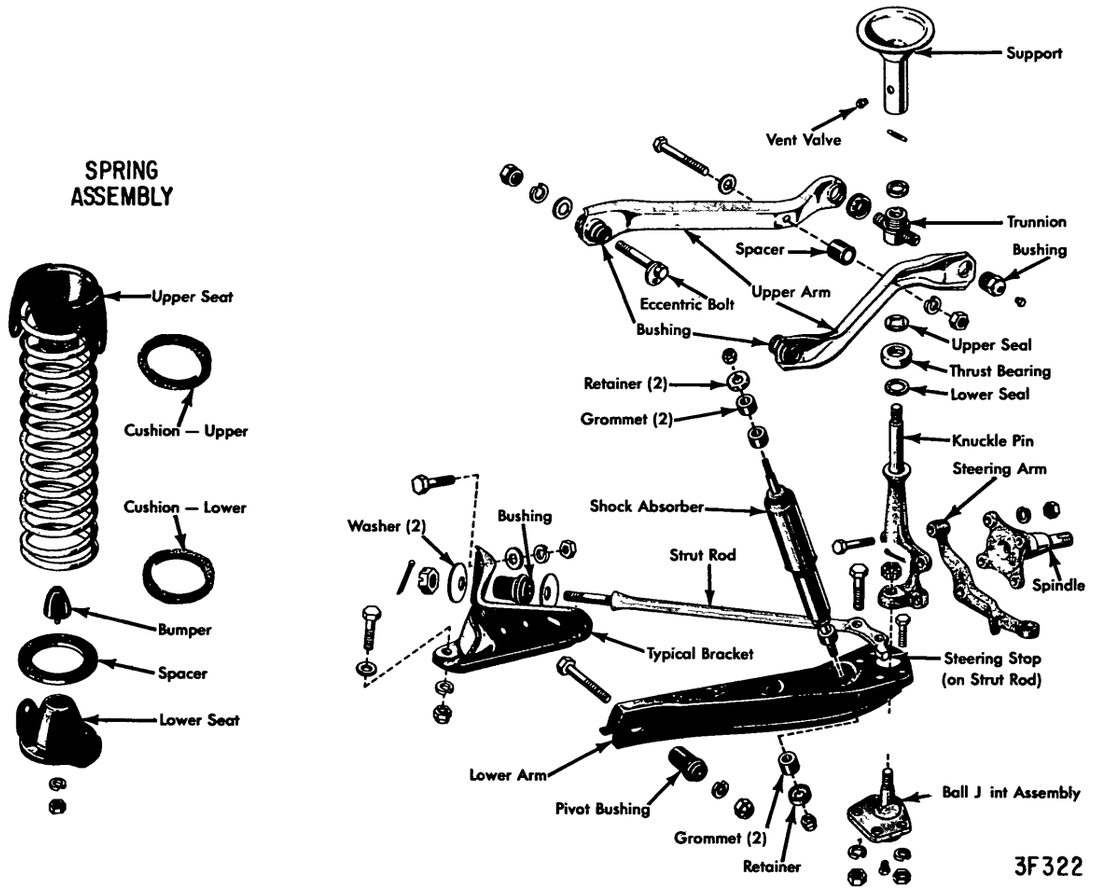
Caster & Camber - *See "Wheel Alignment Specifications and Adjustment" in this section.*
Front Wheel Bearing - *See "Wheel Bearing Adjustment" in this section.*

REMOVAL & INSTALLATION

See 1958 Final Data, page 355, or later Manual editions, except for Series 10, 80 (1962-63) lower control arm assembly as follows:

►*BALL JOINT CHECKING: See Front Suspension Ball Joint Checking in this section.*

Lower Control Arm



Lower control arms are attached to removable crossmember at pivot ends and outer ends are attached to the steering knuckle pin with a ball joint stud assembly. Remove front spring for service on lower control arm or attaching parts.

Series 10,80	Pivot Bolt Nuts	Crossmember Stud Nuts
1962	50-60 ft. lbs.	70-80 ft. lbs.
1963	55-65 ft. lbs.	50-60 ft. lbs.

OVERHAUL

Lower Control Arm Pivot Bushing

The pivot bushing is pressed into control arm as a tight press fit, and when removed or installed should not be turned or twisted. To remove bushing from arm, place arm in vise with a 13/16" socket on one side, and backing tool (Pitman Arm Puller J-5566-03 for 1962 cars; J-5566-04 for 1963 cars) on opposite side. In a similar manner, a new bushing may be installed using the same body of the Pitman Arm Puller and a 1 1/16" socket. Press bushing into control arm a distance of 61/64", as measured from inner edge of outer lip to inside surface of opposite side of control arm. *NOTE - Place a punch of suitable size in bottom open end of lower control arm to keep arm from distorting. Also, grind opening in Pitman Arm Pulley body slightly larger, if necessary, to fit over shoulder on control arm.*

RAMBLER CLASSIC & AMBASSADOR FRONT SUSPENSION ASSEMBLY

Lower Control Arm Ball Joint Assembly

To replace ball joint assembly, drill out two rivets that attach assembly to lower control arm, and remove two strut rod mounting bolts. Then remove steering knuckle arm and stud nut, and remove ball assembly from knuckle pin with Ball Joint Remover J-9656. When installing new assembly, replace rivets that were removed with two bolts, lockwashers and nuts. Lubricate assembly at 33,000 miles or 3 years, by removing plug at bottom and using manual gun and hose, Tool No. J-9670, with Lithium Base Cartridge Lubricant. *NOTE - On early 1962 cars, remove rubber plugs in bottom of ball joint units and tap the hole for a ¼"-28 metal plug.*

Lower Control Arm Strut Rod

Strut rods are fastened at lower control arm ends with two bolts and nuts, and at mounting bracket in a rubber bushing. Upon assembly, torque strut rod-to-cushion nut and strut-to-lower control arm bolt nuts 60-70 ft. lbs. To remove rubber bushing from bracket, break tack welds, then place a 3/32" or 1/8" punch on metal end of bushing and drive out. To install a new bushing place 1 3/4" socket on shoulder of bushing and drive into place, then tack weld in place.

Steering Knuckle Pin

1962-63 cars have steering knuckle pin with a tapered seat (threaded in 1961 models) at lower end to receive lower control arm ball joint assembly.

STEERING LINKAGE

►*POWER STEERING LINKAGE NOTE:* Linkage on these cars is essentially the same as linkage for manual steering cars.

AMERICAN MOTORS

Rambler (All Series)

Linkage - Consists of relay rod connected between pitman arm and steering idler arm with tie rod on left side connected between pitman arm and steering arm. On right side, tie rod is connected between idler arm and steering arm. Ball and socket joints are adjustable on Series 01 (American), and not adjustable on Series 10 & 80 (Classic & Ambassador).

Ball & Socket Joint Adjustment - On idler arm side, tighten adjusting plug until solid contact made, then back out to first cotter pin hole (no more than 3/8-turn, no less than 1/8-turn). On pitman arm side, tighten adjusting plug until solid contact made, then back out 3/4-turn and install cotter pin in holes nearest this position.

CHRYSLER CORP.

Chrysler, Imperial, Dodge, Dart, Plymouth & Valiant

Linkage - Consists of idler arm bracketed to right frame side member and connected to right end of drag link. Pitman arm is connected to left end of drag link. Individual tie rods, connected to drag link near its center, have sleeve adjustment for toe-in.

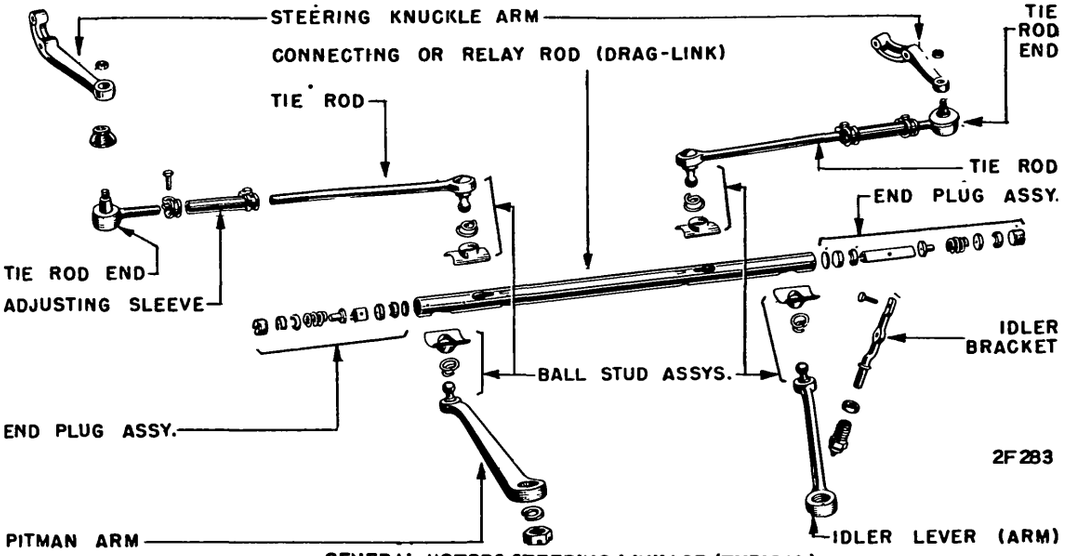
Idler Arm Bushing Replacement - Idler arm with bushing is serviced only as an assembly. When bushing is worn, replace complete assembly.

FORD MOTOR CO.

Comet, Falcon, Fairlane, Ford Pass. Cars, Lincoln, Mercury, Meteor & Thunderbird

Consists of steering (pitman) arm-to-idler arm rod which transmits motion from steering gear through steering arm attached to left end of steering arm-to-idler arm rod, then to front wheels through the tie rods. Tie rods have adjustable sleeves on outer ends for toe-in adjustment. An idler arm is attached to underside of underbody.

Tie Rod End Replacement – *NOTE – Idler (intermediate) rod ends are not replaceable. Complete rod assembly should be replaced when rod ends are worn.* Remove nut from ball end stud, then place a support behind arm near stud and tap with a soft hammer to drive it out of arm. *CAUTION – DO NOT use a wedge type ball stud separator because of special design of ball stud seals.*



Idler Arm & Bushing Replacement - *NOTE - If one bushing is worn, both bushings must be replaced.* Replace bushings with Tool Set T61P-3355-A or 3355 (or suitable puller). *CAUTION - Replace idler arm bracket if threads are worn or bracket is bent. DO NOT attempt to straighten a bent idler arm bracket.*

Ford Trucks

Linkage consists of connecting rod between front wheels. Rod has adjustable features at both ends. The spindle arm attached to connecting rod at left end is in turn attached to a one-piece drag link with manual adjustment features at both ends. Rear of drag link is attached to sector shaft arm.

"C" SERIES FORD TRUCK NOTE - These trucks have a single adjustable type drag link. To adjust, center steering wheel, then adjust drag link for a length of 39 1/8" ± 1/16". Tighten clamp bolt to 35-45 ft. lbs. *NOTE - Greater offset in curved drag link must be toward front of truck for proper tire clearance. Rear clamp opening must face right side of truck, and front clamp opening must face left side of truck.*

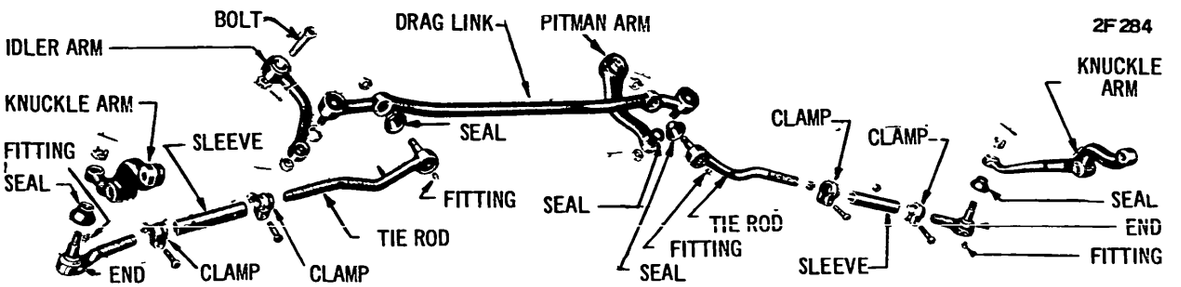
Drag Link Adjustment - Remove cotter pins from each end of drag link. Tighten each drag link plug until drag link ball springs are fully compressed. Back off each plug to first cotter pin hole, then install new cotter pins.

GENERAL MOTORS STEERING LINKAGE (TYPICAL)

GENERAL MOTORS

Buick (Exc. Special)

Linkage - Parallelogram type linkage consisting of an intermediate rod between steering gear pitman arm and idler lever on right side of frame, and individual tie rods between intermediate rod and each wheel. Adjustable sleeves at end of each tie rod for toe-in adjustment. No intermediate rod end plug adjustment is provided.



Idler Lever & Support Adjustment – In order that idler lever ball stud is kept level with pitman arm ball stud, thread support into idler arm bushing until distance from center of support lower bolt hole to nearest face of idler lever is 2 15/16–3 1/16".

Buick Special

Linkage - Consists of an intermediate rod between steering gear pitman arm and idler lever on right side of frame, and individual tie rods between intermediate rod and each front wheel. Adjustable sleeves at end of each tie rod for toe-in adjustment. Intermediate rod end plug adjustment provided at both pitman arm and idler lever ends of intermediate rod on both manual and power steering cars.

Idler Lever & Support Adjustment – In order that idler lever ball stud is kept level with pitman arm ball stud, thread support into idler arm bushing until distance from center of support lower bolt hole to nearest face of idler lever is 7/16".

Intermediate Rod End Plug Adjustment – Adjust plugs on both pitman arm and idler lever ends of intermediate rod as follows: Turn end plug up tight, then back off plug ¼–¾ turn (½ turn preferred) and install cotter pin.

CHRYSLER CORP. STEERING LINKAGE

STEERING LINKAGE (C nt.)

Cadillac

Linkage - Consists of a drag link between steering gear pitman arm and idler lever mounted on right hand frame side rail, and individual tie rods between drag link and each wheel. Adjustable sleeves at outer ends of tie rods for toe-in adjustment. No adjustment plugs are provided at drag link ends as the drag link is attached to idler and pitman arms by spherical pivots.

Drag Link Height Adjustment – Place a straight bar across two adjustable jacks directly below drag link. Adjust height of jacks so distance from top of bar to centerline of lower control arm pivot bolts is equal on both sides (adjust jacks so distance is an even number of inches). Measure distance from top of bar to lower edge of drag link on both sides using a combination square and level with bubble centered in level. *CAUTION – Do not reposition bar or move car.* Difference in measurement between 1st measurement (top of bar to centerline of lower control arm pivot bolts) and 2nd measurement (top of bar to lower edge of drag link) should be 2 15/16"±1/16" and equal at both inner pivot points within 1/16". If idler arm end of drag link not within limits, loosen idler arm support mounting screws and move support. If proper adjustment still not obtainable, remove and bend idler arm slightly. If pitman arm end of drag link not within limits, loosen steering gear mounting bolts and move gear. If proper adjustment still not obtainable, remove and bend pitman arm slightly. *CAUTION – Bend pitman and idler arms off the car and cold.*

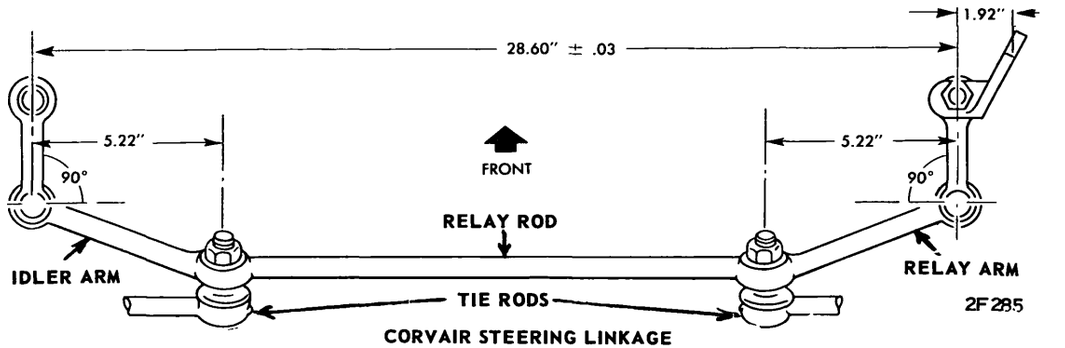
Chevrolet Pass. Cars & Corvette

Consists of steering relay rod between pitman arm and idler arm. Pitman arm connected to relay rod by an adjustable ball and socket joint (Exc. Corvette). Individual adjustable tie rods are installed between relay rod and each front wheel.

Relay Rod Ball Joint Adjustment – Remove cotter pin from end of relay rod and tighten end plug until springs are compressed and plug bottoms. Back off end plug ¾ turn plus amount necessary to insert cotter pin, then insert pin.

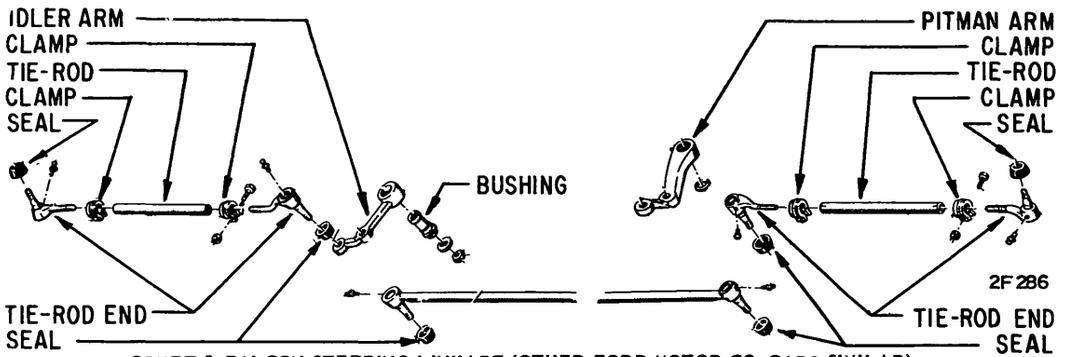
Chevy II

Consists of steering relay rod between pitman arm and idler arm. Pitman arm is connected to relay rod by an adjustable ball and socket joint. Individual adjustable tie rods are installed between relay rod and each front wheel.



Relay Rod Ball Joint Adjustment - Remove cotter pin from end of relay rod and tighten end plug until springs are compressed and plug bottoms. Back off end plug ¾-turn plus amount necessary to insert cotter pin, then insert cotter pin.

Chevrolet Trucks (Series 10-30)



Consists of two tie rod assemblies connected between pitman arm and wheel on left hand side and between idler arm and wheel on right hand side. A relay rod is connected between pitman arm and idler arm.

C rvair

Linkage - Consists of a relay rod connected between pitman arm and steering idler arm located on right hand side of frame. Tie rods are connected between relay rod and each front wheel. Bushing on pitman arm end of relay rod is replaceable.

CORVAIR STEERING LINKAGE

COMET & FALCON STEERING LINKAGE (OTHER FORD MOTOR CO. CARS SIMILAR)

Oldsmobile (Exc. F-85)

Linkage - Consists of steering relay rod between pitman arm and idler arm bracketed to right hand frame side rail. Individual adjustable tie rod ends are attached to center portion of steering relay rod and are provided with adjustable sleeves for toe-in adjustment.

Oldsmobile F-85

Linkage - Consists of steering relay rod between pitman arm and idler arm which is bracketed to right hand frame side rail. Individual adjustable tie rods are attached to relay rod and are provided with adjustable sleeves for toe-in adjustment.

Relay Rod End Plug Adjustment – Thread plugs into relay rod until tight, then back off ¼–¾ turn and install cotter pin with head to front of car.

Idler Arm & Support Adjustment – Thread idler arm support with seal into bushing until distance from upper face of idler arm to shoulder of support is ½". *NOTE – Idler arm must be able to rotate 90° in each direction from straight ahead position.*

Pontiac & Pontiac Tempest

Linkage - Consists of steering connecting rod between pitman arm and idler arm located on bracket on right hand frame side rail. Individual tie rods between steering connecting rod and each front wheel are provided with adjustable sleeves for toe-in adjustment.

Idler Lever & Support Adjustm nt – With lever and support off car, thread idler support into bushing until distance between upper face of idler arm and shoulder at thread end of idler support is 11/16".

KAISER JEEP CORP.

Jeep (Exc. "J" Series)

Linkage - Bellcrank on frame front crossmember linked to each front wheel by adjustable tie rods and to steering gear pitman arm by a steering connecting rod (drag link).

Connecting Rod End Plug Adjustment – On idler arm end of connecting rod, screw plug in firmly against ball, then back off ½ turn (except FC–150), 1/8–1/4 turn (FC–150), and install cotter pin. On pitman arm end, screw plug in firmly against ball, then back off 1 full turn (except FC–150), 1/8–1/4 turn (FC–150) and install cotter pin.

STUDEBAKER CORP.

Studebaker Lark, Hawk & Avanti

Linkage - Consists of two adjustable tie rods attached to bellcrank mounted at center of frame crossmember. Bellcrank is attached to steering gear pitman arm by a reach rod (drag link).

B llcrank B aring Adjustm nt – Insert shims between lower thrust washer and shaft until there is no end-play. Shaft should turn freely in bearings. Lock nut securely with cotter pin.

STEERING WHEEL, HORN BUTTON, DIRECTIONAL SIGNAL SWITCH REMOVAL

AMERICAN MOTORS

Horn Button Removal & Installation

Rambler American - Pry horn button from center of steering wheel. *NOTE* - The horn ring can be removed after removal of steering wheel. To install, reverse removal procedure.

Rambler Classic & Ambassador - Rotate horn button or horn ring approximately ¼ turn counterclockwise and remove from steering wheel. To install, reverse removal procedure.

Steering Wheel Removal & Installation

Rambler (All Models) - With horn button removed, install a suitable wheel puller (J-5290 for Rambler American and J-21232 for Rambler Classic and Ambassador) and pull wheel from steering shaft. To install, reverse removal procedure and tighten steering wheel nut securely.

Directional Signal Switch Removal & Installation

Rambler (All Models) - With steering wheel removed, remove upper spring and cone bushing from steering tube and disconnect directional signal and horn wires. Move directional signal lever to right turn position and remove the two attaching nuts. Push the two capscrews down into gearshift housing and remove directional signal housing from steering tube. To install, insert the two square headed capscrews in holes of directional signal housing and start the nuts on the capscrews. Install directional signal housing, guiding the directional signal and horn wires down through gearshift housing and jacket tube, and align the heads of the two capscrews with slots in upper end of jacket tube. Hold down on the two capscrews and maintain a light downward pressure on housing while tightening the nuts. Tighten one nut two or three turns and then tighten the other the same amount. Repeat until both are tight. Do not over-tighten. Install steering wheel and connect directional signal and horn wires.

CHRYSLER CORP.

Horn Button Removal & Installation

Dodge Dart & Plymouth Valiant - Disconnect battery at negative terminal, then pry cap off horn button. Disconnect horn wire at switch, then remove three screws and insulators attaching horn ring and horn switch to steering column and remove ring and switch. Install by reversing removal procedure.

Chrysler, Dodge & Plymouth (Exc. Imperial, Dart & Valiant) - Disconnect battery at negative terminal, then remove horn button by turning it ¼ turn counterclockwise. On models having a horn ring, remove the two attaching screws from underside of steering wheel. Disconnect horn wire at switch, then remove the three screws and insulators attaching horn ring and horn switch to steering column. Remove horn ring and switch. Install by reversing removal procedure.

Imperial - Disconnect battery at negative terminal, then remove the two screws from underside of steering wheel and remove horn actuator and steering wheel cover. Disconnect horn wire at switch; then remove the four screws and insulators and remove switch. Remove horn switch mounting plate. Install by reversing removal procedure.

Steering Wheel Removal & Installation

All Models - Remove horn button and switch assemblies (see above), then loosen steering shaft nut (do not remove). Install Puller C-3428 and loosen wheel on shaft, then remove nut and wheel. To install, reverse removal procedure and tighten nut to 24 ft. lbs. (Chrysler, Dodge Custom 880, Plymouth & Valiant); 40 ft. lbs. (Chrysler Imperial, Dodge & Dodge Dart).

Directional Signal Switch Removal & Installation

All Models (Exc. Imperial) - Remove steering wheel (see above), then remove direction signal lever from switch and disconnect direction switch wiring at steering column jacket tube below instrument panel. *NOTE - Attach a piece of string or fine wire to direction switch wiring before removing switch from steering column. When switch is removed, leave string or wire in steering column jacket tube to aid in replacement of wiring.* Disconnect direction switch from steering column and remove from top of column. To install, reverse removal procedure and use the string or fine wire to pull switch wire down through column jacket.

Imperial - Remove directional switch lever, then remove steering column lower cover. Disconnect switch wires at connector and remove switch. To install, reverse removal procedure.

FORD MOTOR CO.

Horn Button Removal & Installation

All Models - Disconnect horn button wire at connector under instrument panel, then depress horn button (or steering wheel hub cap) and rotate it counterclockwise for removal. On some models, upper horn contact can be removed. *NOTE - Complete horn contact assemblies can be removed after steering wheel and (or) direction signal assembly are removed (see below).* To install, reverse removal procedure.

Steering Wheel Removal & Installation

All Models - With horn button (or steering wheel hub cap) removed, install a suitable steering wheel puller (Ford & Mercury Tool Nos. 3600AA, 3600N), and pull steering wheel from shaft. To install, reverse removal procedure.

Direction Signal Removal & Installation

Comet & Falcon - With horn button and steering wheel removed, remove direction signal lever, then remove direction signal switch retaining screws and pull switch away from steering column flange. Remove flange retaining nuts and remove indicator switch, column flange, sleeve, and wiring assembly. To install, reverse removal procedure.

Fairlane, Galaxie, Meteor, Monterey & Thunderbird - Remove steering wheel and disconnect direction signal lever. Remove switch mounting bracket screws and remove switch and bracket from steering column. Remove conical tension spring, then remove switch actuating lever.

Lincoln Continental - Remove steering wheel, then remove instrument panel center plate below steering column. Unscrew direction signal lever from steering column. Remove lower left instrument panel cover and disconnect turn signal wires at connector. Remove two screws and remove access plate from bottom side of steering column, then pull switch wires through plate opening. Lift up on selector dial hood and remove hood. Remove selector lamp socket from column, then remove lens, shroud and pointer from column, and slide shroud down toward base of column. Use an offset screwdriver and remove screw attaching wire clamp to tube. Remove switch attaching screws and remove switch. To install, reverse removal procedure.

GENERAL MOTORS

Horn Button Removal & Installation

Buick 4400, 4600, 4700, 4800 - Remove two screws from lower side of actuating bar (steering wheel spoke), then remove cap and four clutch head screws from actuating bar and remove bar. To install, reverse removal procedure.

Buick Special 4000, 4100, 4300 - *NOTE - Remove deluxe steering wheel horn button assembly in same manner as for standard Buick models.* On standard steering wheels, insert a screwdriver through hole in cap and loosen retaining screw, then remove cap. Reverse removal procedure to install.

Cadillac - Pry cap from steering wheel and horn control shroud, then disconnect horn contact wire from top of steering shaft. Remove upper steering shaft nut and lift horn shroud and switch assembly from wheel. To install, reverse removal procedure and tighten steering shaft nut to 50 ft. lbs.

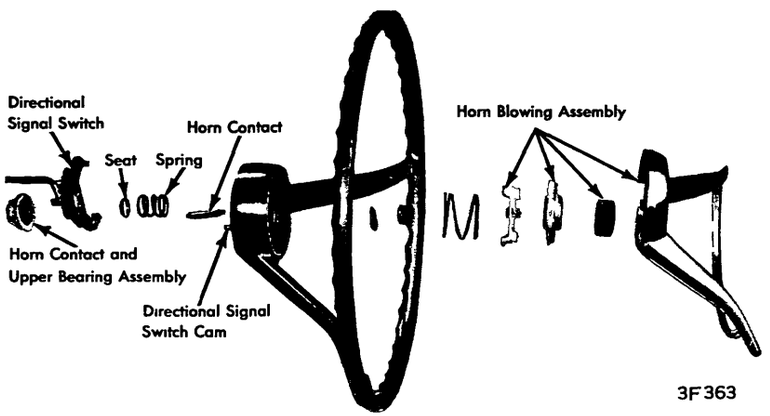
Chevrolet Pass. Cars & Trucks - On all models except Bel Air and Impala, pry horn button out of steering wheel. On Bel Air and Impala, remove two screws from back side of steering wheel spoke and remove the horn button. To install, reverse removal procedure.

Oldsmobile (All Models) - Carefully pry cap and ornament assembly from center of steering wheel. To remove shroud and horn button assemblies on deluxe type steering wheel, remove steering wheel (see below), then remove screws attaching shroud to wheel and remove shroud. Remove switches from shroud. To install, reverse removal procedure.

(Continued)

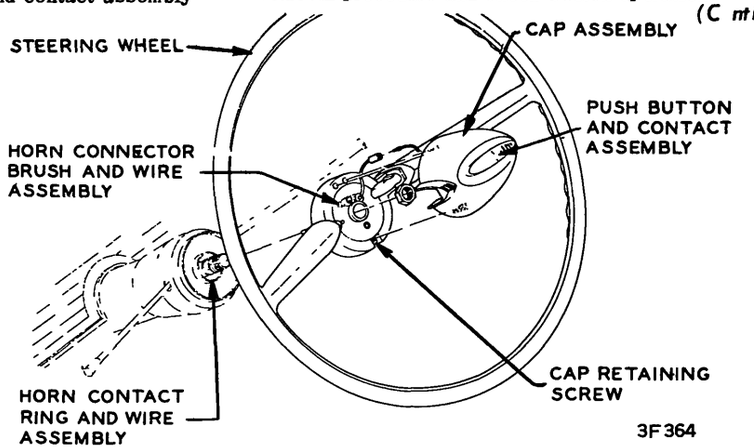
STEERING WHEEL, HORN BUTTON, DIRECTIONAL SIGNAL SWITCH REMOVAL (Continued)

Pontiac (Exc. Tempest) - On standard steering wheel, pry horn button from steering wheel hub. On deluxe steering wheel, rotate horn button cap clockwise to remove. To remove horn ring, remove steering shaft nut and lift ring out. To install, reverse removal procedure. Tighten steering wheel nut to 20-35 ft. lbs.
Pontiac Tempest - On standard and deluxe wheels, pry horn button from steering wheel hub. On custom steering wheel, twist ornament to remove. To remove horn ring on deluxe and custom steering wheels, remove steering shaft nut and remove ring. To install, reverse removal procedure and tighten steering shaft nut to 20-35 ft. lbs. and stake nut in place.



Steering Wheel Removal & Installation

Buick & Buick Special - Disconnect horn wire at mast jacket, then remove horn button assembly (see above). On steering wheels with actuator bar, remove springs and ground plate from steering wheel. Loosen steering shaft nut (do not remove), then install Puller J-3274 and pull wheel up to nut. If wheel is exceedingly tight, place a moderate strain on puller and tap end of puller screw to break hub loose from shaft. Remove steering wheel. To install, reverse removal procedure and note the following: Align mark on wheel hub with mark on shaft for correct alignment. Tighten steering shaft nut to 20-35 ft. lbs.
Cadillac - Remove horn shroud and switch assembly from steering wheel (see above), then scribe a line on wheel hub and on end of shaft for installation of wheel in original location. Install Puller J-1859-02 and use two 5/16"-18 bolts 3½" long, with flat washers, and pull wheel from shaft. To install, reverse removal procedure, aligning scribe marks made at removal. Tighten steering shaft nut to 50 ft. lbs.
Chevrolet Pass. Cars & Trucks - On all models, remove horn button assembly (see above). On steering wheels with horn ring, remove three screws from horn ring adapter and remove adapter, insulator and spacer. Remove steering shaft nut, then install Puller J-2927 and pull wheel from shaft. To install wheel, reverse removal procedures and note the following: On all models except Chevy II, Corvair & Chevrolet Trucks, loosen spring stop clamp which is located at lower end of mast jacket just above steering shaft coupling. After wheel is completely installed, place a .010-.020" shim between coils of spring located above spring stop clamp, then compress spring so it is solid. Tighten spring stop clamp in this position and remove shims.
Oldsmobile & Olds F-85 - Disconnect horn wire from harness, then remove horn button assembly. Remove steering shaft nut and install Puller BT-61-9 and remove wheel. To install, align marks on steering wheel hub and steering shaft and install wheel. Tighten steering shaft nut to 25 ft. lbs. and stake to steering shaft.
Pontiac (Exc. Tempest) - Remove horn button (see above). On standard steering wheel, remove three screws, insulator and horn button retainer, then remove contact ring, pivot contact, spring and insulator. Remove steering shaft nut and remove contact plate. On deluxe steering wheel, remove steering shaft nut, then pull horn ring and contact assembly from steering gear shaft. Remove pivot contact, spring and insulator from steering wheel hub. On all models, install Puller J-3044 and pull wheel from shaft. Remove coil spring and seat from steering shaft. To install, reverse removal procedure and tighten nut to 20-35 ft. lbs.
Pontiac Tempest - On standard and deluxe steering wheels, remove horn button by prying out of wheel hub, then remove steering shaft nut and spacer bushing. Remove horn ring or receiver cup, then remove pivot ring (deluxe wheel) and belleville spring. Remove contact assembly and pull steering wheel from shaft with Puller J-3044-01. On custom steering wheel, twist and remove steering wheel ornament, then remove steering shaft nut. Pull horn ring and contact assembly from steering column upper bearing, then pull wheel from shaft with Puller J-3044. To install, reverse removal procedure and note the following: Make sure wheel is positioned in straight ahead position or marks on wheel hub and on shaft are in alignment. Install steering shaft nut and tighten to 20-35 ft. lbs.



Directional Signal Actuator Removal & Installation

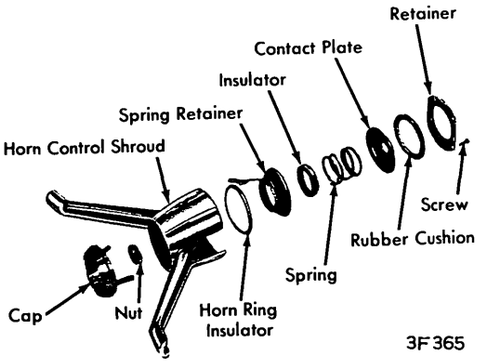
Buick & Buick Special - Remove steering wheel (see above), then unplug horn wire from connector located near wire hole in mast jacket. Attach a length of wire to horn wire terminal (to be used to feed horn contact wire back through mast jacket at reassembly). Remove directional signal operating lever, then remove directional switch on mast jacket. Remove spring pin and spring from lower end of actuator rod and pull rod out of actuator. Remove three Phillips head screws retaining actuator to plate and lift actuator off of mast jacket. Remove cover from actuator. To install actuator assembly, reverse removal procedure and note the following: If spring pin was bent during removal, it may be difficult to install in actuator rod. After installation, adjust directional signal switch.
Directional Signal Switch Adjustment - With directional signal control lever in center detent, loosen switch mounting screws and move switch sideways on jacket until operating pin projecting from switch is centered, then tighten mounting screws and check operation in each position.
Cadillac - Remove steering column lower cover, transmission shift indicator and holder, then disconnect directional switch wires at connector under dash. Remove steering wheel and directional signal cancelling cam wheel spacer. Lower column and remove directional switch harness protector from steering column jacket by removing two attaching screws. Remove three screws retaining directional signal housing to steering column assembly and remove directional signal housing and switch assembly. To install, reverse removal procedure and check switch operation.

(Continued)

TYPICAL AMERICAN MOTORS STEERING WHEEL, HORN BUTTON & DIRECTIONAL SIGNAL SWITCH ASSEMBLY

BUICK SPECIAL (STANDARD) STEERING WHEEL, HORN BUTTON & CAP ASSEMBLY

STEERING WHEEL, HORN BUTTON, DIRECTIONAL SIGNAL SWITCH REMOVAL (Continued)



Chevr let Pass. Cars & Trucks (Except Corvair & C rv tte) - Remove steering wheel (see above), then remove lever arm attaching screw and lever from cancelling assembly. Remove three screws attaching switch assembly to switch housing, then disconnect switch wiring connector from chassis wiring harness connector and disengage from harness retaining clips. Remove directional signal assembly and upper horn bearing from housing. To install, reverse removal procedure.

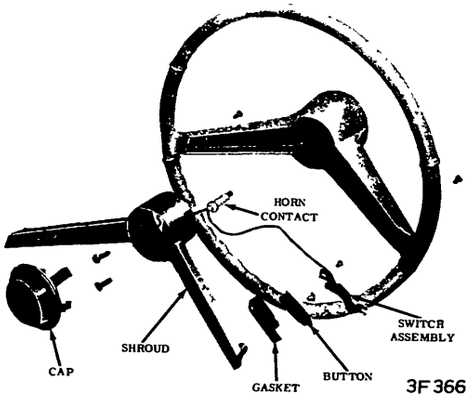
C rvair & C rv tte - Remove steering wheel (see above) and horn bushing assembly, then remove three directional signal housing retaining screws. Disconnect Bowden cable retaining clips and remove directional signal switch from mast jacket. Withdraw directional signal housing and Bowden cable.

Oldsm bil (Exc. Olds F-85) - Remove steering wheel and turn signal lever (see above), then insert a screwdriver (round shank) through turn signal lever hole in housing and pry housing from bearing retainer. Remove the cancel spring and pivot pin with wave washer from lever plate. Depress detent spring to disengage it from upper bearing retainer, then separate lever plate, detent spring, detent roller and detent balls from upper bearing retainer. To install, reverse removal procedure and note the following: Lubricate all frictional areas with Lithium Soap Grease. Press housing over upper bearing retainer so that it just snaps over ring of bearing retainer flange.

Olds F-85 - Remove steering wheel assembly (see above), horn contact, turn signal actuator plate, and upper bearing. Remove three Phillips head screws from actuator retainer anchor plate, then lift actuator assembly off mast jacket. Install by reversing removal procedure.

P ntiac (Exc. T mp st) - With steering wheel assembly removed (see above), disconnect horn cable from terminal, then remove wire connectors from directional signal switch assembly (on mast jacket) and remove switch assembly and horn wire retainer. Hold actuator rod anti-rattle coil spring and bearing plate and remove hair-spring type actuator lever from lower end of actuator rod. *NOTE - Stuff a rag into opening below actuator rod t prevent loss of actuator spring.* Remove anti-rattle spring and bearing plate from actuator rod, then pull actuator rod from top end of steering column. Remove horn connector assembly and horn wire from end of upper bearing support plate. Remove the screws retaining actuator housing and remove housing. *NOTE - Actuator can be removed from housing by removing control lever and pressing out shield.* To install, reverse removal procedure and note the following: Attach a stiff wire to end of horn wire and snake wire through outer slots of bearing support lock plate and retainer plate, then between steering column housing and shifter tube, bringing wire out proper opening in housing. *NOTE - Directional signal switch must be properly centered on steering column. Make sure there is no tension on actuator rod when switch screws are tightened.* Tighten actuator housing attaching screws and switch attaching screws to 10-35 inch pounds.

CADILLAC HORN CONTACT ASSEMBLY



Pontiac Tempest - Remove steering wheel and disconnect horn wire lead and directional signal connector. Rotate directional signal housing on steering column jacket and remove housing from jacket. To install, reverse removal procedure, positioning housing so there is 7/64" clearance between housing and steering wheel hub. If necessary, adjust steering column jacket up or down to provide proper clearance between steering wheel and housing.

STUDEBAKER CORP.

Horn Button Removal & Installation

Studebaker (Exc. Avanti) - Remove horn button by prying it out of center of steering wheel. To remove horn switch, disconnect horn button wire at switch, then remove retaining screws and insulators and remove switch. To install, reverse removal procedure.

Studebaker Avanti - Remove steering wheel center ornament by turning it 1/3 turn counterclockwise, then remove retainer screws and retainer. Remove steering wheel and place it upside down, then mark position of directional signal cancelling ring and remove ring from wheel hub. Remove three switch contact plate retaining screws and insulating washers and lift switch plate, nylon spacers and the spring from wheel hub. To install, reverse removal procedure.

OLDSMOBILE HORN CONTACT ASSEMBLY (DELUXE WHEEL)

Steering Wheel Removal & Installation

Studebaker (Exc. Avanti) - With horn button removed, remove horn ring retaining screws and insulators, then remove steering wheel nut. Remove steering wheel from shaft using a suitable puller (J-5473). To install, reverse removal procedure and tighten steering wheel nut to 23-27 ft. lbs.

Studebaker Avanti - Remove center ornament and retainer. Remove steering wheel nut and pull wheel from shaft using a suitable puller (J-5473-02). To install, align index mark on top of steering post shaft and install wheel. Install retaining nut and tighten to 25-30 ft. lbs. Install center ornament.

Directional Signal Switch Removal & Installation

Studebaker (Exc. Avanti) - With steering wheel removed, remove directional signal lever retaining screw and remove lever from bracket. Disconnect directional signal wires and horn wire from wiring harness at connector under dash. Remove upper bracket and pull directional signal and horn wires up through jacket. Remove directional switch retaining screws in upper bracket and remove switch (including horn contact roller assembly). Install by reversing removal procedure.

Studebaker Avanti - With steering wheel removed, remove directional signal switch lever retaining screw and lever. Remove horn brush and directional signal switch plate retaining screws, then disconnect horn wire and directional signal wires at lower connector. Lift brush plate and signal plate from steering wheel hub and pull wires up out of jacket. Install by reversing removal procedure.

BENDIX LINKAGE TYPE POWER STEERING

Checker (1963)
Comet V8 (1963)
Falcon V8 (1963)
Ford Fairlane & Galaxie (1963)
Jeep, J Series (1963)
Mercury Meteor & Monterey (1963)
Studebaker (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 COMET & FALCON V8 EXCESSIVE STEERING EFFORT & RAPID STEERING WHEEL RETURN CORRECTION:* This condition can be corrected on cars built before June 17, 1963 by installing a new idler arm and bushing, Part No C3DZ-3352-G Cars built after the above date have the new arm and bushing installed in production

Description

"Linkage Type" with control valve assembly and power cylinder built into steering linkage or attached to it A "Reaction Limiting Valve" is incorporated into main control valve assembly on some models This valve assembly limits amount of effort required to turn steering wheel when parking or when making a sharp turn at low speed.

Lubrication

Check fluid level in reservoir every 6,000 miles (Exc. Checker & Studebaker); 5,000 miles (Checker & Studebaker) Start engine and turn wheels right and left a few times, then shut engine off Add Automatic Transmission Fluid Type "A" (Suffix "A"), to bring fluid level up to following specifications:

Checker - Bring level to within 1" of top.

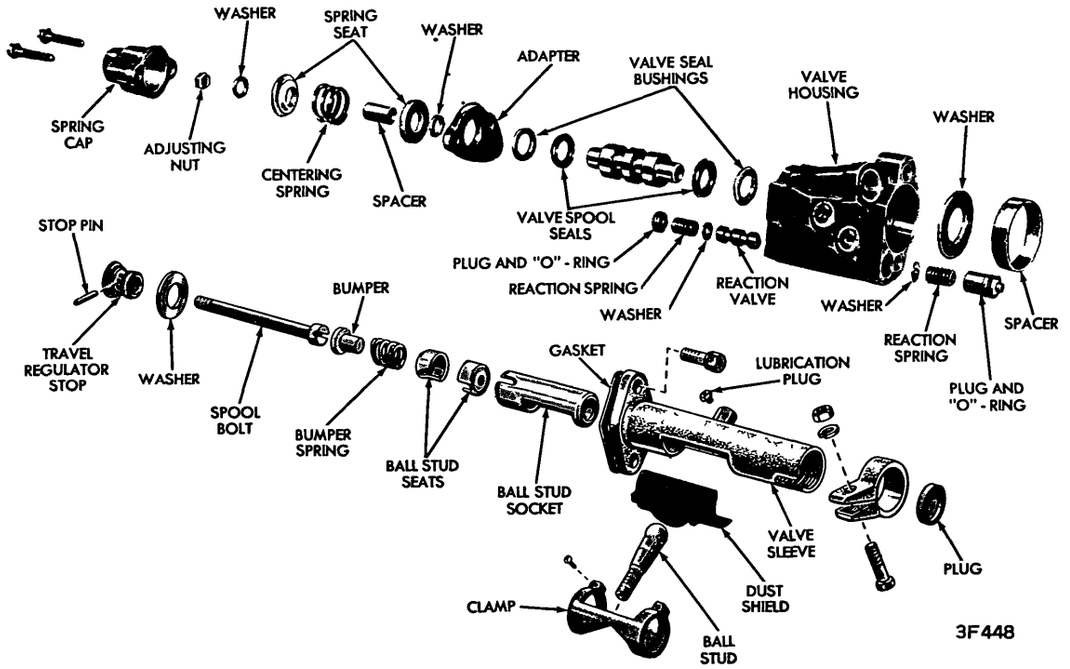
Studebaker - Maintain fluid level ¼" below lowest point of reservoir opening flange with front wheels in straight ahead position.

Other Models (Exc. Air Cond. Cars) - Maintain level at "F" mark on dipstick

Other Models (Air Cond. Cars) - Maintain level ¼" from top (Exc Comet & Falcon); 1" from top (Comet & Falcon)

TESTING

Turning Effort



With wheels properly aligned and tire pressure correct, place car on dry concrete, set parking brake, then proceed as follows: With engine at normal idle speed, turn wheel to right and left several times to bring fluid to normal operating temperature. Hook a spring scale to steering wheel rim and measure pull required to turn wheel at least one full turn in both directions Pull should be about equal in both directions as indicated in table below

Turning Effort Specifications

Car Model	Scale Reading
Comet & Falcon	4 Lbs. Approx.
Fairlane & Meteor	4½ lbs. Approx.
Galaxie & Monterey	4 lbs. Approx
Studebaker	11 lbs Max

Pump Pressur

Install a suitable pressure gauge between pump hose and pump outlet with gauge between pump and shutoff valve of gauge Run engine at idle speed (with shutoff valve open) for two minutes to normalize oil temperature Turn wheels all the way to right and left, noting pressure reading on gauge when wheels are against stops. *CAUTION - Do not hold wheel against stop for more than 30 seconds.* Fluid pressure with wheels against stops should be as listed in table below. Close gauge valve and check pressure If pressure is less than minimum, pump is faulty If pressure increases but does not reach maximum, inspect pump, control valve, and power cylinder If pressure is within limits and steering gear does not function properly, trouble is in control valve or power cylinder

BENDIX POWER STEERING CONTROL VALVE ASSEMBLY (TYPICAL)

Pump Pressure Specifications

Car Model	Pump Pressure
Comet & Falcon	750-900 lbs
Fairlane & Meteor	750-900 lbs.
Galaxie 6 Cyl.	700-900 lbs.
Galaxie & Monterey Other V8	950-1100 lbs.
Studebaker	850 lbs
Checker	700-900 lbs.

ADJUSTMENT

Pump Belt

See "Belt Adjustment" on individual car model pages.

Control Valve Centering Spring Adjustment

Remove two centering spring cap attaching screws and lockwashers and remove cap Tighten adjusting nut securely, then back it off ¼ turn. Install centering spring cap and tighten screws securely

Speed-Up Control Adjustment

See "Carburetor" on individual car model pages.

TROUBLE SHOOTING

Binding Or Poor Recovery

Check pitman arm ball stud in control valve sleeve which may be rubbing against the sleeve slot If this is the case, the roll pin may be missing Check idler arm bushings Check all steering gear adjustments Check operation of control valve and for interference between sector shaft arm and dust shield. Check control valve travel regulator stop adjustment. Check for damaged control valve sleeve and socket tube

Hard Steering

Check to see that pump drive belt is properly tightened and that pump pressure is correct. If pump pressure is within specifications, check control valve spool centering spring adjustment Check control valve spool for free movement and repair as necessary.

Excessive Freeplay

Check steering gear worm and roller mesh adjustment Check for excessive clearance between steering arm ball stud and ball stud seats. If ball stud is loose in seat, adjust control valve travel regulator stop Check control valve centering spring adjustment

Noisy Pump

Check pump belt tension. Noise may also result if correct hose is not used

Steering Chatter

A loose pump belt can cause chatter against the wheel stops during an extremely sharp turn Check belt

(Continu d)

BENDIX LINKAGE TYPE POWER STEERING (Cont.)

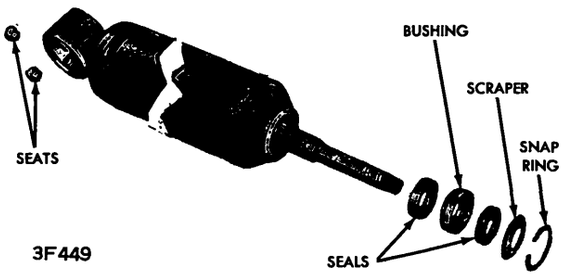
tension. Check for looseness in idler arm connection, and check idler arm bushings. Check power cylinder rod insulators for looseness.

Loss Of Power Assist

Check for damaged or broken hoses. Check pump pressure (see above). Disconnect power cylinder piston rod from idler arm bracket and operate piston by hand to check for resistance of movement. If piston moves freely with little or no resistance, internal parts of power piston are damaged. Replace cylinder. Check adjustment of valve spool centering spring. Check operation of control valve check valve.

REMOVAL & INSTALLATION

Control Valve



Comet & Falcon (Removal) - Disconnect lines at valve and allow to drain, then remove clamp securing valve-to-power cylinder lines. Remove bolts securing control valve to steering rod, then remove nut securing valve to pitman arm. Use Tool 3290-B to press ball stud out of pitman arm.

Installation - Place the stud in a straight vertical position, then measure from center of stud (parallel to bolt mounting surface), to center of first bolt hole (see illustration). This distance should be 4 1/4-4 3/8" (4 5/16"). If not within these limits, adjust by loosening valve sleeve clamp and turning bracket which attaches valve to steering arm rod. Complete the installation by reversing removal procedures.

Ford Galaxie, Fairlane, Mercury Monterey, Meteor (Removal) - Disconnect fluid line fittings at control valve, and drain fluid from lines. Turn front wheels to left and right several times to force all fluid from system, then loosen clamping nut and bolt at right-hand end of sleeve. Remove roll pin from steering arm-to-idler arm rod through slot in the sleeve, then loosen control valve ball stud nut. Use Tool 3290-B to press stud out of sector shaft arm. Turn front wheels fully to left and unthread control valve from steering arm-to-idler arm rod.

Installation - Thread valve onto steering arm-to-idler arm rod until about four threads are still visible on rod, then position ball stud in sector shaft arm. Measure distance between center of grease plug in sleeve and center of stud at inner end of left hand spindle connecting rod (see illustrations). The distance should be 4 3/16" (Fairlane & Meteor), 11 15/16" (Ford Galaxie & Mercury Monterey). If necessary to adjust, disconnect ball stud from sector shaft and turn valve on steering arm-to-idler arm rod to increase or decrease distance. Align hole in steering arm-to-idler arm rod with slot near the end of valve sleeve. Install roll pin in rod hole and tighten valve sleeve clamp bolt. Complete installation by reversing removal procedures.

Stud back r (Removal) - Disconnect hoses at pump body, pump reservoir, and power cylinder. Drain fluid from hoses, then remove hose retaining clips. Disconnect reach rod from steering bellcrank, then remove pitman arm from steering gear shaft with Puller J-5664. Remove control valve, reach rod, and hoses from car as an assembly. *NOTE - B for removing valve ass mbly from reach rod, clean assembly to remove dirt and grease from valve body, then loosen clamp on actuator sleeve and screw valve assembly off reach rod, counting the turns required to unscrew valve from reach rod. Record the number of turns for use at installation to maintain proper reach rod length.*

POWER CYLINDER SEAL ASSEMBLY (TYPICAL)

Installation - Reverse removal procedure and note the following: Screw control valve assembly into reach rod the same number of turns as noted at time of removal. Set front wheels in straight ahead position and center steering wheel so gear is on "high" point, then slip pitman arm on steering gear shaft, aligning marks on arm and shaft. Check and adjust length of reach rod so reach rod ball stud will slip into the bellcrank without moving wheels from straight ahead position. *NOTE - If adjustment is necessary, the valve assembly unit must be removed from car.* With actuator sleeve clamp loose, rotate reach rod clockwise until reach rod ball stud bottoms. In a like manner, rotate valve assembly clockwise until pitman arm stud bottoms in actuator sleeve window, then tighten actuator sleeve clamp securely. Rotate locked reach rod and valve assembly counterclockwise until ball stud is located in center of actuator window.

Power Cylinder

Removal - Disconnect hoses from power cylinder and fasten open ends of hoses in a raised position to prevent fluid draining out. Move front wheels to right and left several times to force all fluid from cylinder. Disconnect piston rod from idler arm bracket, but do not remove at this time. Remove locknut holding cylinder on mounting stud in steering arm-to-idler arm bracket and remove outer washer, bushing, and cylinder from stud. Remove inner bushing, and washer from stud, and pull inner insulator and washer from piston rod.

Inspection - Clean exterior of cylinder and piston rod. Inspect cylinder and rod for damage or wear and check for leakage. If parts are damaged or piston is leaking internally, replace the entire power cylinder assembly. Inspect mounting bushings and insulators for wear or damage and replace as necessary.

Seal Replacement - Except for cylinder seal and hose seat replacement, the power cylinder should be replaced as a complete assembly if faulty. To install seal, proceed as follows: Clamp cylinder in a vise and remove snap ring from end of cylinder, being careful not to distort or crack the cylinder. Pull piston rod out as far as it will go, then apply compressed air to other end of cylinder to blow out the seals. Lubricate a new inner seal with automatic transmission fluid, then place seal, bushing, outer seal, and scraper on piston rod. Push piston all the way in, then using a deep socket slightly smaller than cylinder opening, tap parts into cylinder and replace snap ring. Replace hose seats in same manner as for control valve (see above).

Installation - Reverse removal procedure and tighten bolts to specifications.

OVERHAUL

Control Valve

Disassembly - **1)** Clean exterior of unit, then remove centering spring cap from valve body. *CAUTION - When holding control valve, use a soft jawed vise, and clamp the valve only around the sleeve flange to prevent damage to unit.*

2) Remove nut from end of valve spool bolt and remove washers, spacer, centering spring, adapter, and bushing from bolt and valve housing. Remove bolts holding valve housing and sleeve together and separate housing from sleeve, then remove plug from sleeve.

3) Push valve spool out of centering spring end of valve housing and remove seal from spool. Remove spacer, bushing, and seal from sleeve end of valve housing. Drive the stop pin out of travel regulator stop with a punch. *NOTE - Pull head of valve spool tightly against travel regulator stop before driving pin out of stop.*

4) Turn travel regulator stop counterclockwise in sleeve to remove the stop. Remove valve spool bolt, spacer, and rubber washer from travel regulator stop, and remove rubber boot and clamp from valve sleeve.

5) Slide the bumper, spring, and ball stud seat out of valve sleeve, and remove ball stud socket from sleeve. After removing return port hose seat, remove return port relief valve. Remove spring plug and "O" ring, then remove reaction limiting valve (if so equipped).

Inspection - Wash all parts in solvent and blow dry with air or use a lint free cloth to dry parts. Inspect valve seals and bushings for wear or damage, and replace as necessary. Inspect valve housing and spool carefully for burrs or scoring. Remove any burrs with crocus cloth. *NOTE - Do not round off sharp edges of spool with crocus cloth.* If spool or inside of housing is badly scored, replace complete valve assembly. With housing completely dry, insert valve into housing. The spool should fall freely of its own weight in housing. Inspect mating surfaces of ball stud and socket and the valve sleeve for wear or damage. Remove minor burrs and scores with crocus cloth. Check fit of socket in sleeve.

Tube Seat Replacement - If hose seat is worn or damaged, tap the existing hole in seat with a starting tap of suitable size, then place a nut and large flat washer on a bolt (same size as tap). Insert bolt in tube seat and use the nut as a puller to remove seat. Place a new hose seat in port and thread a bolt of suitable size into the port. Tighten bolt enough to bottom seat in port.

Reassembly - **1)** Coat all parts with automatic transmission fluid before installing. If unit is equipped with a reaction limiting valve, install valve, spring, and plug.

2) Insert one of the ball stud seats (flat end first) into ball stud socket, then insert threaded end of ball stud

(Continued)

BENDIX LINKAGE TYPE POWER STEERING (C nt.)

into socket Place socket into control valve sleeve so threaded end of ball stud can be pulled out through slot in sleeve. Place other ball stud seat, spring, and bumper in the socket, then install and securely tighten travel regulator stop and valve spool bolt *NOTE - Make sure lubrication fitting is tight and does not bind on ball stud socket.*

3) Insert valve spool in housing so that large end of spool will be at centering spring end of housing Rotate spool while inserting it in housing Move spool toward centering spring end of housing, then place small seal, bushing, and spacer in sleeve end of housing Press valve spool against inner lip of seal and, at same time, guide lip of seal over spool with a small screwdriver *NOTE - Do not nick or scratch seal or spool.* Place seal end of bushing on a flat surface so that seal, bushing, and spacer are at bottom end, then push down on valve spool until it stops

4) Carefully install spool seal and bushing in centering spring end of housing around large end of spool Press spool against inner lip of seal and guide lip over spool with a small screwdriver. *NOTE - Do not nick or scratch seal or spool.* Slide spool back and forth in housing and check for free movement.

5) Place valve sleeve on housing so that ball stud is on same side of housing as ports for the two power cylinder hoses, then install two bolts in sleeve and tighten to specifications (see below) Place adapter on centering spring end of housing and install bushing, washers, spacers, and centering spring on valve spool bolt Compress spring and install nut Tighten nut securely, then loosen it not more than ¼ turn

6) Move ball stud back and forth in sleeve slot to check spool for free movement. *NOTE - The spool should travel approximately .060" in each direction from center.* Install centering spring cap on housing and tighten attaching bolts to specifications Install nut on ball stud so that valve can be positioned in a vise with the vise clamping the nut and holding valve securely, then push forward on cap end of valve to check valve spool for free movement Turn valve around in vise, and push forward and check for free movement

Tightening Specifications (Exc. Studebaker)

Location	Ft. Lbs. Torque
Power Cyl to Steering Rod (Galaxie & Monterey)	50-60
Power Cyl to Steering Rod (Others)	35-47

POWER STEERING PUMP

Eaton Roller Type - *See 1958 Final Data, Page 398, or later Manual edition.*

MONROE LINKAGE TYPE POWER STEERING

Rambler, All Series (1963)

Description

Linkage type of same design used on previous models

Lubrication

Check fluid level in reservoir every 4,000 miles. Fluid level should be maintained at a point half way up filler neck (6 Cyl. Models); 1" below top of reservoir (V8 Models) Use Automatic Transmission Fluid Type "A" (Suffix "A").

Bleeding System

With front wheels raised off floor, make several power operated turns from stop to stop. Do not hold steering wheel at maximum turn position for any length of time. Recheck fluid level in reservoir.

ADJUSTMENT

Valve Spool Centering

NOTE - This adjustment is preset at the factory and is not ordinarily required in service.

Turn piston rod end plug OUT and turn pitman arm end plug IN the SAME amount (approximately ½ turn at a time) to correct for hard turn to **left**; easy turn to **right**; poor recovery from **right** turn; or car wanders to **right**. Turn piston rod end plug IN and turn pitman arm end plug OUT the SAME amount (approximately ½ turn at a time) to correct for hard turn to **right**; easy turn to **left**; poor recovery from **left** turn; or car wanders to **left**. After final adjustment, tighten end plugs to 50 ft. lbs.

TROUBLE SHOOTING

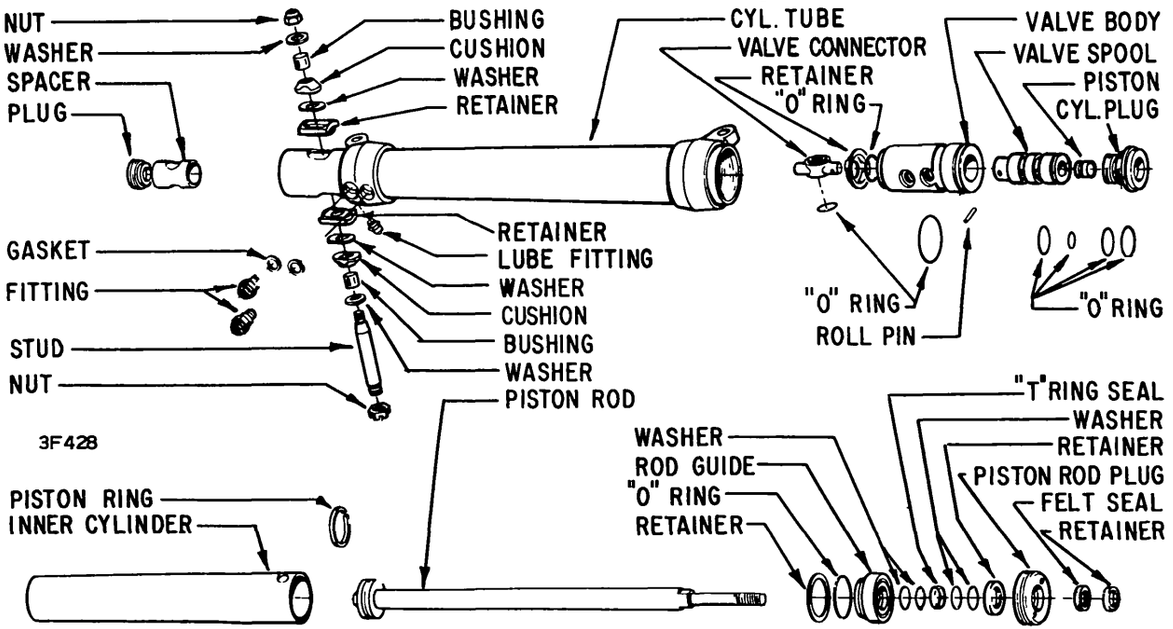
See 1959 Final Data, Page 390, or later Manual edition.

OVERHAUL

S 1959 Final Data, Page 390, or later Manual edition.

POWER STEERING PUMP

American & Classic



Slipper Type - *See 1960 Final Data, Page 403, or later Manual edition.*

Ambassador

Eaton Roller Type - *See 1958 Final Data, Page 398, or later Manual edition.*

PRESSURE TEST

With correct fluid level in reservoir, install oil pressure gauge J-5548-A in main oil line at control valve assembly, then start engine and bring oil to normal operating temperature. Turn wheels against curbing or other obstacle and hold tension on wheel. Oil pressure should be 800-900 lbs (Eaton Roller Type Pump); 850-950 lbs. (Slipper Type Pump) Turn wheel in opposite direction and note pressure. If there is a variation between right and left turn, internal leakage is indicated If pressure is low, stop engine and disconnect cylinder and valve assembly from gauge and cap pressure line. Restart engine and note pressure If pressure is low (belt tension correct), trouble exists in pump. *CAUTION - Do not hold wheels at maximum pressure longer than is necessary to obtain a steady pressure reading.*

MONROE POWER STEERING CONTROL VALVE & CYLINDER ASSEMBLY

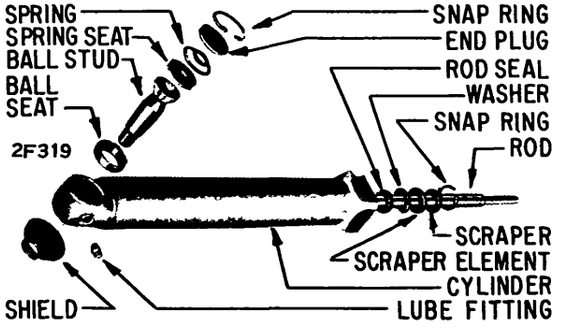
CHEVROLET & PONTIAC LINKAGE TYPE POWER STEERING

Ch vr l t Pass. Cars (1963)
Ch vy II (1963)
P ntiac T mp st (1963)

DESCRIPTION

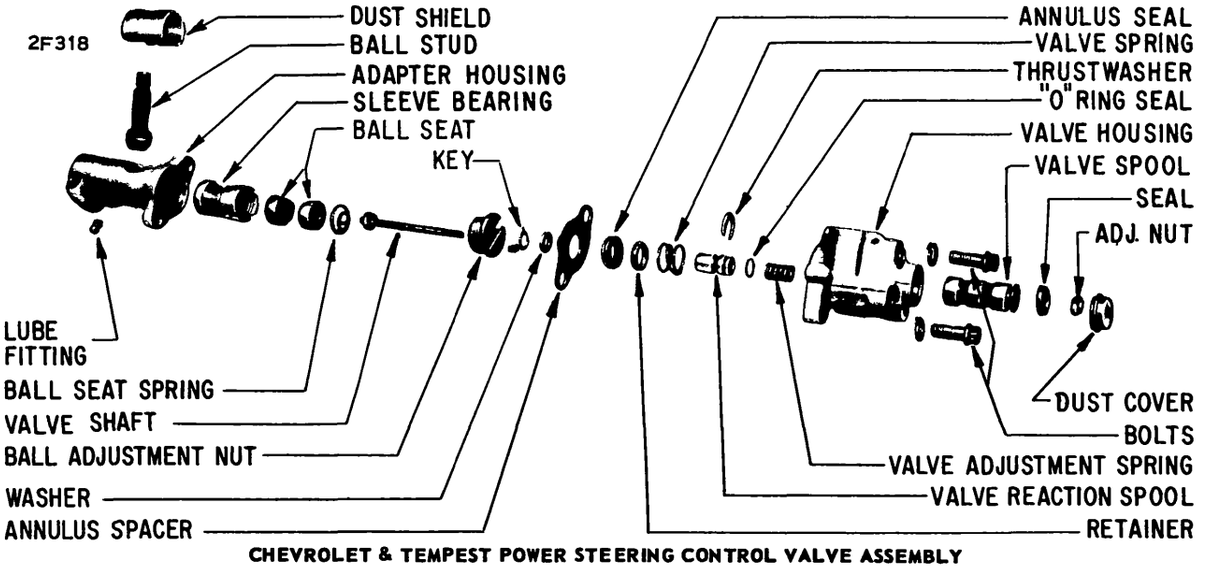
Linkage type with power cylinder mounted between steering relay rod and bracket on frame side rail. Control valve assembly is mounted on left side relay rod and is operated by pitman arm acting on spool valve assembly. The control valve assembly is adjustable to provide greater uniformity of operation and faster response. Power steering pump is mounted on engine and is driven by a belt from crankshaft pulley.

ADJUSTMENT



Pump Belt

See "B lt Adjustm nt" on individual car model pages.



Control Valve Balancing

NOTE - If a hard steering effort is required (in one directi n), balance contr l valve as follows:

Balancing - With car on a hoist, engine running, and power cylinder rod disconnected from car frame bracket, piston rod will be either fully retracted or fully extended (if control valve is out of balance). If piston remains retracted, turn adjusting nut clockwise until piston rod begins to move outward, then turn nut counterclockwise until nut begins to move in. Now turn nut to exactly one-half the rotation needed to change direction of piston rod movement. If rod remains extended, reverse the procedure. *CAUTION - Do not turn nut back and forth more than is abs lutely necessary to balance valv .* With valve properly balanced, it should be possible to move rod in and out manually. Stop engine and connect cylinder rod to frame bracket, then restart engine. If front wheels (still on hoist) do not turn in either direction from center, the valve is properly balanced. Install dust cap.

POWER CYLINDER ASSEMBLY

CHEVROLET & TEMPEST POWER STEERING CONTROL VALVE ASSEMBLY

LUBRICATION

Checking Fluid Level

With oil at normal operating temperature, check fluid level on dipstick. Fill to indicated level with Automatic Transmission Fluid.

Bleeding Hydraulic System

Fill reservoir to proper level and let oil remain undisturbed for at least two minutes, then start engine and run at idle speed for two minutes. Add oil if necessary, then raise front of car so wheels are off ground. Increase engine speed to 1500 RPM (Chevrolet); 1000 RPM (Pontiac), and turn wheels to full right and full left, contacting stops lightly. Lower car and turn wheels right and left on ground. Check oil level and refill as necessary. Continue this procedure as long as

TESTING

Fluid Pressure

Install a suitable pressure gauge (Tool J-5176) between pump and pressure line at pump. With gauge valve open and engine at idle speed, turn wheels against stops a few times to bring power steering fluid to 150-170°F. With wheels against stops, pressure should not be less than that specified in table below. If pressure is less, slowly close valve and check for pressure increase. Pressure will increase if pump is in good condition. If pressure does not increase with valve closed, pump is faulty. *CAUTION - Do not hold gauge valve closed for more than 15 seconds.* After removing gauge, bleed hydraulic system.

Fluid Pressure Specifications

Car Model	ℂ Pump Pressur
Chevrolet Pass. Cars	870-1000 lbs.
Chevy II	870-1000 lbs.
Pontiac Tempest	ℭ 775 lbs.

ℂ - Engine at idle speed and hydraulic fluid at 150-170°F.
ℭ - Minimum pressure.

REMOVAL, INSTALLATION & OVERHAUL

See 1960 Final Data, Page 398, or later Manual edition.

POWER STEERING PUMP

Saginaw Vane Type (Integral Reservoir) - *See 1961 Final Data, Page 390, or later Manual edition.*

FORD TRUCK LINKAGE TYPE POWER STEERING

Ford Trucks, Except Tilt Cab Models (1963)①
Ford Trucks, Tilt Cab Models (1963)②

① - Power cylinder used.
② - Booster (rack & piston) cylinder used.

►CHANGES, CAUTIONS, CORRECTIONS

►*EXCESSIVE STEERING EFFORT AT LOW TEMPERATURE CORRECTION ("C" SERIES TRUCKS):* Disconnect pitman arm from steering drag link and reduce the mesh preload to zero (*see "Gemmer Worm & Roller" manual steering gear*). Measure worm preload at steering wheel with a suitable scale and then adjust mesh preload to a scale reading of 2 25-4 50 lbs above worm preload. Check pitman arm to make sure there is no lash.

Description

Linkage type with control valve assembly connected directly to steering gear pitman arm. On Tilt Cab Models, the operating cylinder is a "rack & piston" booster type cylinder connected between pitman arm and wheel spindle. On the other models, the hydraulic power cylinder is anchored to left side of front axle with the piston rod connected to center of spindle connecting rod. The only basic differences between the two units is in the construction of the operating cylinders.

Lubrication

Check fluid level in reservoir every 4,000 miles (On highway); 500 miles (Off highway). Fluid should be at "F" mark on dipstick or within 1" of top of reservoir. Check fluid at normal operating temperature. Use only Automatic Transmission Fluid Type "A" (Suffix "A").

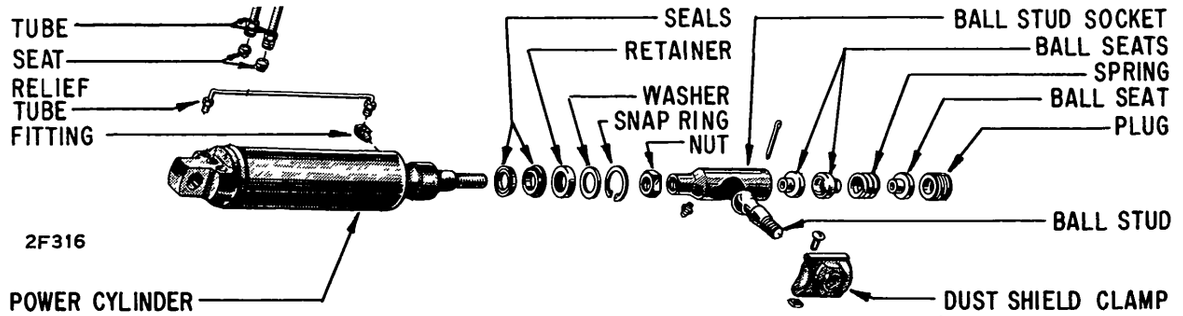
Bleeding System

With fluid at normal operating temperature and engine idling at 1000 RPM, turn steering wheel to full right and left several times.

ADJUSTMENT

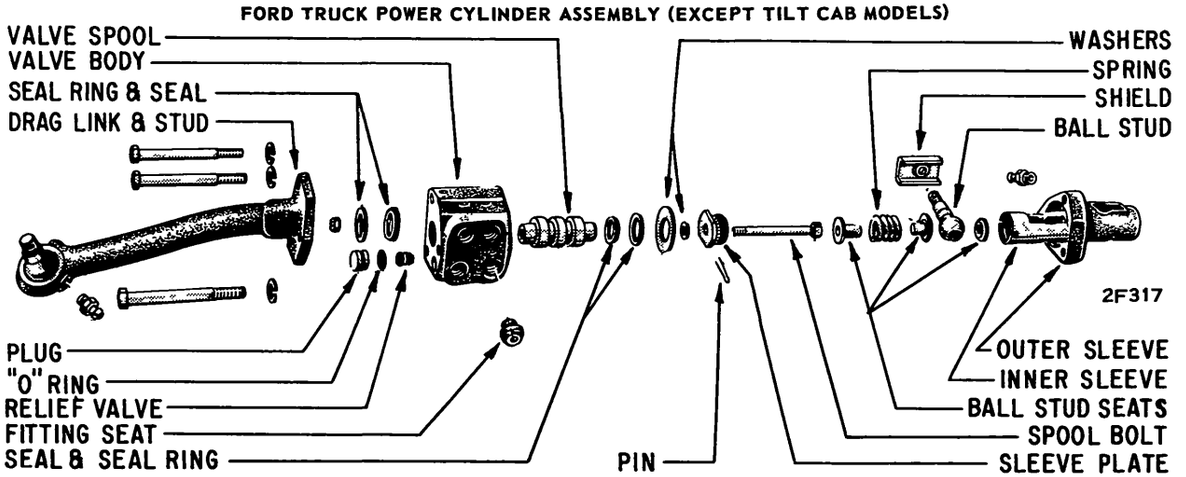
Pump Belt

Belt deflection should be ¼" midway between pulleys. Tighten belt adjusting bolt to 30-35 ft. lbs.



TESTING

Turning Effort



With front wheels properly aligned and tire pressure correct, set brakes, then proceed as follows: Bring fluid to normal operating temperature by turning wheels to right and left several times. Hook a spring scale to rim of steering wheel and measure pull required to turn wheel at least one complete turn in both directions. Pull should be 35-65 lbs. depending on size of truck.

Pump Pr ssure

Install a suitable pressure gauge between pump hose and pump outlet with gauge between pump and shut-off valve. Run engine at idle speed (with shut-off valve open) for two minutes to normalize oil temperature. With wheels in straight ahead position, pressure should be no higher than 700 lbs. with engine at 900 RPM. If pressure is higher, check for faulty pump or control valve. Increase engine speed to 3000 RPM and slowly close shut-off valve of gauge. Pressure should be about 1150 lbs. when shut-off valve is fully closed. *NOTE - Do not leave shut-off valve closed for more than 15 seconds.* If the pressure is less, then the pump is faulty. If pressure increases but does not reach maximum, inspect pump, control valve, and power cylinder. If pressure is within limits and power steering is not satisfactory, trouble is in control valve or power cylinder.

FORD TRUCK POWER CYLINDER ASSEMBLY (EXCEPT TILT CAB MODELS)

FORD TRUCK POWER STEERING CONTROL VALVE ASSEMBLY (TILT CAB MODELS)

TROUBLE SHOOTING

See 1959 Final Data, Page 391, or later Manual edition.

REMOVAL & INSTALLATION

P wer Steering Pump

Remove as much fluid as possible through reservoir filler opening. Disconnect pressure hose from pump and return line from cooler and tie hoses to prevent fluid loss. *NOTE - It is easier on Tilt Cab models to disconnect hoses after pump is removed from mounting bracket.* Loosen adjusting bracket bolt and pivot bolt and remove pump belt. Remove pump attaching screws and remove pump and reservoir as an assembly. To install, reverse removal procedure.

Control Valve

Except Tilt Cab Models - Drain reservoir, disconnect hoses from control valve, then disconnect ball studs and piston mounting bolts. Remove control valve. To install, reverse removal procedure.

Tilt Cab Models - Remove hoses from valve, then disconnect studs from idler arm and sector shaft arm. Remove control valve and drag link. To install, reverse removal procedure.

OVERHAUL

See 1959 Final Data, Page 391, or later Manual dition.

POWER STEERING PUMP

Eat n R II r Typ - *See 1958 Final Data, Page 398, or later Manual edition.*

CHRYSLER CORP. CONSTANT CONTROL POWER STEERING

Chrysler & Imperial (1963)
Dodge & Dodge Dart (1963)
Plymouth (1963)
Valiant (1963)

Description

Design and operation are similar to previous models except for the addition of a new seal at outer end of sector shaft.

Lubrication

Check fluid level in reservoir every 6 months. Fluid level should be at bottom of filler neck when fluid is cold, and should be about half way up filler neck when fluid is hot. **Use Mopar Power Steering Fluid, Part No. 2084329.** DO NOT OVERFILL.

Bleeding System

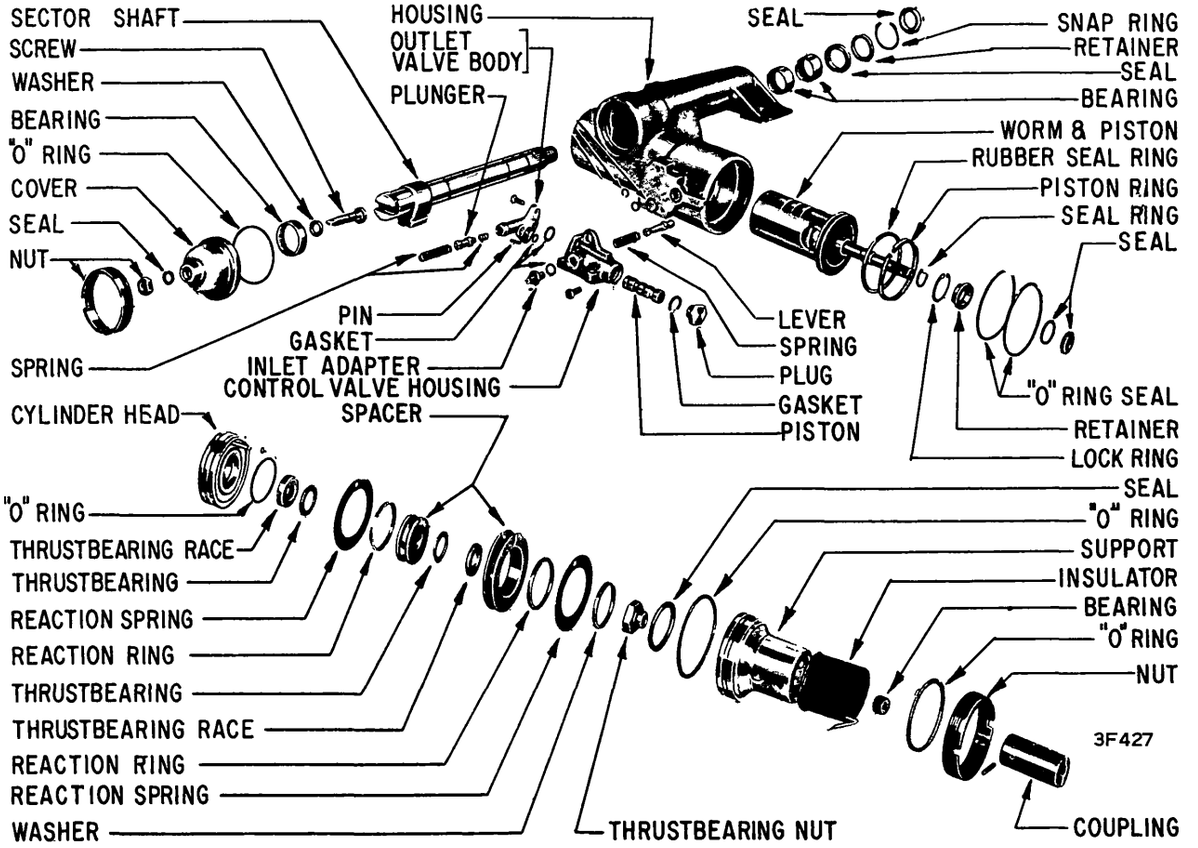
All air can be expelled from unit by turning steering wheel several times from full right to full left and back again.

TESTING

Hydraulic Pressure

Disconnect steering gear pressure hose at pump and connect test hose C-3388 with proper adapters between pump and gauge C-3309-B with shut-off valve between gauge and steering gear. With engine idling at 500 RPM and oil at normal operating temperature (150°-170°F., checked with thermometer in reservoir), pressure should be less than 100 lbs. Increase engine speed to 1000 RPM and slowly close shut-off valve. Pump pressure should be as indicated in table below. *CAUTION - Do not hold valve closed for more than a few seconds.* If pressure is in excess of maximum, relief valve is faulty or pump has wrong relief valve. If pressure less than minimum, relief valve or pump is defective.

Power Steering Pump Pressure



Car Model	Lbs. Pressure
Imperial	1150-1300
Chrysler & Dodge 880	1000-1100
Dodge Dart	650-750
Dodge & Plymouth	850-950
Valiant	650-750

ADJUSTMENT

Gear Shaft Preload

NOTE - This adjustment can be made with the steering gear installed in car.

1) With gear cross shaft in center position, loosen adjusting screw locknut ½ turn and tighten adjusting screw until backlash just disappears. Tighten adjusting screw 1¼ turns from this position and while holding adjusting screw, tighten the locknut. *NOTE - This is a temporary adjustment to insure that piston rack and teeth on sector are in full alignment.* Operate steering gear manually for a minimum of 180° from center in each direction (measured at worm shaft).

CHRYSLER CORP. "CONSTANT CONTROL" POWER STEERING (TYPICAL)

2) Start engine and run at idle speed, then with hydraulic power to steering gear unit and with gear shaft on center (±2°), readjust gear shaft backlash as follows: Loosen locknut and back off adjusting screw until backlash is evident, then retighten adjusting screw until backlash just disappears. Continue to tighten 3/8 to 1/2 turn from this position and tighten the locknut to 50 ft. lbs. while retaining the setting.

Control Valve

NOTE - This adjustment is made with steering gear assembly on the bench (connected to power steering pump and car with suitable hoses). Bleed system and fill reservoir.

1) With gear shaft properly adjusted (see above), turn worm shaft at least one full turn off center, then measure the torque required to turn worm shaft through center position at approximately 2 RPM. This torque should not exceed 25 ft. lbs. in either direction or vary more than 5 ft. lbs. from right to left.

2) To adjust torque, slightly loosen valve body attaching screws and gently tap on back pressure valve body attaching screws to move valve body up on steering housing or tap on end of plug to move valve body down on housing. *NOTE - If torque is greater to the right, move control valve body DOWN. If torque is greater to the left, move valve body UP.* After adjusting, tighten valve body attaching screws to 15 ft. lbs.

Check For Binding

1) After overhaul, with steering gear unit off car, place unit near the full turn position in either direction, then install a torque wrench on steering gear cross shaft. Hold steering gear worm shaft and turn cross shaft with torque wrench until 50 ft. lbs. torque is obtained. Release worm shaft and maintain a constant steady pull on cross shaft (turning cross shaft slowly). If the torque does not drop to 25 ft. lbs. maximum as the piston passes through center position, check for excessive internal drag, binding valve lever, binding valve spool, or cross shaft adjustment too tight.

2) With unit under power, but no load, the torque required to rotate worm shaft through an included angle of 180° (90° either side of center) should be 6-9 inch pounds.

Pump Belt

See individual car model pages for complete details.

(Continued)

CHRYSLER CORP. CONSTANT CONTROL POWER STEERING (Cont.)

TROUBLE SHOOTING

See 1958 Final Data, Page 387, or later Manual edition.

REMOVAL & INSTALLATION

Steering Wheel & Horn Button

See separate "Steering Wheel, Horn Button & Direction Signal Removal" in this section.

Steering Gear

Chrysler, Imperial & Dodge 880 - Remove steering wheel (see above), direction switch and column cover. Remove direction signal switch and wiring from steering shaft. Remove retainer snap ring from groove in steering tube at top of bearing with Tool C-3229. Remove jacket tube shield for access to column tube clamp and remove screw attaching steering jacket tube clamp at instrument panel and remove clamp. Raise carpet and move rubber grommet up on jacket column, then remove screws attaching rubber dust boot to firewall. On Imperial, remove floor inspection panel. Loosen jacket tube clamp at steering gear housing. Remove cotter key and nut at drag link and disconnect link from steering arm, then remove steering arm nut and washer at steering gear shaft. Slide Tool C-3646 up on steering arm and place shoe of puller behind steering arm and pull steering arm from gear shaft. *CAUTION - Do not remove steering arm by prying with a lever or striking with a hammer.* Disconnect hydraulic brake line at master cylinder and brake tee and remove line, then disconnect pressure and return hoses at steering gear (fasten ends of hoses above reservoir oil level and cap all openings). Slide jacket tube up and off steering gear through driver's compartment, then remove jacket tube upper spring and retainer. Remove steering shaft coupling pin, two plastic inserts, horn ground strap, rubber insulator and upper steering tube. Remove gear housing-to-frame bolts, washers, and alignment wedge. Slide steering gear upwards and toward rear of car and at the same time raise lower end of gear and remove gear from engine compartment (Chrysler), from driver's compartment (Imperial).

Installation - Reverse removal procedures and note the following: Make sure there is at least 1/16" clearance between bottom face of jacket tube clamp and column support spanner nut. With steering gear completely installed (gear assembly-to-frame bolts not tightened), tighten front upper and lower gear housing-to-frame attaching bolts to 20 ft. lbs. Install wedge over rear bolt between housing and frame so that tapered surfaces match, tapping it lightly into place, then tighten all three gear attaching bolts to 50 ft. lbs.

Dodge & Dodge Dart - Remove pitman arm with a suitable puller, then disconnect hydraulic lines from steering gear valve (cap all openings). Remove bolts attaching steering gear to frame, then remove the bolt coupling clamp at upper end of steering worm shaft. Support steering gear and tap coupling assembly upward with a mallet until it is free of worm shaft splines, then lift gear assembly through engine compartment (6 Cyl.); from underneath car (V8 Eng.). *NOTE - On 318" Eng. models it is necessary to remove starter motor.*

Installation - Reverse removal procedure and note the following: Place steering wheel for straight ahead position and steering gear in the center "high" spot. Tighten steering gear attaching bolts to 50 ft. lbs. Tighten pitman arm nut to 150 ft. lbs.

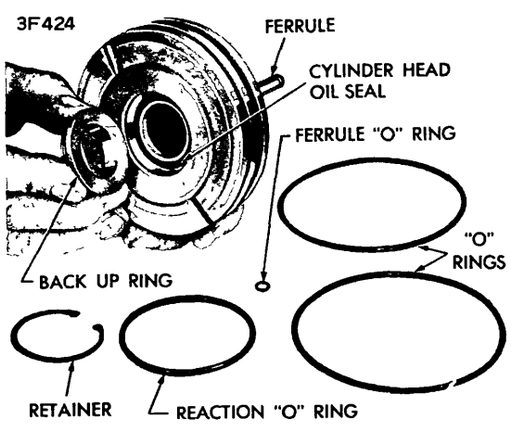
Plymouth & Valiant - Disconnect ground cable from battery, then remove steering column coupling to worm shaft clamp bolt. Loosen jacket tube clamp screw at instrument panel, then tap coupling assembly upward and lift steering column end jacket assembly up and off end of worm shaft. *NOTE - Tie jacket tube to protect it against damage during steering gear removal.* Disconnect hydraulic hoses from steering gear valve (cap all openings), then raise car and remove pitman arm from cross shaft using a suitable puller. Remove steering gear attaching bolts and remove steering gear through engine compartment (6 Cyl.); from underneath car (V8 Eng.). *NOTE - On 318" Eng. models it is necessary to remov starter motor.*

Installation - Reverse removal procedure and note the following: Place steering wheel for straight ahead position and steering gear in the center "high" spot. Tighten steering gear attaching bolts to 50 ft. lbs, and coupling clamp bolt to 30 ft. lbs. *NOTE - Position steering jacket assembly so st ering shaft is centered at midpoint of up and down travel (a 3/16" gauge hole is provided in steering column shaft). When the dimension from top of coupling to centerline of gauge hole is 13/16", the coupling is centered in its travel.* Tighten pitman arm nut to 150 ft. lbs.

OVERHAUL

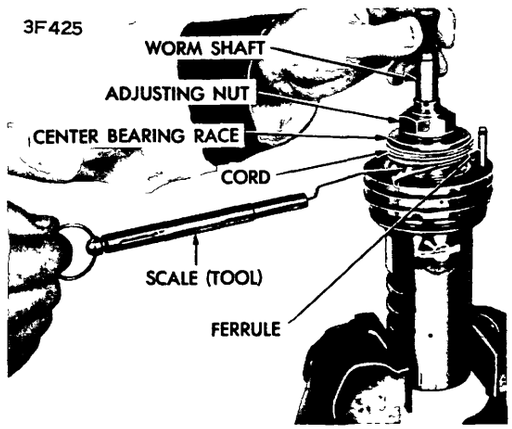
See 1958 Final Data, Page 387, or later Manual edition and note the following:

Power Train



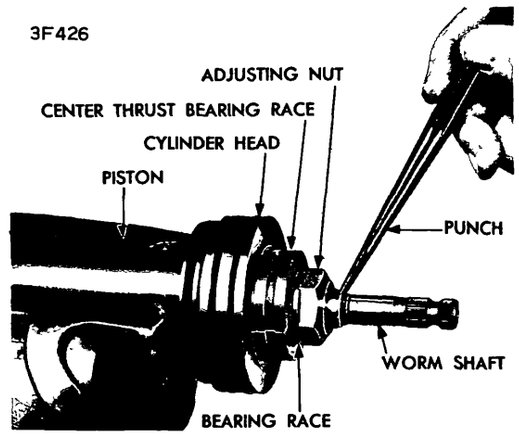
Reassembly - *NOTE - Discard all "O" rings and s als, using new ones lubricated with petrolatum wh n reassembling.*

1) If power piston ring was removed, slide a new piston ring into place in piston groove, then place piston and ring assembly in Tool C-3676 with lower part of piston and ring resting on land of tool .Press down on piston to bottom ring in groove, forcing open ends of ring out for ease in locking ring. Ring should be positioned with ring hooks in line with ball guide.



2) Place piston assembly in a vertical position (worm shaft upward) in a soft jawed vise. Inspect oil passages in ferrule of cylinder head for obstruction and the lands for burrs, then install "O" rings in grooves on cylinder head. Install cylinder head oil seal, back-up ring and retainer, making sure retainer is seated in groove. Install lower reaction seal in cylinder head groove. *NOTE - The small "O" ring for ferrule groove should be installed after worm shaft b aring preload has been established; otherwise, the ring will be damaged by reaction springs and center bearing spacer.*

3) Slide cylinder head assembly (ferrule up) on worm shaft and test worm shaft seal ring to make sure gap is



(Continued)

CYLINDER HEAD OIL SEALS

MEASURING CENTER BEARING PRELOAD

STAKING ADJUSTING NUT

CHRYSLER CORP. CONSTANT CONTROL POWER STEERING (Cont.)

closed to avoid damaging the ring as cylinder head moves against piston flange Lubricate with steering gear fluid and install lower thrust bearing race (thick), lower thrust bearing, lower reaction spring (with small hole over ferrule), lower reaction ring (flange up so ring protrudes through reaction spring and contacts reaction "O" ring in cylinder head), center bearing race, upper thrust bearing, upper thrust bearing race (thin) Start thrust bearing adjusting nut

4) Turn worm shaft counterclockwise one-half turn and hold in this position with splined nut (Tool C-3637) and socket wrench, then tighten the adjusting nut to 50 ft lbs to prestretch worm shaft threads *NOTE - If worm shaft is turned more than one half turn, cylinder head oil seal retainer will clear oil seal on the worm shaft Always position the worm shaft oil seal ring before bottoming the cylinder head against piston top flange to avoid damaging the oil seal*

5) Loosen adjusting nut and place several rounds of cord around center bearing race Make a loop in one end of cord and hook loop to a distributor breaker arm spring scale Retighten worm bearing adjusting nut while pulling on distributor scale to rotate bearing race If adjusting nut is tightened properly, the reading on scale should be 8-16 ounces (12 ounces preferred while turning) Stake upper part of worm shaft adjusting nut into knurled edge of shaft *NOTE - Place a support under the adjusting nut when staking nut* Hold a ¼" flat end punch on center line of worm shaft end at a slight angle to nut flange and strike punch a sharp blow with a hammer, then recheck bearing preload *NOTE - If adjusting nut moved during staking, correct by striking nut a glancing blow in direction required to regain proper preload*

6) After rechecking for proper preload, stake the nut at three more locations 90° apart around upper part of nut To test total staking tighten nut to 20 ft lbs in either direction If nut does not move, staking is satisfactory Recheck preload adjustment to make sure adjustment has not changed

7) Position center bearing spacer assembly over center bearing race, engaging dowel pin on center bearing spacer in slot in race and slot in center spacer entered over the cylinder head ferrule *NOTE - This will align valve pivot lever hole in center bearing race with valve pivot lever hole in center bearing spacer assembly* Install upper reaction pressure spring over reaction ring with cylinder head ferrule through hole in reaction spring Install worm balancing ring (without flange) inside upper reaction ring Lubricate ferrule "O" ring with petrolatum and install it in groove on cylinder ferrule

8) If oil seal was removed from worm shaft support, install a new seal with Tool C-3650, driving seal in (lip upward) until tool bottoms on support Lubricate and install reaction seal ring in groove in face of worm shaft support with flat side of seal out, then install "O" ring in groove on support Slide worm shaft support and arbor, Tool C-3929 over worm shaft, carefully engaging cylinder head ferrule and "O" ring, making sure reaction rings enter circular groove in support With support properly positioned, remove tool arbor Align parts on power train so valve pivot lever hole in center of bearing spacer assembly is 90° counterclockwise from piston rack teeth Complete the reassembly of steering gear as indicated in 1958 Final Data, or later Manual edition

Tightening Specifications

Steering Valve End Plug - 25 ft lbs
Valve Body Attaching Bolts - 10-15 ft lbs

POWER STEERING PUMP

Chrysler, Dodge, Plymouth, Valiant "Slipper" Type - *See 1960 Final Data, Page 403, or later Manual edition*

SAGINAW ROTARY VALVE POWER STEERING

Buick (1963)
Buick Special (1963)
Cadillac (1963)
Chevrolet Truck (1963)
Oldsmobile (1963)
Oldsmobile F-85 (1963)
Pontiac (Exc. T mpest) (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 BUICK (EXC SPECIAL) STEERING GEAR NOISE ON A TURN CORRECTION* This noise, which sounds like a dry or defective idler arm or ball stud, may be caused by the steering gear housing contacting the car frame If lower end of housing is contacting frame side rail, install a 15/32" I D x 1 1/8" O D x 1/8" thick flat washer between gear housing and frame at each of the three attaching bolt locations Tighten attaching bolts to 70 ft lbs

►*1963 CADILLAC POWER STEERING PUMP MOAN CORRECTION* On early cars (before Eng No 137944), a moaning noise in the pump which is noticeable at approximately 900 RPM or 20-25 MPH, can be corrected by installing a new type pressure hose, Part No 5692602 Later cars have the new hose installed during production

Description

All M d ls (Exc. Ch v. Truck) - Same design as previous models.

Ch vr l t Truck - The control valve assembly of this linkage type power steering unit is located directly on the steering gear and is similar to the control valve assembly used on cars with "integral" type power steering Service procedures for control valve are the same as for other models For steering gear overhaul procedures *see "Saginaw Ball Bearing Worm & Nut" on Page 397, 1962 Final*

Lubrication

Check fluid level in power steering pump reservoir every 1000 miles (Chevrolet Truck), every spring and fall (Cadillac), every 6000 miles (Buick, Oldsmobile & Pontiac) Steering gear and fluid must be at normal operating temperature If necessary, add automatic transmission fluid to bring level to proper mark on reservoir filler neck If steering gear and fluid are cold, bring fluid level to lower end of filler neck *NOTE - On Chevrolet trucks, also check lubricant level in gear box and add "Multi-Purpose" lubricant as necessary*

CHECKING & ADJUSTMENT (ON CAR)

Pump Belt

See individual car model pages for power steering pump belt adjustment procedure

STEERING GEAR ADJUSTMENT NOTE - Disconnect pitman arm at intermediate arm or drag link (Buick Special, Cadillac, Oldsmobile F-85 & Pontiac) Remove pitman arm from shaft (Buick, Exc Special, Oldsmobile, Exc F-85), then proceed as follows

Buick & Buick Special

NOTE - Thrust bearing preload and ball nut preload can be adjusted only with steering gear removed from car

Thrust Bearing Preload (Checking) - Turn steering wheel to full right or left position, then attach an inch pound torque wrench to steering wheel retaining nut The torque required to turn wheel steadily for 1/8 turn of steering wheel from either full right or full left position should be 2 11 inch pounds (this is the combined preload at thrust bearing and drag at the valve assembly) *NOTE - Torqu wrench reading should be close to minimum specificati n on a gear that has been in use On a new gear, the reading will be higher*

Adjustment (With Gear Out of Car) - Loosen adjuster plug locknut and back off adjuster plug approximately 1/8 turn Install an inch pound torque wrench on stub shaft and turn shaft to 1/2 turn from either full right or full left position Slowly rotate wrench in an arc 60° in both directions several times and record highest reading (this is valve drag) Tighten adjuster plug until thrust b-aring preload is 1-3 inch pounds greater than valve drag reading Total valve drag and thrust bearing preload should not exceed 11 inch pounds

Worm & Ball Preload (Checking) - Turn steering wheel ½-¾ turn off "high point" (center position of gear) *NOTE - It is not necessary to back off pitman shaft lash adjuster to check ball preload when gear is positioned as indicated* Check torque required to turn wheel This reading should be 1-5 inch pounds higher than reading obtained for "Thrust Bearing Preload" above If this reading is not within specifications it will be necessary to remove and disassemble the gear and install larger or small balls in rack *See "Overhaul" below.*

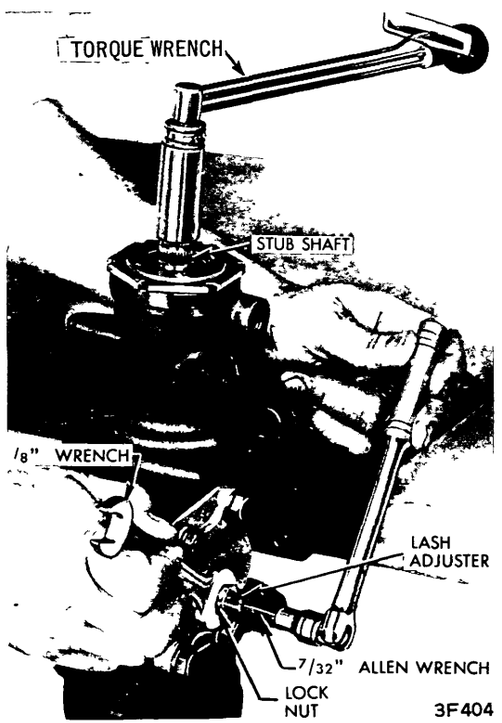
Pitman Shaft Endplay (Checking & Adjustment) - Turn steering wheel through "high point" (center position of gear) The reading should be 4-8 inch pounds higher than reading obtained for "Worm & Ball Preload" above To adjust, loosen lash adjuster locknut and turn lash adjuster as necessary

Cadillac

NOTE - Thrust bearing preload and pitman shaft endplay adjustm nts can b made with st ring g ar installed in car

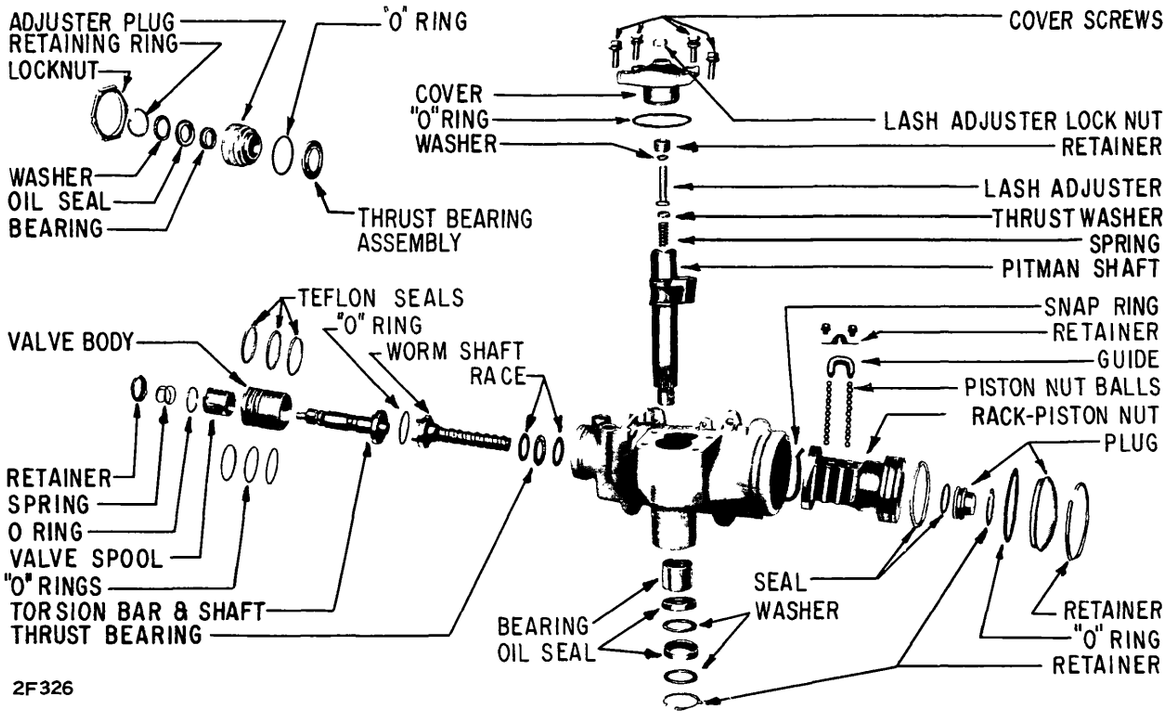
Thrust B aring Pr l ad (Ch cking) - Attach a spring scale to rim of steering wheel and pull at right angle to

(Continued)



SAGINAW ROTARY VALVE POWER STEERING (C nt.)

wheel with steering gear two turns off the "high point" (center position of gear). The force required to pull wheel through an arc not exceeding 1" should be 4-12 ounces.



Adjustment - Back out adjuster plug 1/8 turn and recheck (record this reading). Tighten adjuster plug to obtain 2-6 ounces greater scale reading than that obtained with adjuster plug backed out and tighten locknut.

Worm & Ball Preload (Checking) - Turn steering wheel 1/2 turn off center position and measure pull required to move steering wheel at this position. This reading should be 2-8 ounces greater than that obtained for "Thrust Bearing Preload". If preload is incorrect it will be necessary to disassemble steering gear and replace worm shaft balls. See "Overhaul" below.

Pitman Shaft Endplay (Checking & Adjustment) - With wheel "on center", measure pull required to turn wheel through an arc not exceeding 3". This reading should be 8-20 ounces greater than that obtained for "Worm & Ball Preload", but should not exceed 36 ounces total scale reading. *NOTE - On new steering gears the total pull may be as high as 40 ounces, however, after approximately 100 miles of operation, seating of seals and ball bearings will bring the gear within specifications.* To adjust, loosen locknut and turn adjusting screw to obtain an "on center" preload of 16-18 ounces greater than that obtained for "Worm & Ball Preload" but still not more than 36 ounces total scale reading.

PITMAN SHAFT ENDPLAY ADJUSTMENT

SAGINAW ROTARY VALVE POWER STEERING GEAR ASSEMBLY (EXPLODED)

Chevrolet Truck

NOTE - The following adjustments are to be made with steering gear off vehicle.

Thrust Bearing Preload (Checking & Adjustment) - Install an inch pound torque wrench on stub shaft, then loosen adjuster plug slightly and check torque required to turn shaft from either full right or full left position and record this reading (valve assembly drag). Tighten adjuster plug to obtain a reading of 1-3 inch pounds greater than that obtained with adjuster plug slightly loose.

Pitman Shaft Endplay (Checking & Adjustment) - With steering gear on "high point" (center position of gear), rotate shaft through an arc of 20° and adjust lash adjuster screw to obtain a torque reading of 4-8 inch pounds greater than that obtained for "Thrust Bearing Preload" (total of valve assembly drag and bearing preload). *NOTE - The total reading with all adjustments completed, should not exceed 16 inch pounds.*

Oldsmobile & Olds F-85

NOTE - Pitman shaft endplay is the only adjustment that can be made with steering gear installed on car.

Pitman Shaft Endplay (Checking & Adjustment) - Install an inch pound torque wrench on steering gear nut, then loosen pitman shaft adjusting screw locknut and turn adjusting screw out to the limit of its travel. With steering gear on "high point" (center position of gear), check the combined thrust bearing and ball preload by turning steering shaft through the center of travel and record the highest reading. Tighten pitman shaft adjusting screw until the torque wrench reading is 4-8 inch pounds (Exc. F-85); 3-6 inch pounds (F-85) higher than the previous reading on steering shaft *NOTE* - The total over-center preload should not exceed 16 inch pounds (Exc. F-85); 14 inch pounds (F-85). Hold pitman shaft adjusting screw and tighten the locknut. Recheck the adjustment

Thrust Bearing Preload and Worm and Ball Nut Preload (Checking & Adjustment) - See "Overhaul" below.

Pontiac

NOTE - Thrust bearing preload and pitman shaft endplay adjustments can be made with steering gear installed in car.

Thrust Bearing Preload (Ch cking) - With an inch pound torque wrench installed on steering wheel retaining nut and steering wheel turned one full turn off "high point" (center position of gear), check the torque required to turn wheel to right and to left. Total both readings and take one-half of this total as average torque. If torque is not within limits of 3-5 inch pounds, adjust as follows:

Adjustment - Loosen adjuster plug locknut and turn adjuster plug to obtain correct adjustment.

(Continued)

SAGINAW ROTARY VALVE POWER STEERING (C nt.)

W rm & Ball Pr load (Checking) - Turn steering wheel 1/2 turn oft center position and measure torque required to move steering wheel This torque should be 1/2-5 inch pounds greater than that obtained for "Thrust Bearing Preload" above If preload is incorrect it will be necessary to disassemble steering gear and replace worm shaft balls See "Overhaul" below

Pitman Shaft Endplay (Checking & Adjusting) - With wheel on 'high point" (center position of gear), check torque required to move steering wheel through a slight arc This reading should be 4-8 inch pounds greater than that obtained for "Worm & Ball Preload" but should not exceed 18 inch pounds To adjust, loosen pitman shaft gear lash adjuster locknut and use a 7/32 Allen wrench to turn adjuster Tighten locknut to 20-30 ft lbs *NOTE - The final adjustment should be made in a clockwise or downward direction*

TESTING

Pump Pressure

Install a suitable pressure gauge between pump and pressure line at pump, then with gauge valve open and engine at idle speed, turn wheels against stops to bring fluid to operating temperature With wheels against stops, pressure should not be less than specified in table below If pressure is below specifications, slowly close valve and check for pressure increase Pressure will increase if pump is in good condition If pressure does not increase with valve closed, pump is faulty *CAUTION - Do not hold gauge valve closed for more than 15 seconds* After removing gauge, bleed hydraulic system

Pump Pressure Specifications

Car Model	Minimum Pump Pressure
Buick	1000 lbs
Buick Special	750 lbs
Cadillac	1100 lbs
Chevrolet Trucks	950 lbs
Oldsmobile (Exc F-85)	1100 lbs
Oldsmobile F-85	800 lbs
Pontiac	900 lbs

Bleeding Hydraulic System

Fill reservoir to proper level and let oil remain undisturbed for at least two minutes, then run engine at idle speed for a very short time and add necessary oil to maintain proper level in reservoir Raise front wheels off floor, increase engine speed to approximately 1500 RPM and turn wheels to full right and left, contacting stops lightly Lower car to floor and turn wheels right and left Check oil level and refill as necessary Continue this procedure as long as necessary to bleed all air from system

TROUBLE SHOOTING

See 1959 Final Data, Page 379, or later Manual edition for trouble shooting procedures

REMOVAL & INSTALLATION

St ering Whe i & Horn Button

See separate "Steering Wheel, Horn Button & Directional Signal Removal" in this section

Steering Gear

Buick (Exc. Sp cial) - Removal - Disconnect hydraulic lines from steering gear and elevate ends higher than pump reservoir Remove lower coupling flange pinch bolts, then remove pitman arm from steering shaft Remove steering gear attaching bolts and remove steering gear

Installation - Reverse removal procedure and tighten steering gear attaching bolts to 70 ft lbs , coupling pinch bolt to 20-35 ft lbs and pitman arm nut to 100 ft lbs

Buick Special - Removal - *NOTE - Pitman arm cannot be removed or installed with steering gear installed on crossmember If pitman arm is to be removed from gear, loosen pitman arm nut before disconnecting gear from crossmember When installing pitman arm, do not tighten nut until gear is installed on crossmember* Remove lower coupling clamp bolt, then loosen clamp retaining mast jacket to floor pan cover and 'U" bolt retaining jacket to instrument panel Pull mast jacket assembly up far enough so lower coupling can be removed from worm shaft Raise car and disconnect pitman arm from intermediate shaft, then loosen pitman arm nut (Tool J-8987) Remove steering gear-to-crossmember attaching bolts and remove gear assembly from car *NOTE - Do not remove pitman arm nut or pitman arm unless pitman shaft assembly or seal is to be replaced*

Installation - Reverse removal procedure and note the following Tighten gear-to-crossmember bolts to 55 ft lbs and pitman arm nut to 165 ft lbs Tighten ball stud nut to 45 ft lbs and tighten to nearest slot then install cotter pin Tighten coupling pinch bolt to 30 ft lbs and make sure there is at least 1/16" clearance between coupling and adjuster plug *NOTE - Mast jacket must be positioned so that lower coupling pins are extending through steering shaft flange 1/16-1/8"*

Cadillac - Removal - Disconnect hoses at pump and cap all openings Raise car and disconnect pitman arm from shaft using a suitable puller (Tool J-9172) Remove screw holding flexible coupling to upper steering shaft, then remove steering gear-to-frame side rail and remove gear assembly from car

Installation - Reverse removal procedure and tighten steering gear attaching bolts to 45 ft lbs , coupling screw to 30 ft lbs , and pitman arm nut to 115 ft lbs

Chevrolet Truck - Removal - Disconnect steering shaft from lower coupling, then remove hoses from valve Remove pitman arm, using a suitable puller, and remove steering gear from frame side rail

Installation - Reverse removal procedure

Oldsmobile (Exc. F-85) - Removal - Remove coupling flange hub bolt, then disconnect hoses from pump and cap all openings Raise car and remove pitman arm from shaft using a suitable puller (Tool J-5504-B) Remove steering gear-to-frame attaching bolts, then permit lower shaft to slide free of coupling flange and remove the gear with hoses attached

Installation - Reverse removal procedure and note the following Before installing gear, coat gear mounting pads with fibre grease and make sure alignment pin enters hole in frame side rail as gear is installed Tighten coupling flange bolt to 20-25 ft lbs , making sure there is 040" clearance between coupling hub and steering gear upper seal Tighten steering gear-to-frame bolts to 60-80 ft lbs and pitman shaft nut to 90-120 ft lbs

Oldsmobile F-85 - R moval - Remove coupling flange attaching nuts and lockwashers, then disconnect hoses from pump and gear and cap all openings Disconnect horn wire from harness and remove steering wheel *(see separate "Steering Wheel, Horn Button & Directional Signal Removal" in this section)* Pull horn contact plate up out of recess in actuator assembly enough to provide clearance for removal of upper bearing-to-actuator retaining clip Use a small screwdriver and pry clip out of actuator housing, then pull steering shaft up out of steering column and block the shaft up about 2" Raise car and disconnect pitman arm from relay rod, then remove steering gear-to-front suspension crossmember and remove steering gear

Installation - Reverse removal procedure and note the following Coat steering gear mounting pads with fibre lubricant and tighten attaching nuts to 45-60 ft lbs Tighten pitman arm nut to 150-180 ft lbs

Pontiac - Removal - Disconnect pressure and return hoses from housing, then disconnect pitman arm from shaft using a suitable puller (Tool J-5504) Scribe a mark on steering shaft worm and worm shaft flange and disconnect gear lower flange from steering shaft Remove gear housing-to-frame bolts noting number and location of gear-to-frame shims (if any), and remove steering gear

Installation - Reverse removal procedure and note the following Install any shims that were removed in their original positions between housing and frame Tighten gear-to frame bolts to 70-90 ft lbs , and pitman shaft nut to 110-140 ft lbs Tighten flange attaching bolts to 10-20 ft lbs

OVERHAUL

See 1959 Final Data, Page 379, or later Manual edition and note the following.

Adjuster Plug

Removal - Loosen and remove adjuster plug locknut, then remove adjuster plug with a suitable spanner wrench (Tool J-7624)

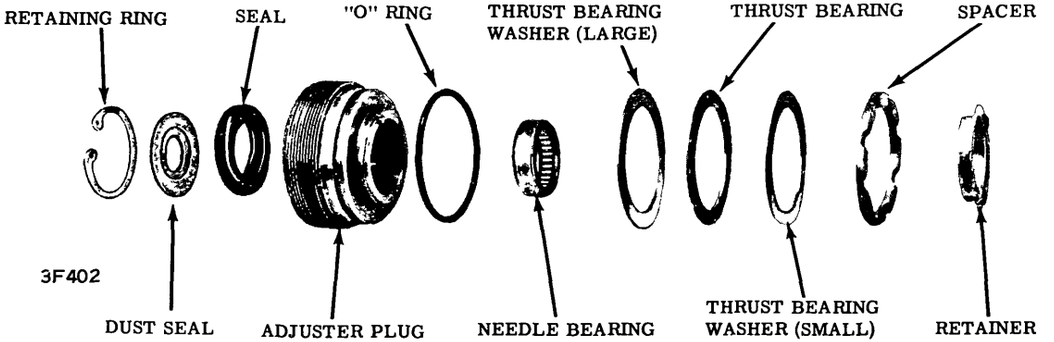
Disassembly - Remove thrust bearing retainer with screwdriver, being careful not to score needle bearing bore, and discard retainer Remove thrust bearing spacer, thrust bearing, and thrust bearing races Remove adjuster plug "O" ring and discard, then stud shaft seal retaining snap ring On Chevrolet Truck, remove seal back-up washer On other cars, remove and discard dust shield On all models, remove stub shaft seal by prying it out with a screwdriver Discard seal Inspect needle bearing in adjuster plug, and if rollers are broken or pitted, remove needle bearing from adjuster plug by pressing from thrust bearing end using Bearing & Seal Remover,Tool J-6221(Buick & Cadillac), J-5254 (Oldsmobile), J-5188 (Pontiac), J-8524-2 & J-7079-2 (Chevrolet Truck) Discard the bearing

Inspection - Inspect thrust bearing spacer for cracks, then inspect thrust bearing rollers for wear, pitting, scoring or cracking If any of these conditions are found, replace both thrust bearing races and check thrust bearing spacer Inspect thrust bearing races for wear, pitting, scoring, cracking, or brinelling Replace if necessary

(Continued)

SAGINAW ROTARY VALVE POWER STEERING (Cont.)

Reassembly - Install needle bearing by pressing from thrust end of adjuster plug against identification end of bearing (use same tool used for removal). *NOTE - End of bearing must be flush with bottom surface of stub shaft seal bore.* Lubricate stub shaft seal with automatic transmission fluid, then on Chevrolet Trucks, install seal and back-up washer. On other models, install seal with spring in seal toward adjuster plug. *NOTE - Use Tool J-8524-1 (Chev. Truck), J-5188 (Buick, Cadillac, Pontiac), J-5254 (Oldsmobile) to install seal far enough in plug to provide clearance for retaining ring (Chev. Truck), dust seal and retaining ring (Other models).* On Chevrolet Truck, install retaining ring. On other models, install dust shield with lip upward in plug, then install retaining ring. Lubricate "O" ring seal with petroleum jelly and install on adjuster plug. Assemble large diameter thrust bearing race, thrust bearing, small thrust race, and thrust bearing spacer on adjusting plug. Press bearing retainer into needle bearing bore with a brass or wooden dowell *NOTE - Radial position of dimples is not important.*



Installation - Install adjuster plug in end of housing just far enough to make certain that all parts are properly seated in gear housing. Back adjuster plug off 1/8 turn and measure valve assembly drag using a torque wrench, then adjust thrust bearing preload (see "Adjustment" above). Complete the installation by reversing removal procedure.

Valve Assembly

Chevrolet Trucks - Overhaul procedures are the same as for other models with power steering except that free length of valve spool spring .760-.790". The control valve housing forms steering gear top cover, and can be removed by removing attaching bolts. *For steering gear overhaul, see "Saginaw Ball Bearing Worm & Nut" (Manual Steering Gear).*

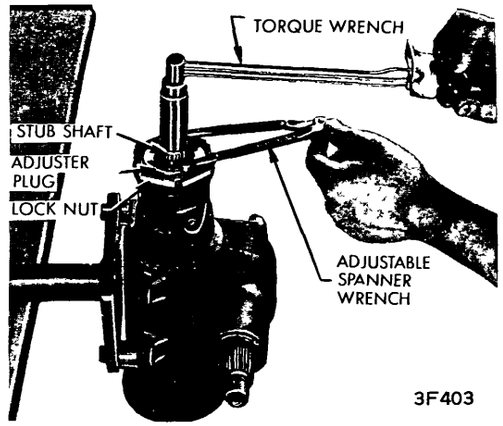
RACK PISTON REMOVAL NOTE - Some models have a snap ring in upper end of piston bore in housing. Do not remove this snap ring during disassembly.

RACK PISTON END PLUG REMOVAL NOTE - This plug may take on a permanent set as it is tightened to 50 ft. lbs. torque. Plug could break if not handled carefully. To remove, rap plug with a plastic or rawhide mallet to unseat threads.

ADJUSTER PLUG ASSEMBLY (TYPICAL)

POWER CYLINDER (CHEVROLET TRUCK)

Disassembly



NOTE - The only repair to make in the field on the power cylinder is to replace piston rod seals. Before removing piston rod seal parts from rod end of power cylinder, clean the exposed portion of seal cavity with clean solvent. Remove snap ring, then to dislodge scraper, washer, dust seal, seal back-up washer and "U" cup seal, use air pressure applied to cylinder port (right hand port looking down) while closing off the left hand port. Remove seal parts from rod.

Inspection

Clean all parts in solvent and dry with compressed air. *NOTE - Do not use waste to wipe off spool or inside bore of valve housing.* Protect spool edges and bore of valve housing from damage during disassembly and reassembly. Inspect parts for nicks, burrs, and excessive wear. Check cylinder scraper washer for fit on piston rod. Clearance should be .001-.0035". Replace if worn.

Reassembly

Assemble open side of "U" cup seal over the rod and into bearing cavity, then install seal back-up washer, dust seal (open side out away from seal cavity), and scraper washer. Slide parts in place and lock in position on rod with snap ring.

THRUST BEARING PRELOAD ADJUSTMENT

POWER STEERING PUMP

Saginaw Vane Type (Integral Reservoir) - *See 1961 Final Data, Page 390, or later Manual edition.*

LINCOLN & THUNDERBIRD "TORSION BAR" POWER STEERING

Lincoln Continental (1963)
Ford Thunderbird (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 POWER LOSS ON RETURN FROM RIGHT OR LEFT TURN CORRECTION:* This condition may be caused by dirt or metal chips imbedded in outer diameter of the power piston teflon seal. To correct, disassemble and clean all parts and replace the teflon power piston seal.

Description

Piston type hydraulic power assist unit having a torsion bar operated control valve combined with a ball nut and worm steering gear enclosed in a single housing. Hydraulic fluid under pressure is supplied to steering gear by a positive displacement pump. Design and operation are similar to previous models.

Lubrication

Check fluid level in reservoir every 6000 miles. Fluid should be at "F" mark on dipstick .Use only Automatic Transmission Fluid Type "A" (Suffix "A").

Bleeding System

If air is in system due to low oil level in pump reservoir, or to disassembly of gear, fill pump reservoir, start engine and turn on windshield wipers. Turn steering wheel through its entire travel three or four times to allow air to escape. Recheck fluid level and add fluid as required. *CAUTION - Do not hold wheels against their stops when bleeding system.*

TESTING

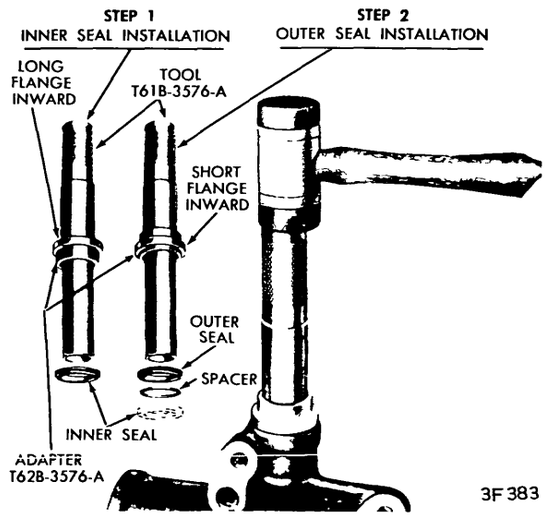
Hydraulic Pressure

Connect a pressure gauge with a hand shut-off valve in pressure line between pump and steering gear (pressure gauge must be between pump and shut-off valve). With shut-off valve fully open, allow steering fluid to come to operating temperature (cycle gear from stop to stop), then note gauge reading with wheels at full left and full right positions. Pressure should be 950-1100 lbs. (Thunderbird), 1120-1250 lbs. (Lincoln). If pressure is less than minimum, close gauge valve and note reading. *CAUTION - Do not leave valve closed for more than 15 seconds.* If pressure is still less than minimum, pump is faulty. If pressure increases, steering gear is at fault.

(Continued)

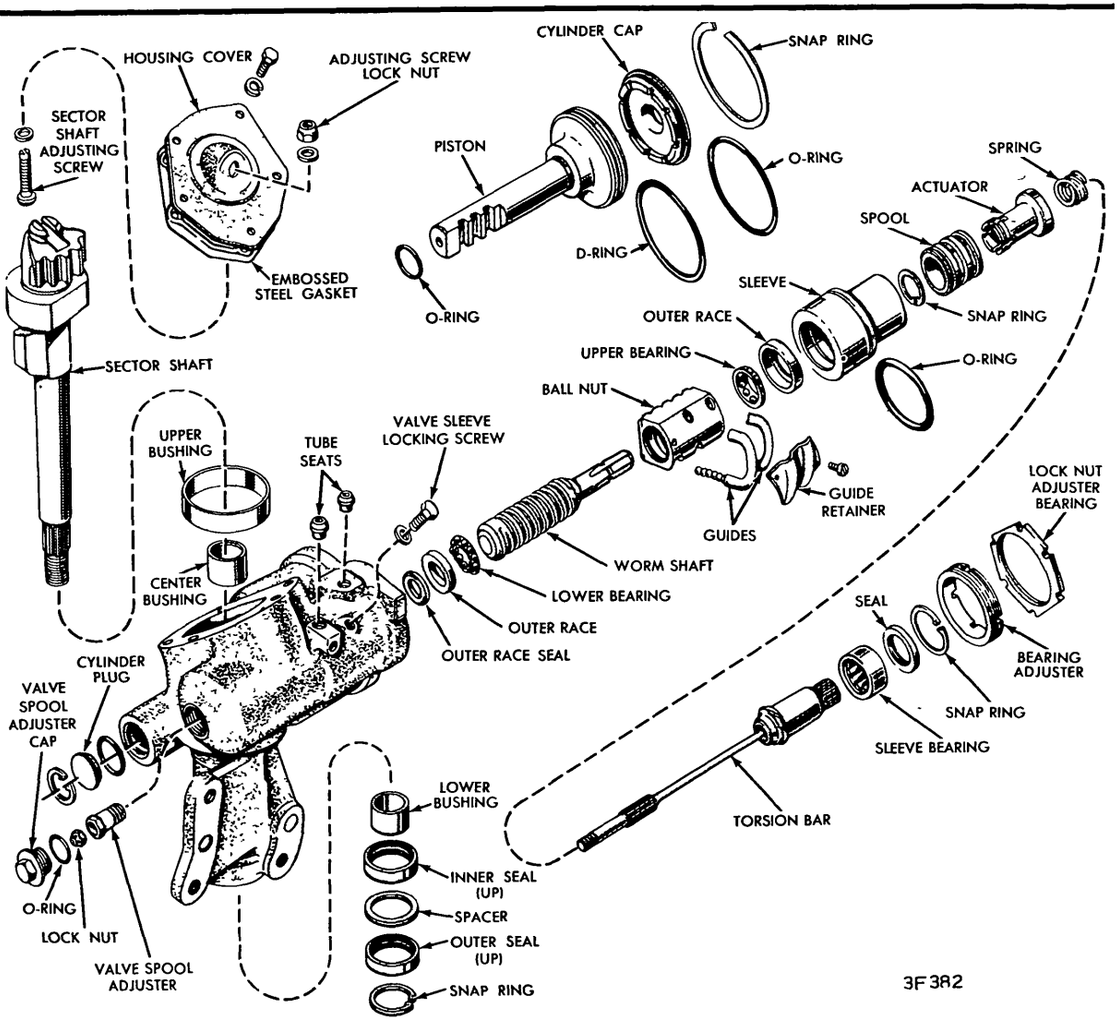
LINCOLN & THUNDERBIRD "TORSION BAR" POWER STEERING (Cont.)

ADJUSTMENT



Pump B lt

Lincoln C ntin ntal - No adjustment. Pump is mounted on engine front cover and driven by engine crankshaft. **Thunderbird** - Use a suitable belt tension gauge and adjust pump mounting bracket for 120-150 lbs. (new belt); 90-120 lbs. (used belt) tension. *NOTE - A used belt is one that has been operated for 15 minutes or longer.*



Worm B aring Prel ad & S ctor Mesh

Linc ln Continental - **1)** Disconnect pitman arm from sector shaft and drain fluid from steering gear housing and from reservoir. *NOTE - Fluid in system will cause incorrect readings.* Remove steering wheel and horn ring, then lock two nuts on steering shaft and install an inch pound torque wrench to upper nut. Turn shaft to either stop, back off ¼ turn and measure torque required to keep shaft turning at a constant rate for one complete turn This is worm bearing preload and should be 5-8 inch pounds To adjust, loosen worm bearing adjuster locknut and turn adjuster as necessary. *NOTE - Always make final adjustment in tightening direction.*

2) Turn steering shaft so ball nut and sector are centered (approximately 2 turns from either stop), then note torque required to turn shaft through center position. Torque should be 8-10 inch pounds greater than for worm bearing preload (above) To adjust, loosen sector shaft adjusting screw locknut and turn adjusting screw as necessary.

SECTOR SHAFT OIL SEAL REMOVAL & INSTALLATION TOOLS

1963 LINCOLN & THUNDERBIRD "TORSION BAR" POWER STEERING GEAR ASSEMBLY

Thunderbird - **1)** Drain fluid from reservoir and steering gear, then remove pitman arm from sector shaft and steering wheel from steering shaft. Install an inch pound torque wrench on steering shaft and measure torque required to move steering shaft approximately 20° from one of the stop positions. If torque is not within limits of 6-8 inch pounds, loosen adjuster locknut and turn bearing adjuster to obtain proper reading. Tighten adjuster locknut and recheck preload.

2) Turn steering shaft to right or left hand stop, then back off 1¾ turns to place steering gear in center position. Rotate steering gear to left hand stop, then using the torque wrench. back off at a constant rate and read the torque at the exact center of steering gear travel. Rotate gear to right hand stop and take a reading in the opposite direction *NOTE - If two slightly different readings are obtained, the larger should be recorded as the "on-center" meshload.* If total "on-center" meshload is not within limits of 15-17 inch pounds, loosen sector adjuster locknut and turn adjuster screw for proper adjustment. Tighten locknut and recheck meshload.

Valve Spool Centering

All Models - **1)** Place steering gear on a bench near fender and insert a 3/8" drive, 3" extension into flexible coupling and retain with setscrew (Lincoln) On Thunderbird, install an 11/16" 12 point socket on input shaft. Remove adjuster cap and install a 7/16" midget socket and a 9/16" offset box wrench on adjuster. Connect a pressure gauge between pressure line from pump and inlet port of steering gear. On

(Continued)

LINCOLN & THUNDERBIRD "TORSION BAR" POWER STEERING (Cont.)

Lincoln, disconnect return line from windshield wiper control valve lower connection and attach line to outlet side of gear On Thunderbird, disconnect power steering hose insulator retainer and connect the return hose from pump reservoir to outlet port of gear assembly On all models, make sure shut-off valve on gauge is fully open

2) Start engine and bring gear housing to operating temperature (cycle from stop to stop), then check and add fluid as necessary With the torque wrench on input shaft, rotate gear to left hand stop, adding sufficient torque to torque wrench to simultaneously obtain a reading of 300 lbs on pressure gauge Repeat this operation on right hand side The torque required to obtain a gauge reading of 300 lbs in both directions should not differ more than 3 lbs To adjust loosen adjuster locknut and turn the adjuster in direction of low reading *NOTE - Only a slight movement of adjuster is required to move the valve spool* After adjusting, recheck the torque in both directions

TROUBLE SHOOTING

See 1958 Final Data, Page 390, or later Manual edition

REMOVAL & INSTALLATION

Steering Wheel & Horn Button

See separate "Steering Wheel, Horn Button & Direction Signal Removal" in this section

Steering Gear

Linc In Contin ntal - Disconnect hoses from steering gear and tie hoses higher than reservoir Raise car and remove transmission linkage splash shield Remove left exhaust manifold-to resonator pipe, then remove pitman arm from sector shaft Remove transmission linkage rods from equalizer shaft and force shaft outward Loosen setscrews locking flexible coupling to steering shaft Remove steering gear attaching bolts and remove steering gear To install, reverse removal procedure and make sure sector shaft is centered in gear Tighten steering gear attaching bolts to 35-50 ft lbs , and pitman arm attaching nut to 100-130 ft lbs

Thunderbird - Disconnect lines from steering gear and plug all openings Remove flexible coupling retaining bolt and disconnect ground wires Raise car and remove left body strut bar, then remove pitman arm, using a suitable puller Remove steering gear attaching bolts and pull gear from steering column shaft coupling Remove lower front insulator and remove gear from car To install, reverse removal procedure and note the following Place gear in position, then install lower front insulator Tighten gear mounting bolts to 35-50 ft lbs and pitman arm nut to 110-150 ft lbs

OVERHAUL

See 1958 Final Data, Page 390, or later Manual edition and note the following

1) Two sector shaft seals and a spacer are used Remove and install as follows

R moval - Remove sector shaft oil seal retaining snap ring, then remove outer seal spacer and inner seal

Installation - Position inner sector shaft seal in housing with rubber seal lip facing inward Seat seal in housing with proper tool (see illustration) *NOTE - Long flange of the adapter should press against seal* Install metal spacer against inner seal, then position outer sector shaft seal with sealing lip facing inward against spacer Seat the seal in position with proper tool (see illustration) *NOTE Short flange of adapter should press against outer seal* Install seal retaining snap ring If outer seal has blocked off snap ring retaining groove in casting, tap tool and adapter against snap ring so that snap ring will seat in groove

2) When installing torsion bar sleeve bearing in sleeve, bearing must be pressed in so there is 095- 105" clearance between upper surface of bearing and seal seat surface of sleeve

HYDRAULIC PUMP

Lincoln Continental

See 1960 Final Data, Page 404, or later Manual edition and note the following

Pump Pressure - 1120-1250 lbs

Thunderbird

See 1958 Final Data, Page 398, or later Manual edition and note the following

Pump Pressure - 950-1100 lbs

G.M. TILT WHEEL STEERING COLUMN

Buick, Exc. Special (1963)
Cadillac (1963)
Chevrolet Belair & Impala (1963)
Oldsmobile, Exc. F-85 (1963)
Pontiac, Exc. Tempest (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 BUICK TILT WHEEL NOT LOCKING SECURELY (IN DOWNWARD POSITIONS) CORRECTION* This condition is due to the actuator lever being too long and interfering with the action of the return spring To correct, grind off 1/8" from threaded portion of lever, then re-chamfer end of lever and clean the threads When completed, threads on end of lever should be approximately 300" long

►*1963 "CHUCKLE" IN TILT WHEEL ASSEMBLY CORRECTION (ALL CARS):* Loosen clamp bolt on upper flange of flexible coupling and pull steering shaft down to take up any axial play Push upper coupling flange down towards firewall by hand and tighten clamp bolt to 25-35 ft lbs *NOTE - If the condition is not corrected by taking up all play in flexible coupling, the trouble is most likely in the spherical joint Correct as outlined below for "Noise Correction"*

►*1963 PONTIAC TILT WHEEL ASSEMBLY NOISE CORRECTION* Disassemble steering shaft assembly (see "Disassembly" below) to point where upper shaft is disconnected from lower shaft, then remove sphere from upper shaft Add shims (furnished in Service Kit No 5679661) in 005" increments as necessary to assure snug fit of spherical joint in yoke *NOTE - Average shim thickness required is 015" Add only enough shims to take out looseness Retention fingers of yoke must move freely over centering sphere* Reassemble steering shaft and column (see "Reassembly" below)

DESCRIPTION

This assembly consists of an upper and lower steering shaft with a universal joint between them providing six different angles (seven on some models) at which the steering wheel can be positioned A release lever to left of steering column allows selection of the desired angle

ADJUSTMENT

Directional Signal Switch

With turn signal lever in neutral position and steering wheel in full down position, insert a 060" locating pin through holes in bracket and switch carrier with switch carrier in neutral position Tighten control cable clamp and remove pin

DISASSEMBLY

Turn Signal & Neutral Safety Switch Removal

Remove attaching screws from mast jacket and disconnect Bowden cable by loosening clamp and removing gripper washer from switch pin, then remove directional signal switch If car is equipped with neutral safety switch and (or) back-up light switch, remove switch, then remove switch lever from shift tube

Actuator Housing Removal

1) Remove steering wheel (see separate "Steering Wheel, Horn Button & Directional Signal Removal" in this section), then with steering column in centered position, remove directional signal lever and tilt wheel release lever

2) On Buick and Pontiac, pry out horn contact from actuator On all models, install remover, Tool J-21347 (Chevrolet), J-21180 (Buick, Oldsmobile & Pontiac) inside cover, then with two sliding hammers attached to tool, alternately tap with each hammer and remove cover On Chevrolet, remove mast jacket trim cover attaching screws and slide cover forward on mast jacket On Chevrolet and Oldsmobile, pry horn contact out of actuator and remove contact and wire assembly

3) Remove upper shaft snap ring with snap ring pliers, then remove washer, collapsible spacer, rubber washer, retainer, bearing seat, inner race and bearing *NOTE - Discard collapsible spacer It must not be re-used*

4) Remove turn signal actuator yoke and detent spring, then pull actuator yoke from housing Install tilt lever and lift up so the column will go to full up position, then unhook upper ends of the two tilt return springs

(Continued)

G.M. TILT WHEEL STEERING COLUMN (Continu d)

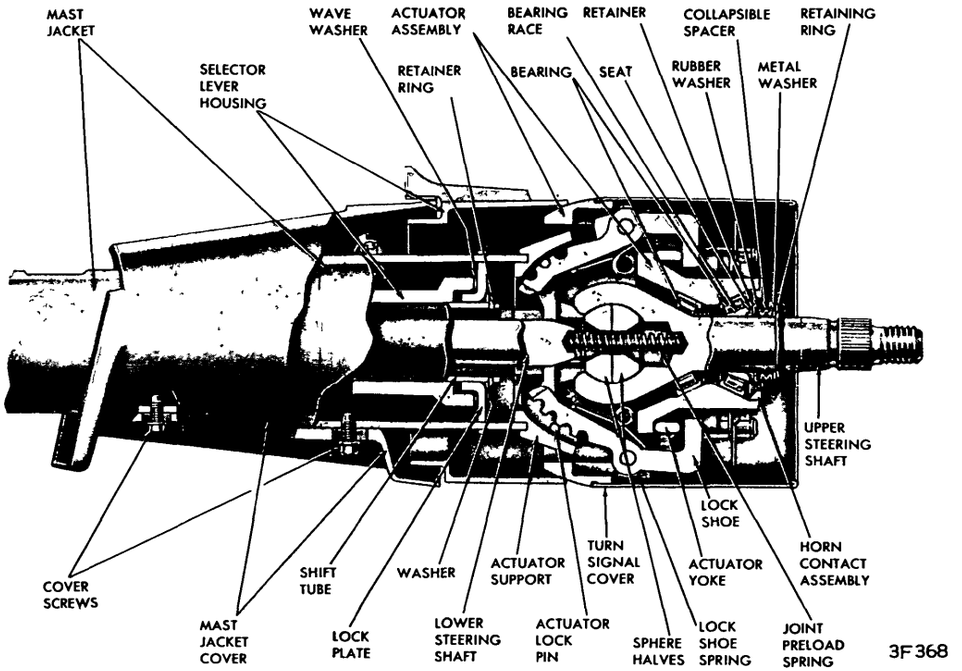
by inserting a small bladed screwdriver through upper coil and lifting upward.

5) To remove the two pivot pins, use Tool J-21179 as follows: Position tool between locating bosses on the support assembly and thread tool screw into pivot pin. Hold the screw and turn nut to remove pin. *CAUTION - Do not allow puller screw to bottom in pivot pins.*

6) Lift the tilt lever to disengage lock shoes from support locking pins and remove actuator assembly. Remove tilt return springs, then lift lower bearing from upper steering shaft, making sure that bearing does not catch on snap ring groove.

Actuator Housing Disassembly

Use a suitable support to back up the inboard side of pivot pin boss in housing, then drive upper and lower lock shoe pivot pins from housing with a 1/8" punch. Remove lock shoes and springs by pushing upper end of lock shoe through openings in actuator housing. *NOTE - The upper shoe may be identified by rubber bumper installed on it.* Remove turn signal switch control cable from turn signal bellcrank by removing retaining screw at top of housing and disconnecting from bellcrank. Remove cable through top of actuator housing.



Steering Shaft Disassembly

Remove steering shaft coupling assembly flange at lower end of steering shaft, then pull steering shaft assembly out of mast jacket. Clamp steering shaft in a brass jawed vise and move the upper shaft fully from centerline of lower shaft. Use two narrow bladed screwdrivers through coils of the spring and compress spring enough to remove the upper end from the upper seat. Move upper shaft to opposite side and allow the spring to snap out of opening between shaft and sphere, then remove spring. Turn upper shaft 90° from centerline of lower shaft and remove upper shaft and sphere from lower shaft.

Shifter Tube & Shifter Bowl R moval (If so Equipped)

All M dels (Exc. Chevr let) - Remove four support screws and lift support from mast jacket, then remove shift tube retainer ring and washer from top of shift tube. Remove shift tube bearing retainer from lower end of mast jacket, then use two slide hammers and Tool J-21180 to pull shift tube from lower end of mast jacket. Remove lock plate, wave washer and shifter bowl from upper end of mast jacket. *NOTE - It may be necessary to slide bowl toward shift lever to remove lock plate.* Drive shift lever pivot pin from bowl, then remove shift lever and spring. Remove anti-rattle grommet from shift lever.

Chevrolet - Remove four screws and remove support from upper end of mast jacket, then remove shift tube retaining ring and washer from top of shift tube. Remove shift tube bearing retainer from lower end of mast jacket. Remove the shift tube downward through the column as follows: Support mast jacket on the edge of a wood block and drive against inner end of lower shift lever with a hammer and metal rod. *CAUTION - Be careful not to bend or distort shift lever.* Remove lock plate, wave washer and selector lever support housing from upper end of mast jacket. If necessary, remove selector lever pin, selector lever and spring.

CHEVROLET TILT WHEEL STEERING COLUMN (OTHERS ARE SIMILAR)

REASSEMBLY

REASSEMBLY NOTE: When assembling steering column, apply a thin coating of lithium base lubricant to all friction parts.

Shifter Tube & Shifter Bowl Installation (If so Equipped)

All Models (Exc. Chevrolet) - Install anti-rattle grommet on shift lever, then place shift lever spring and lever in bowl and install pin. Place shifter bowl on mast jacket with shift lever on right side of column, then insert shift tube and felt dust seal assembly into lower end of mast jacket. Guide shift tube into shifter bowl aligning the key in bowl with keyway in tube. Hold shifter bowl and tap lower end of shift tube until upper end of tube is flush with inner portion of shifter bowl. Position lower mast jacket bushing flange against lower end of mast jacket, aligning slots in bushing with holes in mast jacket, and install retaining ring. Place wave washer on lower side of the lock plate and retain with lubricant, then slide lock plate into position through opening in mast jacket. Align lock plate and wave washer with end of shift tube, then tap lower end of tube to fully seat it in jacket. Install thrust washer and retaining ring on upper end of shift tube. Install support on upper end of mast jacket with long leg aligned with notch in low side of lock plate, then install support attaching screws. Tighten the two larger (left) screws first to 20-25 inch pounds, then tighten the two right hand screws.

Chevrolet - Install selector lever spring, lever and retaining pin, then loosely install mast jacket cover and slide the dash panel seal assembly over lower end of mast jacket. Install selector lever support housing on mast jacket, place wave washer over mast jacket and slide the lock plate into position so tang on locking plate engages slot in mast jacket. Slide shift tube assembly (felt seal in place) into mast jacket from lower end, then with shift tube properly lined up with keyway in support housing, tap shift tube into place. Install washer and retainer. Install tilt actuator support on upper end of mast jacket and tighten the two larger (left) screws first, to 30-40 inch pounds. Tighten right hand screws.

Steering Shaft Reassembly

Apply lubricant to centering spheres and steering shaft sockets and place spheres in upper shaft socket. Turn the spheres so lower shaft may be installed over the grooves. *NOTE - The locating mark on end of upper shaft should be on same side as flat on lower shaft.* Insert joint pre-load spring through spheres into lower shaft, then while using upper shaft to hold spring in place, carefully feed the spring into upper shaft joint with a narrow bladed screwdriver. Install steering shaft assembly into upper end of mast jacket. At the lower end of mast jacket, install lower bearing assembly, being careful not to damage bearing as it passes over splines on shaft.

Actuator Housing Reassembly

Install lock shoe return springs on upper and lower lock shoes in the following manner: *NOTE - The upper lock shoe is identified by the rubber bumper.* Place actuator housing on bench with lower side upward and turn signal and tilt lever openings on the right hand

(Continued)

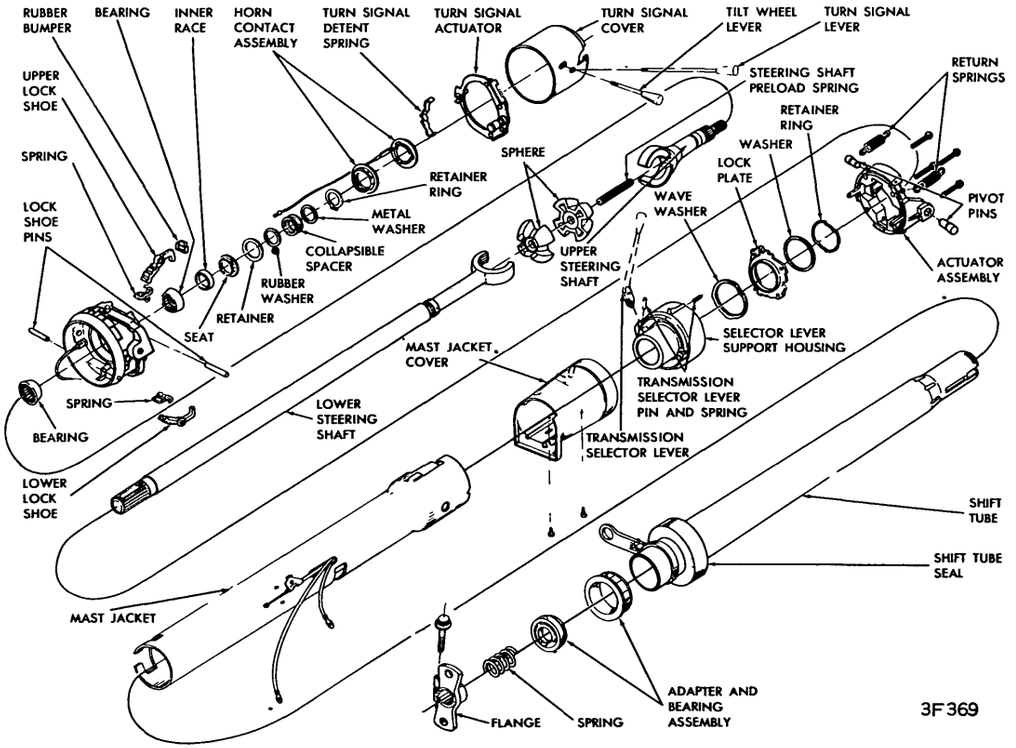
G.M. TILT WHEEL STEERING COLUMN (C ntinu d)

side. Install upper shoe in upper housing opening by pushing on rubber bumper and the end of shoe. Turn housing around and insert lower shoe in same manner as for upper shoe. Install pivot pins in actuator and through lock shoes making certain that pins are centered. From top of actuator housing, install turn signal switch control cables on plastic bellcrank with the cable loops facing toward center of actuator, then install cable bracket screw. Install horn contact wire through keyway in actuator housing (do not install contact at this time). Install upper shaft lower bearing with rollers downward, then install the lower ends of the two return springs on support spring anchors. *NOTE - Loops on upper ends of springs must have opening toward top of column.* Install the tilt lever in actuator.

Actuator Housing Installation

1) Raise tilt lever up slightly to prevent lock shoes from engaging the pins, then install actuator assembly over steering shaft while guiding turn signal cable and horn wire through the shift bowl. Align actuator assembly pivot pin holes with holes in support assembly, then install pivot pins using a brass drift to fully seat the pins. *NOTE - Steering shaft may have to be raised slightly to have lock shoes clear the socket.*

2) Raise tilt lever and lift upper steering column to full "up" position, then install upper ends of the two tilt return springs with Tool J-21181. *CAUTION - Do not use old springs if they show any indication of distortion.*



3) Install turn signal actuator yoke making sure that ball socket engages bellcrank ball, then install detent spring. Install upper bearing with rollers facing upward, inner race, bearing seat (flanged portion up), retainer (dish facing up), rubber washer, a new collapsible spacer and washer. *NOTE - When installing these parts on shaft make sure that they do not hang up on snap ring groove.*

4) Install snap ring over shaft and against collapsible spacer, then place Tool J-21179 over steering shaft with window in tool in line with snap ring opening. Install steering wheel nut and turn down until upper edge of the window in Tool J-21179 is in line with upper edge of snap ring groove (this will compress the spacer and preload upper shaft bearings). Remove steering wheel nut and tool, then make sure that snap ring is seating firmly in groove.

5) After checking steering shaft torque (see below), complete the reassembly by reversing disassembly procedure.

Checking Steering Shaft Torque

Install steering wheel nut on upper shaft, then use a socket wrench and an inch pound torque wrench and check the torque required to turn steering shaft in each tilt wheel position. *NOTE - Steering shaft must not be connected to steering gear when checking turning torque.* Torque should be 35-45 inch ounces (exc Oldsmobile); 2½ inch pounds (Oldsmobile). *NOTE - On Pontiac models, the torque in center position should be 25 inch ounces.* If torque is too low, repeat step "4" above. If torque is too high, spacer has been been collapsed too far and must be replaced.

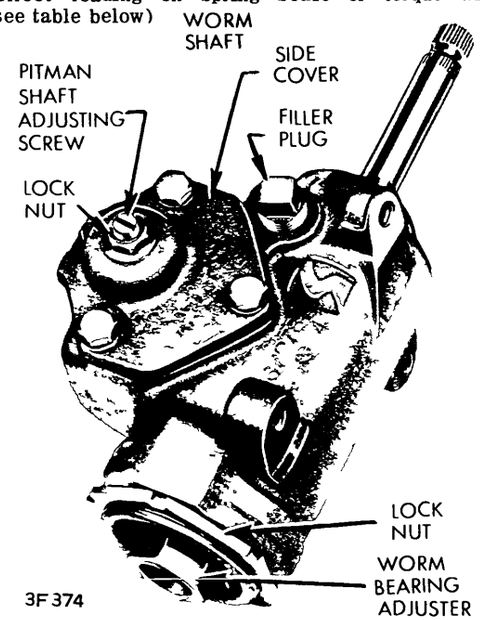
►CHANGES, CAUTIONS, CORRECTIONS

►*1963 COMET & FALCON V8 EXCESSIVE STEERING EFFORT & RAPID STEERING WHEEL RETURN CORRECTION:* On cars built prior to June 1963, this condition may be due to a high friction and torque wind-up of steering idler arm bushing. To correct, install a new idler arm and bushing, Part No. C3DZ-3352-G.

Description

Recirculating ball nut type. Nut mounted on worm and driven through steel balls which circulate in helical grooves in both worm and nut. Return guides attached to nut serve to recirculate the two sets of balls through grooves. Gear teeth on nut mesh with sector teeth on cross shaft so that cross shaft (and steering gear pitman arm) rotate as steering wheel is turned, causing nut to move up and down. *(Continued)*

SAGINAW BALL BEARING WORM & NUT STEERING GEAR (C nt.)



ADJUSTMENT

Steering G ar Alignment

Before any adjustments are made to steering gear, check for binding at frame bracket mounting bolts and at instrument panel bracket or flexible coupling Disconnect relay rod from pitman arm and check tightness of pitman arm nut, then back off pitman shaft adjusting screw just enough to obtain a slight backlash between ball nut and pitman shaft Steering shaft should turn through full range in both directions without binding or hard pull and be free of any rough spots Binding indicates misaligned steering gear on mountings or coupling Rough spots indicate damaged bearings or parts Hard pull indicates excessive preload adjustment

Worm Bearing Preload (All Models)

With relay rod disconnected from pitman arm and pitman arm properly tightened on steering gear pitman shaft, loosen pitman shaft adjusting screw to obtain a slight backlash between ball nut and pitman shaft Loosen worm thrust bearing adjuster locknut at upper or lower end of worm shaft (depending on car model) and turn adjuster until a slight load is felt (with steering wheel at extreme right or left position), then tighten locknut Install a spring scale at right angle to steering wheel spoke or install an inch-pound torque wrench on steering shaft (see "Worm Bearing Setting" table below for proper method to use in checking preload on a specific car model) Note spring scale or torque wrench reading required to keep steering wheel moving (when off the high point) Rotate adjusting nut as necessary to obtain correct reading on spring scale or torque wrench (see table below)

STEERING GEAR ADJUSTMENT LOCATIONS (TYPICAL)

Pinion Shaft Endplay (Gear Mesh)

With bearing preload adjustment completed (see above), check effort required to pull steering wheel through center (high spot) of gear If turning effort is not within specifications (see table below), turn pitman shaft adjusting screw clockwise to increase turning effort and counterclockwise to decrease turning effort With locknut tightened, recheck turning effort and adjust as necessary

PITMAN SHAFT ENDPLAY ADJUSTMENT NOTE - This is a "push-pull" type adjustment and controls pitman shaft endplay as well as gear mesh

REMOVAL & INSTALLATION

Steering Wheel, Horn Button & Directional Signal

See separate "Steering Wheel, Horn Button & Directional Signal Removal" data in this section

⑨ - Worm bearing preload plus 3-7 inch pounds Total overcenter pull not to exceed 11 inch pounds

FORD & MERCURY MOVABLE STEERING COLUMN

Ford Galaxie (1963)
Mercury Monterey (1963)

Description

A pivot bracket and flexible coupling at lower end of steering column and shaft allows lateral movement of steering column assembly which is supported at upper end on a latching mechanism.

Operation

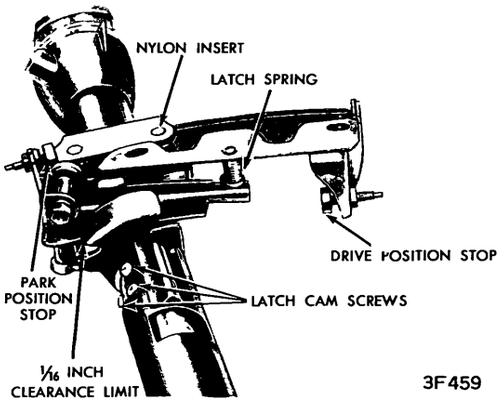
With transmission selector lever in "Park" position, the steering column may be swung approximately 9" toward center of car. Transmission selector lever cannot be moved from "Park" position until steering column is swung outboard into driving position. With selector lever in any other position than "Park", the steering column is locked in driving position.

ADJUSTMENT

Park Stop Position

Loosen locknut and turn "Park" position stop outward (away from column) as far as it will go, then swing column to "Park" position. With column in this position, adjust the stop against column so that the column, and shroud, and the latch cam do not interfere with any other part of the car.

Drive Position Stop



Loosen locknut and turn "Drive" position stop away from column as far as it will go, then swing column into "Drive" position so it is locked in place. Adjust stop so that it is snug against the column. Move selector lever to "Park" and swing column inboard, then turn "Drive" position stop ½ turn more toward the column and tighten locknut. Move column back to "Drive" position. The latch should contact middle of the sloped surface (latch plate) on the column.

Latch Cam

Loosen screws attaching latch cam to shift tube, then move latch cam in its slotted holes so that upper edge of cam slot is not more than 1/16" from upper edge of latch (with column in any swing position, not locked in drive). Tighten locknut on cam setscrew.

Latch Cam Setscrew

Adjust lock cam setscrew so that it will lift latch clear of latch plate when selector lever is moved into ' Park" position.

"PARK" POSITION

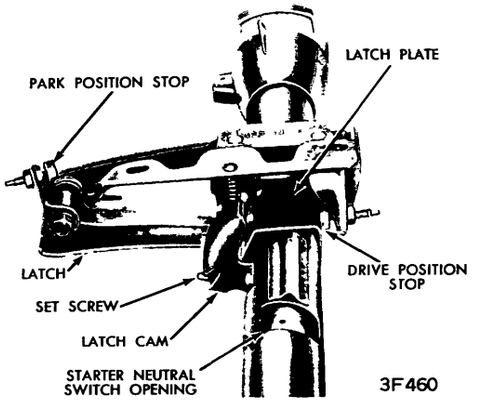
Nylon Wedge Setscrews

NOTE - This adjustment is made when nylon wedges are replaced. Tighten setscrews into wedges so they are just snug. From this position, tighten three more turns, then back out 1½ turns.

OVERHAUL

Upper Bearing Replacement

Remove upper steering shaft-to-flex joint clamp bolt, and disconnect turn signal and horn wires. Remove steering wheel, turn signal lever, and turn signal switch plate from steering column tube hub. Remove snap ring above column upper bearing and pull steering shaft upward to work bearing from shaft. To install, transfer rubber (outer) to new bearing, and position bearing assembly over steering shaft and install upper snap ring. Complete the installation by reversing removal procedure.



TROUBLE SHOOTING & DIAGNOSIS

Binding, Rough, or Rasping Column Movement

Latch cam rubbing latch. Nylon shipping guide not removed at assembly. Shroud is rubbing. Nylon inserts broken or missing. Latch rubbing on top of column. Mounting bracket rubbing on track. Setscrew rubbing on latch. Not properly lubricated.

Hard Column Movement

Not properly lubricated. Nylon wedges bound up. Nylon shipping guide not removed. Mounting bracket rubbing on guide.

"DRIVE" POSITION

Possible Shift Into Reverse (With Column Out of Driving Position)

Latch cam-to-latch clearance is too great. Manual shift linkage not properly adjusted.

Poor Shifting Into Or Out Of "Park"

Manual shift linkage not properly adjusted. Driving position stop is not properly adjusted.

Lateral Looseness In Column When Locked

Driving position stop improperly adjusted. Track-to-instrument panel mounting bolts loose.

Vertical Looseness In Column When Locked

Track bracket-to-steering column bolts loose. Track-to-instrument panel mounting bolts loose. Nylon wedges not seated properly.

Interference With Air Conditioning Unit

Park position stop improperly adjusted.

Column Will Not Shift Into "Park" Position

Latch cam setscrew improperly adjusted.

THUNDERBIRD MOVABLE STEERING WHEEL

Description

This unit consists of a lateral movement mechanism at the instrument panel and a flexible joint at the steering gear which allows steering wheel to be moved toward center of car.

Operation

With steering column in driving position and transmission selector lever in any position other than "Park", column is locked to brake pedal support assembly by a pawl type lever controlled by transmission selector tube. Two coil springs assist pressure from selector tube and provide positive engagement of pawl in lock plate. When selector lever is moved to "Park" position, latch tube bracket fastened to selector tube disengages pawl from locking plate. Steering column assembly can now be moved about 10" to the right. When column is moved inboard, transmission cannot be shifted. When column is moved back to driving position, pawl engages locking plate. Transmission can now be shifted.

ADJUSTMENT

Track-to-Column Bracket

Track notched edge must be centered under bracket notch for full distance of track travel. To adjust, loosen track-to-pedal support bolts.

Slide Tension

Adjust friction between track and steering column bracket by loosening or tightening nuts on cam type friction adjustment bolts. *NOTE - Both bolts must be adjusted equally.*

Lock Plate

Adjust engagement of pawl in lock plate by loosening plate mounting bolts and adjust cam bolt and screws so lock pin clears bottom of lock plate by no more than 1/32" for the full travel. Pawl must be fully engaged in lock plate when column is locked.

Stops

With selector lever out of "Park" position and nylon button of detent spring in its track center notch, position stop bracket against bumper. Pawl pin must be engaged fully and also clear corner of notch as pin enters or leaves. There should be no lateral movement of column as pawl pin engages or disengages. *NOTE - On Air Conditioned cars, spring projects to left of its attaching bolt and left notch in track is used. If right shroud hits, adjust right hand stop.*

TROUBLE SHOOTING & DIAGNOSIS

Binding, Rough or Rasping Column Movement

Track-to-column bracket misaligned. Lock plate rubbing pawl.

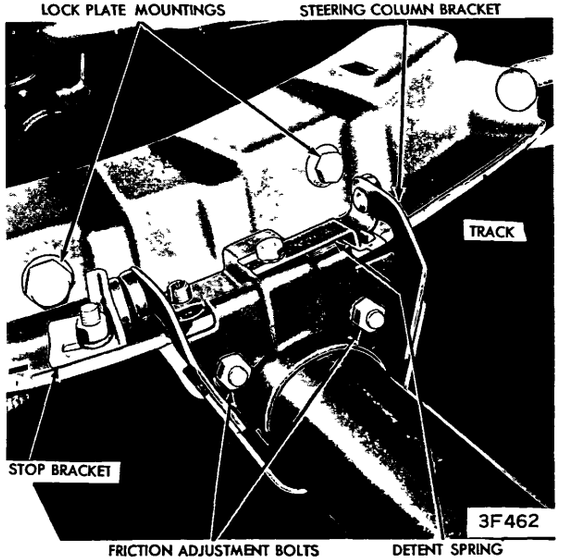
Transmission Shift Into Reverse With Column at Extreme Right

Lock plate out of adjustment.

Poor Shift Into or Out of "Park"

Left stop out of adjustment. Lock pawl binding in pivot bushing

Lateral Looseness In Column When Locked



Lock pawl arm loose in pivot bushing. Pivot bracket loose at steering gear.

Vertical Looseness in Column When Locked

Loose track or braces. Pivot bracket loose at steering gear. Slide tension out of adjustment.

Right Shroud Hits Air Conditioning Unit

Right stop bolt on track out of adjustment.

MOVABLE STEERING COLUMN MOUNTING ASSEMBLY

GEMMER WORM & ROLLER STEERING GEAR

Chrysler (1963)
Dodge Custom 880 (1963)①
Ford Trucks (Exc. 2-Whl. Dr. F-100 & F-250) (1963)②
Ford Trucks, 4-Whl. Dr. F-100 & F-250 (1963)
Rambler American (1963)③

① - For other Dodge models, see "Saginaw Ball Bearing Worm & Nut".
② - For F-100 & F-250, see "Saginaw Ball Bearing Worm & Nut".
③ - For Rambler Classic & Ambassador, see "Saginaw Ball Bearing Worm & Nut".

Description

Similar in design to units used on previous models. Roller shaft adjusting screw is secured in end of roller shaft with a snap ring on some models. Chrysler Corp. cars have a flexible coupling between steering gear worm shaft and steering tube.

Adjustment

See 1962 Final, Page 394 for adjustment procedures and specifications and note the following:
Cross Shaft Roller & Worm Mesh (Chrysler & Dodg) - Disconnect pitman arm from drag link then rotate steering wheel to mid-position and check for backlash by moving pitman arm back and forth. If backlash exists, loosen roller shaft adjustment screw and tighten screw enough to eliminate freeplay. *CAUTION - Be sure roller shaft and worm do not bind.* Recheck the backlash. Tighten adjusting screw locknut while holding adjusting screw from turning, then connect pitman arm. *NOTE - If steering gear is off the car, a torque of 9-13½ inch pounds should be required to rotate steering shaft through the center position (high point). Adjust torque load by turning adjusting screw in or out as required.*

Steering Wheel, Horn Button & Directional Signal

Removal & Installation - *See separate "Steering Wheel, Horn Button & Directional Signal Removal" data in this section.*

Removal & Installation

See 1962 Final, Page 395 for removal and installation procedures.

Overhaul

See 1962 Final, Page 396.

ROSS SL-54 SINGLE LEVER STEERING GEAR

Studebaker Avanti & Hawk (1963)
Jeep, J-Series (1963)

Description

Cam and single lever type with cam follower mounted in roller bearings on inner side of cam lever and engaged in grooves of cam (worm gear shaft) On Studebaker Avanti, a flexible coupling connects worm shaft to steering shaft On Studebaker Hawk, the worm shaft is integral with steering shaft

ADJUSTMENT

NOTE - Two adjustments are required and they must be made in the proper sequence as indicated

Steering Shaft Endplay

Avanti & Jeep - Loosen cam lever adjusting screw locknut and back off the adjusting screw Remove steering wheel and replace shaft nut, then use an inch pound torque wrench and socket to measure the amount of torque required to turn steering shaft If torque is not within limits of 2-4 inch pounds (Avanti), 1-5 inch pounds (Jeep), see "Adjustment" below

Hawk - Loosen cam lever adjusting screw locknut and back off the adjusting screw Attach a light spring scale (calibrated in ounces) to rim of steering wheel at the spoke A steady pull of 4-7 ounces (tangent to rim of steering wheel) should be required to turn steering gear smoothly If not within limits, see "Adjustment" below

Adjustment - Remove steering gear top cover attaching screws and lift the cover, then add or remove shims to secure proper torque reading (shims must be split before removal or installation) Torque is increased by removing shims and decreased by installing shims

Cam Lever Clearance

All Models - With steering shaft endplay adjustment completed, place steering shaft in center position (exactly half way between full right and full left), then measure the turning torque or pounds pull required to turn shaft through center (high spot) of travel *NOTE - Use the same method of measuring as used for "Steering Shaft Endplay" above* On Avanti, the torque should be 6¼-8½ inch pounds On Hawk models with manual steering, the scale reading should be 12-20 ounces (12-16 ounces with power steering) On Jeep models with manual steering, the torque should be 12 inch pounds (7 inch pounds with power steering) To adjust, turn cam lever adjusting screw as required to obtain correct reading

REMOVAL & INSTALLATION

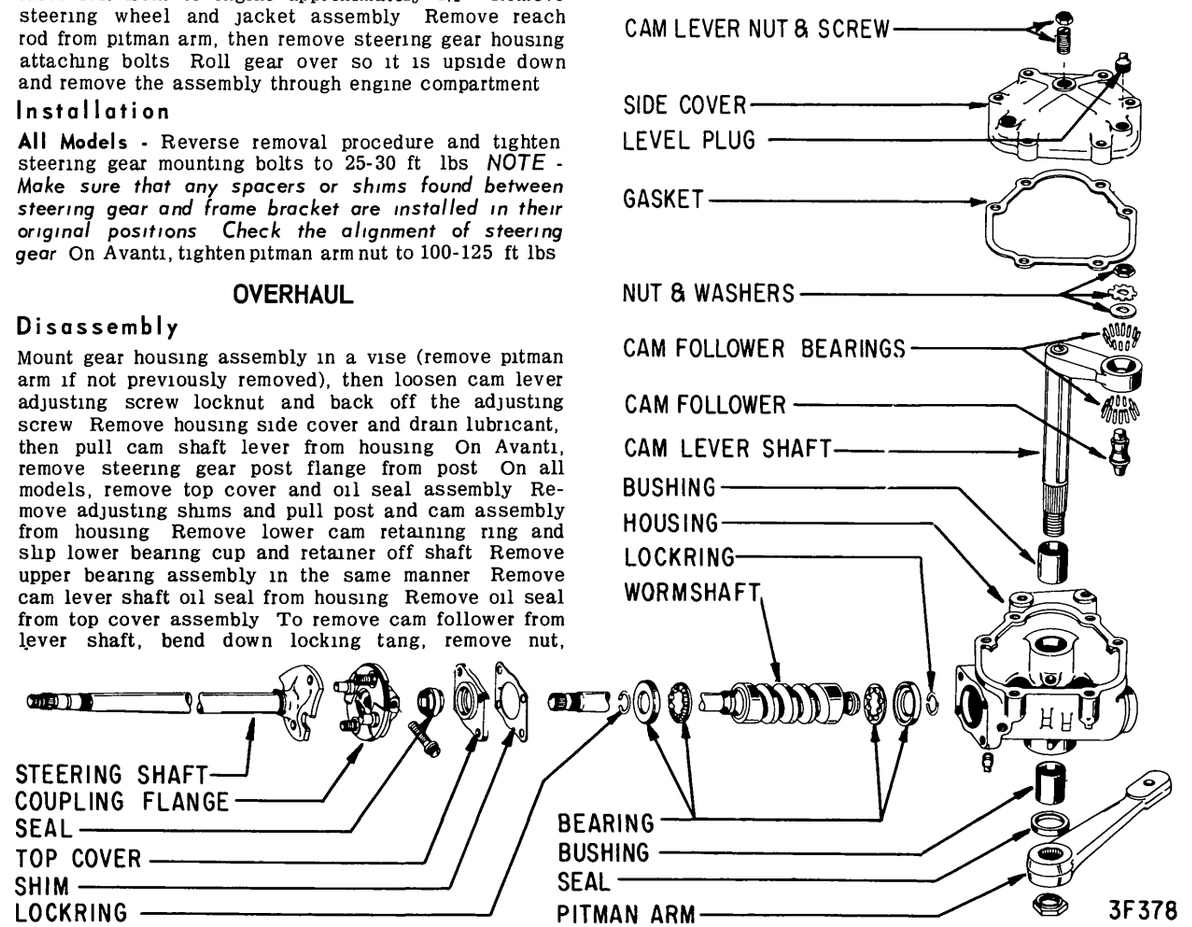
Removal

Avanti - Disconnect battery and remove power brake assembly, then remove starter solenoid from fender apron and the radio emission shielding from in front of left bank spark plugs If car has a manual transmission, disconnect upper and lower rods from clutch pedal bellcrank and remove bellcrank from frame Remove starter motor, then remove the pitman arm Remove steering gear to frame mounting bolts then disconnect steering column flange and pull gear forward to disengage lower flange from upper flange Turn steering gear assembly so post flange end of gear is upward and forward and is clear of top of frame Turn the assembly clockwise so the end of cam lever shaft will pass between rear end of exhaust manifold and the upper shaft flange as the assembly is lifted out of engine compartment

Hawk - Disconnect and remove battery and disconnect horn switch wire at connector Disconnect battery cable at starter switch Remove distributor cap, then remove left front engine support cushion stud nut and raise left front of engine approximately 1½" Remove steering wheel and jacket assembly Remove reach rod from pitman arm, then remove steering gear housing attaching bolts Roll gear over so it is upside down and remove the assembly through engine compartment

Installation

All Models - Reverse removal procedure and tighten steering gear mounting bolts to 25-30 ft lbs *NOTE - Make sure that any spacers or shims found between steering gear and frame bracket are installed in their original positions Check the alignment of steering gear* On Avanti, tighten pitman arm nut to 100-125 ft lbs



OVERHAUL

Disassembly

Mount gear housing assembly in a vise (remove pitman arm if not previously removed), then loosen cam lever adjusting screw locknut and back off the adjusting screw Remove housing side cover and drain lubricant, then pull cam shaft lever from housing On Avanti, remove steering gear post flange from post On all models, remove top cover and oil seal assembly Remove adjusting shims and pull post and cam assembly from housing Remove lower cam retaining ring and slip lower bearing cup and retainer off shaft Remove upper bearing assembly in the same manner Remove cam lever shaft oil seal from housing Remove oil seal from top cover assembly To remove cam follower from lever shaft, bend down locking tang, remove nut, lockwasher and retainer, and slip bearings and stud out of shaft If necessary to remove cam lever shaft bushings, use a suitable arbor press and press inner and outer bushings from housing

Reassembly

Reverse disassembly procedure and note the following After installing cam follower on lever, hold cam follower and tighten the nut to eliminate all play, then back nut off slightly so cam follower can be turned by hand Use an inch pound torque wrench and socket and check the amount of torque required to turn cam follower If not within limits of 1-3 inch pounds, adjust the nut as required After reassembly, place gear housing in the approximate installed position in the vise and fill with recommended lubricant Adjust steering shaft endplay and cam lever clearance (see "Adjustment" above)

ROSS SL-54 SINGLE LEVER STEERING GEAR

BUICK, CHEVROLET TRUCK & PONTIAC 3-SPEED SYNCHRO-MESH

Buick, Exc. Special (1963)
Ch vrolet Trucks, ½,¾, 1-Ton (1963) Heavy Duty
Pontiac (1963) S N t .

1963 PONTIAC TRANSMISSION NOTE - This transmission is standard equipment on Star Chief, Bonneville (Exc Safari), Grand Prix Models, heavy duty chassis, taxicabs and police cars

Description

Warner three-speed, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse) Side opening case with transmission shift levers integral with side cover assembly

Removal & Installation

Se 1962 Final Data, Page 411 ("Chevrolet & Pontiac 3-Speed Synchro-mesh") and note the following·

R moval (Buick) - Drain transmission, then mark propeller shaft and front companion flange (for installation in original position) Disconnect propeller shaft from front flange and slide propeller shaft as far rearward as possible Disconnect speedometer cable and shift rods at transmission, then loosen three exhaust pipe joints so transmission and engine can be lowered slightly Remove bolts attaching transmission mounting pad to transmission support, leaving mounting pad bolted to transmission Use a wood block and jack up engine until transmission mounting pad clears support, then remove transmission support and lower jack so transmission clears underbody Remove upper left and lower right transmission to flywheel housing attaching bolts and install suitable guide pins (Tool J-1126) Remove remaining attaching bolts and slide transmission back until drive gear shaft is clear of housing, then lower transmission from car

Installation (Buick) - Reverse removal procedure and note the following Lightly coat splines on end of main drive gear with lubriolate for a distance of 1" Fill groove in inner surface of throw-out bearing with wheel bearing grease

Shift Linkage Adjustment

See 1962 Final Data, Page 413 ("Chevrolet & Pontiac 3-Speed Synchro-mesh") and note the following·

Buick - *NOTE - The shift linkage adjustment on this car is very critical and the following procedure should be followed closely to prevent first-reverse sliding gear remaining partially engaged with countergear when a first-second shift is made* Loosen shift rod adjusting clamps at transmission end of rods, then place first-reverse shift lever in neutral and second-third shift lever into second gear (lower end of lever fully forward) Place manual control lever on steering column in second-third range, then move control lever toward instrument panel until top of knob is 3½" from lower edge of instrument panel nose pad Tighten second-third adjusting clamp on transmission end of control rod to 10-12 ft lbs *NOTE - Over-tightening will cause hard shifting and binding* Move second-third transmission shift lever into neutral position, then move manual control lever on steering column to obtain a good cross-over position with control lever in neutral cross-over Move manual control lever from first-reverse to second-third position several times until no interference is felt Hold manual control lever at first-reverse end of cross-over, then move the first-reverse shift rod up and down to determine free movement Set shift rod in middle of free movement range and tighten first-reverse adjusting clamp nut to 10-12 ft lbs *NOTE - Over-tightening will cause hard shifting and binding* After completing adjustment, operate car in first gear coast, then depress clutch and listen for gear engagement noise Slowly move control lever toward neutral cross-over (clutch disengaged) and listen for engagement noise to stop If linkage is properly adjusted, engagement noise should stop just before neutral cross-over is reached

Pontiac - *NOTE - An interlock pawl, connected to clutch pedal linkage, prevents transmission from jumping out of first or reverse and also assures full engagement of first and reverse gears Shifting into or out of reverse is prevented until clutch pedal is fully depressed*

Interlock Pawl Adjustment - With transmission shift linkage properly adjusted, place first-reverse lever on transmission in neutral position and adjust interlock pawl rod at forward end until pawl bottoms on first-reverse lever pin Tighten nut to 5-10 ft lbs

Overhaul

See 1958 Final Data, Page 406 ("Chevrolet & Pontiac 3-Speed Synchro-mesh")

CHEVROLET & PONTIAC 3-SPEED SYNCHRO-MESH

Chevy II (1963)
Chevrolet Pass. Cars (1963)
Corvette (1963)
Chevrolet Trucks ½, ¾-Ton (1963) Light Duty
Pontiac Catalina & Safari (1963)

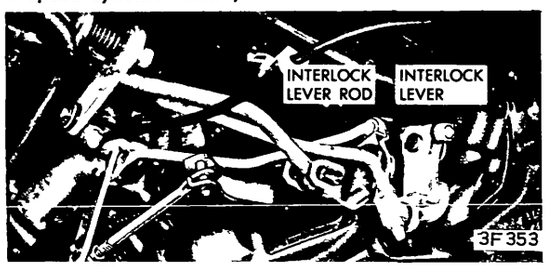
Description

Three speed, constant mesh, synchro-mesh (2nd & high), sliding gear (low & reverse) of same design as used on previous models On Pontiac, a new interlock pawl is installed on transmission side cover to assure full engagement of first and reverse gears and to prevent transmission from jumping out of first or reverse gear during hard acceleration The pawl is connected to clutch linkage to prevent shifting into or out of reverse until clutch pedal is fully depressed

Removal & Installation

See 1962 Final Data, Page 411 ("Chevrolet & Pontiac 3-Speed Synchro-mesh")

Shift Linkage Adjustment



See 1962 Final Data, Page 411 ("Chevrolet & Pontiac 3-Speed Synchro-mesh") and note the following:

Pontiac - *NOTE - An interlock pawl, connected to clutch pedal linkage prevents transmission from jumping out of first or reverse and also assures full engagement of first and reverse gears. Shifting into or out of reverse is prevented until clutch pedal is fully depressed*

Interlock Pawl Adjustment - With transmission shift linkage properly adjusted, place first-reverse lever on transmission in neutral position and adjust interlock pawl rod at forward end until pawl bottoms on first-reverse lever pin Tighten nut to 5-10 ft lbs

Overhaul

See 1962 Final Data, Page 411 ("Chevrolet & Pontiac 3-Speed Synchro-mesh").

PONTIAC GEARSHIFT INTERLOCK

CHEVROLET TRUCK 4-SPEED SYNCHRO-MESH

Chevrolet Trucks ½, ¾, 1, 1½ Ton (1963)

Description

Four speed, constant mesh, synchro-mesh (second, third & fourth), sliding gear (low & reverse), of same design used on previous models

Removal Of Transmission

Removal - Drain lubricant, then remove parking brake lever *NOTE - Not necessary to remove parking brake lever on Series 10 trucks* Remove propeller shaft Slide open end of Tool J-8109 over shift lever and engage lugs of tool in open slot of retainer, then press down on tool and turn it to left to disengage lugs on retainer and remove shift lever Remove screws and slide steering column jacket grommet up jacket, then remove accelerator pedal and floor mat Remove transmission cover On Forward Control models, remove front and rear floor pans On all models, remove speedometer cable at transmission Remove two upper transmission attaching bolts and install guide pins, J-1126, then remove flywheel lower pan and lower transmission attaching bolts Slide transmission back on guide pins until clear of clutch assembly and remove transmission

Overhaul

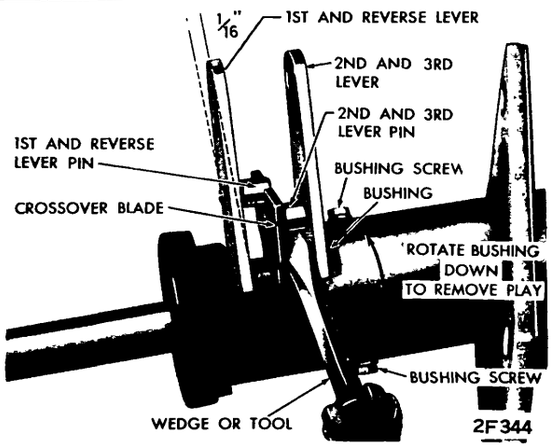
See "Chevrolet Truck 4-Speed Helical Gear (Synchro-mesh)" in Transmission Section of Manual and note the following.

Third Gear Mainshaft Bearing Installation - To insure proper initial lubrication when installing third gear mainshaft bearing, it is important to place grease on that area of mainshaft on which the bushing will be placed

Design Changes - A needle bearing replaces the roller bearing and spacer at front countergear position New design ball bearings are used at clutch gear, mainshaft rear bearing, and rear countergear positions A spline lock feature is used for third and fourth gear clutch assembly A new disc shaped magnetic chip collector is bonded to inside of transmission case

Countergear Front Bearing Installation Note - This bearing cannot be installed with Tool J-994 Install bearing flush with front of transmission case by tapping or pressing on steel plate or other flat surfaced tool positioned to cover entire front face of bearing assembly If bearing that is intended to be re-used is removed from case, it should be tapped out of case using a tool that will provide full circle contact on rim of bearing assembly rear face Bearing will be damaged if not removed as directed

CHRYSLER CORP 3-SPEED SYNCHRO-MESH

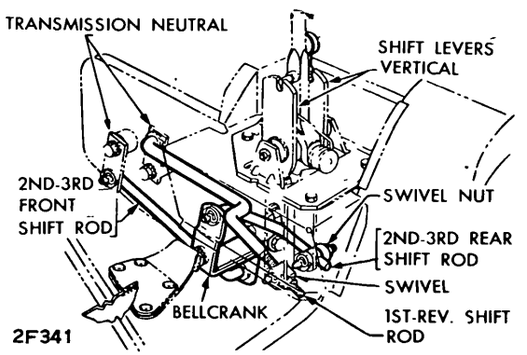


Chrysler, Dodge, Plymouth, Valiant (1963)
NOTE - Light duty transmissions are standard equipment on 6 cylinder models. Heavy duty transmissions are standard equipment on all V8 models and optional equipment on 6 cylinder models.

Description

Three-speed synchro-mesh of same design used on previous models. Taxi models (if so equipped) have a special interlock assembly that prevents shifting into low or reverse without fully depressing clutch.

Shift Linkage Adjustment



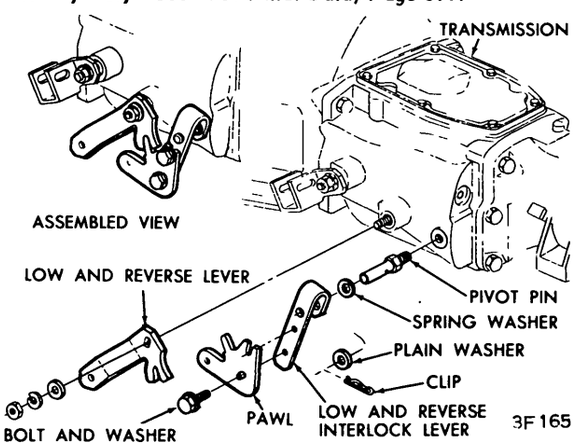
Steering Column Shift - With 2nd-3rd control rod disconnected from lever on end of steering column and 1st-reverse control rod disconnected from lever on transmission, position both levers on transmission in neutral. *CAUTION - Make sure neutral detent balls are properly engaged.* Check axial freedom of shift levers in steering column. If outer end of levers move axially more than 1/16", loosen the two upper bushing screws and rotate plastic bushing (downward) until all freeplay of levers is removed, then tighten bushing screws securely. Install a wedge or suitable tool between crossover blade and 2nd-3rd lever so that crossover blade is engaged with both lever crossover pins. Adjust swivel on end of 2nd-3rd control rod until stub shaft of swivel enters hole in steering column lever, then secure swivel to lever and tighten locknut to 70 inch pounds. *NOTE - During the above adjustment 2nd-3rd shift control rod should also be adjusted to position selector lever at steering wheel so it is 5° (116" wheelbase cars); 10° (106" wheelbase cars) above horizontal with transmission in neutral.* Slide clamp and swivel (on end of 1st-reverse rod) until swivel stub enters hole in transmission lever and secure in position. Determine mid-backlash position in linkage and tighten clamp bolt to 100 inch pounds. Remove positioning wedge or tool from crossover blade and lever, then move selector lever through all positions to check adjustment and crossover smoothness.

STEERING COLUMN SHIFT ASSEMBLY

Floor Shift (Exc. Chrysler 300J) - Remove screws holding upper boot and retainer to floor pan and slide boot up on gearshift lever. Disconnect shift rods at lower end of shift assembly levers, then place shift levers on transmission in neutral position. With crossover pin in shift control lever engaged in 2nd-3rd lever, the gap from crossover pin to 1st-reverse lever should not exceed .055". Clip crossover pin tool over 2nd-3rd end of crossover pin so that pin engages both shift levers. *NOTE - A suitable wedge can be used at same location to engage crossover pin in both levers if clip tool is not available.* With shift levers on shift assembly vertical and shift levers on transmission in neutral position, adjust swivel on end of 1st-reverse shift rod so it freely enters hole in shift lever. Repeat this procedure for 2nd-3rd shift lever - to-bellcrank rod. When adjustment completed, tighten swivel nut to 20 inch pounds, then remove crossover pin or wedge. Replace upper boot and check shift in all positions.

Floor Shift (Chrysler 300J) - Loosen lever assembly pivot bolt and screw, then install a ¼" rod through the two lever aligning holes and bracket slot provided in shift assembly. Pre-set length of 1st-reverse shift rod to obtain the proper hand lever position (5-6" from front of knob to closest point on instrument panel with transmission in neutral). Install 1st-reverse rod by rotating lever assembly in the adjusting slot until 1st-reverse lever hole lines up with the pre-set rod length, then tighten lever assembly pivot bolt and screw. Adjust length of 2nd-3rd rod to match the lever holes and install rod and remove locking pin. Place shift lever in 3rd gear, then adjust lever stopscrew (at forward side of shift assembly housing) to provide a clearance of .020-.040" between end of stopscrew and shift lever. Place shift lever in 2nd gear and repeat the adjustment between stopscrew (at rear side of shift assembly housing) and shift lever. Lock stopscrews in place and check shift operation in all gears.

FLOOR MOUNTED GEARSHIFT ASSEMBLY (EXC. 300J)



Interlock Adjustment (Taxi)

Pawl Adjustment - With transmission in neutral and pawl-to-pawl lever attaching bolts loose, rotate pawl forward into FULL engagement with 1st-Rev. lever pawl slot. Position pawl to provide equal clearance with pawl slot on both sides of pawl, then tighten pawl bolts to 200 inch pounds.

Linkage Adjustment - With clutch linkage adjusted, make sure clutch pedal is in fully returned position, then shift transmission into neutral. Install interlock rod with anti-rattle washer and clips leaving the sliding adjustment bolt loose. Rotate pawl lever forward to bottom the pawl in transmission 1st-Rev. lever pawl slot, then tighten sliding clamp bolt to 100 inch pounds. *CAUTION - Do not pull interlock rod backwards against fork pull back spring load during this adjustment.* With engine not running, shift transmission in normal manner with clutch disengaged, from neutral to first, and from neutral to reverse, engaging the clutch when in gear. If operation is not normal, readjust pawl linkage. Disengage clutch and shift transmission half-way between neutral and first. Let the clutch out. When properly adjusted, the interlock should allow clutch pedal to return to about 5" from fully returned position.

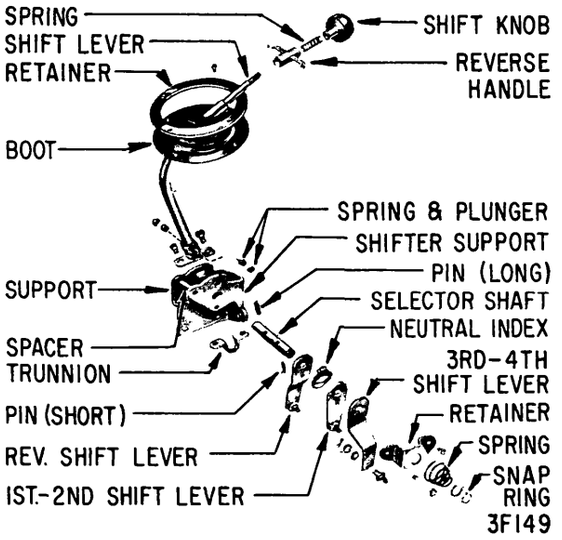
Overhaul

Light Duty - *See 1960 Final Data, Page 407 or later Manual edition.*
Heavy Duty - *See 1961 Final Data, Page 399.*

INTERLOCK ASSEMBLY (TAXI)

COMET & FALCON (6 CYL.) 4-SPEED SYNCHRO-MESH

Comet 6 Cyl. Models (1963)
Falcon 6 Cyl. Models (1963)



DESCRIPTION

Four-speed fully synchronized type with all forward speed gears in constant mesh. Transmission shift lever and linkage are mounted on transmission extension housing with selector lever entering driver's compartment through a hole in floor pan. A finger operated release lever is provided on selector lever to prevent accidental shift into reverse gear.

ADJUSTMENT

Shift Linkage

With transmission in neutral position, insert a ¼" rod into the alignment hole in outer lever and through holes in other two levers (see illustration). *NOTE - If rod will not enter, check for bent connecting rods.* To adjust, loosen connecting rod retainer locknuts on end of each shift lever and position levers so rod will enter alignment holes. *NOTE - Make sure levers are in neutral and that reverse shifter lever is in neutral detent.* Check for smooth cross-over operation and for engagement of detents.

SHIFT LEVER ASSEMBLY

REMOVAL & INSTALLATION

Transmission Removal

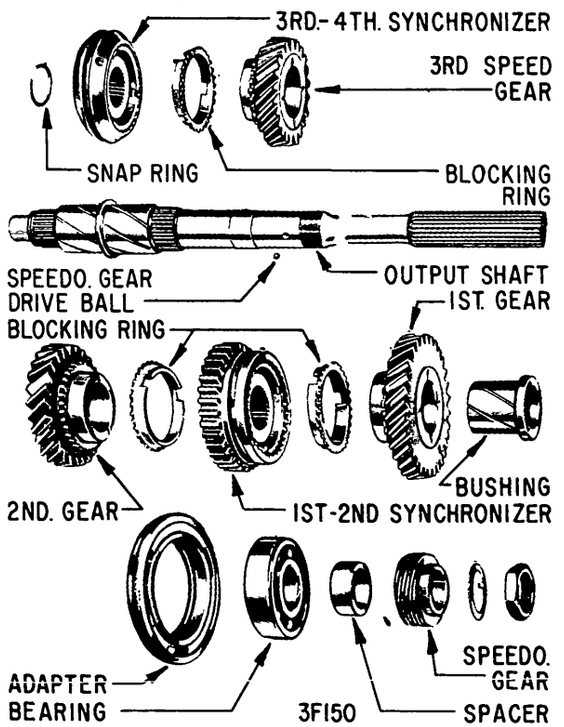
Remove screws attaching retaining ring and boot to floor pan, then raise boot and ring on shift lever and disconnect shift lever from linkage assembly by removing capscrews at lower end of shift lever. Raise car and disconnect cable from starter, then remove starter. Drain transmission lubricant and disconnect driveshaft at pinion flange, then pull driveshaft off transmission shaft. Remove backup lamp switch from shift control linkage bracket, then remove clip from equalizer bar at clutch release rod and remove rod. Remove linkage return spring from release lever, then disconnect parking brake front cable from equalizer bar and speedometer cable from extension housing. Support engine with a jack and remove two bolts attaching rear mount spring to extension housing. Raise rear of engine and remove transmission support crossmember from underbody. Support transmission and remove bolts attaching flywheel housing to engine. Remove housing cover. Move transmission and clutch housing assembly toward rear until transmission input shaft splines are clear of clutch housing.

Transmission Installation

Reverse removal procedure and tighten all bolts and nuts to specifications (see "Tightening Specifications" below).

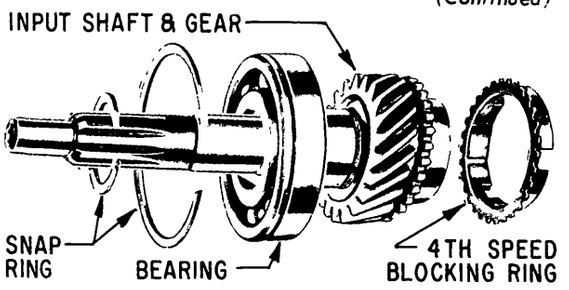
OVERHAUL

Disassembly



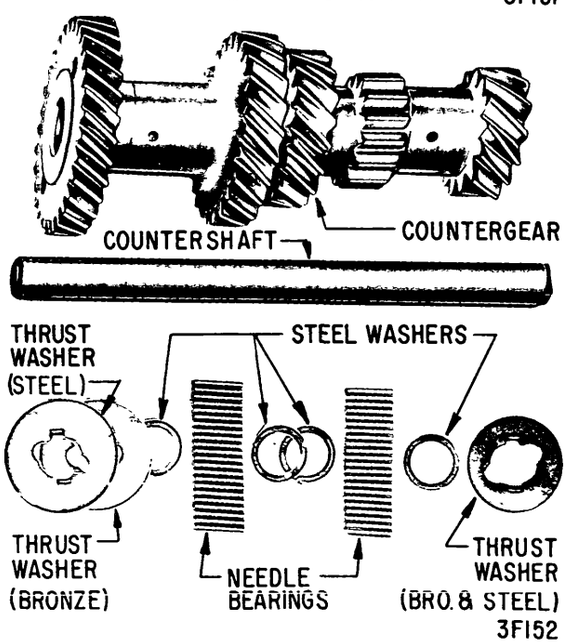
1) Disconnect shift rods from shift levers, then remove bolts attaching shift selector assembly to housing. Insert a screwdriver (grind notch in end of blade) through hole in clutch release lever and unhook retainer that secures clutch release lever to retainer bracket (see illustration), then remove flywheel housing from transmission.

2) Remove shift cover from transmission and remove input gear bearing retainer. Disconnect and remove extension housing from transmission. Drive countershaft toward rear of case until it is just clear of front wall of case, then use a "dummy" shaft and push countershaft out until "dummy" shaft and countergear drop out of position.



3) Remove output shaft assembly from rear of case and input gear and bearing from front of case. Lift countergear assembly out through cover opening of case. *NOTE - Smallest diameter thrust washer will be found between rear of gear and case and the larger diameter steel and bronze washers at front.* Thread a 5/16"-24 bolt into rear end of reverse idler gear shaft and pull shaft using a suitable puller, then remove idler gear. If necessary to remove input shaft bearing from shaft, use a suitable support plate and an arbor press to press shaft out of bearing.

4) Remove output shaft nut and lock, then remove speedometer drive gear, drive ball and spacer. Support output shaft assembly on front face of second speed gear in an arbor press and press output shaft out of gear train. Remove snap ring from in front of 3-4 synchro-



(Continued)

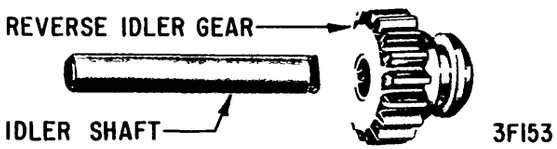
OUTPUT SHAFT ASSEMBLY

INPUT GEAR & BEARING ASSEMBLY 3F151

3F152

COUNTERGEAR ASSEMBLY

COMET & FALCON (6 CYL.) 4-SPEED SYNCHRO-MESH (C nt.)



nizer on output shaft, then press third gear and 3-4 synchronizer off shaft.

5) Before disassembling synchronizer, scribe an alignment mark across hub and sleeve to insure reassembly in original position. Remove front and rear insert springs from both synchronizer assemblies, then slide sleeves off hubs. Remove hub inserts.

Inspection

Wash all parts thoroughly, then inspect transmission case for cracks, wear, damaged bearing bores, or damaged threads. Remove all small nicks or burrs from case machined surfaces. Check all parts for wear, chipped or broken teeth, and damage. Replace all damaged or worn parts.

Countershaft Gear Endplay Check - Temporarily install countergear and "dummy" shaft assembly in transmission with thrust washers in proper position. Check endplay between thrust washers and transmission case with a feeler gauge. Endplay should be .008-.022". If endplay is excessive, replace thrust washers.

REVERSE IDLER ASSEMBLY

Reassembly

1) Place long inserts into slots in 1-2 synchronizer hub and slide combination sleeve and reverse gear over it making sure that scribe marks on hub and sleeve are aligned. Snap insert springs into place with tab on each spring set into underside of an insert. Position short inserts into slots in 3-4 synchronizer hub and slide clutch sleeve over it making sure that scribe marks are aligned, then install insert springs in same manner as for 1-2 synchronizer.

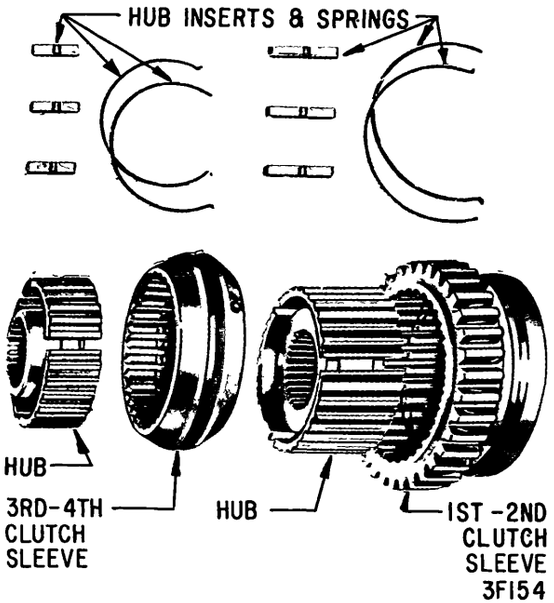
2) Place second gear on rear of output shaft with clutch teeth and tapered synchronizer end toward rear. Install a blocking ring with clutch teeth toward front. Install first and second synchronizer and reverse gear assembly on rear of output shaft with shift fork groove toward rear. *NOTE - Be sure second speed blocking ring is not cocked on gear and that the three index slots align with synchronizer inserts.*

3) Install first speed blocking ring with clutch teeth toward rear and with slots engaging synchronizer inserts. Slide first gear and sleeve onto output shaft with taper and clutch teeth toward front (bushing shoulder toward rear). Assemble output shaft ball bearing into recess in bearing adapter, then position adapter and bearing on rear of output shaft with adapter forward. Hold first gear and sleeve forward and place assembly in a press with supports against bearing inner race. Press shaft through until bearing is firmly seated against first gear bushing.

4) Place spacer, speedometer gear drive ball, speedometer gear (shoulder to rear), and nut on output shaft. Tighten nut securely, then lock in place with lock tabs. Place third speed gear on front of output shaft with clutch teeth toward front and install blocking ring on gear. Install 3-4 synchronizer with wide thrust surface of hub toward rear. Align blocking ring slots with synchronizer inserts. *NOTE - Hub-to-shaft spline fit may require a slight press to assemble.* Install snap ring in its groove on front of output shaft.

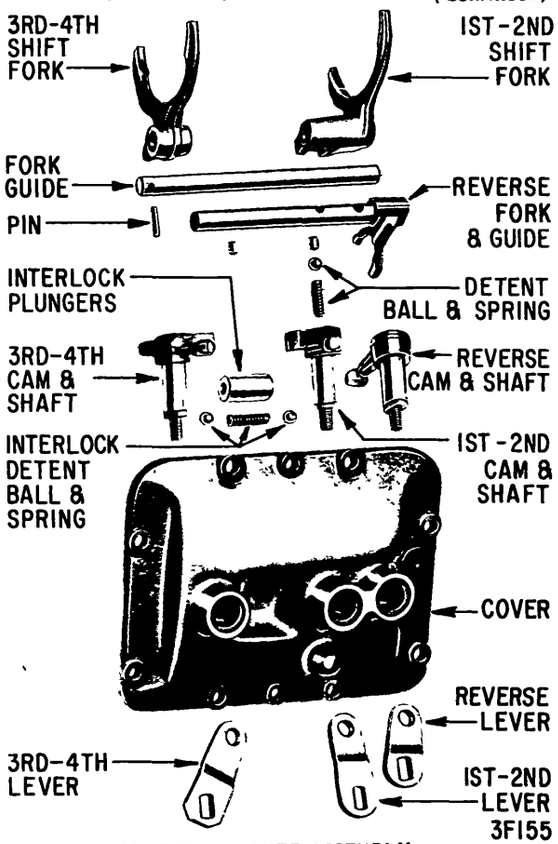
5) Install "dummy" shaft in countershaft gear, then drop a steel washer over shaft and into gear. Coat each needle bearing with grease and install 22 of them into gear. Lay another steel washer on ends of needles and install proper thrust washers. Repeat this operation at other end of countershaft gear. Position countershaft gear in case with the two thrust washers at front.

6) Press input bearing onto input shaft with outer race snap ring toward front, then install snap rings on bearing outer race and on output shaft. Install 17 roller bearings in bore of input shaft, holding them in position with grease, then install input shaft assembly in case front bore. Place fourth gear blocking ring on rear of input shaft with clutch teeth forward.



7) Enter output shaft assembly through rear of case and guide front pilot into input shaft counterbore and bearings. *NOTE - Be sure fourth gear synchronizer blocking ring slots index with inserts on 3-4 synchronizer assembly.* Raise countershaft gear assembly and thrust washers until countershaft can be inserted from rear of case into gear and bearings. Push countershaft through, displacing the "dummy" shaft until it contacts front of case. Position flat on rear of shaft horizontally so it aligns with slot in extension housing, then tap shaft into place.

8) Install reverse idler gear with fork groove toward rear and idler shaft flat in a horizontal position and parallel with countershaft flat. Install a new gasket on rear of case using a non-drying sealer, then install extension housing. Align dowel in housing with hole in rear bearing adapter, and tighten bolts. *NOTE - If two long and two short bolts reus d, install long bolts in upper right and lower left holes.*



9) Install new bearing retainer gasket, using a sealer, then install retainer, with drain slot facing downward. Tighten bolts to 12-15 ft. lbs. *NOTE - If a new seal was required in retainer, remove with Tool T58L-101-A and a sliding hammer.* Tap new seal into position with a hammer.

10) Place 1-2 and 3-4 synchronizers in neutral and reverse idler gear in reverse (forward) position. Set reverse shift lever in position, then install a new shift cover gasket on case, using sealer. Install shift cover and attaching bolts (dip bolts in sealing compound before installation) and tighten to 10-13 ft. lbs.

11) Install flywheel housing, using sealer on attaching bolts, and tighten them to 32-36 ft. lbs. Install clutch release bearing on release lever, then position lever through housing (from inside housing) and clip lever retainer on its hook using the same notched screwdriver used for removal. Install shift selector assembly on housing and connect shift rods, then adjust shift linkage (see "Adjustment" above). *(Continued)*

SYNCHRONIZER ASSEMBLY

GEARSHIFT COVER ASSEMBLY

COMET & FALCON (6 CYL.) 4-SPEED SYNCHRO-MESH (Cont.)

Disassembly (Shift Cover)

Remove levers from cams and shafts, then remove roll pin from upper fork shaft and remove forks and shafts. Remove reverse cam and shaft, then rotate reverse fork and shaft assembly to disengage detent ball and remove fork and shaft. *NOTE - Hold cloth over shaft cover boss nearest to fork to catch detent ball and spring when shaft clears boss hole.* Remove other cam assemblies while holding a cloth to catch detent balls. Push interlock sleeve, spring and remaining ball out of cover. Remove interlock pins from reverse fork and shaft bosses in cover. If seals need replacing, remove them with a screwdriver.

Reassembly (Shift Cover)

Install 1-2 and 3-4-to-reverse interlock pins in holes in reverse fork and shaft bosses, then install 3-4 shift cam in cover. Install 1-2-to-3-4 cam interlock sleeve, ball, spring and another ball. Hold 3-4 cam in neutral position with the 1-2 ball depressed while 1-2 cam is installed in cover. Install levers and tighten retaining nuts to specifications (see below). Check clearance between interlock, detent sleeve and 1-2 and 3-4 shift cams (in and between all shift positions). Clearance should be .0005" to .010". *NOTE - Service sleeves are available to compensate for wear.* With 1-2 and 3-4 shift cams in neutral position and the 1-2 and 3-4-to-reverse interlock pin resting on cams, install reverse shaft detent spring and ball and reverse fork and shaft. Install reverse shift cam through cover and into aligned fork and shaft. Install reverse cam operating lever (leave nut and washer loose). Position 1-2 and 3-4 forks onto shift cams and install fork shaft. Align shaft hole with the one in cover and install lock pin. Check all shift positions for freedom of movement and interlock action.

Disassembly (Gear Selector)

Remove snap ring from end of selector shaft and remove washer and spring, then disconnect selector levers and bracket from shaft. Drive short selector lever pin from shaft, then drive out long selector pin and remove trunnion and shaft. If necessary to remove studs from selector levers, remove cotter pins, washers and studs.

Reassembly (Gear Selector)

Reverse disassembly procedure.

Tightening Specifications

Extension Housing Bolts (7/16"-14)	12-20 ft. lbs.
Extension Housing Bolts (3/8"-16)	23-28 ft. lbs.
Input Shaft Bearing Retainer Bolts	12-15 ft. lbs.
Transmission to Flywheel Housing Bolts	32-36 ft. lbs.
Transmission Cover Bolts	10-13 ft. lbs.
Rear Support to Extension Housing Bolt	18-24 ft. lbs.
Universal Joint U-Bolt Nut	7-10 ft. lbs.
Shift Levers to Cam & Shaft Lock Nuts	12-15 ft. lbs.

COMET & FALCON (6 CYL.) 3-SPEED SYNCHRO-MESH

Comet (1963)
Falcon (1963)

Description

Three speed, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse). All helical gear type of same design used on previous models.

Removal & Installation

Removal - Remove propeller shaft, then disconnect speedometer cable and gearshift rods at transmission. Remove extension housing-to-support bolt. Place a jack under flywheel housing and raise rear of engine slightly, then remove transmission mounting bolts and install two guide pins in lower holes. Remove transmission by sliding to rear to clear input shaft and guide pins. *NOTE - To prevent oil leakage after removal of propeller shaft, install Tool T60K-7657-A (Falcon), 7657-G (Comet). Tool must be removed before transmission can be removed from car.*

Installation - Reverse removal procedure.

Overhaul

See 1960 Final Data, Page 406 or later Manual edition.

FORD MOTOR CO. FULLY SYNCHRONIZED 3-SPEED SYNCHRO-MESH

Comet & Falcon V8 (1963)
Falcon Station Bus (1963)
Falcon Club Wagon (1963)
Fairlane & Meteor (1963)
Ford Galaxie (1963)
Mercury Monterey (1963)
Ford Truck F-100, F-250 & P-350 (1963)
Econoline (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 TRANSMISSION INPUT SHAFT NEEDLE BEARING INSTALLATION CAUTION:* When installing needle bearings in input shaft, use a minimum amount of grease to retain bearings in position during installation to prevent clogging input shaft lube holes. If excessive grease is used, lubricant flow to bearings will be restricted.

Description

Three-speed, fully synchronized type, with all gears except reverse gear in constant mesh. Forward speed gears are all helical-cut. Reverse gears are spur-cut.

Removal & Installation

Fairlane, Meteor, Galaxie & Monterey

Removal - Drain transmission and remove propeller shaft, then disconnect speedometer cable and shift rods at transmission. On cars with overdrive, disconnect overdrive wires and control cable. Disconnect parking brake cable and support engine with a jack, then remove engine rear support and crossmember as a unit. Remove transmission-to-flywheel housing attaching bolts and install two guide pins in lower bolt holes. Move transmission to rear to clear clutch assembly and remove from car.

Installation - Reverse removal procedure and refer to "Tightening Torque Table".

Ford Truck

Removal - Drain lubricant, disconnect speedometer cable, propeller shaft, and gearshift linkage at transmission. On propeller shaft type parking brake, disconnect cable clevis at cam and remove cable conduit clamp. On models with overdrive transmission, disconnect wires and control cable at transmission. On 4-Wheel drive models, remove transfer case shift lever bracket from transmission. On all models, remove transmission attaching bolts and install guide studs, then pull transmission rearward to clear clutch assembly, and remove transmission.

Installation - Reverse removal procedure and refer to "Tightening Torque Table".

Econoline Truck

Removal - Drain transmission and remove propeller shaft, then disconnect speedometer cable and shift rods at transmission. Support engine with a jack and remove rear support anchor bolt and nut, then lower engine to clear support. Remove transmission attaching bolts and move transmission rearward to clear clutch assembly, and remove from truck.

Disassembly

1) Drain transmission, then remove transmission cover and gasket, extension housing and gasket, and front bearing retainer and gasket. *NOTE - On Econoline Trucks, remove companion flange from transmission output shaft before removing extension housing.*
2) Remove lubricant filler plug from right side of case, then work through plug opening and drive roll pin out of case and countershaft with a small punch. Hold countershaft gear with a hook and push countershaft out of case toward rear with a suitable dummy shaft (Tool T63-P-7111-B) until countershaft gear can be lowered to bottom of case.
3) Remove input shaft and gear from front of case (Except 352" & 390" Eng. transmissions). *NOTE - On 352" & 390" Eng. transmissions, move input shaft forward until gear contacts case, then remove large outer snap ring. Input shaft will be removed after output shaft assembly is removed.*
4) Remove snap ring securing speedometer gear to shaft (snap ring not used on Econoline Trucks), then slide gear off output shaft and remove gear lock ball. Remove output shaft bearing snap ring, then remove bearing using tool shown in illustration.
5) Place both shift levers in neutral position, then remove setscrew retaining detent springs and plugs in case and remove these parts (see illustration). Remove 1st-Rev. shift fork setscrew and slide shift rail out through rear of case. Rotate shift fork upward and re-

(Continued)

FORD MOTOR CO.
FULLY SYNCHRONIZED 3-SPEED
(Continued)

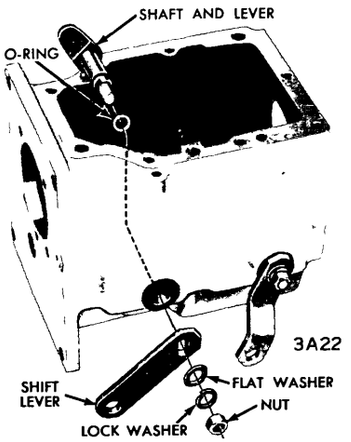
move. Remove 2nd-3rd shift fork setscrew and rotate shift rail 90° with a pair of pliers. *CAUTION - Do not damage rail surface with pliers.* Lift interlock plug from detent bore with a magnet and tap inner end of 2nd-3rd shift rail to drive expansion plug from front of case. Remove shift rail from case, then remove remaining detent plug and spring from detent bore. Remove 2nd-3rd shift fork from case.

6) Lift output shaft assembly out through top of case. On 352" & 390" Eng. transmissions, push input shaft and gear into case until bearing is free of bore, then remove assembly from case.

7) Drive reverse idler gear shaft out through rear of case with a drift punch, then remove idler gear and thrust washers from case. Remove countershaft gear from case, being careful not to allow dummy shaft and needle bearings to fall out of gear. Remove countershaft retaining pin from bottom of case.

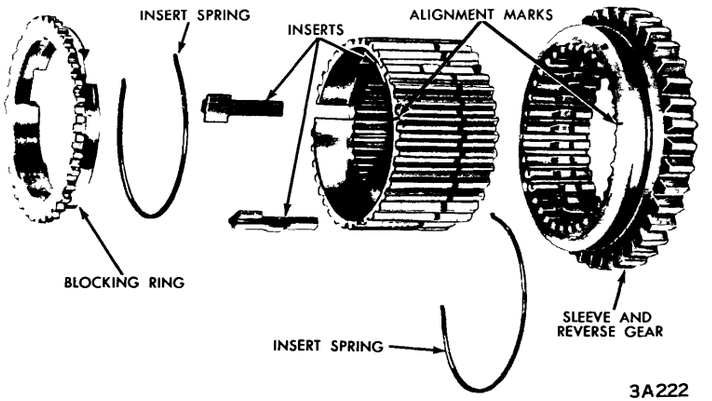
8) Remove outer shaft levers from shift shafts, then slide both shift shafts out of case (discard "O" rings).

9) Remove snap ring from front of output shaft and slide synchronizer and second speed gear off shaft. Remove the next snap ring and tabbed thrust washer from output shaft and slide off 1st gear and blocking ring. Remove the third snap ring from output shaft and slide off reverse gear and sleeve.



10) Remove dummy shaft from countergear and remove 50 roller bearings and two retainer washers from countergear. If input shaft bearing is to be replaced, remove and install with tools shown in illustration. Disassemble synchronizer units (see illustrations).

Inspection



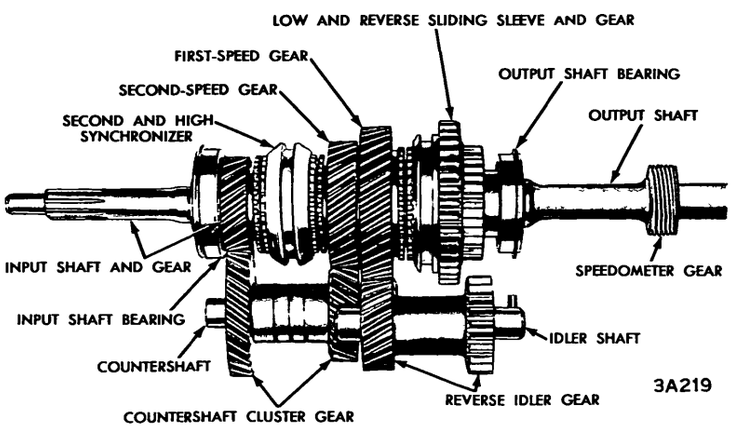
Wash all parts in cleaning solvent and dry with air. Dip bearings in transmission lubricant after they have been dried, then wrap in clean lint-free cloth until ready for installation. Inspect transmission case for cracks, wear, damaged bearing bores, or damaged threads. Remove all small nicks or burrs from front of case. Check all other parts for wear, chipped or broken teeth, and damage. Replace parts as necessary.

Countershaft Gear Endplay Check - Install dummy shaft in gear, then install 25 needle bearings and a retainer washer at each end of gear (retain in position with grease). Install countershaft gear assembly, thrust washers, and countershaft in case, then turn transmission case in a vertical position. Check clearance between upper thrust washer and surface of gear. Clearance should be .004-.018". If clearance is excessive, install new thrust washers as required. Remove countershaft with the dummy shaft and allow countershaft gear to remain in case.

Reverse Idler Gear Endplay Check - Clearance should be .004-.018". Check in same manner as for countershaft gear (above). If clearance is excessive, replace thrust washers. *NOTE - Thrust washer with flat side must be at web end and spur gear must be toward rear of case.*

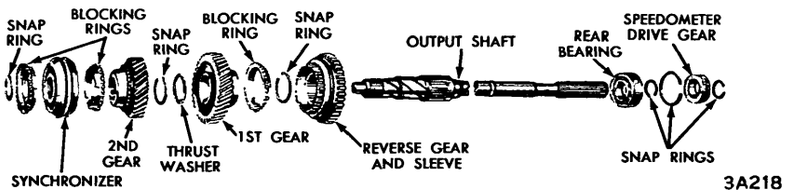
SHIFT LEVER ASSEMBLIES

1ST & REV. SYNCHRONIZER ASSEMBLY



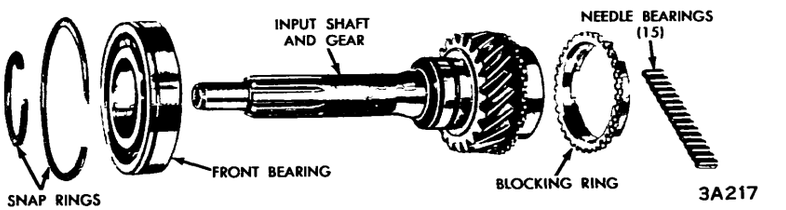
Reassembly

1) If countershaft gear was not installed in case for endplay check, apply grease to both ends of bore in gear and install 25 needle bearings and retainer washer at each end, with dummy shaft inserted in countergear. Install thrust washers at each end of gear and install countergear assembly in transmission case. Allow assembly to rest on bottom of case.



2) Install insert spring in groove of 1st-Rev. synchronizer hub, making sure that spring covers all insert locations, then start hub in sleeve, aligning index marks. Position three inserts in hub so that small end is over spring and shoulder is on inside of hub. Slide sleeve and reverse gear onto hub until detent is engaged, then install second insert spring in front of hub to hold inserts against hub.

3) Install an insert spring in groove of 2nd-3rd synchronizer hub so all three insert locations are covered,



(Continued)

TRANSMISSION GEAR TRAIN

OUTPUT SHAFT ASSEMBLY

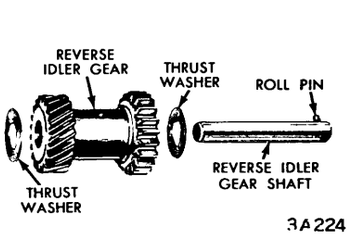
INPUT SHAFT ASSEMBLY

FORD MOTOR CO. FULLY SYNCHRONIZED 3-SPEED (C ntinued)

then start hub into sleeve, aligning index marks. Place three inserts on top of retaining spring and push assembly together. Install remaining insert spring so spring ends cover same slots as the other spring (do not stagger springs). Place a synchronizer blocker ring in each end of synchronizer sleeve.

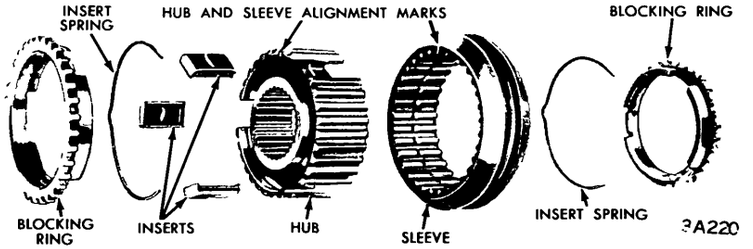
4) Lubricate output shaft with transmission lubricant and slide 1st-Rev. synchronizer assembly onto output shaft with teeth end of gear facing toward rear of shaft. Install snap ring. Coat tapered machined surface on 1st gear with grease and place blocker ring on greased surface. Slide 1st gear onto output shaft with blocker ring toward rear of shaft (rotate gear as necessary to engage three notches in blocker ring with synchronizer inserts), then install thrust washer and snap ring.

5) Coat tapered machined surface of 2nd gear with grease and slide blocker ring onto it, then slide 2nd gear with blocker ring and 2nd-3rd synchronizer onto output shaft. *NOTE - Tapered machined surface of 2nd gear must be toward front of case, and notches in blocker ring must engage synchronizer inserts.* Secure in position with snap ring.



6) Install new "O" ring seal on each shift shaft, then lubricate with transmission fluid and install shafts in case. Install outer shift levers. Coat bore of input shaft and gear with grease and install 15 needle bearings in bore.

7) On 352" & 390" Eng. transmissions, install input shaft and gear assembly through top of case, then work through rear opening in case, tap input shaft and gear assembly into case with a drift until gear contacts case. *NOTE - Make sure none of the needle bearings drop out.* On all models, position output shaft assembly in case.



8) Place a detent plug spring and plug in case, then place 2nd-3rd speed shift fork in synchronizer groove. Rotate fork into position and install 2nd-3rd speed shift rail (it will be necessary to depress detent plug to enter rail in bore). Move rail inward until detent plug engages center notch (neutral), then secure fork to rail with setscrew. Install interlock plug in case (top of plug will be slightly lower than surface of 1st-Rev. shift rail bore if 2nd-3rd shift rail is in neutral position). Install 1st-Rev. shift fork in groove of synchronizer, then rotate fork into position and install 1st-Rev. shift fork rail until center (neutral) notch is aligned with detent bore. Secure fork to rail with setscrew. Install remaining detent plug and spring, then install and tighten setscrew until head is flush with case. Install expansion plug in case.

9) On all models (Exc. 352" & 390" Eng. transmissions), install input shaft and gear in front of case, then install bearing retainer and gasket (oil return groove in in retainer at bottom). Install attaching screws and tighten to 19-25 ft. lbs.

10) On 352" & 390" Eng. transmissions, install large snap ring on input shaft bearing and carefully work shaft and gear onto front of output shaft until snap ring is seated against case. *CAUTION - Make sure needle bearings in input shaft do not fall out and that notches in blocker ring engage inserts in synchronizer.* Install bearing retainer and gasket (oil return groove in retainer at bottom), then install attaching screws and tighten to 19-25 ft. lbs.

REVERSE IDLER GEAR ASSEMBLY

2ND & 3RD SYNCHRONIZER ASSEMBLY

11) On all models, install large snap ring on rear bearing, then place bearing on shaft with snap ring end toward rear. Press bearing into place with tool shown in illustration. Secure bearing to shaft with snap ring. Hold speedometer drive gear lock ball in detent and slide speedometer gear onto shaft. Secure in place with snap ring (except Econoline Truck).

12) Place transmission in vertical position, then work through drain hole in bottom of case, align bore of countergear and thrust washers with bores in case, using a screwdriver. Insert countershaft into transmission case from rear and push dummy shaft out of countershaft gear. *CAUTION - Before countershaft is completely inserted, make sure that hole for roll pin is aligned with hole in case.* Install roll pin in case and countershaft, working through lubricant filler hole in case.

13) Install filler and drain plugs (magnetic drain plug in bottom). Install extension housing and gasket (coat gasket with sealer). Dip threads of attaching bolts in sealer before installing, and tighten to 42-50 ft. lbs. With transmission in gear, fill with lubricant while rotating gear assembly. Coat new cover gasket with sealer, then install cover and tighten screws to 14-19 ft. lbs.

Extension Housing Bushing & Seal Replacement - Bushing and seal should be replaced with extension housing attached to transmission case.

Removal (Bushing & Seal) - Remove bushing and seal in a single operation using Tool T52L-7000-GAE or 7000-G.

Removal (Seal Only) - Use Tool 1175-AB and a suitable sliding hammer.

Installation (Bushing) - Use Tool T57P-7697-B or 7657-G.

Installation (Seal Only) - Use Tool T57L-7657-A or 7657-D.

FORD TRUCK 3-SPEED SYNCHRO-MESH

Ford Trucks (1963)

Description

Transmission is same design as used on corresponding previous models.

Removal Of Transmission

Drain transmission, then disconnect speedometer cable, propeller shaft, and gearshift linkage at transmission. On propeller shaft type parking brake, disconnect cable clevis at cam and remove cable conduit clamp. On models with overdrive transmission, disconnect wires and control cable at transmission. On 4-wheel drive models, remove transfer case shift lever bracket from transmission. On all models, remove transmission attaching bolts and install guide studs, then pull transmission rearward until input shaft clears clutch assembly and remove transmission.

Overhaul

See "Ford Truck 3-Speed Light & Medium Duty" in Transmission Section of Manual.

FORD TRUCK 4-SPEED SYNCHRO-MESH

Ford Trucks (1963)

Description

Transmission is same design as used on corresponding previous models.

Removal Of Transmission

On all models, except Tilt Cab, remove floor mat and accelerator pedal, then remove transmission cover plate. Disconnect parking brake and remove gearshift housing. On Tilt Cab models, disconnect parking brake rod at transmission and remove rear cross shaft housing. On all models, disconnect drive shaft and speedometer cable, then remove two upper transmission attaching bolts and secure jack to transmission. Remove remaining transmission attaching bolts and slide transmission rearward to clear clutch assembly and remove from truck.

Overhaul

See "Ford Truck 4-Speed (Synchro-mesh)" in Transmission Section of Manual.

OLDSMOBILE (EXC. F-85) 3-SPEED SYNCHRO-MESH

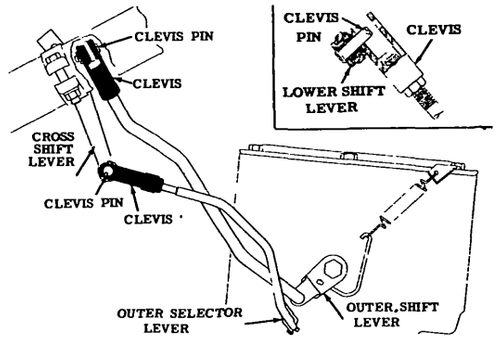
Oldsmobile, Exc. F-85 (1963)

Description

Same design transmission as used on previous models.

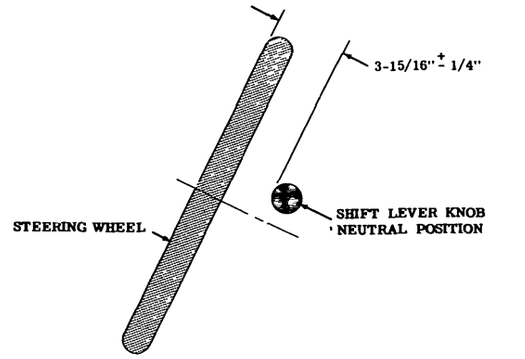
Shift Linkage Adjustment

NOTE - Two adjustments required as follows:



Shift Lever - Place outer lever on transmission in second gear position (outer lever forward, inner lever to rear), then disconnect shift rod from steering column lower shift lever at clevis. Hold steering column lower shift lever upward against its stop in mast jacket, then install clevis pin through lower shift lever from bottom side and adjust clevis so it slides freely over pin. Shorten shift rod by turning clevis **5½ turns.** Install clevis pin and cotter pin, and tighten clevis locknut.

Cross Shift Linkage - Disconnect cross shift rod from steering column cross shift lever. With transmission selector lever on transmission against its stop (rearward), adjust upper clevis so that clevis pin will easily enter hole in cross shift lever at lower end of steering column. Remove clevis pin and lengthen rod by turning clevis 5 turns. *NOTE* - This should bring selector lever at steering wheel to within 3 15/16" ± 1/4" of steering wheel (see illustration). Install clevis pin and cotter pin, then tighten clevis locknut.



Removal & Installation

Removal - Drain transmission and disconnect control rods and speedometer cable at transmission. Remove propeller shaft, then remove four transmission-to-clutch housing bolts and slide transmission rearward until main shaft clears clutch housing. Remove transmission from under car.

Installation - Reverse removal procedure and note the following: Apply a light coat of lubricant to pilot on main drive gear. Tighten transmission-to-clutch housing bolts to 60-70 ft. lbs.

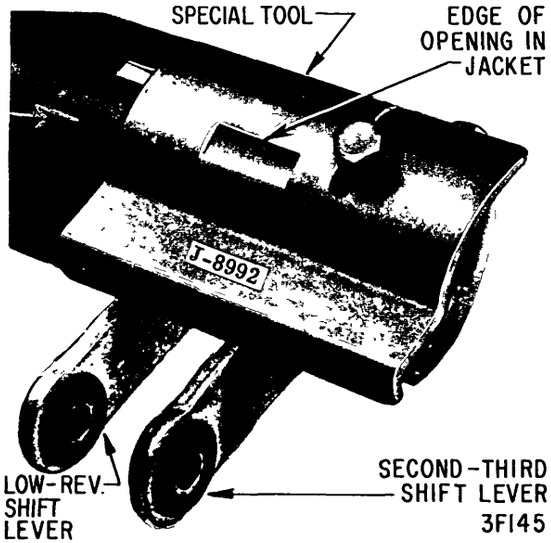
SHIFT LINKAGE ADJUSTMENT

CROSS SHIFT ADJUSTMENT

Overhaul

See 1957 Final Data, Page 369, or later Manual edition.

BUICK SPECIAL & OLDSMOBILE F-85 3-SPEED SYNCHRO-MESH

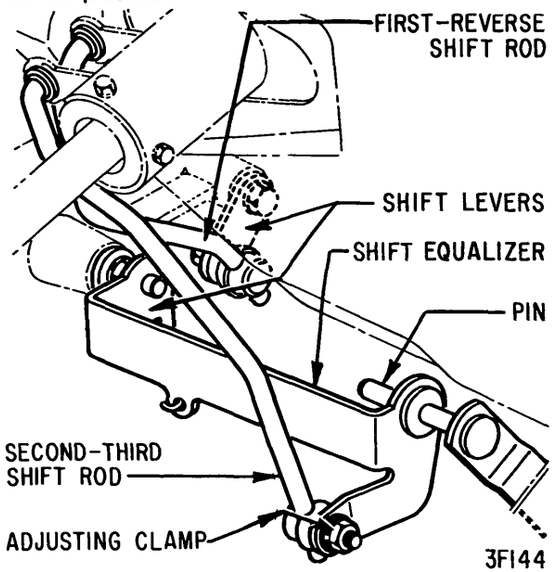


Buick Special (1963)
Oldsmobile F-85 (1963)

Description

Warner T-86 three speed, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse). Top opening, with transmission shift levers and shafts mounted in side of case.

Shift Linkage Adjustment



NOTE - Make sure shift equalizer is aligned and not binding. The equalizer pin welded to underbody side rail should go through outboard side of shift equalizer at right angles and should be located in center of hole in equalizer (rubber washer). If necessary to align pin, bend bracket as required. CAUTION - Use to care to avoid breaking the weld. With transmission in neutral, loosen shift rod adjusting clamps (see illustration). Loosen lever retainer ring bolt at lower end of steering column and install Tool J-8992 on mast jacket, then position second and third shift lever against tool and tighten adjustment clamp at equalizer to 10-12 ft. lbs. (do not over-tighten). Move first and reverse shift rod until a good cross-over point is obtained (lift control lever at steering wheel location several times until no interference is felt when moving lever from second-third to first-reverse neutral position). *NOTE - When lever is in first-reverse position it should spring down to second-third neutral position when released.* Hold lever midway in cross-over position and tighten adjusting clamp at equalizer. Recheck for smooth cross-over.

SHIFT LINKAGE ADJUSTING TOOL

Overhaul

See 1961 Final Data, Page 395 for overhaul and service procedure.

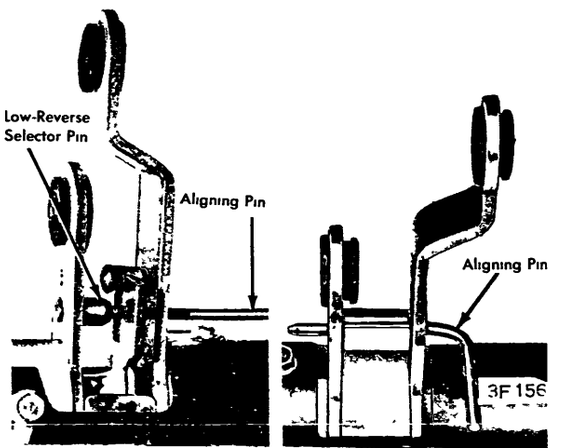
NOTE - Transmission model number is cast in side of transmission case.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 RAMBLER TRANSMISSION LUBRICATION NOTE: Automatic Transmission Fluid Type "A" (Suffix "A") is recommended for synchro-mesh transmission lubrication.*



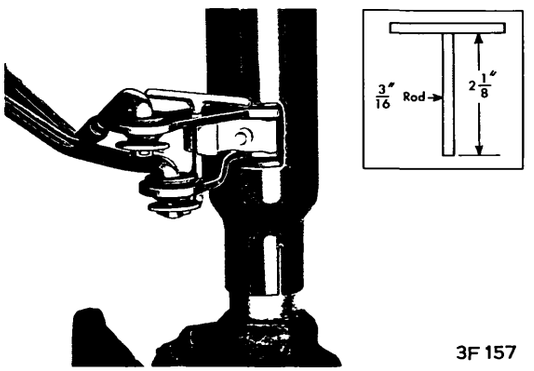
Description

Transmissions are same design as used on corresponding previous models

Shift Linkage Adjustment

Rambl r - *"Ainsworth" and "Douglas" type shift systems used in production. Adjustment procedures are different.*

"**Ainsworth**" **Type** - *NOTE - Shift levers are actuated by a shift gate slot which engages a pin on shaft lever.* Disconnect shift rods from levers at lower end of steering column, then insert a 3/16" rod through hole in lever retaining bracket into holes in upper lever and in pin of lower lever Adjust trunnions on gearshift rods so they enter freely into operating levers (shift levers on transmission in neutral position) Connect shift rods to levers and tighten trunnion locknuts Remove aligning rod and check shift lever operation in all positions .



"AINSWORTH" TYPE "DOUGLAS" TYPE

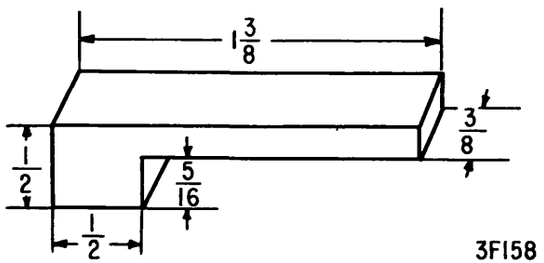
RAMBLER SHIFT LEVER ALIGNMENT

"**Douglas**" **Type** - *NOTE - Shift levers are actuated by lugs on shifter tube engaging in slots in levers.* Disconnect rods from levers at lower end of steering column, then insert a ¼" rod through lever spacer and operating levers Adjust trunnions on gear shift rods so they freely enter into levers (shift levers on transmission in neutral position). Reconnect rods and tighten locknuts, then remove aligning pin and check gear shift in all positions .

Studebaker (Exc. Avanti) - Disconnect shift rods at levers on transmission and place transmission levers in neutral position Align shift levers at lower end of steering column and insert a 3/16" rod through levers and spacer Adjust length of each shift rod so clevis pin hole aligns with hole in transmission shift lever, **then shorten reverse rod 2 full turns.** Connect shift rods to levers on transmission and remove aligning rod from levers at lower end of steering column. Check operation of gearshift in all positions *NOTE - If resistance is felt at cross-over point when shifting from low to second, shorten low-reverse rod an additional one or two turns.*

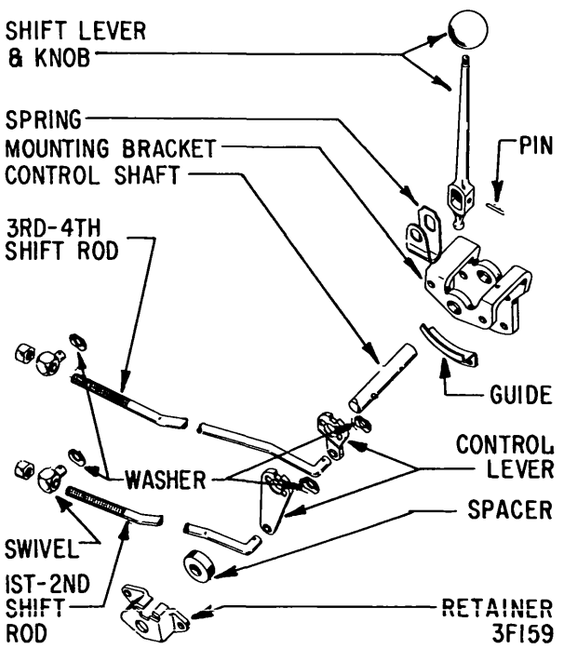
STUDEBAKER SHIFT LEVER ALIGNMENT

Studebaker Avanti (Floor Shift) - Remove console mounting plate cover from around shift lever so that notches in top of levers are visible. Loosen locknuts of control rod swivel at transmission shift levers and place transmission shift levers in neutral position. Install gauge block (see illustration) with thicker portion of block in the upper notches of control levers. With block in position and transmission shift levers in neutral, tighten the swivel locknuts being careful not to move levers on transmission out of neutral position. Remove gauge block and check for proper shifting.



Jeep (2-Wheel Drive Models) - Place shift levers in neutral position and disconnect both control rods at transmission levers. On all models except those with 6-226 engines, install a ¼" rod through aligning holes in steering column levers. On 6-226 engine models, position Tool W-259 on slot and insert a 3/16" rod through steering column shift levers and index rod in slot at top of gauge On all cars, adjust steering column end of shift rods so that lower ends will enter transmission levers freely If shift pin strikes edge of slot in lever clutches, disconnect low-reverse rod at transmission (rear lever) and lengthen or shorten rod slightly so pin will engage both slots freely

Jeep (Forward Control Models) - With gearshift levers in neutral, loosen jam nut at rear end of remote control rods, then remove rods from transmission shift levers Make sure levers on transmission are in neutral position, then adjust length of rods so they easily slip into holes in transmission shift levers Replace cotter pins and tighten jam nuts and check for smooth operation



Removal & Installation

Removal (Rambler) - *NOTE - Engines in Rambler Classic and Ambassador models must be supported before removal of transmission assembly.* On Rambler American, Disconnect rear spring front brackets from

(Continued)

AVANTI FLOOR SHIFT ALIGNMENT BLOCK

AVANTI FLOOR SHIFT ASSEMBLY (3-SPEED)

WARNER 3-SPEED SYNCHRO-MESH (Continu d)

floor pan, brake hose bracket, and brake cable at equalizer. On other models, disconnect brake tube bracket from floor pan, parking brake cable at equalizer, and cable housing at torque tube bracket, then disconnect torque tube from transmission. On all models, disconnect shock absorbers at lower mounting and move rear axle assembly to rear, disengaging drive line from transmission. Disconnect shift levers, speedometer cable (and overdrive cable and wires if so equipped). Remove transmission attaching bolts and install two guide pins, Tool J-1434, in upper bolt holes, then slide transmission back to clear clutch assembly.

Installation (Rambler) - Reverse removal procedure.

Removal (Studebaker, All Models) - Disconnect propeller shaft at rear joint flange and slide it out of transmission housing. Disconnect rods at transmission shift levers (Exc. Avanti), from shift assembly (Avanti). On Avanti models, remove shifter assembly mounting bracket from transmission, then push the assembly upward to provide working clearance. On all models, disconnect speedometer cable at transmission housing, then remove speedometer pinion. On all models (Exc. Avanti), remove clutch operating bracket, shaft and bearing at transmission. On all models, support transmission and remove attaching bolts, then move transmission back to clear clutch assembly and remove from car. *NOTE - On Avanti, lower front end of transmission until drive pinion clears clutch housing.*

Installation (Studebaker, All Models) - Reverse removal procedure.

Removal (Jeep 2-Wheel Drive) - Disconnect shift rods at transmission levers, and speedometer cable at transmission (and overdrive cables and wires if so equipped). Disconnect propeller shaft at front universal. Remove support at rear of overdrive and take out overdrive governor. Position jack under engine for support and remove frame crossmember with insulators attached. Back out transmission attaching screws as far as possible and yet support transmission, then pull transmission back to provide an opening between it and bell housing. Insert a long screwdriver through opening in side of bell housing and pry clutch release fork from engagement with release bearing carrier. Remove transmission attaching screws and pull transmission back to clear bell housing, then remove from car.

Installation (Jeep 2-Wheel Drive) - Reverse removal procedure.

Removal (Jeep 4-Wheel Drive) - Drain transmission and transfer case, then remove access cover from floor pan and remove gearshift housing (Exc. models with remote control). On remote control models, disconnect shift linkage at transmission. On all models, remove transfer case shift lever pivot pin, shift levers, and springs. *NOTE - If equipped with power take-off, remove shift lever plate and lever.* Disconnect propeller shafts at transfer case (disconnect end of power take-off shaft at transfer case, if so equipped). Disconnect speedometer cable at case, then disconnect hand brake cable. On Forward Control models, disconnect clutch release cable at bellcrank. On all models, place jacks under transmission and engine and remove nuts attaching rear mounting to frame crossmember, then remove transfer case snubbing rubber bolt at crossmember. Remove engine rear support crossmember, then remove transmission attaching bolts. Force transmission to right side to disengage clutch control lever tube ball joint, then lower jacks under engine and transmission and slide transmission and transfer case toward rear until clutch shaft clears bell housing.

Installation (Jeep 4-Wheel Drive) - Reverse removal procedure.

Overhaul

See 1959 Final Data, Page 398 or later Manual edition.

► *1963 (EARLY) STUDEBAKER NOISY FLOOR SHIFT LEVER ASSEMBLY CORRECTION:* A buzz or rattle condition in this assembly can be corrected by installing a new kit containing a shift lever, pivot pin, nylon bushing and spring and spacer washer. The new kits are available under the following part numbers: 1560157 (Avanti) 1560158 (Studebaker without bucket seats); 1560159 (Studebaker with bucket seats). Later production cars will have the new kits installed during assembly.

Description

4-Speed helical gear type (except reverse), with constant mesh, synchro-mesh in all forward speeds. Sliding gear (reverse).

Removal & Installation

See 1962 Final Data, Page 419 ("Warner 4-Speed Synchro-mesh") and note the following:

Removal (Buick, Exc. Special) - Drain transmission, then mark propeller shaft and front companion flange (for reassembly in original position). Disconnect propeller shaft at front companion flange and slide propeller shaft rearward as far as possible. On Buick LeSabre, remove gearshift knob, then remove floor shift trim bezel. On all models, disconnect speedometer cable from transmission and shift control rods from transmission shifter levers. Loosen three exhaust pipe joints so transmission and engine can be lowered slightly. Remove bolts attaching transmission mounting pad to transmission support, leaving mounting pad bolted to transmission. Use a wood block and jack up engine until transmission mounting pad clears support, then remove transmission support and lower jack so transmission clears underbody. Remove upper left and lower right transmission-to-flywheel housing attaching bolts and install suitable guide pins (Tool J-1126). Remove remaining attaching bolts and slide transmission back until drive gear clears housing, then lower transmission from car.

Installation (Buick, Exc. Special) - Reverse removal procedure and note the following: Lightly coat splines on end of main drive gear with lubriplate for a distance of 1". Fill groove in inner surface of throw-out bearing with wheel bearing grease.

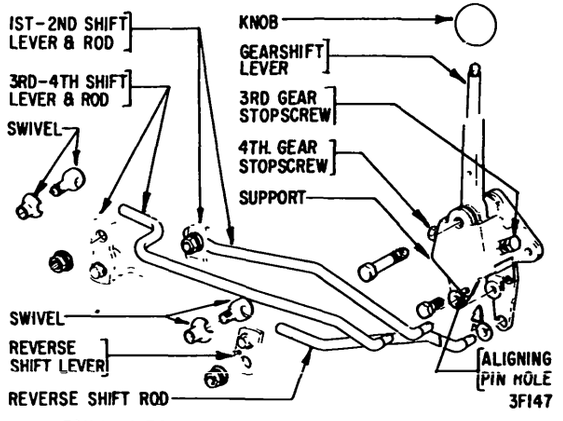
Removal (Buick Special, Pontiac & Oldsmobile F-85) - Drain transmission, then remove boot retainer screws and slide boot over shift lever. Disconnect speedometer cable at transmission. Disconnect shift control rods from shift levers on transmission, then remove manual shift lever and bracket assembly from extension housing. Remove complete drive line assembly and support rear of engine. On Buick Special, remove transmission mounting plate bolts and washers, then remove support-to-underbody bolts and remove transmission support. On Pontiac, remove transmission extension bracket-to-crossmember retaining nuts. On Oldsmobile F-85, disconnect intermediate exhaust pipe from cross-over pipe, then support rear of engine and remove rear mount-to-crossbar bolts and remove crossbar from side rails. On all models, remove two top transmission-to-clutch housing bolts and insert guide pins in these holes. Remove lower transmission-to-clutch housing bolts and slide transmission straight back on guide pins (on Pontiac, tilt rear of transmission upward to disengage bracket studs from crossmember support). *NOTE - On long wheelbase Pontiac models, it is necessary to remove crossmember support before removing transmission.*

Installation (Buick Special, Pontiac & Oldsmobile F-85) - Reverse removal procedure.

Removal (Chevrolet & Corvette) - Disconnect speedometer cable at transmission, then disconnect shift rods at shift levers and remove shift lever assembly from extension housing. On all models, except Corvette, remove bolts attaching center support to frame member, then remove propeller shaft and bearing assembly. On Corvette, disconnect propeller shaft at rear universal and remove it from transmission. On all models, support rear of engine and remove transmission support crossmember. Remove two top transmission-to-clutch housing bolts and install guide pins in these holes. Remove lower attaching bolts and slide transmission straight back on guide pins until shaft is clear of clutch assembly and remove transmission.

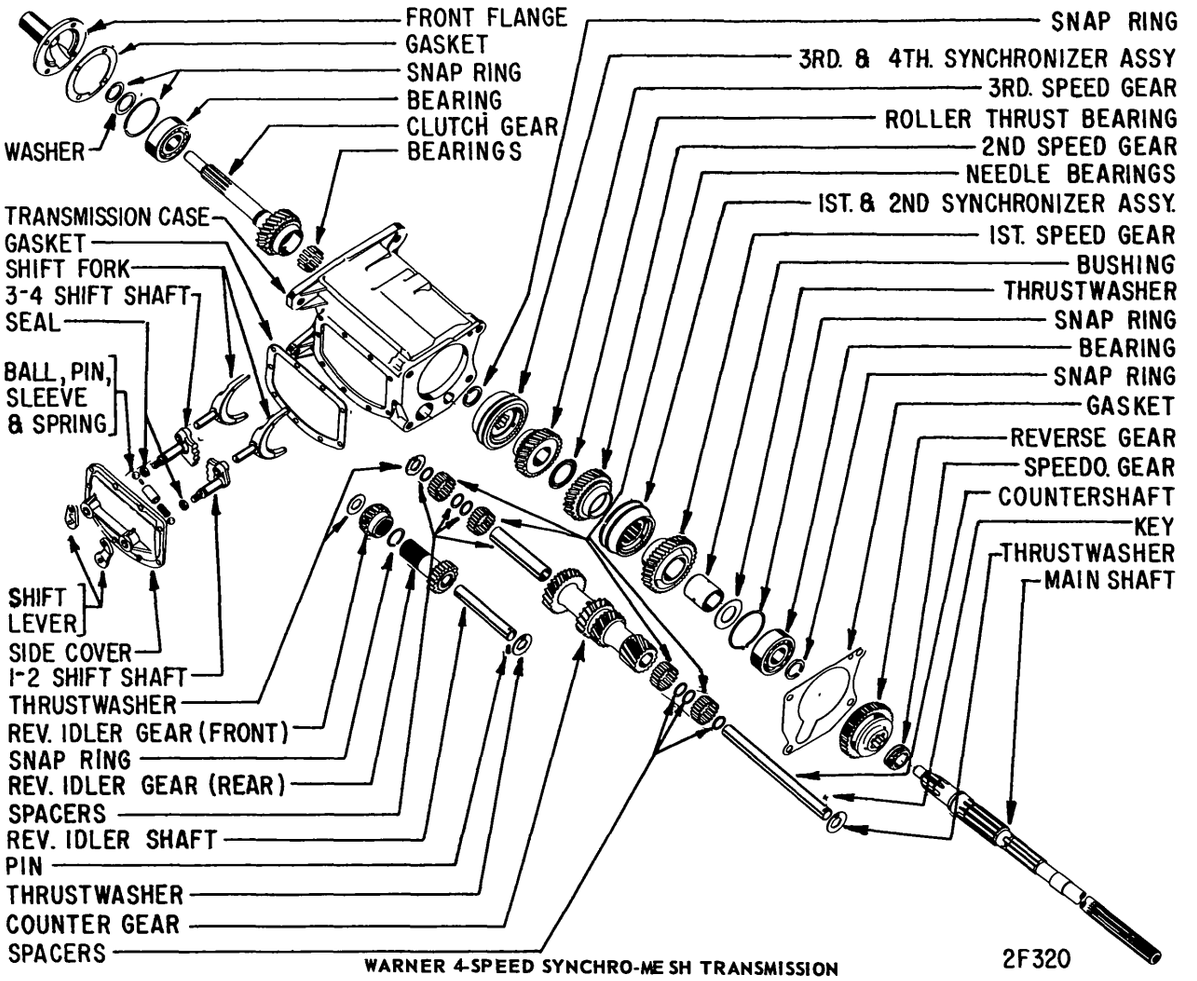
Installation (Chevrolet & Corvette) - Reverse removal procedure.

(Continued)



WARNER 4-SPEED SYNCHRO-MESH (Continu d)

Removal (Comet V8, Falc n Vo, Fairlane, Ford Galaxie, Mercury Monterey & Meteor) - Remove transmission gearshift lever boot retainer, then remove shift lever retaining bolts and remove lever from shift assembly. Remove propeller shaft and disconnect speedometer cable from extension Disconnect parking brake cable at equalizer bar and support engine with transmission jack. Remove bolts retaining extension housing to engine rear support, then raise rear of engine with transmission jack and remove crossmember and engine rear support as a unit. Support transmission on a jack and remove transmission-to-clutch housing bolts. Install two guide pins in lower bolt holes and slide transmission to rear until input shaft clears clutch housing. *CAUTION - Do not depress clutch pedal while transmission is removed.*



Installati n (C met V8, Falcon V8, Fairlane, Ford Galaxi , M rcury M nt rey & Meteor) - Reverse removal procedure.

Rem val (D dg & Plymouth) - Remove attaching screws and slide shift lever boot up on lever, then remove lever attaching bolts and remove lever and boot from shift housing stub lever. Drain transmission and remove propeller shaft, speedometer cable, housing and pinion. *CAUTION - Be careful not to crush housing when removing cable.* Disconnect back-up light switch leads at connector (if so equipped), and disconnect parking brake control cable. Install a suitable engine support. *NOTE - If Tool C-3806 is used, make sure hooks are properly engaged in frame side members and that support ends are up against underside of oil pan flange.* Raise engine slightly and remove engine rear crossmember. Support transmission with a suitable jack, then remove transmission attaching bolts and slide transmission toward rear until main drive pinion shaft clears clutch disc. Remove transmission from under car.

Installati n (D dg & Plymouth) - Reverse removal procedure and note the following; Place a small amount of wheel bearing lubricant around inner end of main drive pinion shaft pilot bushing in the flywheel (do not lubricate end of pinion shaft). Tighten transmission attaching bolts and crossmember attaching bolts to 50 ft. lbs.

BUICK LESABRE SHIFT LINKAGE ASSEMBLY

WARNER 4-SPEED SYNCHRO-ME SH TRANSMISSION

Removal (Studebaker) - Drain transmission, then disconnect and remove shift assembly (On Avanti, push shift assembly upward out of way to provide working clearance). On all models, except Avanti, disconnect crossmember under transmission and slide it to rear along exhaust pipes for clearance. On all models, disconnect and remove propeller shaft. Remove speedometer pinion and cable from rear extension housing, then remove transmission attaching bolts. Move transmission to rear until shaft clears clutch assembly, and remove transmission from car.

Installation (Studebaker) - Reverse removal procedure.

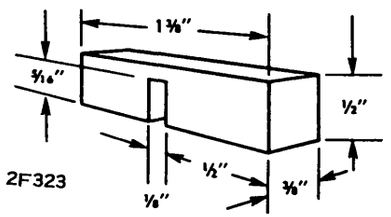
Overhaul

Se 1962 Final Data, Page 419 for overhaul and s rvic procedure.

Shift Linkage Adjustment

Buick LeSabre - Install guide pin, Tool J-21196 into hole in shift control (see illustration), then loosen shift rod adjuster clamps at transmission end of shift rods. Place shift levers on transmission in neutral position and tighten adjusting clamps. *CAUTION - Do not over-tighten clamps.* Remove guide pin in shift control and lever assembly, then hold shift lever in 4th gear position by resting hand on lever to remove all lash. Turn "stop" bolt on forward side of shift control until it just contacts shift lever, and tighten locknut. Repeat same procedure for 3rd gear and tighten "stop" bolt on rear side of shift control until it just contacts shift lever. Tighten locknut and check for ease of shifting.

Buick Wildcat - Loosen carpet on left side of console and install guide pin, Tool J-21196 through access hole in hole in shift control to align levers (see



(Continued)

WARNER 4-SPEED SYNCHRO-MESH (C ntinued)

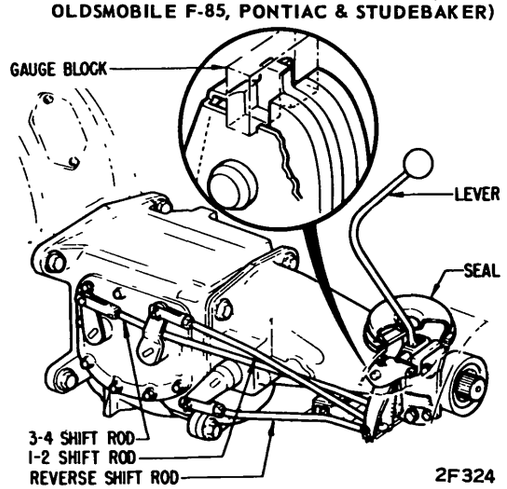


illustration). Loosen shift rod adjuster clamps at transmission end of shift rods and place levers on transmission in neutral. Tighten adjusting clamps to 10-12 ft. lbs. (do not overtighten). Remove guide pin, then install carpet and check for ease of shifting.

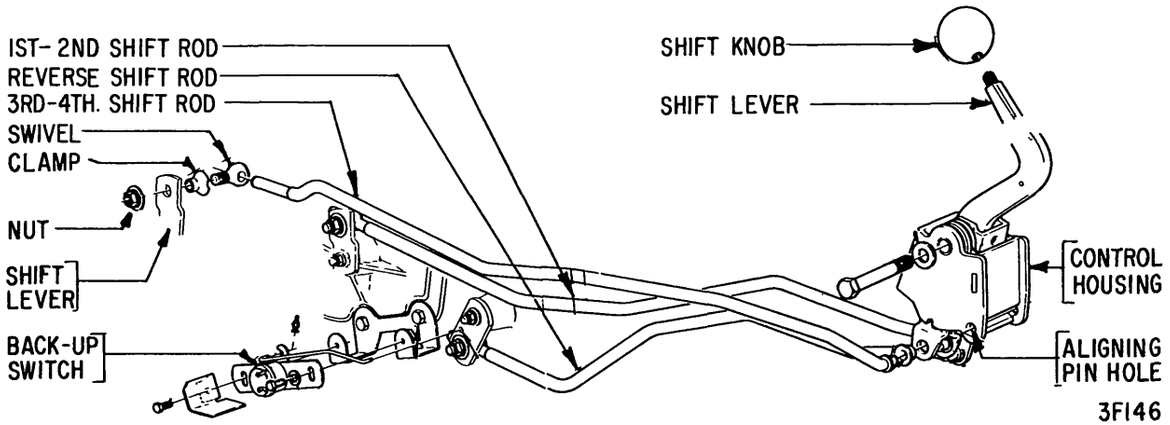
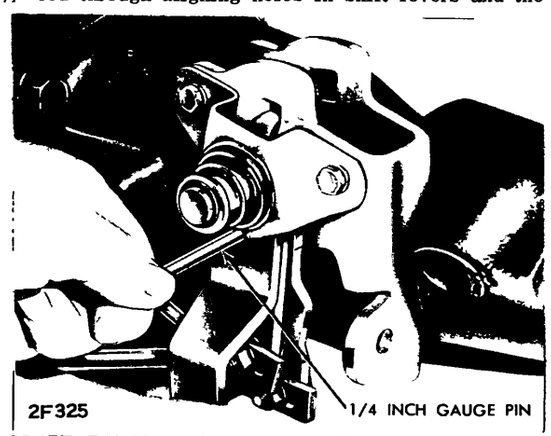
Buick Special, Chevrolet (All Models), Oldsmobile F-85, Pontiac & Studebaker - *NOTE - The gauge block (see illustration) will facilitate adjustment, however, the adjustment can be made by having an assistant hold manual shift lever in neutral position.* Remove transmission gearshift lever seal from floor pan, then place transmission in neutral and install gauge block (see illustration). Remove cotter pin, anti-rattle washer and clevis pin from each transmission shift lever. Make sure levers on transmission are in neutral position, then adjust threaded clevis on each shift rod to permit free entry of clevis pin into hole in transmission shift levers. Remove gauge block and reconnect clevis to each shift lever and check each shift. *NOTE - If roughness still exists, determine rod and clevis requiring further adjustment by sighting along the slot where gauge block was used. Levers in this assembly should not be out of line.*

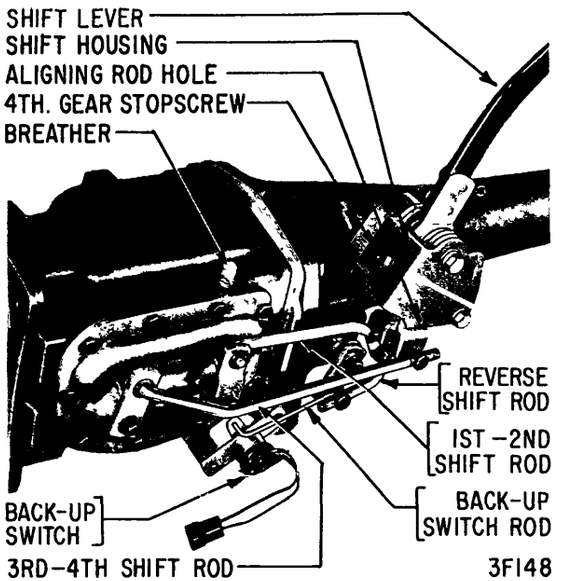


Comet, Falcon, Fairlane, Ford Galaxie, Mercury Monterey & Meteor - Place shift lever in neutral, then raise car on a hoist and insert a ¼" drill or alignment

SHIFT LINKAGE GAUGE BLOCK (BUICK SPEC., CHEVROLET, OLDSMOBILE F-85, PONTIAC & STUDEBAKER)



SHIFT LINKAGE ASSEMBLY (BUICK SPEC., CHEVROLET, OLDSMOBILE F-85, PONTIAC & STUDEBAKER)



BUICK WILDCAT SHIFT LINKAGE ASSEMBLY

rod into alignment hole (located in center of shift levers on extension housing. See illustration). If rod will not enter, check for bent or bellied connecting rods. If rods are correct shape, check for loose lever locknuts at rod ends. Adjust linkage by loosening rod-retaining locknuts and moving the levers until drill or gauge rod will enter alignment holes. *NOTE - Make sure levers on transmission are in neutral position and the reverse shifter lever is in neutral detent. If there is any doubt about location of neutral position, disconnect shift rods at retaining locknuts and rotate each forward-speed shift lever through its three positions until the center (neutral) detent is positively located. Move reverse shift lever forward until positive engagement of detent is felt.* Install and tighten shift rod and locknuts. Check operation of shift for smooth cross-over.

Dodge & Plymouth - Remove shift lever boot attaching screws and slide boot up shift lever, then make sure pivot bolt is tightened securely. Disconnect adjusting swivels on shift rods from gearshift assembly. Insert a ¼" rod through aligning holes in shift levers and the slots provided in gearshift support (to hold levers in a neutral position). Make sure all levers on transmission are in their neutral position, then adjust swivels on ends of shift rods for free entry into holes in shift levers at gearshift assembly. Connect and secure swivels on shift levers and remove alignment pin. Place gearshift lever in 4th speed position, then adjust "stop" screw located on front side of gearshift support so there is .020"-.040" clearance between lever and stop. Place gearshift lever in 3rd gear position and repeat the "stop" screw adjustment on the rear stopscrew. *NOTE - Use an Allen wrench to turn adjusting "stop" screws.* Check for ease of shifting and for smoothness of cross-over.

COMET, FALCON, FAIRLANE, FORD GALAXIE, MERCURY MONTEREY & METEOR SHIFT LINKAGE ADJUSTMENT.

DODGE & PLYMOUTH SHIFT LINKAGE ASSEMBLY

WARNER 4-SPEED (JEEP) SYNCHRO-MESH

Jeep 4-Wheel Drive M d ls (1963)

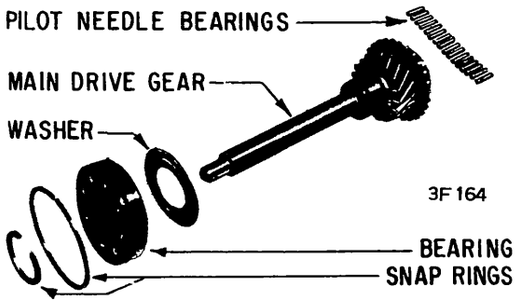
Description

Four-Speed synchro-mesh (2nd, 3rd, & 4th), sliding gear (low & reverse). Low & reverse gears are spur type; others are helical type.

Removal Of Transmission

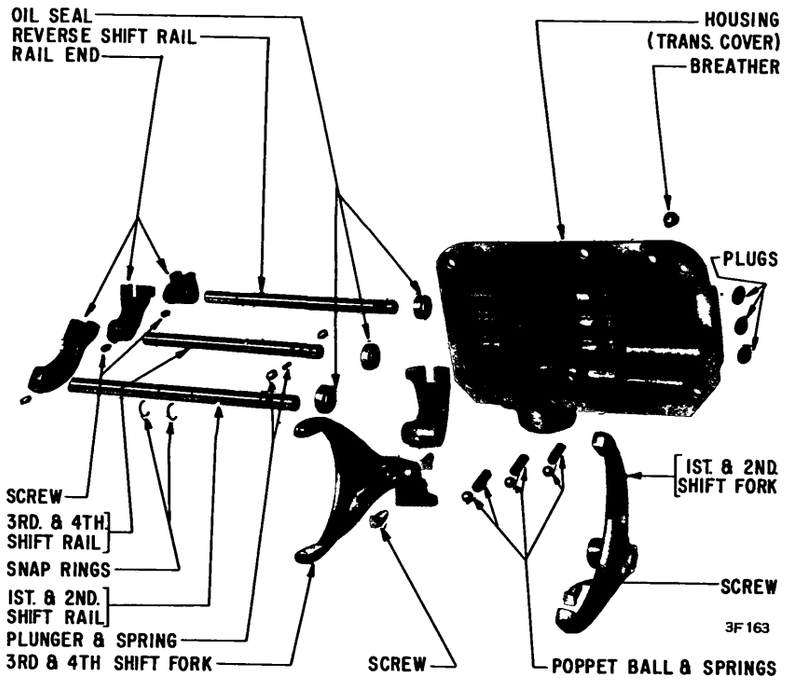
NOTE - Transmission and transfer case must be removed as an assembly.

1) Drain transmission and transfer case, then disconnect remote control rod shift linkage at transmission and transfer case. *NOTE - If equipped with power take-off, disconnect bowden wire at shift lever.*



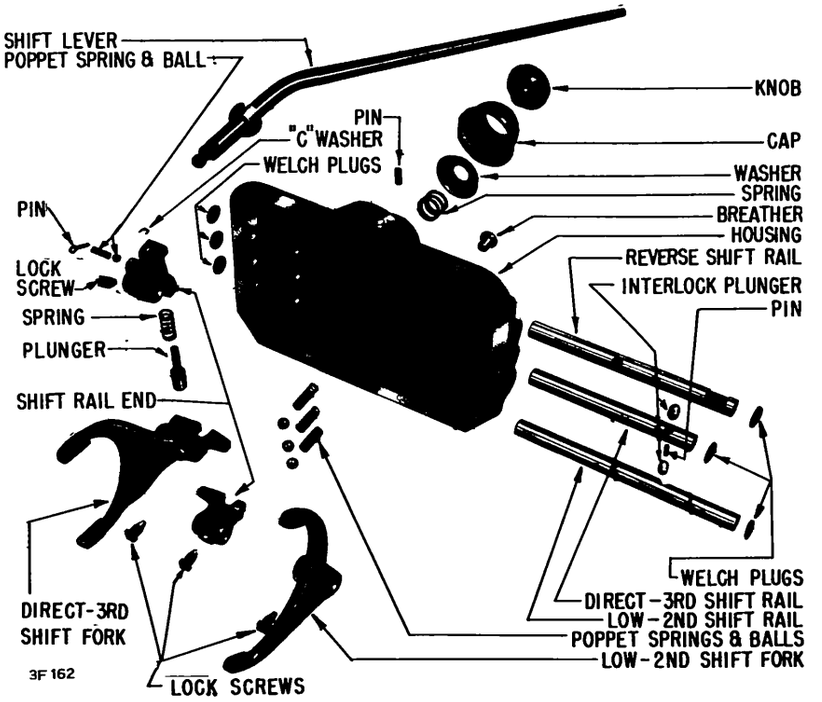
2) Disconnect front and rear propeller shafts from transfer case (if so equipped, disconnect power take-off drive shaft at transfer case end). Disconnect speedometer cable at transfer case, then disconnect hand brake cables at hand brake lever mounted on frame crossmember or at transmission brake.

3) Place jacks under transmission and engine, then remove nuts holding rear mounting to frame crossmember. Remove transfer case snubbing rubber bolt nut at crossmember. Remove bolts holding rear engine support crossmember to frame side rails and remove crossmember. Remove bolts holding transmission to bell housing.



4) On FC-150 models, force transmission to right to disengage clutch control lever tube ball joint. On all models, lower jacks under engine and transmission, then slide transmission and transfer case assembly toward rear until transmission mainshaft clears bell housing. Lower jack under transmission and remove transmission and transfer case assembly from car

Overhaul



See 1962 Final Data, Page 417

MAIN DRIVE GEAR SHAFT ASSEMBLY

FORWARD CONTROL MODELS

OTHER MODELS

WARNER 4-SPEED TRANSMISSION SHIFT ASSEMBLY

RAMBLER "TWIN STICK" TRANSMISSION CONTROL

Rambler (1963)

OVERDRIVE CONTROL

DESCRIPTION

Twin-Stick overdrive control used on models with floor mounted gearshift consists of conventional electrical components (see wiring diagram), a "kickdown" button mounted in center of transmission gearshift lever, and an overdrive control lever which is mounted on console to right side of transmission gearshift lever. Overdrive unit is locked out when control lever is in forward position, and is engaged when control lever is in the rear position. The kickdown button on transmission gearshift lever replaces the accelerator pedal operated kickdown switch used in conventional systems. With car in overdrive at speeds above 28 MPH, depressing kickdown button, places overdrive in "overtake" position if accelerator pedal is partially depressed. A vacuum switch prevents overdrive going into "overtake" when car is decelerating. A relay actuated indicator light on overdrive control lever escutcheon plate lights up when in overdrive.

TROUBLE SHOOTING & DIAGNOSIS

Faulty Operation

Check the following: Blown relay fuse in solenoid circuit. On Series 10 & 80, check for blown "Heater" fuse on fuse panel (part of governor circuit). On all models, check for insufficient travel of shift rod (adjust control cable to operating lever). Loose terminals or incorrectly located connecting wires. Grounded circuits, Defective solenoid points. Dirty or sticking relay points. Insufficient travel or poor contact in kickdown switch. Excessive endplay in governor shaft. Burned contact points in governor or damaged governor cap and contacts.

Overdrive Inoperative

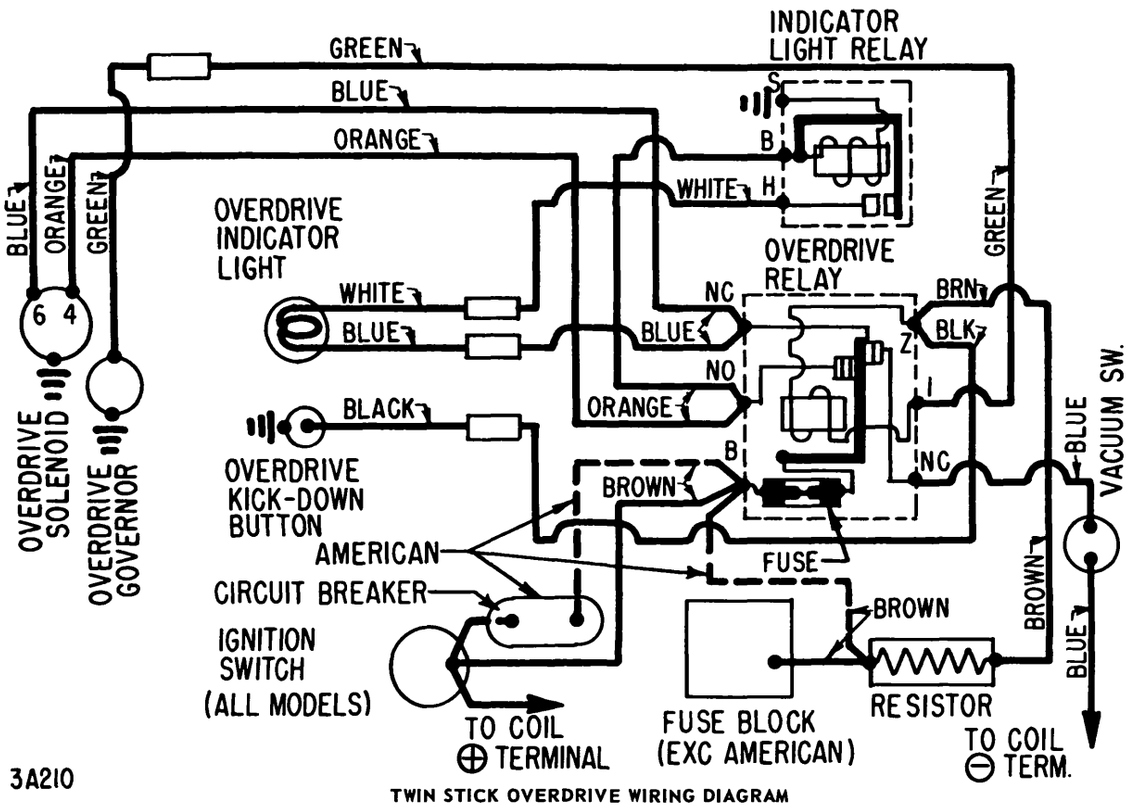
Check to see if overdrive control is pushed to rear limit of travel. Check to make sure that overdrive cable is adjusted to move overdrive lever firmly against stop on overdrive housing when in engaged position.

TESTING

With ignition switch on and manual overdrive control in rear position, use a test wire or 12 volt test light as follows:

1) Check 15 amp fuse in overdrive relay (Series 01); 20 amp heater fuse on fuse panel for line circuits and clean contacts.

2) Connect test leads directly from battery terminal of starter solenoid to "NO" terminal on overdrive relay. Overdrive solenoid should operate. If it does not, check for defective wire or connection at solenoid.



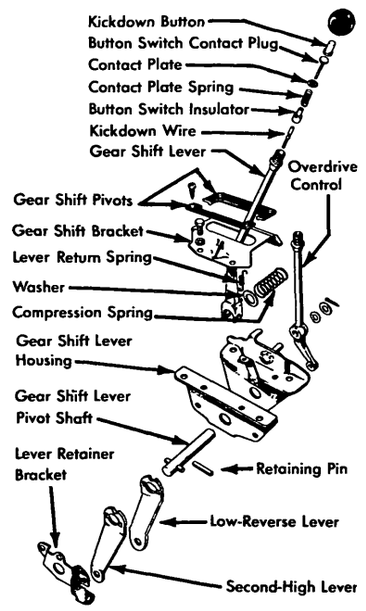
3) Connect jumper wire from No. 1 terminal of overdrive relay and to ground. If relay, resistor, and kickdown switch are operating properly, relay points will close and solenoid will operate.

4) To check for shorted pushbutton kickdown switch, remove wires from No. 2 terminal of overdrive relay, then connect a jumper wire from No. 2 terminal to "B" terminal of relay. If relay now operates, pushbutton kickdown circuit is shorted.

5) If solenoid does not operate, check for a defective resistor by connecting a jumper wire across resistor terminals.

6) Ground governor terminal. Solenoid should operate.

NOTE - If indicator light is shorted, engine will start. However, when engine is accelerated and vacuum switch closes, ignition coil will be shorted to ground through shorted indicator light.



TWIN STICK OVERDRIVE WIRING DIAGRAM

GEARSHIFT CONTROL

Adjustment

Disconnect control rods at levers on transmission, then remove snap-in plug from left side of console assembly. Install a 5/16" diameter pin through snap-in plug hole, through hole in console lever retainer bracket, then through slots in selector lever and into housing bracket. *NOTE - Selector levers will now be in neutral position.* Place transmission shift levers in neutral position, then adjust trunnions on shift rods so they enter freely into holes in transmission shift levers. Install trunnion cotter pins and remove alignment rod. Check gearshift in all positions, then install snap-in plug in side of console.

SHIFT LEVER ASSEMBLY

BUICK TWIN TURBINE AUTOMATIC TRANSMISSION

Buick, Except Special (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

Engine can be started by pushing. Place shift lever in "N" position until car speed reaches 15 MPH, then shift into "L" position and increase speed until engine starts.

Towing or Pushing Car

Car may be towed or pushed for short distances with selector lever in "N" position only, and at speeds less than 25 MPH. If car is to be towed an extended distance, raise rear wheels off ground or disconnect drive line.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 TWIN-TURBINE TRANSMISSION CODE NUMBER NOTE:* A code number consisting of a letter followed by a number is stamped on lower edge of reaction shaft flange directly to rear of high (left) accumulator. This number should be used as identification when ordering parts or for service procedure changes.

DESCRIPTION

Twin turbine torque converter and automatic transmission of same design as used on previous models.

LUBRICATION

Checking Fluid Level

Check fluid level every 6,000 miles. With transmission at normal operating temperature, selector lever in "P" (Park) position and with engine idling, check fluid level on dipstick. Add recommended fluid (see below) as necessary to maintain level between "ADD OIL" and "FULL" marks on dipstick. *NOTE - One pint of fluid will raise level from "ADD OIL" mark to "FULL" mark. DO NOT OVERFILL.*

Draining & Refilling

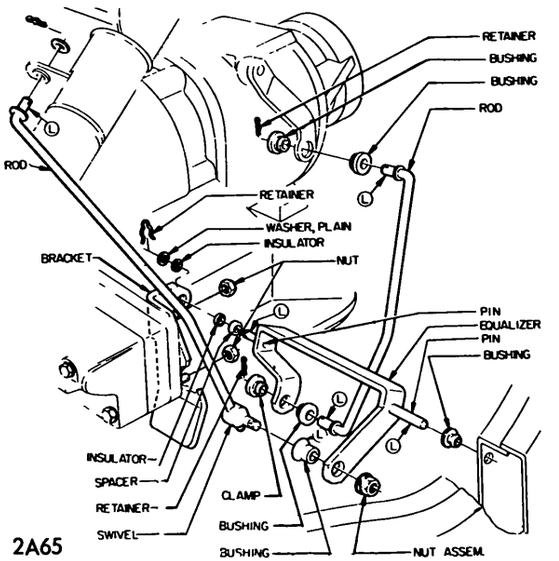
Drain & refill every 24,000 miles. *NOTE - It is not necessary to drain converter assembly.* With transmission at normal operating temperature, remove filler pipe fitting from oil pan and drain completely. *CAUTION - Do not remove accumulator caps.* Remove oil pan and screen and clean thoroughly, then reinstall using a new oil pan gasket. Install and tighten oil oil filler pipe, then pour in 3 qts. of recommended fluid (see below). With transmission selector lever in "P" (Park) and engine idling, add sufficient fluid to bring level to "FULL" mark on dipstick.

Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity

12 qts. (after draining). *NOTE - A completely dry transmission requires an additional 1¾ pints.*



ADJUSTMENT

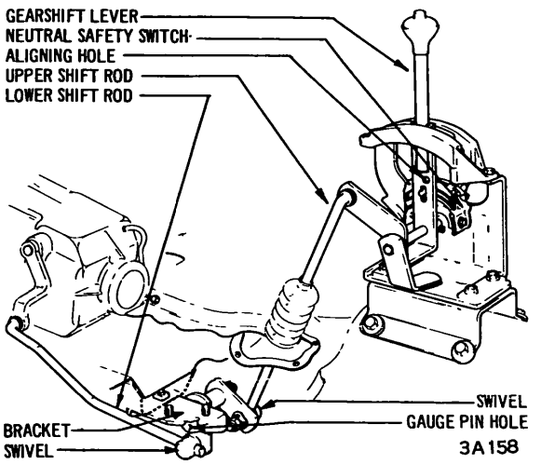
Throttle Linkage

See CARBURETOR on Car MODEL pages.

Manual Shift Linkage (Steering Column)

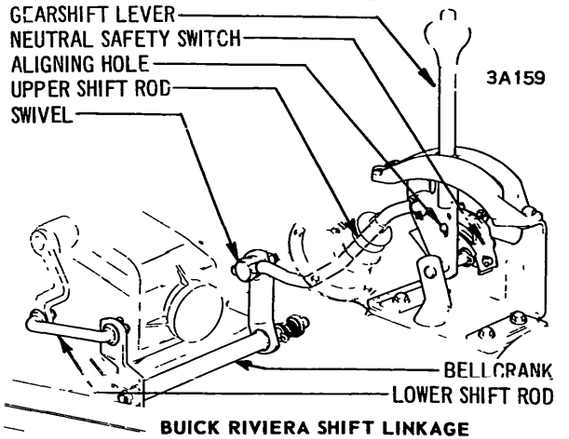
Buick (Exc. Special) - Place transmission selector lever in "P" (Park) position, then raise car and loosen clamp nut at lower end of upper shift rod. Move manual lever on transmission to make sure it is in "Park" detent, then tighten clamp nut. To check adjustment, distance from "Drive" detent to "Drive" stop should be approximately equal to distance from "Low" detent to "Low" stop. *NOTE - If pointer does not line up with "D" on dial with transmission manual lever in "Drive" detent, remove steering column lower housing, then either loosen dial pointer setscrew or carefully bend pointer to line it up with "D" on dial. Tighten setscrew.*

MANUAL SHIFT LINKAGE



Manual Shift Linkage (Floor Mounted)

Wildcat - Loosen upper and lower shift rod swivel clamp nuts at bellcrank levers (see illustration), then place gearshift lever in "P" (Park) position. Move control lever on transmission to "P" (Park) detent. Align gauge pin hole in bellcrank bracket and hole in lower shift rod bellcrank lever using a punch or a pin. Tighten nuts on adjusting swivel clamps on upper and lower rods to 10-15 ft. lbs. Check shift in all ranges. **Riviera** - Loosen upper shift rod swivel clamp nut at bellcrank lever (see illustration), then place gearshift lever in "P" (Park) position. Move control lever on transmission to "P" (Park) detent, then tighten nut on adjusting swivel clamp to 10-15 ft. lbs. Check shift in all ranges.



Neutral Safety Switch

Steering Column Mounted Shift Lever - Mounted on steering column under cowl. Starter should operate in "N" (Neutral) and "P" (Park) only. To adjust, place selector lever in "N" (Neutral) and insert a 3/32" drill through gauging hole in operating lever and in switch body. *CAUTION - Do not allow lever to move out of position.* If drill will not enter holes or is not in line with steering column, loosen switch mounting screws and move switch for proper alignment. Tighten screws and check operation of starter in "N" or "P".

Floor Mounted Shift Lever - Mounted on lower end of shift lever in shift lever bracket. To adjust, loosen switch mounting screws, then hold gearshift lever against neutral stop. Align holes in switch and in lower end of gearshift lever (see illustration) using a punch or a pin. Tighten switch mounting screws. Check operation of starter which should operate only when gearshift lever is in "N" or "P". *(Continued)*

BUICK WILDCAT SHIFT LINKAGE

BUICK RIVIERA SHIFT LINKAGE

Band Adjustment

NOTE - Bands cann t b adjust d with transmission installed in car. Adjustment is required only at time of overhaul.

Low & Reverse Band - Remove band adjusting cover, then loosen locknut and turn adjusting screw clockwise until considerable resistance is felt indicating that band is in full contact with drum (Low) or ring gear (Reverse). Back off screw until just a trace of freeplay can be felt by prying up on locknut with a screwdriver. From that point, back off screw **6 full turns** and tighten locknut finger tight. Note position of adjusting screw slot, then tighten locknut to 20-25 ft. lbs. Remove torque wrench and check to make sure that adjusting screw did not turn. Install band adjusting cover with a new gasket.

TESTING

Hydraulic Control Pressures

Make following tests with transmission at normal operating temperature and with fluid level at "FULL" mark on dipstick. Make sure manual linkage is properly adjusted.

Support rear of car solidly with wheels off floor so that transmission can be operated. Connect a suitable pressure gauge (J-2575) and make tests as follows:

Front Oil Pump - Connect pressure gauge at pipe plug opening on left side of transmission case. Run engine at 500 RPM and check pressure with selector lever in "L", "D" & "R" ranges. Repeat test at 1000 RPM and at 1800 RPM in "L" & "D" only. See table below for correct pressures. Low or erratic pump pressure indicates air leakage in suction lines, improper pressure regulator valve action, or excessive pump clearances.

Front Oil Pump Pressures

	Selector Lever		
Engine RPM	**Low**	**Drive**	**Reverse**
500 RPM	120 lbs.	90 lbs.	120 lbs.
1000 RPM	180 lbs.	90 lbs.	
1800 RPM	180 lbs.	90 lbs.	

High & Low Accumulator - Connect pressure gauge at pipe plug opening on top of accumulator body (**High** - left side of car); (**Low** - right side of car). Place selector lever in "D" range (High Accumulator Test); "L" (Low Accumulator Test). Run engine and check pressure at speeds indicated in table below. Low accumulator pressure may be caused by leakage past accumulator body gasket. If accumulator pressure is more than 10 lbs. lower than front pump pressure, check for leakage between accumulator and multiple disc clutch and for restricted or plugged metering orifice in accumulator dump valve.

Accumulator Pressures

	Selector Lever	
Engine RPM	**Low**	**Drive**
500 RPM	115 lbs.	80 lbs.
1000 RPM	175 lbs.	85 lbs.
1800 RPM	175 lbs.	85 lbs.

Stator - Connect pressure gauge at pipe plug opening on left end of reaction shaft flange. Test pressure in "D" range at 500 RPM, 1000 RPM, 1800 RPM. Minimum pressures should be as follows:

Stat r Pr ssur

Engin RPM	S l ct r L v r in Driv
500 RPM	10 lbs.
1000 RPM	65 lbs.
1800 RPM	75 lbs.

TROUBLE SHOOTING & DIAGNOSIS

►*EXCESSIVE DYNAFLOW WHINE CORRECTION: (This condition is usually the result of excessive clearance between input shaft and bearing in the reaction shaft).* **If transmission is to be disassembled to correct whine, perform the following:**

1) Remove converter cover, twin turbine assembly, and sun gear, then mount dial indicator on end of input shaft with indicator button contacting reaction shaft. Position indicator button 90° to left of top center (facing end of shaft) then move input shaft away from and toward indicator while noting the gauge reading. Repeat this check at 45° to left of top center. If dial reading exceeds .005", excessive clearance exists between input shaft and bearing in reaction flange.

2) Before replacing bearing, remove reaction flange assembly and input shaft and observe the following: (a) Inspect bearing surface on input shaft. If surface appears abnormally rough or scored, replace input shaft; if not, polish journal area with crocus cloth. (b) Inspect the two oil seal rings toward rear of input shaft and the mating surface in the reaction shaft for scoring or other damage. If reaction shaft or input shaft shows evidence of scoring or other damage, replace worn or damaged parts.

3) If inspection reveals that condition of reaction shaft and input shaft are satisfactory, replace only the input shaft bearing (see Overhaul data).

4) If input shaft, reaction flange, or the bearing requires replacement, it will be necessary to replace the converter sun gear and planet pinions. *NOTE* **- When installing reaction flange service bushing, be sure the assembly is supported on rear end of reaction shaft to prevent distortion of aluminum reaction flange.**

Car Will Not Move

1) With selector in any Range (rear wheels free). If car will not move for 1-8 minutes after standing over night - Check front pump oil pressure (see Testing) after allowing car to stand for several hours. If zero pressure noted, check pump for excessive clearances allowing pump to lose its prime. Check alignment of bell housing and converter primary pump hub.

►*CAUTION: If this condition found, inspect Clutch and Bands for excessive wear due to slippage caused by low oil pressure.*

If car will not move after extended operation in Reverse - Check for air leaks in pump suction line (at rear oil pump gaskets), or excessive clearance in front pump (at pump gears and covers). Check alignment of bell housing and converter primary pump hub.

2) With selector in any Range (rear wheels locked). Parking lock engaged. Broken parts in transmission or rear axle. Parking brake applied.

3) With sel ctor in Driv Range. Check front oil pump pressure and High Accumulator pressure. If OK, check for sticking Low Band Anchor Piston, remove and inspect Clutch for worn or sticking clutch plates, leaking clutch seal rings. If High Accumulator pressure pressure low, also check rear pump Check Valve for correct installation and proper seating, check for leaks at accumulator body gasket, reaction flange gasket, clutch piston outer seal and clutch ball check valve, and leaks at sealing rings on reaction shaft flange and low drum.

4) With selector in Revers Rang . Check reverse band for displaced operating strut caused by too loose adjustment, improper installation, or broken band anchor (indicated by free up and down movement of band operating lever). If band assembly OK (no free movement of lever), check servo operation by running engine and shifting into Reverse. Remove Valve & Servo Body and check for reverse servo piston seal leaks.

Excessive Slippage

1) In all Speed Ranges. Low oil level. Incorrect manual control linkage adjustment. Air leak in oil pump suction pipe at oil screen sealing ring. Low front oil pump pressure caused by wear or excessive clearances in in pump. Leaks at front pump cover or reaction shaft flange, pressure regulator valve. Valve & Servo Body gasket. Pressure regulator valve defective.

2) In Drive Range. Incorrect manual control linkage adjustment. If High Accumulator pr ssure low, check for leak at accumulator body gasket; if gasket OK, check for leaking clutch sealing rings, sticking clutch piston, worn or sticking clutch plates.

3) In Low Range. Incorrect manual control linkage adjustment. Incorrect low band adjustment. Low band and drum worn or scored. If Low Accumulator pressure low, check for leak at accumulator body gasket; if gasket OK, remove Valve & Servo Body and check for gasket leaks or leaks at low servo piston seal.

4) In Reverse Range. Incorrect manual control linkage adjustment. Reverse band out of adjustment, st rut out of place, or anchor broken. If front oil pump pressure low, remove Valve & Servo Body and check for gasket leaks and leaking reverse servo piston seal.

Car Creeps

1) Creeps forward with s lect r in N utral. Incorrect manual control linkage adjustment. Sticking low servo piston (check by removing low band adjustment cover), Sticking clutch caused by warped, binding, or incorrectly assembled clutch plat s (not stacked properly with "dish" in same direction).

If Car Creeps only when ngin acc l rat d to 2500 RPM - Check clutch vent ball checks in clutch piston and reaction shaft flange.

2) Creeps forward with sel ct r in R v rs r backward with selector in Low. Incorrect manual control linkage adjustment.

Shifts Are Rough

1) Low-to-Drive Shift. Incorrect Low Band adjustment. If High Accumulator pressure low, check for leak at accumulator body gasket and for dump valve or accumulator piston sticking down (top land of piston should be visible through top port in body). Sticking low band anchor piston (remove Valve & Servo Body to check), or incorrect piston location (see piston shimming data in Valve & Servo Body Reassembly). Valve & Servo Body gasket leaks. Clutch plates worn or binding.

Excessive Chatter Or Clunk

►*CAUTION: Slight "clunk" when shifting into Low or Reverse is normal, and slight chatter when car starting to move in reverse (disappearing as soon as car in motion) is also normal.*

1) In Low & Reverse Range. Incorrect Low or Reverse Band adjustment. Engine and transmission mountings loose or incorrectly adjusted, thrust pad at transmission mounting broken (see Engine Mountings in Buick Special Data). Clutch plates warped, sticking, or incorrectly assembled (not stacked properly with "dish" in same direction). Reverse ring gear bushing worn. Planet pinion needle bearing rough.

Noise In Transmission

►*CAUTION: Hum or low whine in Neutral or Parking is normal (due to free rotation of all planetary gears) and slight hum in Low and Reverse may be expected.*

1) Buzzing Noise. Low oil level. Front pump check valve hanging up on edge of gasket between valve and servo bodies. If noise noticed in Parking or Neutral, pressure regulator valve clearance in body may be excessive or orifice in valve land oversize (correct by replacing valve and body).

2) Clicking Noise. If noticed in all ranges, may be caused by foreign material in converter. If noticed only when car in motion, may be caused by parking lock pawl contacting ratchet wheel due to incorrect manual control linkage adjustment.

3) Abnormal Hum or Whine (see Caution above). If noted in all ranges, may be caused by worn parts or excessive front pump clearances (front pump noise will increase in Low and decrease at car speeds above 45 MPH. in Direct Drive). Check front pump for excessive clearances by testing for low pump pressure. If noise noted in all ranges except Direct Drive, may be caused by trouble in planetary gears (gears locked out in Direct Drive).

4) Squealing or Screeching following installation of Front Oil Pump. Pump driving gear installed backward.

►*CAUTION: Above conditions must be corrected WITHOUT FURTHER OPERATION OF TRANSMISSION or severe damage will result.*

TRANSMISSION REMOVAL & INSTALLATION

Removal

Remove transmission in the usual manner and note the following:

1) If transmission is being removed to correct clutch or band troubles, cooler and lines must be flushed with air and oil to remove residue.

2) When disconnecting propeller shaft at rear companion flange, mark flange and shaft so parts can be reassembled in same position. Support shaft to prevent damage to center joint. Support transmission with suitable transmission jack, then remove center bearing support bolts and slide propeller shaft rearward to disengage it from transmission.

3) Remove transmission support crossmember. *NOTE - If shims are used between support and frame side rails, note number of shims and their locations as they may be reinstalled in same position.*

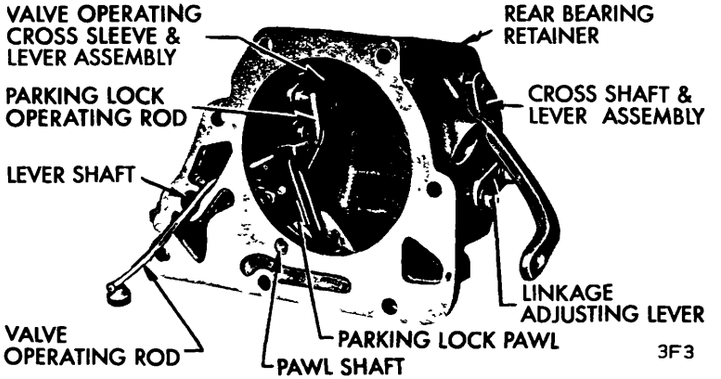
Installation

Reverse removal procedure and note the following: Turn flywheel so one converter bolt is straight up. Tighten all bolts and nuts to specifications (see "Tightening Specifications" below).

TRANSMISSION OVERHAUL

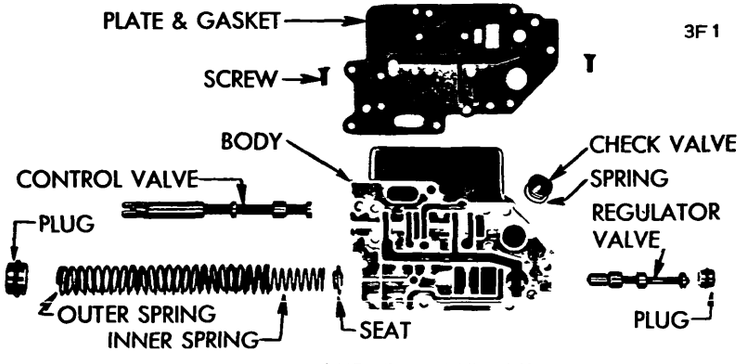
See 1960 Final Data, Page 414, or later Manual edition and note the following:

Rear Bearing Retainer



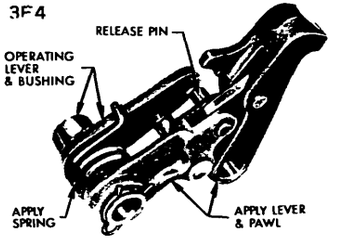
NOTE - Rear Bearing Retainer, Rear Bushing, Parking Lock and Speedometer Drive Gear can be removed with transmission in car by removing oil pan and disconnecting propeller shaft.

Removal - Disconnect valve operating rod (if not previously done), then remove retainer-to-case bolts, retainer and gasket. Remove speedometer gear and ratchet wheel retaining ring and remove speedometer drive gear, shims and spacer.

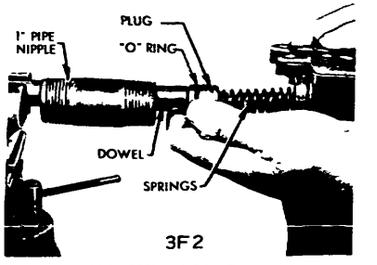


Disassembly - Remove spring from detent roller lever and support, then remove nut at adjusting lever. Pull roller lever and support assembly into bearing retainer and remove. *NOTE - Inspect "O" ring on support shaft and replace it damaged.* Remove cotter pin and clip from valve operating rod. *NOTE - If valve operating rod does not have a hole for installation of cotter pin, install later type valve operating rod and parking lock operating rod.* Thread parking lock operating rod ball stud out of lever. Thread a ¼" - 20 bolt into pawl shaft and withdraw shaft from retainer. Pull lever shaft from retainer in same manner, then remove parking lock pawl and lever assembly from retainer. Drive roll pin out of cross shaft and remove cross shaft and lever assembly and cross sleeve and lever. *NOTE - Inspect cross shaft seal and lever and replace if seal is worn or damaged. If bearing is worn so excessive freeplay exists between it and cross shaft, mark position of bearing in retainer and drive out bearing with a drift. Press a new bearing into place to same position as original bearing. Inspect output shaft bushing and if necessary, drive it out with Tools J-7273-7 and J-7013-1.*

Reassembly - If new output shaft bushing is to be installed, drive bushing into position (flush with counterbore) with Tools J-7273-7 and J-7013-1. Coat outer diameter of new seal with Permatex and install with Tool J-8864. Lubricate cross shaft seal and position it in recess over cross shaft bearing with lip inward. Hold valve operating lever and shaft in position inside retainer and slide cross shaft through bushing and seal inside valve operating lever and sleeve. Line up holes and install roll pin. Install detent roller lever and support, then assemble linkage adjusting lever on support shaft and install nut and lockwasher. Install detent spring, then assemble parking lock operating rod



(Continued)



REAR BEARING RETAINER

VALVE BODY ASSEMBLY

PARKING LOCK & PAWL ASSEMBLY

VALVE BODY PLUG & SPRING INSTALLATION

to operating lever assembly using a lockwasher under ball end hex. *NOTE - Full pivoting ball end of rod must be assembled to operating lever.* Position pawl levers and rod assembly in retainer and slide pawl and lever shafts into place making sure that tapped holes are outward. Attach parking lock operating ball end to upper lever using a lockwasher under ball end hex. Assemble valve operating rod to valve operating lever with a clip and cotter pin. *NOTE - If rod does not have a cotter pin hole, replace rod with later type.*

Lube Oil Pressure Regulator

Do not remove lube oil pressure regulator valve. Use compressed air and solvent to clean valve.

Valve Body

Disassembly - Remove lower valve operating lever and linkage adjusting lever-to-upper lever shaft and remove levers. Remove safety nuts and washers from studs and lift valve body and gasket from servo body, then remove shift control valve from valve body. Remove rear pump delivery check valve and spring from servo body. Cover large pressure regulator valve plug with a wadded cloth and pull plug retaining pin out of valve body. *CAUTION - Use care when removing retaining pin as there is heavy spring pressure behind plug.* Remove two springs and spring seat. Remove small plug retainer pin, then thread a ¼"-20 capscrew into plug and remove plug from valve body. Remove pressure regulator valve. Remove valve body plate and gasket, then remove front pump delivery check valve and spring.

Reassembly (Valve Body) - Place front pump delivery check valve spring in body with large end down and place check valve on spring with ridged side up. Install valve body plate and a new gasket, making sure that check valve is seated against plate and not caught under gasket. Check oil orifice in pressure regulator valve and land to make sure it is clear, then install valve with land outward. Assemble "O" ring on small plug and install plug with tapped hole outward and install short retaining pin with shoulder of pin toward valve body plate side of body. Assemble spring seat on inner spring and install springs and seat into valve body through large plug opening. Clamp a drift or dowel in a vise and position a 1" inside diameter pipe nipple over the dowel. Position plug and "O" ring over spring ends and against dowel. Slide pipe nipple over plug so that when pressure is exerted to compress springs into valve body, plug will not slip off dowel. Push valve body toward dowel to push plug into valve body. Install long retaining pin with shoulder toward valve body plate side of valve. Install shift control valve with slotted end on same end of valve as large pressure regulator plug. Install rear pump delivery check valve in its seat in servo body, ridged face inward, and place valve spring on valve with large end up. Install a new gasket and the valve body on servo body, using care to keep pump delivery check valve spring below gasket, then install lock washers and safety nuts on two studs adjacent to control valve and tighten nuts evenly to 11-15 ft. lbs. Insert valve operating upper lever shaft through bearing in servo body, then with upper lever pointing toward reverse servo, place lower lever with linkage adjusting lever on shaft so that forked end of lower lever engages shift valve pin, then install lockwasher and nut.

Tightening Specifications

Location	Ft. Lbs.
Converter Housing to Crankcase	45-55
Converter Housing Cover	15-18
Torque Converter to Flywheel	28-32
Converter Pump to Cover	28-32
Converter Housing to Case	35-40
Converter Housing to Reaction Flange Stud	35-40
Front Oil Pump to Reaction Flange	18-22
Oil Pump Cover to Reaction Flange (3/8")	35-40
Oil Pump Cover to Reaction Flange (5/16")	20-25
Accumulator Body to Case	25-30
Accumulator Body to Flange Stud	25-30
Accumulator Body	40-50
Oil Pan to Case	10-12
Oil Pan to Reaction Flange Stud	10-12
Oil Filler Pipe to Oil Pan	30-35
Valve Body and Servo Body to Case	11-15
Valve Body to Servo Body Stud	11-15
Servo Body to Case	15-20
Valve Operating Lever Shaft	10-15
Rear Bearing Retainer to Case	25-30
Rear Oil Pump to Case	25-30
Front to Rear Planet Carrier	25-30
Band Adjusting Lock Screw	20-25
Mounting Pad to Rear Bearing Retainer	50-60
Input Shaft Retainer	30-35

Planetary Gear Set

Installation - Install reverse ring gear thrust washer and planet carrier rear thrust washer in case, then compress ends of reverse band with band installing clip J-2595, and install in case. *NOTE - When installing band, make sure that heavy side of band is in correct position so that it will attach to reverse anchor and not to strut.* Remove clip, then rotate servo band toward servo opening. Insert anchor through opening and engage with hooked end of band, then rotate band and anchor back to normal position. Hold band operating lever (with offset end) in place with strut shoulder toward inside of case and insert anchor shaft through case, anchor, and lever. *NOTE - Tapped end of shaft must be outward. If adjustment screw is not centered in servo opening, the low band operating lever has been installed by mistake.* Install reverse ring gear slipper in case, then install assembled planetary gearset.

Reaction Shaft Flange

Installation - To check endplay, assemble a suitable dial indicator support to transmission case. *NOTE - A 3/8" - 16 bolt with a .312" rod welded to head makes good arrangement.* Assemble dial indicator so plunger bears on end of output shaft. Push shaft forward with some force and rotate a few turns to squeeze grease from thrust surfaces. Set dial indicator at zero, then pull output shaft rearward and check indicator reading. If reading is more than .040", select a thicker washer for installation forward of needle thrust bearing and recheck endplay. If reading is less than .020", select a thinner washer and recheck. Endplay should be between .020" and .040".

BUICK SPECIAL AUTOMATIC TRANSMISSION

Buick Special (1963)

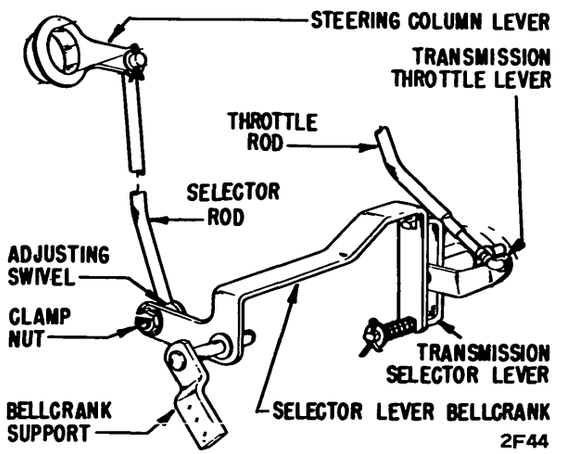
PUSHING (TO START) & TOWING

Pushing Car To Start Engine

The engine cannot be started by pushing (or towing) car. If necessary, a booster battery must be used.

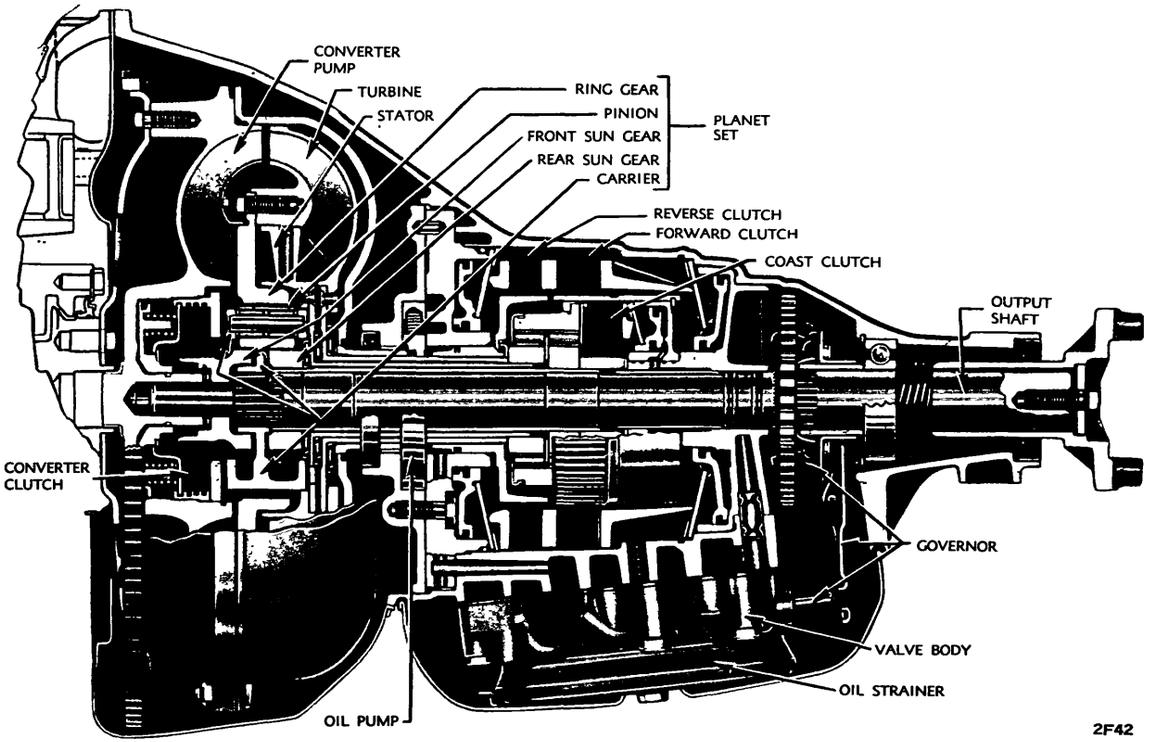
►*BOOSTER BATTERY CAUTION:* Connect negative (-) terminal of booster battery to negative (-) terminal of car battery. Alternator will be damaged if battery is connected improperly.

Towing Or Pushing Car



Car may be towed or pushed for short distances with selector lever in "N" position only, and at speeds less than 25 MPH. If car is to be towed an extended distance, raise rear wheels off ground or disconnect drive line.

►CHANGES, CAUTIONS, CORRECTIONS



►*1963 BUICK SPECIAL AUTOMATIC TRANSMISSION CODE NUMBER NOTE:* A code number consisting of a letter followed by a number is stamped on raised surface of case, forward of oil pan on left side. This number should be used as identification when ordering parts or for service procedure changes.

►*1963 FRONT SUN GEAR-TO-CONVERTER PUMP BEARING RACE PRODUCTION CHANGE:* Beginning with Transmission Code No. K062, a new .060" thick bearing race, Part No. 1359998 is used in production to replace the previous .040" race. This new race CANNOT be used in earlier converter units. When installing this new race, it must be used next to converter pump. Additional races or spacers should be used between rear sun gear and rear sun gear bearing.

►*1963 OVERRUNNING CLUTCH ASSEMBLY PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* Beginning with Transmission Code No. K300, a new clutch assembly incorporating sixteen bronze slippers on cam is being used in production and for service replacement on earlier 1963 transmissions. These new bronze slippers will prevent roller from crushing spring if roller "pop out" occurs. A Kit, Part No. 1396108 is available for installation on transmissions before Code K300. *See "Overhaul" below for clutch disassembly and reassembly procedure.*

MANUAL SELECTOR LEVER

BUICK SPECIAL AUTOMATIC TRANSMISSION

DESCRIPTION

"Dual-Path" 2-Speed automatic transmission of same design used on previous models.

LUBRICATION

Checking Fluid Level

Check fluid level every 6,000 miles. With transmission at normal operating temperature, selector lever in "P" (Park) position and with engine idling, check fluid level on dipstick. Add recommended fluid (see below) as necessary to maintain lever at "FULL" mark on dipstick. *NOTE - One pint of fluid will raise level from "ADD" mark to "FULL" mark. DO NOT OVERFILL.*

Draining & Refilling

NOTE - There is no oil pan or converter drain plug. It is recommended that oil pan be removed and cleaned, and the strainer replaced. If transmission is equipped with an oil screen, wash screen and reinstall.

Drain & refill every 24,000 miles. Remove single oil pan retaining bolt and remove oil pan, strainer (or screen). Wash oil pan and screen (install a new strainer if so equipped), then reinstall these parts. Tighten strainer or screen attaching bolts to 100 inch pounds, and oil pan bolt to 15-20 ft. lbs. Do not overtighten. Add 5 pts. of recommended fluid **before starting engine**, then start engine in "N" (Neutral). DO NOT RACE ENGINE. Immediately add oil to bring level to ½" below "FULL" mark on dipstick (approximately 8 pts. if converter is empty, none if converter full). Recheck and adjust fluid level after transmission is warm.

Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity

12 pints (transmission and converter dry), 5 pints (converter full).

ADJUSTMENT

Throttle Linkage

See CARBURETOR in Car Mod l pags.

Manual Shift Linkage

Loosen adjusting swivel clamp nut where shift rod connects to transmission lever extension, then place

(Continued)

transmission selector lever in "Park" detent. Move selector lever at steering wheel to "P" (Park) position, then tighten swivel clamp nut.

Neutral Safety Switch

Mounted on steering column under cowl. Place selector lever in "N" (Neutral) and insert a 3/32" drill through gauging hole in operating lever and in switch body. *CAUTION - Do not allow lever to move out of position.* If drill will not enter holes or is not in line with steering column, loosen switch mounting screws and move switch for proper alignment. Tighten screws and check operation of starter in "N" & "P".

TESTING

Road Testing

With throttle and manual linkage properly adjusted and engine at normal operating temperature, accelerate from a stop with accelerator pressed just to detent. Upshift should occur smoothly at 40-45 MPH. If upshift occurs at speeds other than those specified, see "Trouble Shooting & Diagnosis" below.

TROUBLE SHOOTING & DIAGNOSIS

Growl Before Upshift

May be caused by a galled or worn front sun gear-to-converter bearing.

Governor Valve Buzz

This noise, which occurs in "D" range only, near the upshift point, can be corrected by installing Damper Tube, Part No. 1396256 in governor pressure tap in transmission case.

Upshift At Too Low Speed

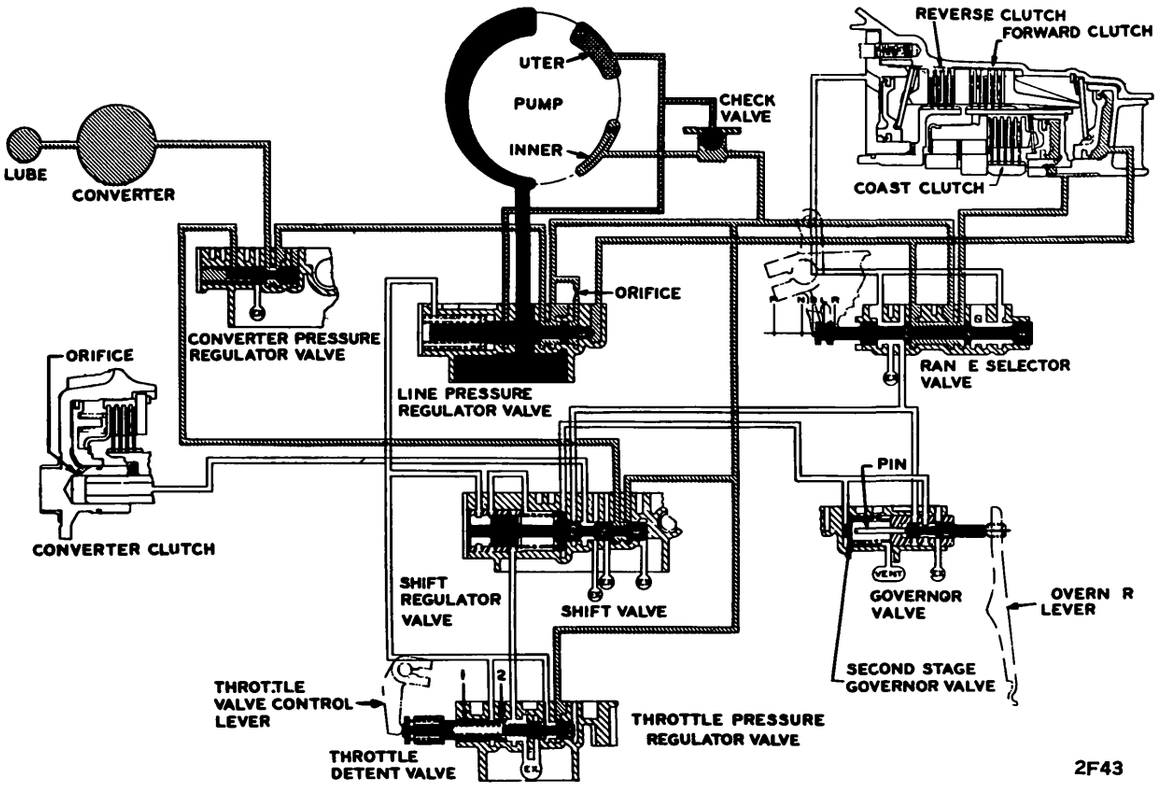
Governor valve not adjusted properly or is sticking. Shift valve or shift valve regulator sticking. Throttle valve pressure too low (worn or broken springs or valve sticking).

Upshift At Too High Speed

Same as for "Upshift At Too Low Speed" except that throttle valve pressure may be too high.

Slow Engagement of Converter Clutch

Converter pressure regulator valve sticking (lowering converter pressure too slowly).

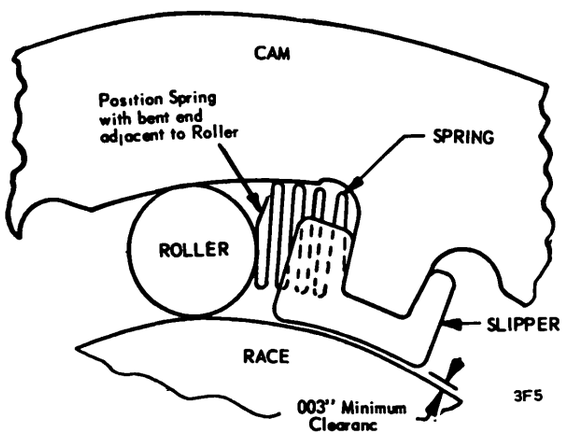


Fast Engagement of Converter Clutch

Converter charging pressure too low. Converter pressure regulator valve sticking.

REMOVAL & INSTALLATION

Removal



In addition to usual procedure for transmission removal, note the following: Remove engine exhaust crossover pipe assembly. Remove transmission filler pipe. Mark flywheel and converter pump for reassembly in original position and remove the three converter-to-flywheel bolts.

BUICK SPECIAL AUTOMATIC TRANSMISSION HYDRAULIC CIRCUITS

Installation

Reverse removal procedure and tighten all bolts and nuts to proper torque (see "Tightening Specifications" below).

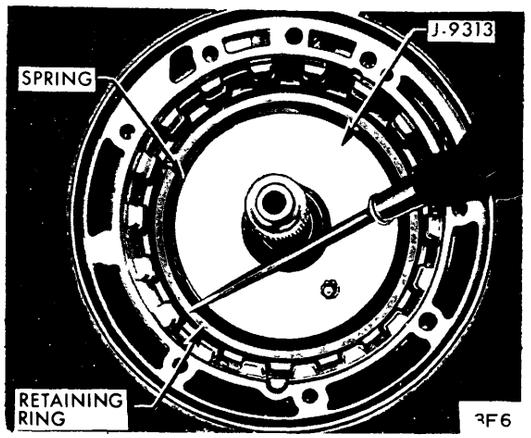
OVERRUNNING CLUTCH (LATER TYPE)

OVERHAUL

See 1961 Final Data, Pag 404 and note th f ll wing changes in overhaul procedure.

Overrunning Clutch

NOTE - This procedure appli s t transmissi ns aft r Code No. K300 and to earli r 1963 transmissions that have been modified. See "1963 Ov rrunning Clutch Assembly Production Chang & S rvic Replacem nt Note" above.



Disassembly - Remove backing plate and overrunning clutch assembly, then pull rear sun gear race and thrust washer out of cam assembly (rollers, springs, and slippers will fall out). Remove separator and stator race from cam.

Inspection - Check rollers for wear, scoring or denting. Inspect race for wear, scoring, or damage to splines. If cam must be replaced, drive out roller retainer and stake in place on new cam. If bronze slippers show signs of excessive wear or scoring, replace all sixteen slippers.

Reassembly - Place cam and roller assembly on a clean surface, then place stator race inside cam and install sixteen bronze slippers in proper direction

(Continued)

(see illustration). *NOTE - Stator race has larger splined inner diameter than the rear sun gear race. Sun gear race also has a counterbore.* Check clearance between race and slipper which should be .003" minimum. If clearance is less than .003", check for burrs and nicks which may prevent slipper from seating If there is no damage, interchange slippers on cam legs to obtain .003" minimum clearance. Assemble spring and roller by compressing spring with a small screwdriver and install roller. *NOTE - Position springs with bent end adjacent to roller and pointing outboard* (see illustration). Lubricate and install separator on stator race, then install bronze thrust washer into counterbored end of rear gear race and place race and thrust washer inside cam Install bronze slippers, springs and rollers in same manner as for stator race (above). Install cam and race assembly in coast clutch housing, rotating cam assembly so lugs on cam engage notches in coast clutch housing.

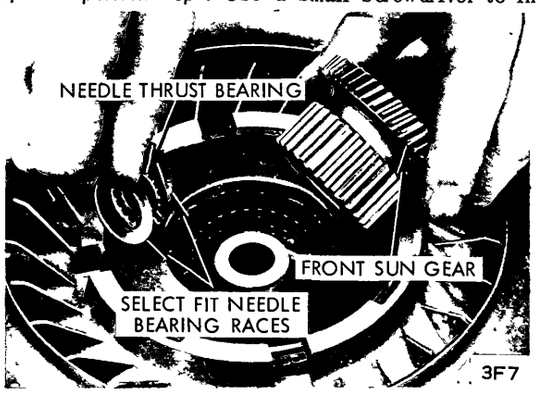
OVERRUNNING CLUTCH RETAINER RING INSTALLATION

Torque Converter & Gearset

After removal of front sun gear, needle thrust bearing and two selective fit needle bearing races, remove planet carrier retaining ring using a thin bladed screwdriver to pry ring out of groove.

Range Selector Levers

Removal - Use a 3/8" socket and 7/16" wrench to remove screw and nut attaching lever to shaft. Slide inner lever off shaft and remove, then slide outer lever and shaft out of range selector shaft. Check "O" ring and remove if worn or damaged. Use the same tools and remove screw and nut attaching range selector inner lever to shaft. Slide range selector inner lever off shaft, then remove inner lever and parking lock assembly. Check "O" ring and remove if worn or damaged. If parking lock actuator is bent or damaged, or if range selector requires replacement, pry retainer off actuator rod. To install, reverse removal procedure.

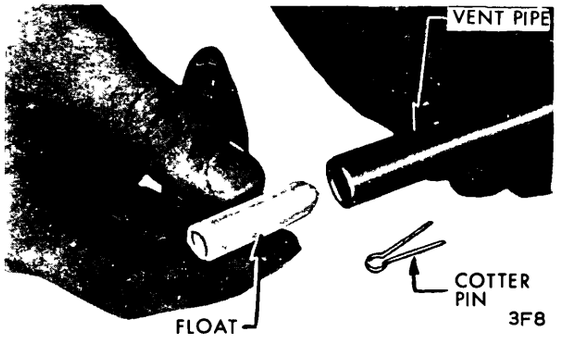


Coast & Overrunning Clutch

Installation - With transmission case in a vertical position, install forward clutch levers, then install forward clutch release spring flat on levers (inner edge of spring downward). Position spring centering tool, J-9313, over coast clutch support to rest on levers and center spring. Install spring retainer over spring and press down and outward to slightly compress spring and position retainer in groove of case. *NOTE - Retaining ring must be correctly installed.* Check to make sure ring is in groove all the way around, then remove tool. *Complete installation as outlined on Page 409 of 1961 Final Data.*

Torque Converter & Gear Set

NOTE - This procedure replaces "Step No. 9" on Page 410 of 1961 Final Data.



Place planet carrier over rear sun gear with tanged thrust washers inplace at front and rear. *NOTE - Deeper pocket of carrier "down" toward rear sun gear and splined portion "up".* Use a small screwdriver to install retainer ring in groove of output shaft. Assemble new converter pump oil seal to pump (do not twist square seal). Lubricate and install needle thrust bearing and two selective fit bearing races into front sun gear. Retain in place with chassis lubricant. *NOTE - The .030" bearing race must be toward sun gear.*

CONVERTER THRUST BEARING INSTALLATION

Transmission Vent

Replacement - Remove vent assembly from case by pulling straight up. To reinstall, reverse removal procedure. If necessary to remove float from vent pipe, remove cotter pin and slide float out of tube. Wipe off float and clean tube in solvent. To reassemble, install float, pointed end first, then install cotter pin.

TRANSMISSION VENT ASSEMBLY

Tightening Specifications

Location	Ft. Lbs.
Transmission to Cylinder Block	30-40
Cover Pan to Cylinder Block	8-12
Oil Pan to Transmission	15-20
Filler Pipe Clamp to Case	4-8

CHEVROLET (ALUMINUM) POWERGLIDE

Chevrolet Pass. Cars 6 Cyl. & V8 (1963)
Chevy II, 4 & 6 Cyl. (1963)
Corvette (1963)
Chevrolet Trucks, Series 10 & 20 (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

Turn off all electrical loads, then turn ignition ON and place transmission selector lever in "N" (Neutral) until a speed of 25 MPH is obtained, then place selector lever in "L" (Low) until engine starts.

Towing Or Pushing

Do not exceed speeds of 30 MPH with transmission in "N" (Neutral). If car is to be towed or pushed at speeds above 30 MPH or for long distance, disconnect drive shaft.

►CHANGES, CAUTIONS, CORRECTIONS

►*ENGINE SPEED INCREASE OR RUNAWAY AT HIGHER SPEED NOTE:* This condition which could occur during upshifts or forced downshifts may be caused by low oil level, improper band adjustment or a stuck modulator valve.

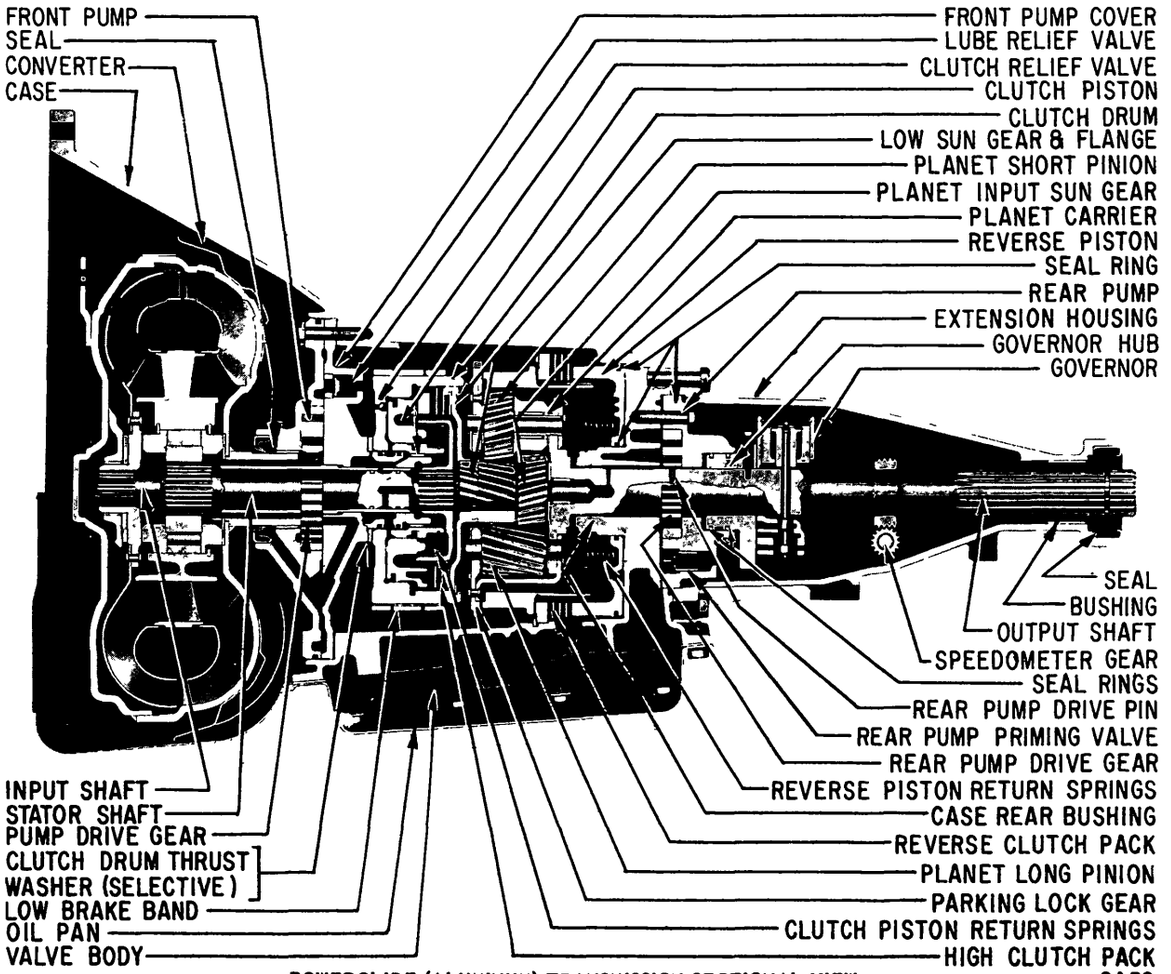
DESCRIPTION

Two speed planetary type automatic transmission of same design used on 1962 Pass. Cars with 327" engine.

LUBRICATION

Check fluid level every 1,000 miles. *NOTE - Periodic draining & refilling of transmission is not required. See "Draining & Refilling" below.*

Checking Fluid Level



With transmission at normal operating temperature, selector lever in "N" (Neutral), fluid level should be at FULL mark on dipstick.

Draining & Refilling

NOTE - Periodic draining and refilling of transmission is not required. If necessary to remove transmission, drain and refill as follows: Loosen oil pan bolts and drop one end of pan so fluid will drain out. Allow oil to drain, then replace oil pan. To refill transmission, remove dipstick from filler tube and pour in sufficient fluid to bring level up to FULL mark on dipstick. Start engine and operate at normal idle speed with selector lever in "N" (Neutral). *NOTE - Shift transmission through all ranges with engine at idle speed, then run engine at 800-1000 RPM with transmission in "N" (neutral) until fluid warms up.* Check fluid level with engine at idle speed, transmission in "N" and add necessary fluid to bring level up to FULL mark on dipstick.

Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

POWERGLIDE (ALUMINUM) TRANSMISSION SECTIONAL VIEW 2A52

Capacity

1½ qts. (Exc. Trucks); 4½ qts. (Trucks) refill after transmission oil pan removed. Total capacity including torque converter is 7½ qts. (Chevy II); 9 qts. (Chev. 6 Cyl. Pass. Cars & Corvette); 10 qts. (Chev. V8 Pass. Cars); 10½ qts. (Chev. Trucks). *NOTE - All above capacities are approximate.*

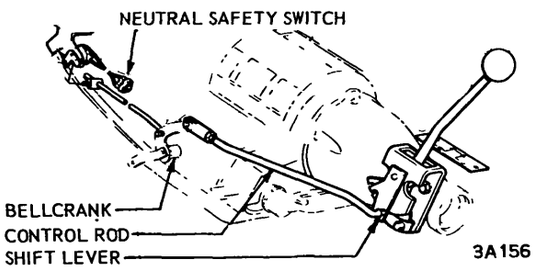
Throttle Linkage

See CARBURETOR on Car Model pages.

Manual Shift Linkage

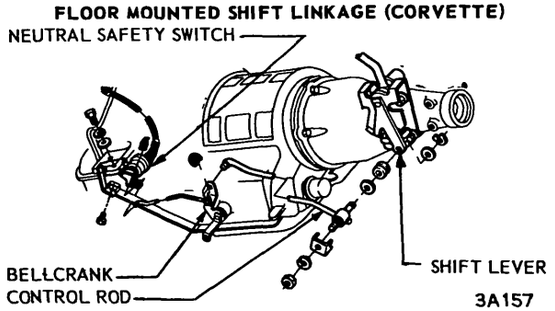
Steering Column Mounted Gearshift - *NOTE - To check linkage for proper adjustment, stop engine, lift up on transmission selector lever and move lever to position where transmission DRIVE detent is felt. Slowly release lever to feel if shaft lever tang freely enters lockplate. Check REVERSE range in similar manner. If tang does not enter lock plate in DRIVE and REVERSE ranges, linkage adjustment is required.* Place selector lever in "D" (Drive) range, then disconnect shift rod at its swivel attachment on lower end of mast jacket. Place shift lever on transmission in "D" (Drive) detent (first detent position clockwise from the fully counterclockwise position), then hold shift control lever on lower end of mast jacket against DRIVE stop of range selector lock plate (with control rod through swivel) and tighten clamp nut. Check transmission selector lever in all ranges.

Floor Mounted Gearshift - *NOTE - Check linkage for proper adjustment in same manner as for "Steering Column Mounted Gearshift" above.* Disconnect control rod at lower end of gearshift lever. Loosen clevis nut at bellcrank end of control rod (Corvette). On all models, place control rod bellcrank on transmission in



(Continued)

"P" (Park) position and place gearshift lever in "P" (Park) position, then hold in this position and adjust the control rod at clevis so the rod freely enters hole in gearshift lever. Tighten nut at clevis and connect rod to lower end of gearshift lever. Check gearshift pattern.



Neutral Safety Switch

St ering C lumn M unt d Gearshift - Located on steering column mast jacket under instrument panel. Place selector lever in "N" (Neutral) position and loosen screws securing switch retainer. While holding ignition key in "Start" position, adjust position of neutral safety switch until engine starts cranking. Hold switch in this position and tighten retainer screws. Check adjustment to make sure that engine starts only in "P" or "N".

Floor M unt d G arshift - Located on left side of transmission case and linked to transmission control lever. Adjust switch so engine will start only with gearshift lever in "P" or "N"

FLOOR MOUNTED SHIFT LINKAGE (CORVETTE)

FLOOR MOUNTED SHIFT LINKAGE (EXC. CORVETTE)

Low Band

NOTE - Low band adjustment is not ordinarily required in servic (adjustment is made when transmission is overhauled). Tighten low servo adjustment screw located on left side of transmission case to **40 inch pounds.** *NOTE - Input and output shafts must be rotated simultaneously t prpperly center low band on clutch drum when adjustment is being made.* Back off adjusting screw EXACTLY four complete turns and tighten locknut.

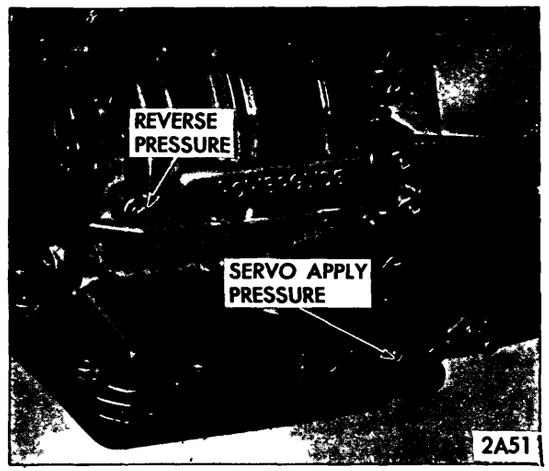
Thr ttl Valv

NOTE - No provisi n is mad for ch cking throttl valve pressur s. H wever, if operati n of transmission is such that some adjustm nt of throttl valv is indicated, pressures may b rais d or low red by adjusting th position of jam nut on throttl valv body (s "Throttle Valve Adjustment" illustration). To raise throttle valve pressure 3 lbs., back off jam nut one full turn. This increases the dimension from jam nut to throttle valve assembly stop. Tightening the jam nut one full turn lowers throttle valve pressure 3 lbs. A difference of 3 lbs. in throttle valve pressure will cause a change of approximately 2-3 MPH in wide open throttle upshift point. Small pressure adjustments can be made by partial turns of jam nut. The end of throttle valve adjusting screw has an Allen head so screw may be held stationary while jam nut is moved. *CAUTION - Use care when making this adjustment since no pressure point is provided to check throttle valve pressure.*

TESTING

Pressure Tests

CAUTION - Stall tests that allow engine vacuum to drop below 10" Hg. are not recommended.



Connect pressure gauge hoses at low servo apply (main line), and reverse test points (see illustration), then run gauge lines into driving compartment by pushing aside mast jacket seal. Tie lines out of way and connect to a suitable gauge set. Test as follows:

Wide Open Throttle Upshift Pressure Test - Wide open throttle upshift should occur at 98-108 lbs. (All 4 Cyl. and 6 Cyl. engines and V8 truck engines); 95-105 lbs. (283" Pass. Car engines); 93-103 lbs. (327" Pass. Car engines) as indicated on low servo apply (main line) gauge.

Idle Pressure in "D" Range - *NOTE - In addition to pressure gauges, connect a vacuum gauge to engine intake manifold.* With parking brake applied and selector lever in "D" (Drive), low servo apply (main line) pressure should be 60-70 lbs. at 16" Hg. of vacuum and 89-99 lbs. at 10" Hg. of vacuum.

Manual "L" Range Pressure Test - Connect a tachometer to engine, then apply brake and place selector lever in "L" (low) and adjust engine speed to 1000 RPM with car stationary. Low servo apply (main line) pressure should be 126-134 lbs. (All engines). *NOTE - If pressures are not within specified range, check for one or mor of th following conditions: Partially plugg d oil suction scre n. Brok n or damaged ring in l w s rv . Pr ssur r gulator valv stuck. Leakag at valv body-to-case gasket. Leak between valve body gaskets. Leak at servo center. Front pump clearances incorrect.*

Drive Range Overrun (Coast) Pressure Test - With car coasting in "D" (Drive) range at 20-25 MPH with engine vacuum at approximately 20" Hg., low servo apply (main line) pressure should be 48-54 lbs. (all models).

THROTTLE VALVE ADJUSTMENT

PRESSURE TEST POINTS

TROUBLE SHOOTING

Engine Speed Flares

On Standstill (But Acceleration Lags) - Low band partially applied. Low oil level. Clogged oil suction screen. Improper band adjustment. Servo apply passage blocked. Servo piston ring broken or leaking. Band facing worn. Low band apply linkage disengaged or broken. Converter stator not holding. *NOTE - This last condition is a very rare occurrence.*

On Upshift - Low oil level. Improper band adjustment. Clogged oil screen. High clutch partially applied, blocked feed orifice. High clutch plates worn. High clutch seals leak. High clutch piston hung up. High clutch drum relief ball not seating. Vacuum modulator line plugged.

Upshifts

No Upshift - Low band not releasing because of one or more of the following malfunctions: Stuck low drive valve. Defective governor. No rear pump output because of stuck priming valve, sheared drive pin or defective pump. Throttle valve stuck or not adjusted properly. Manual valve lever not adjusted properly.

Harsh Upshifts - Incorrect throttle valve linkage adjustment. Improper low band adjustment. Vacuum modulator line broken or disconnected; diaphragm leakage; or valve stuck. Hydraulic modulator valve stuck.

(Continued)

Downshifts

Closed Throttle (Cast) Downshifts Harsh - Improper low band adjustment. High engine idle speed. Downshift timing valve not operating properly. High mainline pressure because of vacuum modulator failure or because of hydraulic modulator valve sticking. Check for pressure regulator valve sticking.

No Downshift - Sticking low-drive shift valve. Low-drive shift plug stuck. High governor pressures or low throttle valve pressure.

Clutch Failure

Burned Plates - Low band adjusting screw backed off more than specified. Improper order of clutch plate assembly. Extended operation with low oil level. Clutch drum relief valve stuck. Abnormally high speed upshifts which may be due to improper governor action or operating transmission at high speed with selector lever in "L" (Low).

No Drive In Reverse

Incorrect manual lever adjustment. Reverse clutch piston stuck. Reverse plates worn out. Reverse clutch leaking excessively. Blocked reverse clutch apply orifice.

Car Creeps

In Drive - Engine idle speed adjusted too high.
In Neutral - Incorrect manual lever adjustment. High clutch or low band not released.

Impr per Shift Points

Incorrectly adjusted throttle linkage or throttle valve. Governor defective. Rear pump priming valve stuck.

Unable To Push Start

Rear pump drive gear not engaged with drive pin or output shaft. Drive pin sheared off. Rear pump priming valve not sealing.

Oil Forced Out of Filler Tube

Oil level too high. Water in oil. Leakage in pump suction circuits.

① - Std. engine. ② - High performance engine. ③ - With 700 x 15 tires and specified axle ratio.

TRANSMISSION REMOVAL

See 1962 Final Data, Page 438 and note the following additional information.

Corvette - Remove shift lever knob and disconnect neutral safety switch wiring at quick-disconnect. Remove both exhaust pipes (exhaust manifold-to-frame crossmember).

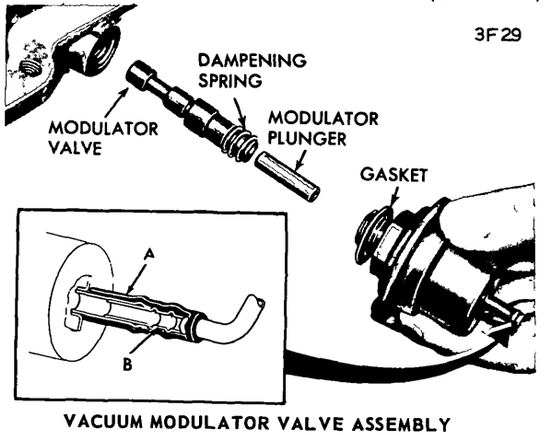
TRANSMISSION OVERHAUL

See 1962 Final Data, Page 438 and note the following changes.

Vacuum Modulator

This unit has been changed and incorporates a plunger and dampening spring (see illustration).

Rear Pump



When installing **rear pump priming valv** , install retaining seat flush to .020" below surface of pump face. When properly installed, tip of valve must extend above face of pump to insure priming valve operation. When installing **downshift timing valve,** press to a height of 17/32", measured from shoulder of valve assembly to face of pump cover. If **lube relief valve** is replaced, use an "easy out" for removal. To install, tap seat in place with a soft hammer or brass drift so it is flush to .010" below surface of pump cover.

High Clutch

There are 21 return springs instead of the 24 springs used on previous models. The number of clutch drum plates have been changed on some models. Install same number of plates in the same order, as found in original assembly.

3F29

VACUUM MODULATOR VALVE ASSEMBLY

CORVAIR TRANSAXLE

Corvair (1963)
Corvair 1200 Series Trucks (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

Place transmission selector lever in "N" (Neutral) until car reaches 25 MPH, then move selector lever to "L" until engine starts.

Towing Or Pushing Car

With transmission selector lever in "N" (Neutral), car may be towed at speeds not to exceed 30 MPH.

DESCRIPTION

The Transaxle consists of either an integral differential (rear axle) assembly and synchro-mesh transmission; or a differential (rear axle) assembly and a Powerglide automatic transmission. All assemblies are the same design used on previous models.

LUBRICATION

Checking Fluid Level

Check fluid level every 1,000 miles. With transmission at normal operating temperature, check the various units as follows:

Rear Axle & Synchro-mesh Transmission - Check fluid in differential first (plug is adjacent to rear axle universal joint on left side of transmission case). If level is low in differential carrier, also check level in transmission. *NOTE - Fluid should be level with bottom of filler plug hole under operating conditions.*

Powerglide Transmission - Place transmission selector lever in "N" position, engine idling, and check fluid level on dipstick in filler tube at right side of engine near firewall. Add recommended fluid to bring level to "Full" mark on dipstick.

Draining & Refilling

NOTE - Draining and refilling of transmission is not recommended except at time of overhaul. Drain oil by loosening filler tube attaching nut on oil pan. Tighten filler tube nut and add 4 pints of recommended fluid using filler tube and a suitable funnel. Start engine and allow to idle 3-5 minutes in "N", then add sufficient fluid to bring level to "Full" mark. Capacity is 6 pints (approximately) for normal refill. 13 pints (approximately) with transmission and torque converter dry.

ADJUSTMENT

Synchro-mesh Transmissions

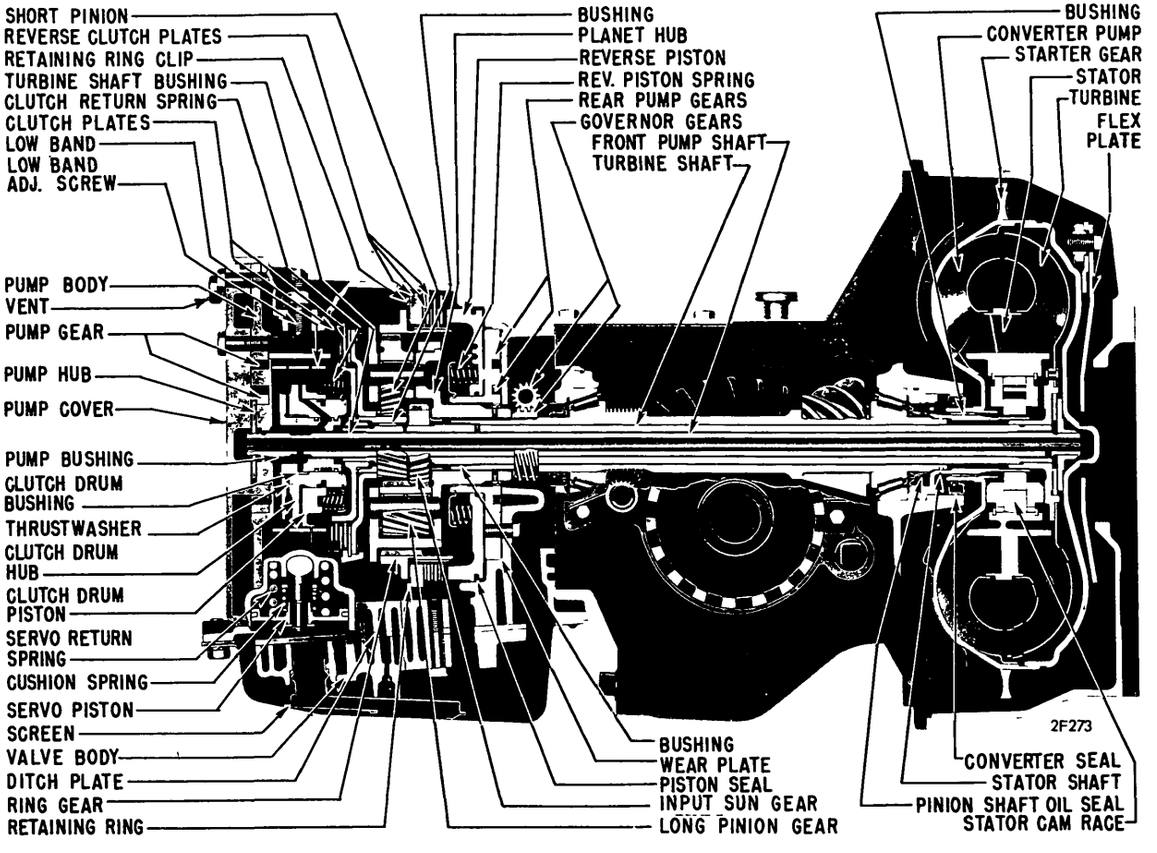
NOTE - Before making any adjustment, lash in system must be taken up by moving shift control rod to rear.

500 & 700 Series (3 & 4-Speed Trans.) - With seat in full forward position, shift transmission to first gear, then loosen coupling clamp nut on transmission shift control rod. Adjust shift lever so distance from lever to edge of seat is ½". Test shifts in all ranges.

900 Series (3 & 4-Speed) - Shift transmission into reverse, then loosen coupling clamp nut on transmission shift control rod. Adjust shift lever so distance between center of gearshift lever housing, rearward, to center of gearshift lever knob is 2¼" (3-Speed Trans.); 3¼" (4-Speed Trans.). Tighten clamp nut and check shift in all ranges.

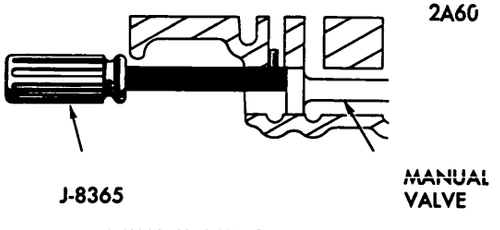
1200 Series (3 & 4-Speed) - Remove spring from gearshift lever shaft. Rotate gearshift control rod to left side of truck and pull out until third gear is engaged (3-Speed Trans.); fourth gear (4-Speed Trans.), then loosen control rod coupling nut. Insert a 1½" wood block between rod end and front flange of the front crossmember. Remove gauge block and tighten clamp nut, then install spring. Check shift in all ranges.

Clutch Linkage (Synchro-mesh Trans.) - *See "Chevrolet & Pontiac (Own) Clutch" in Clutch Section.*



Automatic Transmission

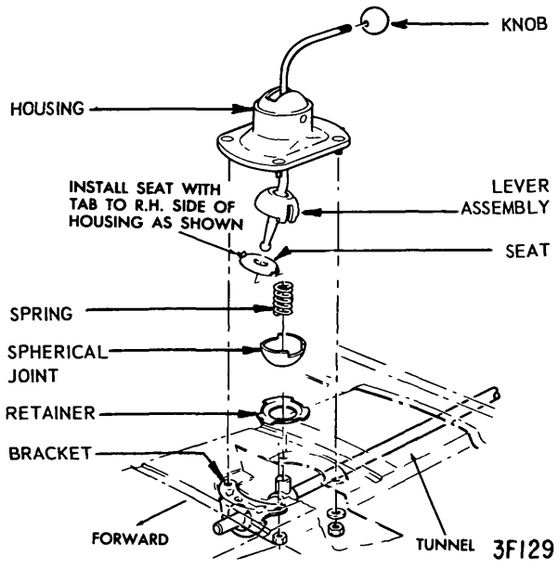
Throttle Linkage - *See CARBURETOR on Car Model pages.*



Manual Linkage - Drain transmission oil and remove oil pan. Place transmission selector lever in "D" (Drive), then insert Tool J-8365 into manual valve bore (end opposite linkage) with tab of gauge upward so it engages forward port of valve body (see illustration). With tool in place, push forward on manual valve levers. If valve is properly adjusted, tool will be held in place horizontally without being supported. If adjustment is necessary, loosen lockscrew in manual valve linkage (inside transmission) and push manual valve levers forward so tool is held in horizontal position. Recheck adjustment, then install oil pan and fill transmission.

Neutral Starter Switch - Loosen two switch mounting screws and place transmission selector lever in "N" (Neutral) position. Turn ignition switch to "Start"

(Continued)



CORVAIR POWERGLIDE TRANSMISSION

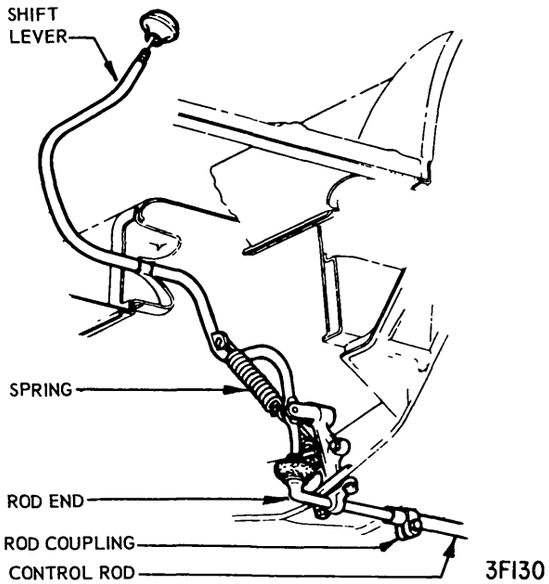
MANUAL VALVE GAUGING TOOL

position, then move neutral switch fore and aft until engine cranking begins. Secure switch in that position, then check to make sure engine will not start with transmission selector lever in any position other than "N" (Neutral).

Low Band - *NOTE - Periodic adjustment of the low band is not recommended. Access to the adjusting screw, from inside the car through parcel compartment area, has been eliminated.* To adjust (with transmission out of car), loosen lock nut and tighten square head adjusting screw to 40±5 inch pounds, **then back adjusting screw off 4 full turns exactly.** Hold adjusting screw stationary and tighten locknut

MANUAL SHIFT LEVER ASSEMBLY (EXC. 1200 SERIES)

TROUBLE SHOOTING & DIAGNOSIS (AUTOMATIC TRANSMISSION)



No Drive

In Any Selector Lever Position (Cannot Load Engine) - Low oil level. Clogged oil suction pipe screen. Broken or disconnected manual cable. Defective pressure regulator valve. Defective line pressure limit valve. Defective front pump. Rear pump check valve and rear pump priming ball not seating (both must occur for possible malfunction). Front pump shaft disengaged at either converter or pump gear. Front pump priming valve not seating.

In Reverse - Manual valve lever adjustment not correct. Cable linkage adjustment not correct. Reverse clutch piston stuck. Reverse clutch plates worn out. Reverse clutch leaking excessively. Blocked reverse clutch apply orifice.

Engine Speed Flares

On Standstill Starts But Accelerati n Lags - Low band only partially applied caused by one or more of the

MANUAL SHIFT LEVER ASSEMBLY (1200 SERIES)

following conditions: Low oil pressure. Clogged pickup pipe screen. Improper band adjustment. Servo piston apply passage blocked. Servo piston ring broken or leaking. Band facing worn. Low band apply linkage disengaged or broken. Converter stator not holding.

On Upshift - Low oil level. Clogged oil suction screen or pipe. High clutch partially applied (blocked feed orifice). Clutch plates worn. Clutch seals leaking. Clutch piston hung up. Clutch drum relief valve ball not seating. Vacuum modulator hose collapsed.

No Upshift

Low band not releasing due to one of the following conditions: Stuck low-drive valve. Defective governor. No rear pump output (stuck priming ball, drive pins not engaged, or defective pump). Throttle valve stuck or improperly adjusted. Improperly adjusted manual valve lever.

Harsh Upshift

Incorrect carburetor-to-transmission throttle valve rod adjustment. Improper low band adjustment. Vacuum modulator hose broken or disconnected. Vacuum modulator diaphragm leaks. Vacuum modulator valve stuck. Hydraulic modulator valve stuck.

Harsh Downshift

With Closed Throttle - Improper low band adjustment. Vacuum modulator hose disconnected or broken. Vacuum modulator diaphragm ruptured. Vacuum modulator valve stuck. Engine idle speed too high. Sticking pressure regulator or hydraulic modulator valves in valve body assembly.

Car Creeps

Excessiv ly in Drive - Engine idle speed too high.

In Neutral - Incorrect manual valve lever adjustment. High clutch or low band not released.

Oil Forced From Filler Pipe

Oil level too high. Oil pickup pipe split or not sealed, causing air to enter system.

Unable To Push Start

Rear pump drive gear not engaged with drive pins on planet carrier hub. Rear pump defective. Rear pump priming ball not seating.

TESTING

NOTE - Transmission must be at normal operating temperature, fluid level at "F" mark on dipstick, and manual and throttle linkage adjustments must be correct.

Road Test

Road test car to determine transmission shift points as indicated below.

Transmission Shift Speeds

	MPH
UPSHIFTS:	
Minimum Throttle	10–12½
Full Throttle	41–47
Part Throttle (Detent Touch)	34–41
DOWNSHIFTS:	MPH
Closed Throttle	8–12
Full Throttle	38–44
Part Throttle (Detent Touch)	23–30
Manual Low (Inhibited)	41–46

Pressure Tests

NOTE - Pressure tests can be made by raising rear wheels 3-5" off floor on jack stands.

FRONT PUMP PRESSURE TESTING CAUTION

Front pump pressures must be obtained with engine at idle speed (16" Hg. of vacuum). A very slight increase in engine speed (even that caused by an inaccurately set engine idle speed) will allow rear pump to take over, causing front pump pressure to fall to zero. If no front pump pressure is indicated, check first for proper engine idle speed.

Front Pump - Remove plug located at 6 o'clock position in pump cover (accessible through the engine **front mount) and connect pressure gauge. With engine at idle speed(approx. 16" of vacuum), pressures should be as follows with selector lever in the indicated range: 81–98 lbs. (Reverse); 47–57 lbs. (Neutral & Drive); 71–82 lbs. (Low). Disconnect vacuum hose at balance tube, then with engine at idle speed, check pressure which should be: 140–157 lbs. (Reverse); 71–82 lbs. (Neutral, Drive & Low). If there is no pressure in front pump, check for stuck pressure regulator, broken or disengaged front pump shaft, or missing plug from front end of front pump shaft. Moderately low front pump pressures in all ranges indicate a restricted front pump inlet. Failure of pressure to raise when vacuum hose disconnected (or high pressures with vacuum hose connected) indicates a stuck vacuum modulator valve, defective vacuum modulator, or a collapsed hose.**

(Continued)

Rear Pump - With gauge connected as for "Front Pump" (rear wheels raised), place selector lever in "D"(Drive) and accelerate engine. Front pump pressure should drop to approximately 0-5 lbs. at 20 MPH. If pressure does not drop, rear pump is disengaged or clogged, or rear pump check ball is not seating.

Throttle Valve - Remove plug located at 8 o'clock position in front pump cover (access through engine front mount) and connect pressure gauge. Disconnect throttle valve rod at carburetor and vacuum hose at balance tube, then with engine at idle speed, depress accelerator to wide open position. *NOTE - By disconnecting throttle valve rod at carburetor, engine remains at idle speed throughout test.* Pressures should be as follows with selector lever in the indicated range: 0 lbs. (Reverse & Neutral); 52–54 lbs. (Drive); 66–77 lbs. (Low). If pressures not as specified, they can be corrected by adjusting the position of the jam nut located on end of detent valve assembly (part of throttle valve assembly inside transmission case). Insert an Allen wrench in end of adjusting screw and hold screw from turning, then turn jam nut as necessary. To raise pressure, back off jam nut (one full turn is equal to 3 psi). Tightening the nut lowers pressure.

REMOVAL & INSTALLATION

Power Train

Remove complete engine, transmission & rear axle assembly as a unit. *See "Engine" on Car Model pages.*

Synchro-mesh Transmission

Removal - With the "Power Train" removed, support with a chain fall or suitable lift and sling, then drain transmission and differential carrier. Remove starter and the two screws securing clutch pull rod dust seal assembly, then remove pin attaching pull rod to clutch fork. Separate Transaxle from engine by removing attaching bolts securing differential carrier to clutch housing. Pull Transaxle away horizontally to prevent damage to clutch fork. Remove clutch shaft (transmission input shaft). Remove clutch fork and clutch release bearing from differential carrier. *NOTE - Fork is attached to carrier by a ball and socket and spring retainer.* Separate three-speed transmission from differential carrier by removing the four attaching bolts and disengaging transmission output shaft from splines in differential carrier.

Installation - Use a new gasket (hold in place with petrolatum), then couple transmission to differential carrier, being sure to engage splines of transmission mainshaft to internal splines of pinion in differential carrier. Secure transmission to carrier with four bolts (install two bolts on right side from transmission end and the two on left side from carrier end). Tighten bolts to 24-32 ft. lbs. Install clutch release bearing and clutch fork on differential carrier. *NOTE - Clutch release bearing slips over shaft and the fork has a spring retainer and socket which attaches to ball stud on carrier.* Install clutch shaft in Transaxle, then check distance from end of clutch release bearing shaft to end of clutch shaft. If fully engaged, the dimension should be 2 9/16"±1/32". Support Transaxle with a chain fall or other suitable lift and sling, then align attaching bolt holes in carrier and clutch housing. Pilot clutch shaft splines into clutch, then install attaching bolts and tighten securely. Connect clutch pushrod to clutch fork with pin, then position and secure clutch pushrod dust seal assembly. Install starter and fill transmission and differential carrier.

Powerglide Transmission

Removal - With "Power Train" removed, drain transmission, then disconnect modulator tube-to-carburetor balance tube hose. Remove engine front shield and remove starter. Disconnect converter from engine flex plate by removing the three attaching bolts through the access hole (at 12 o'clock position) in converter housing. Support Transaxle with a chain fall or suitable lift and sling, then remove attaching bolts and lockwashers securing differential carrier to converter housing. Pull Transaxle away from engine and remove converter assembly. Pull turbine shaft out of Transaxle assembly. Place Transaxle on a flat surface and remove screws securing governor assembly and remove governor. Remove three bolts securing transmission to carrier, then carefully pull transmission straight away from carrier to prevent pump shaft from damaging bushings in transmission and pinion shaft. Remove gasket from carrier, then remove governor gear and selective spacers from pinion shaft of carrier.

Installation - *NOTE - Before connecting Powerglide transmission and differential carrier, determine thickness of thrust washers required at front face of governor gear. See "Rear Selective Thrust Washer" below.* After determining proper size thrust washer, install a new gasket to either carrier or rear face of transmission (hold in place with petrolatum). Align carrier and transmission on a flat surface and carefully guide the pump shaft through differential carrier so as not to damage bushing in pinion, then engage splines of pinion shaft with planet carrier internal splines in transmission. Install governor, then secure the transmission-to-carrier with four bolts. Drive the two bolts from carrier side first (to minimize chance of cocking mating surfaces), then tighten bolts to 24-32 ft. lbs. Install turbine shaft, being careful not to damage its bushings as it is inserted over pump shaft splines. *NOTE - Be sure to engage the two sets of splines (forward splines engage clutch drum and the rear set engage into sun gear in planet gearset).* DO NOT tip rear of Transaxle downward after installation unless converter holding plates are used. Position Transaxle adjacent to engine on a chain fall or similar lift, then remove converter holding plates if installed. Align converter with flex plate, then pilot converter hub onto crankshaft. Align mounting holes in differential carrier and converter housing, then secure top left bolt (11 o'clock position). Install flex plate to converter bolt accessible at the "1 o'clock" position to prevent accidental turning of converter or flex plate and loss of attaching hole alignment. Drive remaining converter housing-to-differential carrier mounting bolts, then install starter. Drive the two remaining converter-to-flex plate bolts through the access hole in converter housing. Install engine front shield, then reinsert filler tube through front shield and connect it to oil pan. Connect vacuum modulator to carburetor balance tube with a short length of hose. Refill transmission (*See "Draining & Refilling" above*).

Rear Selective Thrust Washer - *NOTE - Any time repairs are made that require the separation of Powerglide transmission and differential carrier, the proper thickness of thrust washer to be used at front face of governor gear must be determined as follows:* Install dial indicator on Support J-8364 and install a 3" indicator extension. Without gasket, place support on rear pump cavity surface of transmission case (transmission front end down) so that dial indicator tip rests on planet carrier hub. Adjust indicator as required to permit maximum indicator travel, then set dial to zero. *NOTE - Transmission must face downward when indicator is zeroed.* Slowly lift indicator and support off rear pump cavity and note its range of needle deflection from zero position. *NOTE - If indicator is properly positioned on support, indicator should not deflect more than .050" (one-half turn) when removed; otherwise raise or lower dial indicator on support post as required and again "zero" gauge.* Place support and dial indicator on governor gear on differential carrier pinion shaft (support J-8364 will fit over pinion shaft), then slowly lower support (indicator tip of dial indicator against machined face of differential carrier housing) so that revolutions of dial indicator can be counted. *NOTE - Measurement starts once the indicator needle reaches "zero".* Fully depress support on governor gear and note indicator reading, then refer to following table for thickness of spacers to be installed on governor gear.

►*NOTE: After selected spacers are installed on governor gear, recheck measurement. If spacer stack is correct, indicator reading will now be between .025-.045". If not add or remove spacers until reading is within this range.*

Thrust Spacer Chart

Indicator Reading	No. Req'd	② Spacer Thickness
.025-.046" Ⓒ	None	
.047-.062"	1	.016" ± .001"
.063-.078"	2	.032" ± .002"
.079-.094"	3	.048" ± .003"
.095-.110"	4	.064" ± .004"
.111-.126"	5	.080" ± .005"
.127-.142"	6	.096" ± .006"
.143-.155"	7	.112" ± .007"

Ⓒ - If initial indicator reading is below .025", replace thrust washer at clutch hub (front pump) with a .050" thrust washer, then repeat entire rear thrust spacer selection procedure.

② - Spacer, Part No. 6256827 (.016" thick) furnished. Use number indicated.

OVERHAUL

Differential Case

Standard Differential Case - *See 1960 Final Data, Page 433, or later Manual edition and note the following:*

Differential case has been redesigned to accommodate side gears of equal length. Because of this change, universal joint trunnions are unequal in length and the differential pinion shaft has flats on both sides to clear longer universal joint trunnions. A new "pressed on" speedometer gear replaces the former integral gear.

Differential Side Bearing Installation - Use Tool J-8359 to install side bearings on differential case and cover.

►*DRIVE PINION DEPTH SETTING NOTE (When Installing Service Replacement Drive Pinion):* Ring gear and drive pinion sets manufactured after February 1, 1961 and date coded 2-61 and later will not be

(Continued)

marked f r pinion mounting distance. On these later service replacement units, select shims using pinion code "14" as indicated in "Pinion Setting Shim Chart" under "Corvair Transaxle" in 1960 Annual Data or later Manual edition.

Positraction Differential

See 1962 Final Data, Page 448 and note the following: 1963 type units have five plates. Previous type units used seven plates.

3-Speed Synchro-mesh Trans.

See 1960 Final Data, Page 433, or later Manual edition and note the following: Transmission case is redesigned to provide piloting on differential carrier pinion front adjusting sleeve. In addition, a cast iron transmission case is used and the transmission mainshaft has been lengthened at output end.

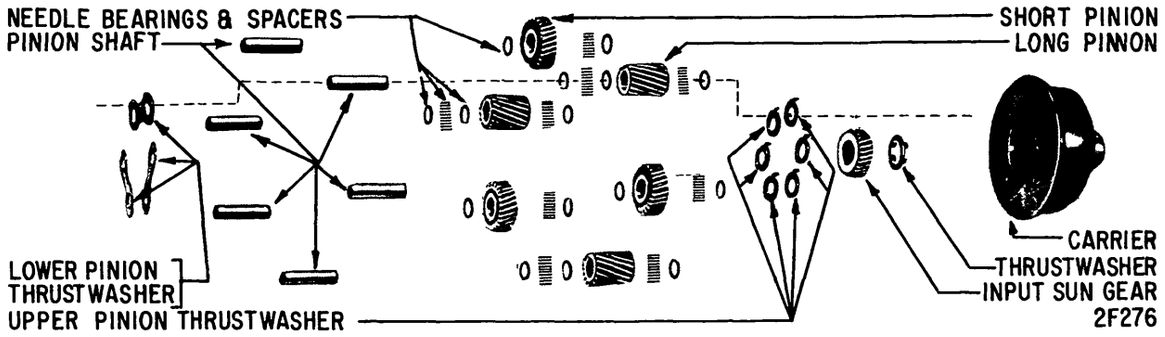
4-Speed Synchro-mesh Trans.

See 1961 Final Data, Page 423 for overhaul procedures.

Powerglide Transmission

See 1960 Final Data, Page 433, or later Manual edition and note the following:

Line pressure regulator valve has been eliminated and facing material is no longer used on reverse clutch thick reaction ring. On 1200 series trucks, transmission oil is cooled by circulating it through a cooler located in left front wheel housing compartment. On these models, a bypass valve located in front pump body allows oil to circulate within the transmission case in the event any restrictions creating a pressure build-up of more than 15 lbs. On all models, the planet carrier assembly can be disassembled for repair as follows:



Planet Carrier - Disassembly - 1) With carrier removed from the transmission assembly, wash carrier in clean solvent, then blow out all passages and dry with air. Inspect complete unit for damage and wear. Check clearance of planet gears which should be .005-.0035". Place planet carrier assembly in a vise with splined end facing down.

2) Starting with a short planet pinion, and using a soft steel drift punch, drive on upper end of pinion shaft until shaft is driven beyond staked position and press fit area of carrier housing. Feed Tool J-9560-1 into short planet pinion from upper end, pushing planet pinion shaft ahead until tool is centered in pinion. Remove short planet pinion and lower pinion thrust washer from the assembly, then remove pinion shaft.

3) Remove Tool J-9560-1, needle bearings, and needle bearing washers from short planet pinion. *CAUTION - Do not lose any of the planet pinion needle bearings. Twenty long bearings are used with short pinion. Forty short needle bearings are used with long pinions (twenty on each end with a spacer in the middle).* Remove and disassemble remaining short planet pinions.

4) Remove input sun gear thrust washer, then by following the procedure outlined for removal of short pinions, remove the long planet pinions and upper and lower pinion thrust washers. Wash all parts in solvent and blow dry with air. Recheck all needle bearings and parts and replace as necessary. *CAUTION - If needle bearings are worn, all bearings must be replaced.*

Reassembly - 1) Use Tool J-9560-2 and assemble bearing spacer and short needle bearings (20 in each end) in a long planet pinion. *NOTE - Use cup grease to hold needle bearings in position during assembly.* Place a needle bearing washer at each end of planet pinion, then reverse position of planet carrier in vise and position the long planet pinion (with Tool J-9560-2 centered in pinion and with thrust washers at each end) in planet carrier. *NOTE - Oil groov s in thrust washers must be towards gear. Locate sh rt pini ns in carrier openings and l ng pini ns pp site cl s d portions of carrier.*

POWERGLIDE PLANET CARRIER ASSEMBLY

2) Align thrust washers with carrier holes, then select the proper pinion shaft (lubricate it with oil) and install it by tapping with a hammer, pushing Tool J-9560-2 ahead of it. Use a brass or soft steel drift punch and drive pinion shaft until lower end engages staked positions on lower face of carrier.

3) Assemble and install remaining long planet pinions in the same manner, then install input sun gear thrust washer and input sun gear. Follow the same general procedure as outlined for long pinions and assemble and install short pinions in carrier. *NOTE - Paired thrust washers are used on pinion thrust surfac t - ward flanged side of plan t carri r, from th short to the long planet pinions while th pposite thrust surface has an individual thrust wash r.*

4) Check end clearance of gears which should be .005-.035". Use a chisel or centerpunch and restake pinion shaft at four places on both ends of planet carrier.

CHRYSLER CORP. TORQUEFLITE SIX & EIGHT TRANSMISSION

Chrysler, Imperial, Dodge, Plymouth, Valiant (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

Turn ignition switch on, then push the "L" (Low) button in and depress accelerator pedal slightly. After car attains a speed of 15 MPH, transmission will start engine.

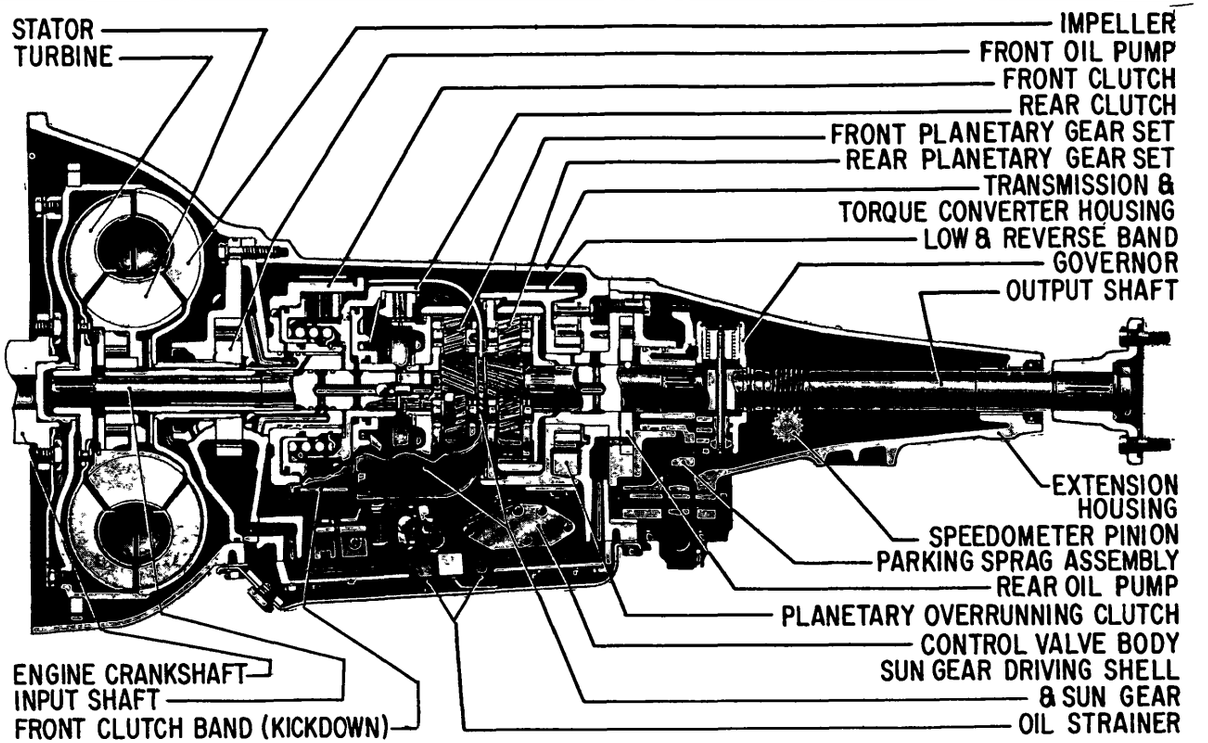
Towing Or Pushing Car

Transmission Operating Properly - Car may be towed safely in "N" (Neutral) position at moderate speeds. For long distance towing (over 100 miles), the propeller shaft should be disconnected.

Transmissi n Inoperative - Tow car with rear end raised or remove the propeller shaft.

DESCRIPTION

Three speed automatic transmission of same design used on previous models.



LUBRICATION

Checking Fluid Level

With transmission at normal operating temperature, parking brake applied and engine at idle speed, depress each button momentarily, ending with the "N" (Neutral) button pushed in. Fluid level should be slightly below "F" mark on dipstick (never above "F" mark). Add or remove fluid as necessary to bring to proper level. *NOTE - If necessary to check fluid level with transmission cold, fluid level should be at, or slightly below "Add One Pint" mark. Do not overfill.*

Draining & Refilling

NOTE - Not required in normal service except at time of overhaul. For police, taxicab or towing trailer service, drain and refill every 34,000 miles. For extremely severe service, drain and refill every 10,000 miles. Remove transmission drain plug (if there is no drain plug, loosen pan bolts and tap pan with a soft mallet to break it loose and allow fluid to drain). Remove converter access cover plate and converter drain plug. After draining, replace plugs and cover plate (tighten oil pan bolts if necessary). *NOTE - It is recommend d that pan and intake screen be removed and cleaned and that a new fluid filter be installed in oil cooler return line.* Pour 5 qts. of recommended fluid into transmission (TorqueFlite Six); 8 qts. (TorqueFlite 8), then start engine and allow it to idle for. at least two minutes. With brakes applied, depress each button momentarily, ending with "N" (Neutral) button depressed. Add sufficient fluid to bring level up to "Add One Pint" mark on dipstick (approximately 2½ qts. TorqueFlite Six; 1½ qts. TorqueFlite Eight). Recheck fluid level after transmission is at normal operating temperature. Level should be at "F" mark or slightly below.

TORQUEFLITE SIX TRANSMISSION SECTIONAL VIEW

Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity

15 pts. (TorqueFlite Six); 18½ pts. (TorqueFlite 8).

ADJUSTMENT

Throttle Linkage

See CARBURETOR on Car Model pages.

Manual Control Cable

1) With car raised on a hoist, have an assistant depress "R" (Reverse) button and hold it down. Remove pushbutton control cable adjustment wheel lockscrew at left side of transmission case.

2) Back adjustment wheel off cable guide (turn counterclockwise) until two or three threads are showing behind wheel on guide. *CAUTION - Check wheel for free turning on guide and remove any burrs in threads that might interfere. Lubricate threads with a few drops of transmission fluid.*

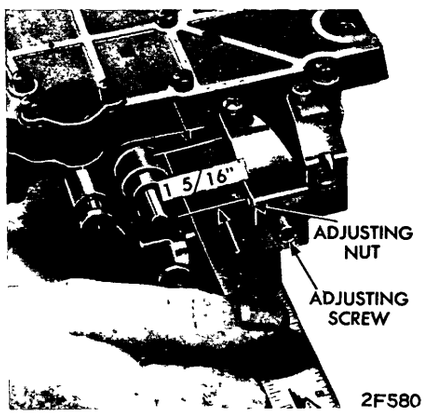
3) Hold cable guide centered in hole in transmission case and apply only enough pressure to bottom assembly at reverse detent While holding cable bottomed, rotate adjusting wheel clockwise until it just contacts case. Turn wheel just enough clockwise to make next adjustment hole line up with screw hole in case.

4) Counting this hole as number one, continue turning the wheel clockwise until the fifth hole lines up with screw hole in case, then install lockscrew and tighten to 40 inch lbs.

Parking Lock Cable

To check adjustment, operate parking lock lever from one end of slot in instrument panel to the other. The lever should have clearance at both ends. *NOTE - One hole in parking lock arm is slotted to permit parking lock lever adjustment.* To adjust, move lever to fully OFF position, then loosen two nuts attaching lock arm to push button housing. *NOTE - Loosen nuts just enough to free up lever arm.* Block locking lever 1/16" from OFF position end of slot, then tighten both nuts on pushbutton housing. Recheck lever travel to be sure clearance exists at both ends of travel. Have an assistant hold parking lock lever on instrument panel in OFF position, then loosen clamp bolt securing cable housing in parking pawl lever cover on bottom of transmission extension housing. Tap end of clamp bolt lightly to release its hold on cable, then gently pull outward on cable housing to its limit of travel and tighten clamp bolt to 10 inch pounds. *CAUTION - Do not use pliers or similar tool to pull outward on cable as cabl cover might be damaged.* Check adjustment by allowing car to roll slightly on a slight incline. Parking pawl should freely engage sprag with lever in ON position, and there should be no ratcheting noise with lever in OFF position.

Neutral Safety Switch



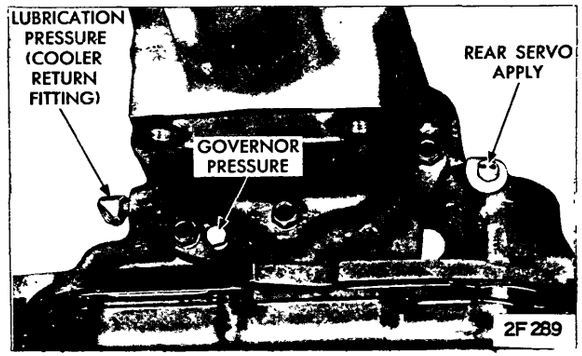
With manual control cable properly adjusted(see above), depress "N" (Neutral) pushbutton, then raise car on a hoist and drain approximately 2 qts. of fluid from transmission (see "Draining & Refilling" above). Remove neutral switch from transmission and check to see that switch operating lever is aligned in center of switch opening in case. Place cupped washer and "O" ring seal over threads of switch, then screw switch into transmission case a few turns. Connect one lead of a test lamp to battery current and other lead to switch terminal. Screw switch into transmission case until lamp lights, then tighten switch an additional 1/3 to 1/2 turn. *CAUTION - Switch must be tightened enough to prevent oil leakage. If not, add a thin washer and readjust switch.* Remove test lamp, connect wire to switch, then add fluid to bring to proper level.

Kickdown (Front) Band

NOTE - Kickdown band adjusting screw is located on left side of transmission near throttle lever shaft. Loosen locknut and back off approximately five turns, then check adjusting screw for free turning in case. Use a torque wrench and tighten band adjusting screw to 72 inch pounds. *NOTE - If special adapter, Tool C-3705 is used, tighten adjusting screw to 47-50 inch pounds.* **Back off adjusting screw the amount of turns shown in "Band Adjusting Specifications" below.** Tighten locknut to 29 ft. lbs.

Low-Reverse (Rear) Band

Remove transmission oil pan, then loosen adjusting screw locknut and back off nut approximately five turns. Check adjusting screw for free turning in lever. Use a torque wrench and tighten band adjusting screw to 72 inch pounds. *NOTE - If special adaptor, Tool C-3705 is used, tighten adjusting screw to 47-50 inch pounds.* **Back off adjusting screw the amount of turns shown in "Band Adjusting Specifications" below.** Tighten locknut to 35 ft. lbs. Install oil pan and refill transmission.

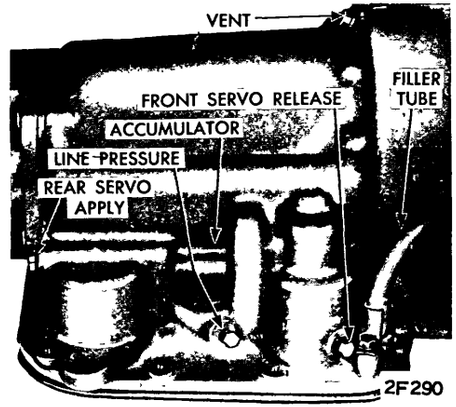


HYDRAULIC LINE PRESSURE ADJUSTMENT

Band Adjusting Specifications

Engine	Back Off Adjusting Screw Kickdown Band	Back Off Adjusting Screw Low-Reverse Band
170" 6 Cyl.	2 5/8 turns	5¼ turns
225" 6 Cyl.	2 turns	5¼ turns
All V8	2 turns	3 turns

Line Pressure



Remove valve body assembly from transmission and measure distance between manual valve and line pressure adjusting screw. This measurement must be 1 7/8" (see "Spring Retainer Location" illustration). If not, loosen spring retainer screws and reposition retainer. Adjust line pressure as follows: Adjust "Allen" type screw in end of pressure regulator spring bracket so measurement between valve body and inner edge of adjusting nut on end of spring (see "Line Pressure Adjustment" illustration) is 1 5/16". *NOTE - The above line pressure adjustment can be varied to obtain specified line pressure. One complete turn of adjusting screw changes closed throttle line pressure approximately 1 2/3 lbs. Turning screw counterclockwise increases pressure.*

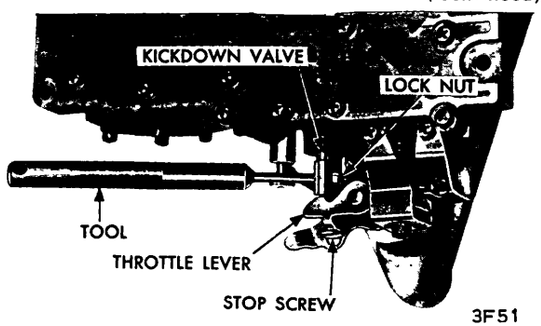
PRESSURE TEST LOCATIONS (REAR)

Throttle Pressure

NOTE - Throttle Pressure cannot be tested accurately. If malfunction is evident, inspect the adjustment. Remove valve body assembly from transmission, then loosen throttle lever stopscrew locknut and back screw off approximately five turns. Insert gauge pin of Tool C-3763 between throttle lever cam and kickdown valve (see "Throttle Pressure Adjustment" illustration). By pushing on tool, compress kickdown valve against its spring so throttle valve is completely bottomed inside the valve body. As force is being exerted to compress the spring, tighten throttle lever stopscrew finger tight against throttle lever tang with throttle lever cam touching the tool and throttle valve bottomed. *CAUTION - Be sure the adjustment is made with spring fully compressed and valve bottomed in valve body. Remove tool and tighten stopscrew locknut securely.*

PRESSURE TEST LOCATIONS (RIGHT SIDE)

TESTING



HYDRAULIC PRESSURE

NOTE - All of the following tests must be made with transmission at normal operating temperature.

Line & Front Servo Release

Install a tachometer on engine, then raise car and position tachometer so it can be read under the car. Connect two 0-100 lbs. pressure gauges to pressure take-off points at top of accumulator and at front servo release (see illustration). With transmission selector lever in "D" (Drive) position, and wheels free to turn, speed up engine slightly until transmission shifts into direct drive. Reduce engine speed slowly to 1000 RPM. Line pressure at this time should be 54-60 lbs., and front servo release pressure must not be more than 3 lbs. below line pressure. Disconnect throttle linkage from transmission throttle lever and move transmission throttle lever gradually to full throttle position. Line pressure must rise to a maximum of 90-96 lbs. just before or at kickdown into low gear. Front servo release pressure must follow the line pressure up to the kickdown point and should not be more than 3 lbs. below line pressure. If line pressure is not 54-60 lbs. at 1000 RPM, adjust pressure (see "Adjust-

(Continued)

THROTTLE PRESSURE ADJUSTMENT

ments" above). *NOTE - If front servo release pressures are less than specified, and line pressures are within limits, there is excessive leakage in front clutch or front servo circuits. Always inspect external throttle lever for looseness on valve body shaft when making pressure tests.*

Lubrication Pressure

Install a "tee" fitting between cooler return line fitting and fitting hole in transmission case at rear left side of case. Connect a 0-100 lbs. pressure gauge to "tee" fitting. At 1000 RPM with throttle lever in closed position and transmission in direct drive, pressure should be 5-15 lbs.

Rear Servo Apply

Connect a 0-300 lbs. pressure gauge to apply pressure take-off point at rear servo, then with transmission in "R" (Reverse) and engine speed at 1600 RPM, pressure should be 240-280 lbs.

Governor Pressure

Connect a suitable pressure gauge to governor pressure take-off point located on lower left side of extension housing mounting flange. Governor pressures should be within limits indicated in tables below. If pressure is not correct, governor valve or weights are sticking.

AIR PRESSURE

Front Clutch

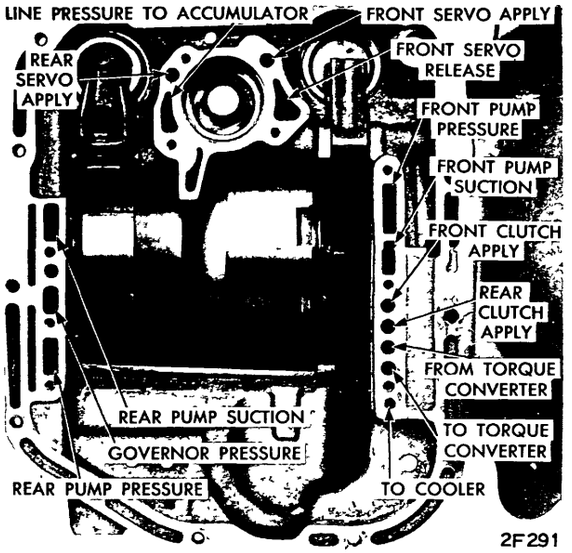
Apply pressure to front clutch apply passage and listen for a dull thud which indicates that front clutch is operating. Hold air pressure on for a few seconds and inspect system for excessive leakage.

Rear Clutch

Apply air pressure to rear clutch apply passage and listen for a dull thud indicating rear clutch is operating. *NOTE - If a dull thud cannot be heard in clutches, hold finger tips on clutch housing and again apply air pressure. Movement of piston can be felt as clutch is applied.*

Kickdown Servo

Direct air pressure into front servo apply passage. Operation of servo is indicated by tightening of front band. Spring tension on servo piston should release the band.



Low & Reverse Servo

Direct air pressure into rear servo apply passage. Operation of servo is indicated by tightening of rear band. Spring pressure on servo piston should release the band.

TROUBLE SHOOTING & DIAGNOSIS

Harsh Engagement

In D, 1, 2, & R - Engine idle speed too high. Hydraulic pressures not within specifications. Low-Reverse band out of adjustment. Valve body leaking or not operating properly. Accumulator sticking, broken rings, or spring. Low-Reverse servo, band or linkage not operating properly. Front and (or) rear clutch worn or faulty.

AIR PRESSURE CHECK POINTS

Delayed Engagement

In D, 1, 2, & R - Fluid level low. Control cable not correctly adjusted. Hydraulic pressures not within limits. Valve body leaking or not operating properly. Accumulator sticking, broken rings or spring. Clutches or servos sticking or not operating. Front pump faulty. Front and (or) rear clutch worn or faulty. Worn or broken input shaft and (or) reaction shaft support seal rings. Fluid is aerated.

Runaway & Harsh Upshift

Incorrect throttle linkage adjustment. Fluid level is low. Hydraulic pressures not within specifications. Kickdown band out of adjustment. Valve body leaking or not operating properly. Governor not operating properly. Accumulator sticking, broken rings or spring. Clutches or servos not operating or sticking. Kickdown servo, band or linkage not operating properly. Worn or faulty front clutch. Worn or broken input shaft and (or) reaction shaft support seal rings.

Harsh 3-2 Kickdown

Same as for "Runaway & Harsh Upshift" above.

No Upshift

Low fluid level. Throttle linkage not properly adjusted. kickdown band out of adjustment. Hydraulic pressures not within limits. Governor sticking. Valve body leaking or not operating properly. Accumulator sticking, broken rings or spring. Clutches or servos sticking or not operating. Faulty rear pump. Kickdown servo, band or linkage not operating properly. Worn or faulty front clutch. Worn or broken input shaft and (or) reaction shaft support seal rings.

① - Std. Eng. ② - Hi Perf. Eng. ③ - With 8.00-14 tires. (1 MPH higher with 8.50-14 tires.).

N Kickdown

Throttle linkage and (or) control cable not correctly adjusted. Kickdown band out of adjustment. Hydraulic pressures not within limits. Governor sticking. Valve body leaking or not operating properly. Accumulator sticking, broken rings or spring. Clutches or servos sticking or not operating. Kickdown servo, band or linkage not operating properly. Overrunning clutch not holding.

No Normal Downshift

Same as for "No Kickdown" above.

Shifts Erratic

Low or aerated fluid. Throttle linkage and (or) control cable not correctly adjusted. Oil strainer clogged. Valve body leaking or not operating properly. Clutches or servos sticking or not operating properly. Faulty front and (or) rear pump. Worn or broken input shaft and (or) reaction shaft support seal rings.

Slippage

NOTE - In all cases of slippage, check for low fluid level or for aerated fluid.

In Forward Drive Positions - Throttle linkage and (or) control cable not adjusted properly. Hydraulic pressures not within limits. Valve body leaking or not operating properly. Accumulator sticking, broken rings or spring. Clutches or servos sticking or not operating. Worn or faulty front and (or) rear clutch. Overrunning clutch not holding. Worn or broken input shaft and (or) reaction shaft support seal rings.

In Reverse Only - Control cable not correctly adjusted. Hydraulic pressures not within limits. Low-Reverse band out of adjustment. Valve body leaking or not operating properly. Front clutch or rear servo sticking or not operating. Low-Reverse servo, band or linkage not operating properly. Faulty front oil pump.

In All Positions - Hydraulic pressures too low. Valve body leaking or not operating properly. Faulty front oil pump. Clutches or servos sticking or not operating. Worn or broken input shaft and (or) reaction shaft support seal rings.

No Drive

In Any Position - Fluid level low. Hydraulic pressures low. Oil strainer clogged. Valve body leaking or not operating properly. Faulty front oil pump. Clutches or servos sticking or not operating.

In Forward Drive Positions - Hydraulic pressures low. Valve body leaking or not operating properly. Accumulator sticking, broken rings or spring. Clutches or servos sticking or not operating. Worn or faulty rear clutch. Overrunning clutch not holding. Worn or broken input shaft and (or) reaction shaft support seals.

In Reverse - Control cable not adjusted properly. Hydraulic pressures low. Low-Reverse band out of adjustment. Front clutch or rear servo sticking or not operating. Low-Reverse servo, band, or linkage not operating properly. Worn or faulty front clutch.

Drives In Neutral

Control cable not adjusted properly. Valv body leaking or not operating properly. Rear clutch inoperative.

Drags Or Locks

Kickdown band out of adjustment. Low-Reverse band out of adjustment. Kickdown and (or) low-reverse servo, band, or linkage not operating properly. Front and (or) rear clutch faulty. Planetary gear sets broken or seized. Overrunning clutch worn, broken or seized.

Noise

Grating, Scraping, r Growling - Kickdown band not adjusted properly. Low-Reverse band out of adjustment. Output shaft bearing or bushing damaged. Governor support binding or broken seal rings. Front and (or) rear pump scored or binding. Front and (or) rear clutch faulty. Planetary gear sets broken or seized. Overrunning clutch worn, broken or seized.

Buzzing - Fluid level low. Pumps sucking air. Valve body not operating properly. Overrunning clutch inner race damaged.

(C ntinued)

Hard To Fill

High fluid level. Breather clogged. Oil strainer clogged. Aerated fluid.

Overheating

Fluid level low. Band adjustments too tight. Cooling system faulty. Front and (or) rear pump faulty. Insufficient clutch plate clearance in front and (or) rear clutches.

Cannot Push Start

Fluid level low. Low-Reverse band slipping. Valve body leaking or not operating properly. Rear oil pump faulty. Low-Reverse servo, band or linkage not operating properly. Worn or faulty rear clutch. Worn or broken input shaft and (or) reaction shaft support seal rings.

TORQUE CONVERTER

TORQUE CONVERTER NOTE - This is a sealed unit and cannot be disass mbled for overhaul. In the event of parts failure in transmission, the torque converter should be flushed in the following manner.

Flushing Torque Converter

With torque converter assembly removed from engine, place it in an upright position and pour two quarts of clean solvent or kerosene into converter through impeller hub. Turn and shake converter so as to swirl solvent through internal parts. *NOTE - Turning turbine and stator with transmission input and reaction shafts will help dislodge for ign material.* Position converter in its normal operating position with drain plug at lowest point, then drain solvent. Rotate turbine and stator, and shake converter while draining. Repeat the above operation at least once, or as many times as required until solvent is drained out clean. After flushing, shake and rotate converter several times with drain plug out to rem ove all solvent and dirt. Reinstall drain plug and tighten to 20 ft. lbs.

TRANSMISSION REMOVAL & INSTALLATION

TRANSMISSION AND TORQUE CONVERTER REMOVAL CAUTION - Transmission and torque converter must be removed and installed as an assembly to prevent damage to converter drive plate, front pump bushing, and oil seal. DO NOT allow weight of transmission to rest on plate during removal or installation.

Removal

1) Disconnect high tension lead from distributor (to prevent engine starting when remote control starter switch is used to turn engine), then drain converter and transmission.
2) Mark converter and drive plate for use at installation. *NOTE - Crankshaft flange bolt circle, inner and outer circle of hol s in drive plat , and the four tapped holes in front face of converter all have one hole offset so these parts will be installed in original position.*
3) Rotate engine to locate two converter-to-drive plate bolts at "5" and "7" o'clock positions and remove bolts, then rotate engine and remove remaining two bolts. *CAUTION - Do not rotate converter or drive plate by prying with a screwdriver or other tool. DO NOT engage starter if drive plate is not attached to converter with at least one bolt or if transmission case-to-engine bolts have been loosened.*
4) Disconnect negative ground cable from battery, then remove starter motor and disconnect neutral safety switch wire from switch. Remove gearshift control cable to transmission adjusting wheel lockscrew and pull gearshift cable out of case as far as possible, backing off adjusting wheel a few turns if necessary. Insert a small screwdriver above and slightly to right of cable and disengage cable adapter lockspring by pushing screwdriver handle to the right while pulling outward on cable.
5) Remove throttle link and lever assembly from transmission throttle shaft, then disconnect oil cooler lines at transmission and remove oil filler tube. Remove speedometer pinion assembly, then loosen transmission parking pawl cable clamp where cable enters cover and remove housing cover lower plug. Insert screwdriver through hole, then gently exert pressure against projecting portion of cable lock spring and withdraw lock cable.
6) Disconnect front universal joint and secure propeller shaft out of the way. *NOTE - On Chrysler Imperial, remove propeller shaft center bearing housing bolts and slide front propeller shaft rearward to disengage universal joint from flange.*
7) Remove two bolts securing extension housing to crossmember insulator, then install a suitable engine support fixture (C-3487, V8; C-3809, 6 Cyl.) and raise engine slightly. Remove crossmember attaching bolts and remove crossmember, insulator and spring assembly.
8) Attach a small "C" clamp to edge of bell housing to hold converter in place during removal of transmission, then remove bell housing retaining bolts. Carefully work transmission rearward off engine block dowels and disengage converter hub from end of crankshaft. Remove transmission and converter assembly from car. After removing "C" clamp, carefully slide converter assembly out of transmission.

Installation

Reverse removal procedure and note the following:
1) To install converter on transmission, rotate front pump rotors with Tool C-3756 (6 Cyl.); C-3881 (V8) until two small holes in handle are vertical, then carefully slide converter assembly over input shaft and reaction shaft. Make sure converter impeller shaft slots are also vertical and fully engage front pump inner rotor lugs. Inspect for full engagement by placing a straightedge across face of case. Surface of converter should be at least ½" to rear of straightedge when converter is pushed all the way into transmission. Attach a "C" clamp to edge of converter housing to hold converter in place during installation of transmission.
2) Coat converter hub hole in crankshaft with wheel bearing lubricant and rotate converter so mark on converter (made during removal) will align with mark on drive plate. *NOTE - Offs t hol s on plat ar located next to 1/8" hole in inner circl of plate. A stamped "V" mark identifies offset hole in converter front cover.*
3) After transmission is in position on engine, tighten all bolts to specifications *(see "Tightening Specifications" below).*
4) On Chrysler Imperial, place propeller shaft center bearing housing shims under housing, then install retaining bolts and tighten to 35 ft. lbs.

5) To install control cable in case, engage "R" button and hold it firmly depressed. Insert pushbutton control cable into transmission case and push inward on cable, making sure lock spring engages cable. Adjust control cable *(see "Linkage Adjustment" above).*

TRANSMISSION UNITS REMOVAL & INSTALLATION (TRANSMISSION IN CAR)

See 1962 TorqueFlite Eight Transmission in 1962 Final Data, Page 460. Procedures are the same for 1963 TorqueFlite Six and TorqueFlite Eight with the following exceptions.

Output Shaft Oil Seal

Replacement (TorqueFlite Six) - Disconnect propeller shaft and remove output shaft flange. Drive Tool C-3899 through output shaft seal to remove rubber lips from seal, then screw tapered end of Tool C-3753 into seal and remove seal. To install new seal, slide protector sleeve, Tool C-3768 over output shaft splines, then drive in seal (lip side facing inward) with Tool C-3754. Install output shaft flange and propeller shaft.
Replacement (TorqueFlite Eight) - Disconnect propeller shaft and remove output shaft flange. Screw tapered end of Tool C-748 into seal and remove seal. To install seal, drive seal into housing (lip side facing inward) with Tool C-3837. Install output shaft flange and propeller shaft.

Extension Housing

Removal - Remove speedometer drive pinion assembly, then remove output shaft flange. Drain two quarts of fluid from transmission and loosen parking cable clamp bolt where cable enters housing cover. Tap end of clamp bolt lightly to release its hold on cable, then remove housing cover lower plug. Insert screwdriver through hole, then while exerting force on projecting portion of cable lock-spring, withdraw lock cable. Remove bolts securing extension housing to crossmember insulator and raise transmission slightly with a suitable jack. Remove crossmember bolts, crossmember, insulator and spring assembly. Remove extension housing attaching bolts and tap housing with a soft mallet to break it loose from transmission, then remove housing.

Bushing Replacement (TorqueFlite Six) - Drive seal out of housing with a drift, then drive bushing out with Tool C-3755. Slide a new bushing over ground end of Tool C-3751, then drive bushing into housing, making sure that oil hole in bushing aligns with slot in housing. Install a new seal (see above).

B aring R placem nt (T rqu Flit Eight) - Pry old seal out of housing, then remove bearing snap ring and drive bearing rearward out of housing with Tool C-3275. Place a new bearing in housing and drive it into posi-

(Continu d)

tion with Tool C-3204. Install retaining snap ring, then install a new seal (see above).
Installation - Reverse removal procedure and note the following: Tighten all bolts and nuts to specifications *(see "Tightening Specifications" below)*. Check fluid level in transmission and add fluid as necessary.

TRANSMISSION UNIT REMOVAL (TRANSMISSION REMOVED)

See 1962 TorqueFlite Eight Transmission in 1962 Final Data, Page 461. Procedures are the same for 1963 TorqueFlite Six and TorqueFlite Eight with the following exceptions.

Front Pump Oil Seal

Replacement - *NOTE - Seal can be replaced without removing front pump and reaction shaft support assembly from transmission case as follows:* Remove seal with Tool C-3758 (6 Cyl.); C-3861 (V8). To install seal, place seal in opening of pump housing (lip side facing inward), then use Tool C-3757 (6 Cyl.); C-3860 (V8)and drive seal into housing until tool bottoms.

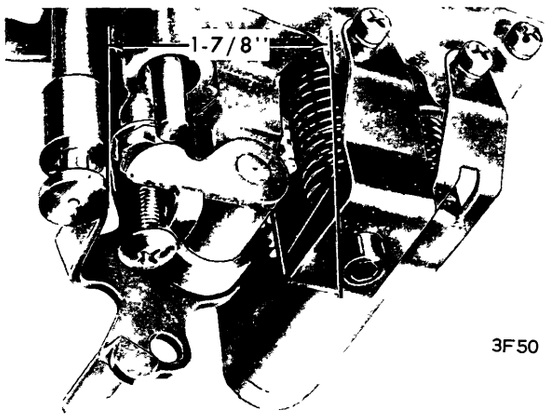
Drive Train Endplay

NOTE - Selective thrust washer for adjusting endplay is located between reaction shaft support and front clutch (TorqueFlite Eight); between input and output shafts (TorqueFlite Six). Endplay specifications are .030-.070" (TorqueFlite Eight); .022-.071" (TorqueFlite Six).

TRANSMISSION UNIT OVERHAUL

See 1962 TorqueFlite Eight Transmission in 1962 Final Data, Page 462. Procedures are the same for 1963 TorqueFlite Six and TorqueFlite Eight with the following exceptions.

Front Pump Bushing



Replacement (TorqueFlite Six) - Procedures are same as for TorqueFlite Eight except that Tool SP-3551 and SP-3624 should be used for removal and installation.

Reaction Shaft Bushing
